Great was the astonishment of the crews and of the garrison when, for nearly four days, the allied commanders lay before the place doing nothing, the Russians making every moment of the time available for the repairs of their batteries, and for adding strength to the defences in every direction. The confidence of the garrison was also greatly increased, for they naturally supposed that the fleet had suffered so much it became necessary to employ the interval in repairs. This was announced as a fact in the St. Petersburg journals, and profuse praise was bestowed upon the artillery officers, and men, who worked the batteries with such skill and energy as to inflict such extensive damage upon the ships as required four days to repair. No satisfactory explanation can be given of the supineness of the fleet. It is alleged that the commanders were disconcerted by having the dead body of Admiral Price on board during the action; that that circumstance accounted for the deficient energy displayed during the cannonade, and the unwillingness to renew the engagement afterwards. A new influence must have fallen upon the British navy, when the presence of a dead admiral on board depresses the crews of a fleet! Time was, when British sailors would have stood to their guns, although the best and bravest officers fell fast around them. Nor has that time departed—the crews of the British ships at Petropaulovski would have dared anything which British seamen ever dared, if they had been commanded by men of the old school. On the 1st of September, the *Virago* steamer took on board the body of the admiral, and buried it in the Bay of Tarinski. He was interred at the foot of a large tree, upon which

the sailors cut with their knives the initials of his name.

The energy of the commanders did not appear to revive when their fine feelings were relieved by the burial of their deceased chief, for they remained inactive to the 4th of September, except so far as mutual courtesies and consultations mitigated the crime of their inertness. It is alleged, however, that some information was supplied by an American skipper concerning certain unseen batteries, which determined the chiefs of the two squadrons to vary the plan of attack. They resolved to assault the north end of the town by land; at the same time the ships were to bombard certain batteries. Four hundred men from each division of the fleet were placed on board the *Virago*. This steamer also took *La Forte* alongside, and the *President* astern, and brought them in. The boats for embarking the troops being placed at the off-side, so that the disembarkation might be effected while the ships and batteries were engaged, and with as little observation from the latter as possible. The arrangement appeared altogether to be cumbrous and clumsy. Scarcely had the ships got within range of the batteries, than sad havoc was made by the latter among the masts and rigging of the former. The decks of the *Virago* were crowded with the landing party, as if the concoctors of the plan were as solicitous to expose them as they were, no doubt, uneasy at their exposure. The five-gun battery was, however, silenced by the *Virago* and *La Forte*. The *President* in the meantime anchored within 600 yards of "the Saddle Battery," so called by the British, because of its shape. This little battery engaged the whole force of the *President* for some hours. According to the Russian accounts, the damage done to the material of the battery was extensive, but there was but little loss of life. It was at last silenced; and the signal was given for the landing party to take to the boats—the English sailors under Captain Burridge; the French under Captain Lagrandière; the marines of both forces under Captain Parker.

The assailing body was divided into two parties: one was to ascend the hill called Nikolaiska, which overlooked the town from the north; the other was to take a road to the left, and storm the batteries which commanded "the gorge." Before either of these movements could be executed, or even attempted, the Russians, well posted, opened fire from their guns, and some of the assailants fell. The hill which the marines and French seamen were to storm was crowned with batteries, flanked with log-houses, armed with heavy guns, and sheltering musketeers. On the brow of the hill a Russian force of infantry

was drawn up, sufficient to dispute with musketry and bayonet the ascent of the marines. The movement of the latter was in fine order; and the spirit and courage of the men magnificent. On they pressed, under showers of grape and canister, rifle and musket balls; and as men fell the ranks closed in with the most perfect coolness and discipline, except as the jungle by which the hill was clothed impeded the order and celerity of their movements. It at the same time protected them from the fire above, receiving showers of missiles, which would have still more thinned their ranks, but also sheltering detachments of Russian rifles, who fired with impunity. The Russians posted on the brow of the hill did not await the charge of the bayonet, but withdrew behind their works. The advancing lines now divided, taking those works on either flank, as well as in front. Here Captain Parker fell, at the head of his brave marines, being the first man to top the hill. Lieutenants M'Cullem and Clements fell severely wounded. The gallantry of these officers had greatly sustained the men in the desperate assault, in which they had to encounter difficulties more formidable than the British at Bunker's Hill—so successfully surmounted, but not more heroically attempted. The men fell back when they saw their leaders fall, being uncertain as to the plan of attack to be pursued. They nevertheless repeatedly rallied, and were every time received with a fire from cannon and small arms within murderous range. In vain they persevered: they did all that the most chivalrous valour could do; but their officers had fallen, their ranks were thinned, the enemy was reinforced, and the storming of the batteries and log-houses became an impossibility. How to fall back with the least loss was the only consideration open to either prudence or valour. As they retired the enemy advanced; but so regular was the retreat, and so steady the discipline of the marines, that they effected the descent with a precision such as they might be expected to maintain in moving off parade. It was now found that the thickest parts of the jungle were occupied by more numerous bodies of riflemen; and the pursuers, dispersing among the jungle, kept up unseen a deadly fire. When they reached the beach, the enemy opened a well-directed fire of musketry against the boats, which were beaded with the balls. In the descent and embarkation many fell. Captain Lefebvre was killed, and Lieutenants Howard and Palmer were wounded.

The left attack was as unfortunate as the right. Captain Lagrandière led his party gallantly against the batteries in that direction; but it was like leading a forlorn hope: to come near the gorge was an impossibility. Cannon and small arms swept the approach, and the

stricken party fell back like their companions who stormed the Nikolaïska Hill, proving that they had the courage and discipline requisite to perform anything short of the impossible. The left attack was not persevered in with the same obstinacy as the right, and the loss was much less. Never did brave men under defeat cover themselves with more glory. They were borne away from the hopeless contest—

“ Few and faint, but fearless still.”

In the accounts published in St. Petersburg, no generous acknowledgment of such heroism was mingled with the exultation of victory. Those accounts were expressed in terms of cold-blooded satisfaction over the loss of the allies, such as the brave never employ towards a gallant but unfortunate enemy. There was much praise bestowed upon the courage of the Russians in this affair by certain portions of the British press. That they did not display cowardice is certain, but they made no opportunity for the display of valour. To keep up a murderous fire from jungle, blockhouses, and batteries, upon a body of men ascending a steep hill, impeded at every step by brushwood—a body of men not half the number of those who thus continued to fight under every description of cover they could make available—was no proof of courage. They might as well be canonised for their bravery because they fought at all. Had French or British troops been so posted, and the same number of Russians attempted to storm their positions, they would have bayoneted them down the hill—not a man of them would ever have reached their boats. Cunning, skill of arrangement, and avoidance of all exposure and hand-to-hand encounter with their antagonists, marked the defenders; a valour daring and dauntless, a chivalrous attachment to their officers, and willingness to sacrifice their own lives in their defence, characterised the assailants. The praise expended in western Europe upon Russian valour, in this as well as in other instances, has been more generous than considerate—or perhaps has been less pervaded by consideration or generosity than by political partisanship. Be the day far distant when it shall be thought a feat of valour for British men-at-arms to achieve so much!

The folly of the attack itself must be obvious to every thinking person, however unacquainted with military affairs. To storm such strong positions without any attempt to feel the way, and bring out a tolerable knowledge of the numerical force of the enemy, was as rash on the part of the allied officers as their conduct on the deep had been timid and temporising. On the element where adequate exertion might have enabled them to intercept the enemy, and where a generous rashness

would have enabled them to produce effects extremely destructive to the place, the commanders of the allies were slow, cautious, and indecisive; on land, where their resources were inadequate, they plunged 800 men recklessly into a fire of musketry from twice their number, sheltered in almost every conceivable form, and under close range from batteries armed with numerous guns of large calibre. No means were taken by those who planned or ordered the right attack to ascertain if the brushwood or jungle was occupied by the enemy; the men were urged on through every obstacle, as if marching up the hill was itself sufficient to clear the jungle of sharpshooters, and the crest of the ascent from the cannon and infantry which crowned it.

The 5th of September was spent in attending to the wounded, and burying such of them as died, and the gloom and despondency of both divisions of the fleet were extreme. There were no murmurings among the crews, but a wide-spread conviction prevailed among them that incompetency, which almost looked like treason, had brought disaster and disgrace upon their arms. Two officers were killed, and four wounded, all severely. Sixty men were missing, and about a third of the whole force was wounded, many of the men repeatedly. The escapes were wonderful; few of the whole landing party that did not carry away some mark of the enemy: caps, clothing, arms, knapsacks, were struck with grape-shot and musket balls. Had the enemy's aim equalled his opportunity, it is difficult to conceive how any could have reached the ships. After cruising about some days, all thoughts of resuming the attack was abandoned, and the fleet undertook the performance of other duties.

The loss of the Russians from the land attacks was very small, from the sea very heavy. The St. Petersburg journals reported it as being very trifling altogether, but it was obvious from the fleet that great damage was inflicted. The Russian ships (especially the *Aurora*) were much shattered. Several batteries were broken to pieces, three cannons spiked, and six times as many rendered unserviceable by the fire of the fleet. The Russians could not have lost less than 200 men in killed and wounded, judging from what was seen from on board the assailing squadrons.

Some notice of the unfortunate Admiral Price's history is here appropriate. He was an old man when he fell by his own hand. He had been half a century in the British navy. His first active services were at Copenhagen, in 1801. In 1806, when a midshipman, he assisted at the capture of four French frigates. In 1807 and 1808, he served in the Baltic. On board the *Hawk*, as lieutenant, he took part in the destruction of the French frigate

Amazone, and in the capture of a French convoy, and three brigs of war. In one of these exploits he was smartly wounded. When in command of the gig of the *Hawk*, he brought off several transports, and a 10-gun brig, from under batteries, and was again wounded. In 1815, he retired from active service, having seen little of the sea until appointed to the Pacific command, in which his career terminated so disastrously. He had seen much glory, performed brilliant services, and displayed considerable capacity. Twice he was made prisoner by the Danes, and many times he passed through extreme perils in his warfare against the French. All his exploits, however, had been performed when under orders, or when exercising inferior command. For the first time in his life he found himself in any important authority, after thirty years of repose, and in very old age; his promotion having quietly gone on in the way of seniority all the while. His mind was unequal to the emergency, and he first proved himself incapable of the promptitude and energy required, and then sank under the sense of responsibility. It is generally acknowledged among naval men that if he had health and physical energy, he was equal to the charge which devolved upon him; he had always previously proved himself a dashing, gallant, and skilful naval officer.

The intense state of alarm which prevailed throughout India when the allied squadrons failed to destroy the strongholds and ships of Russia in the North Pacific, may be exemplified by the following extract from the *Madras Athenæum*. It is written in playful ridicule of the exaggerated fears that prevailed, but it affords a graphic sketch of the way in which public apprehension and watchfulness against the enemy was manifested, which will afford the reader an easier insight to the state of mind in India on the subject than more grave accounts. "A sight more ominous than that of the *Flying Dutchman* to the storm-tossed sailor—than the notice of bankruptcy to the struggling tradesman—than the collector's camp to the Indian ryot—than the examining committee to the palpitating ensign—was offered to the gaze of the inhabitants of Madras on Sunday evening, in the guise of Russian colours, fearlessly displayed at the peak of a goodly vessel standing in, as it appeared to the various spectators, for the fort, Black Town, St. Thomé, and, in short, every spot on the coast where there were houses to be knocked down and treasure to be lifted. The major portion of the European population were at church, and ignorant of danger, but the alarm spread through the native quarters with the marvellous rapidity that has been so often commented on; and every kind of vehicle was put in requisition to convey mister, mistress, and the

misses and masters Ramasawney to places of safety. The governor, with a wise appreciation of the real character of the peril, ordered the town-major to go on board the steamer with a party of her majesty's 43rd and a detachment of artillery veterans; and Captain Thompson, 'whittling' the danger down to a 'point,' contented himself with merely ordering the men to be kept in readiness, whilst he prepared to pass the night on the *Bengal*, which kept a good look-out, and dispatched a boat to keep the enemy in sight. We can answer for it that there were sleepless pillows in many dwelling-places, where the roar of the surf penetrated; and, at daylight, the shore was dotted with eager spectators, straining with anxious eyes to discern whether the intruder was, as we had surmised in our 'extra,' a harmless trader, or a disguised ship of war, waiting with her accomplices outside, to rain bombs and bullets from Corvelong to Coromandel. The doubt was soon dispelled. The *Bengal*, having first ascertained that the lady passengers had been duly furnished with their morning cup of tea, steamed forth on her dubious mission, and to the lasting honour of the Peninsular and Oriental service, challenged, boarded, and captured the stranger, whom she took in tow, and anchored within musket-range of the Custom-house. The crew, sixteen in number, and all natives of Finland, were brought on shore, and the chief magistrate was appealed to, to find a place for their safe custody; when, to the infinite disgust of the captors, Mr. Elliot proclaimed her to be 'No prize!' On inspecting the ship's papers, it turned out that she was the *Idealett*, from Harlepool to Madras, laden with coal, and out from England 145 days. She was consigned to Messrs. Binny and Co.; and the London agents had written that they intended to apply for leave for her to go on to Moulmein, under the provisions of the recent order in council. When these documents were produced, there was nothing for it but to release the ship and crew, and inform the town-major and Captain Bowen, of the *Bengal*, that their labour had been all in vain. Whilst obliged to record this harmless termination of a fright—which was far more general than the public cares to own—we should be sorry to be suspected of a design to ridicule the efforts made to avert an apparent danger. Nothing was more likely than that a Russian man-of-war, disguised as a trader, should be sent in to reconnoitre the fort and town; and, in that case, the steamer might have found her heels not quite nimble enough to save her from capture or destruction. It is half a century since an enemy has threatened Madras; and the government owe it to the timid natives, as well as to their own reputation, to save the capital of the presi-

dency from the disgrace of being braved with impunity by a single vessel of war, steamer, or sailing ship. But for the accidental presence of the *Bengal*, our rulers would have been obliged to board the *Idealet* from a masulah boat, or allow her to come and go at discretion."

The activity of the Russian cruisers, where it was supposed British men-of-war were not likely to pursue, was worthy of a better cause. In the different Pacific ports where they touched, much surprise was expressed at the good seamanship on board these ships; the education and nautical skill of the officers also excited remark. At the close of the season the *Kamschatka*, especially, produced a sensation in the South American ports by her movements in quest of British traders. The *San Franciscan Sun* thus described her:—"It is now pretty generally understood that the Russian ship *Kamschatka*, which arrived in our harbour a few days ago, is a regular privateer, instead of a peaceful merchantman, as at first reported; her visit to our waters being for the purpose of obtaining stores, their supplies having been cut short by the capture of the ship *Sitka*. The *Kamschatka* mounts ten guns, and has a crew of 120 men, who appear to be under the best possible discipline. She is said to be an excellent sailer, and has been cruising in the Okhotsk Sea in search of English and French whalers, some of which narrowly escaped capture. She is a vessel every way calculated for the business in which she is engaged, and will no doubt make sad havoc among the French and English merchant fleet in the Pacific." The frigate *Diana*, referred to in a previous page, made her way to Japan, and was there destroyed, in harbour, by an earthquake. Notwithstanding the eager zeal of the enemy, the commerce of the allies suffered little.

It can hardly fail to strike our readers with surprise, how zealous *all classes* of Russians proved in the service of the czar in every port—from the Arctic Sea to the Danube, from *Kamschatka* to Armenia. What fires a whole people, living under a despotism, with so emulous a patriotism—from the frozen and monotonous shores of Russian Lapland to the beautiful hills and vales of Georgia? It cannot be the paternal character of the government under which they live, nor the commercial prosperity by which a free people may be enriched; it cannot be a traditionary pride in the liberty and honourable career of their ancestors, for whatever page of their history we turn over, we find them ground down by a barbarous oppression, and sunk in the most brutish sensuality and ignorance. In Geyer's *History of Sweden* (vol. i., p. 241), it is stated that reports respecting the condition of the Russians were made from time to time to King Gustavus Adolphus, in which the follow-

ing observations occur:—"There were two main causes of the weakness of Russia: one was the corruption of the clergy, whence the education of the people was wretched, so that gluttony and bloodshed were vices made matters of boast; the other was the foreign soldiery, for the Muscovites, although they hated everything outlandish, could effect nothing against foreigners without foreign aid. All that they accomplished was done by treachery and superiority of numbers. The indigenous soldier received no pay, wherefore he robbed; in the defence of fortresses he had always shown himself stout. . . . With respect to taxes there was no definite law, but the lieutenants extorted what they could, or took bribes for their remissness. The condition of the lower class in the Russian dominions was miserable, from four causes: through slavery, through the multiplicity of races, through the weight of imposts, and, lastly, through the number of festival days, which were consumed in debaucheries. The safeguards of laws were unknown. The peasants, who must labour five days of the week for their lords, had only the sixth and seventh to themselves. . . . Thralldom was regarded by the Muscovites not as a shame, but as an honour. All boasted of being the serfs of the Grand Duke. His will was law, even if he should command a man to slay his father or mother. That such a condition of things might be maintained, egress from the kingdom was forbidden them, out of fear that, if they came to foreign princes and nations, their civilisation might make slavery abhorrent to them."

There is little to add to the above description to complete the moral and physical portrait of the Russian people at this day; yet do we see them at *Sitka*, at *Petropaulovski*, at *Kola*, and at *Archangel*, as patriotic and as strenuous for the glory and aggrandisement of Russia, and the unrighteous triumph of the czar, as where they are overshadowed by his throne! The true solution of this is in the fanaticism of the people: the aggrandisement of Russia is the aggrandisement of their faith; the triumph of the czar is not only the triumph of their military and civil chief, but of the sacred head of their "holy orthodox Church." The Muscovite party is especially the party of nobles, priests, army, and people; the dissidents are only a philosophical coterie at *St. Petersburg*, or the Lutherans and Latins of the more recently acquired provinces, and who can hardly be computed as Russians, although subjects of the empire. A writer in *Berlin* thus conveys similar representations: "With the same muddle of religion and politics, the Muscovite party embraces the war as a godsend for the furtherance of their purposes, and reckons religiously on the assistance of Russia's patron

saint—St. George, the dragon-killer—to protect her from any eventual damage, as in 1812. On the other hand, victory over Mohammedanism would confer such a *prestige* and halo on the Russo-oriental Church, that the specific Russianism, or, as I have called it above, the Muscovite party, could proceed to extirpate Catholicism, and, what it abhors as much, Lutheranism. Russia would then, as an entire unmixed state, containing one nationality, and professing one creed, march forth, invincible in the strength of her faith, to the conquest of Europe.”

From the remote seas and shores whither we conducted the reader in the last two chapters, we now once again turn to scenes nearer home, and to our Western lands themselves. A history of the war would not prove to be what it professed, if it only narrated the battles fought, or traced out the policies of the contending nations. It is necessary to mark well the events which at home ran parallel with those abroad, to note every fact which indirectly bears upon the great struggle, and depict every phase and change of popular feeling.

CHAPTER XXIX.

HOME EVENTS BEARING ON THE WAR.—AGITATIONS OF THE PEACE PARTY.—LAUNCH OF THE “ROYAL ALBERT.”—EFFORTS OF M. KOSSUTH TO CREATE A PUBLIC OPINION IN FAVOUR OF SETTING UP THE SUPPRESSED CONTINENTAL NATIONALITIES.—DESIGNS OF THE CZAR TO FORM AN ALLIANCE WITH AMERICA.—LOSS OF THE “EUROPA” TRANSPORT.—GALLANT DEATH OF LIEUT.-COL. MOORE.—THE FRENCH ARMY OF THE NORTH.—VISITS OF KINGS AND PRINCES TO BOULOGNE.—THE FRENCH EMPEROR’S PROCLAMATIONS TO HIS SOLDIERS.

“An honourable peace lasts long, but the dishonourable no longer than till kings have power to break them; the surest way, therefore, to peace is a constant preparedness for war.”—DR. EDWARD FOX (*Almoner and Secretary to Henry VIII.*)

DURING the entire spring and summer of 1854, the peace parties made great efforts to disgust the country with the war. Mr. Bright, with his usual vivid and startling eloquence, led the controversy on his side of the question. He denounced the government as fomenting war for rival purposes, and the people as sustaining it from a bloodthirsty, or, at all events, combative and vainglorious spirit. In the Commons he represented the burthens inflicted upon the British people, at the very outset, to be such that every man might be said “to carry a Turk on his back.” He predicted also that six months of war would throw the operative classes out of employment, cause famine among the poor, and lead to insurrection in our great cities. As Mr. Bright is as honest and earnest as he is eloquent, these speeches produced much effect; and as the grave and serious eloquence of Mr. Cobden, and the beautiful and impassioned eloquence of George Thompson, aided the agitation, the impression produced by Mr. Bright was extended, and many converts to the peace doctrine were made in the manufacturing towns of the north. Mr. Cobden was very prophetic as well as Mr. Bright; and both adopted language in denouncing the war party, as they termed the country, which passed the bounds of ordinary declamation, as well as legitimate discussion. The great services rendered by these eloquent and earnest men to their country, created a tolerance in the public mind towards their severity of denunciation creditable to popular gratitude. The result of these discussions,

however, was that the nation became more warlike than before, and more determined to exact from their government a vigorous prosecution of the contest. In vain Mr. Cobden and Mr. Bright endeavoured to stem the torrent of national feeling for the war. These two gentlemen, so closely united, were destined to be proved false prophets, as well as to share in a common logical discomfiture. Their vaticinations were singularly unfortunate; none of them came to pass. The country was not ruined; our streets were not filled with revolutionary violence, or torn up, by rioters for bread; famine did not follow the war; and so far from national bankruptcy or the destruction of trade and commerce ensuing, that when 1854 closed, the imports and exports were greater than were ever presented by the trade reports before.

The main topic insisted upon by all the orators on the peace side was not, however, the national ruin it would produce: some insisted upon the sin of war—of all war, offensive and defensive; others upon the impolicy of this war, which they represented as being for what was called the balance of power, which they denounced as unreal—a mere chimera which no one could define—a political shibboleth which none but a certain school could pronounce. Mr. Bright challenged the noble Secretary of the Home Department, since premier (Lord Palmerston) in his place in the Commons, to give him, or the House, or the public, any idea of what it meant. The reply was one of the most happy ever given by the illustrious statesman, and

was received in the Commons with repeated bursts of admiration and applause:—"Why, sir, call it the balance of power, or what you will, the idea is one familiar to the mind of man, and which has influenced the conduct of all mankind from the earliest ages. The balance of power means, that a number of weaker states combine together, to prevent one strong one from acquiring a power which shall be dangerous to their liberties, their independence, and their freedom of action. It is the doctrine of self-preservation; it is the doctrine of self-defence, with this simple qualification—that it is combined with sagacity and foresight;—that you endeavour to prevent an imminent danger before it comes thundering at your gates. I know that the honourable member is so attached to his principles, that he thinks peace is of all things the best, and war of all things the worst. I happen to be of opinion that there are things for which peace may be advantageously sacrificed, and that there are calamities which nations may endure still worse than war."

So intelligent have the people become, and so free is discussion in our land, that the national purpose was invigorated by the discussions thus provoked. The more the popular will was resisted and obstructed by men in power, the more it grew in force; until, as the torrent, dammed up by temporary expedients, and bursting the insufficient barriers with accumulated pressure, so the mind of England rose resolutely but steadily against all restraints, and demanded a persistent war, until the aggressor should learn justice, or submit to its restraints.

Among the home events which most interested the public was the launch of the *Royal Albert*, at Woolwich, on the 13th of May. It was alleged that 60,000 spectators were assembled on the occasion. The river in front of Woolwich Dockyard was covered with craft of every size and description, decorated with flags, and having on board bands of music. Within the dockyard, there was a series of raised platforms facing an amphitheatre around the launch. Thousands occupied these platforms; amongst them the members of the Lords and Commons, the foreign ambassadors, the officers of the various departments of government, especially of the Admiralty and the Dockyard.

The ship which excited this interest was certainly a just cause of pride to the country—in the sense in which an individual or country may be proud of anything without vainglory. Her extreme length was 272 feet; length between the perpendiculars, 252½ feet; length of keel, 198½ feet; extreme breadth, 61½ feet; breadth for tonnage, 60½ feet; "moulded breadth," 59½ feet; extreme depth, 66 feet; depth of hold, 24½ feet. Her burden, 3726

tons, and her piercing was for 131 guns. Her screw-propeller was to be driven by trunk engines of 500 horse-power. Her armament has been thus described:—ten 8-inch guns, for firing shells or hollow shot, and twenty-six long 32-pounders; on the middle deck six 8-inch guns, and thirty 32-pounders; on the main deck, thirty-eight 32-pounders; and on the upper deck twenty 32-pounders. On the fore-castle she will carry a 68-pounder gun, weighing five tons, and capable of throwing round shot a distance of three miles.

Early in the afternoon the royal carriages arrived with the royal family. Her majesty "christened" the ship, as the ceremony is absurdly, if not very improperly termed; and the launch was effected while the strains of "Rule Britannia," and the shouts of the excited multitude, filled the air. The author of these pages made frequent visits to Woolwich during the preparations for this event, and was struck with the pride which was felt by all concerned in the dockyards, in their new *protégé*, and by the general expectation that this great castle of the deep would perform wonders of war. It was not then understood that the tiny mortar boat, and hulking raft battery, would be called more into requisition on the seas where our enemy skulked into every creek, and sought the shelter of every form of defence. This specimen of the naval might of Britain was towed down to Sheerness to be fitted for sea, and subsequently disappointed the great expectations entertained of her efficiency.

The eminent foreigner, Louis Kossuth, aided by Mazzini, and other refugees, Hungarian, Polish, and Italian, appeared at this juncture very prominently before the British public as advisers in reference to the conduct of the war. M. Kossuth was the most popular of these refugee agitators. He argued that England erred in allowing the progress of Russia to be so long unchecked; denounced the partition of Poland as a political crime; and held up the interference of the czar in suppressing the Hungarian revolution as an attack on constitutional liberty everywhere, which England, therefore, ought to have resisted.

These arguments were well received by the public, but the events were past, and could not be redeemed. In reference to the war of Hungarian independence, the friends of Lord Palmerston maintained that he did all which he could do; that Russia, in her interference, only sought to maintain the previous relations of Hungary to Austria, territorially considered, however injurious to liberty the aid she proffered to Austria might be: besides, France was unwilling to assist in the defence of Hungary; and England was not prepared to encourage a war of nationalities; some of which would, if they gained the independence they sought, be

is hostile to freedom as the tyrannies from which they might escape. It cannot be forgotten that when British sympathy encouraged the revolt of the Sicilians, it was repaid by acts of intolerance to Englishmen as cruel as those of the power from which the Sicilians had revolted. One of the first acts of the short-lived independence of Sicily was to make war against religious liberty. Greece, for which the protocols and monies of England were so recklessly spent, is a more intolerant and tyrannical state than that against which she rose. Belgium, liberated from Holland with the cry of civil and religious liberty on her lips, has since sought every opportunity to bind her emancipated hands with double manacles. A deeply-pervading hostility to religious and constitutional liberty pervades the mind of nearly the entire Belgian nation. We agree with the witty and eccentric Sidney Smith, that however generous it may be to think of the oppressed nationalities, it is dutiful to remember the overburthened English. A war for people whose first use of independence would be to infringe the independence of others, is neither sound in policy nor in ethics. In the love of liberty pervading Hungary we have entire confidence, and sigh for the wrongs inflicted upon the dauntless Magyars; but it is impossible to espouse the cause of the nationalities, and wage war for their restoration, against the allied despotisms of Europe. With a good cause, and a *just necessity* for war, England against all Europe; but however good the cause, unless the necessity for her participation in the quarrel, from interest or honour, could be made out, the duty of England is to use her moral influence for the oppressed, but to allow the sword to rest in its scabbard. We have no hesitation in saying that the policy of Palmerston has been more to the interest of England than that commended by Kossuth. With the latter we have more sympathy; in the former, more confidence. The policy of Kossuth is just, but for England at present impracticable; that of Palmerston is eminently practical, and not unjust. Were any English statesman to attempt the line of political action recommended by the great Magyar, he would be opposed by numerous, wealthy, and powerful sections of the community, and would not be supported heartily by the masses. He would engage England in a bloody and desperate struggle, unsupported by allies, without a hearty sympathy from the peoples, and with the despotisms leagued against her. A war with France, Russia, and the whole of Germany, for the purposes of restoring Poland to independence, Hungary to nationality, and to make petty republics of the Italian states, would be the maddest career upon which any British statesman ever set out. Whatever be the

greatness and resources of our country—whatever her valour, love of freedom, and sympathy with the oppressed—she is not called upon by any national, international, or social obligation to this desperate hazard. No man intimately conversant with the various sections of British society—religious, social, and political—would ever think of addressing to them such epistles as the majority of those written by Kossuth and Mazzini. These able and patriotic men are ignorant of the habits of thought, inculcated prejudices, commercial interests, spirit of caste, and religious earnestness of the whole people. They are misled by the tone of the *cliques* that surround them, and thus judge the British people erroneously. They have much to learn from the British people, and concerning them, before they can stand in the attitude of their public political instructors. An intimate knowledge of English history, great command of the English language, a political knowledge of England's foreign relations, and a philosophical acquaintance with the genius of her government, may be conceded to both Kossuth and Mazzini—especially the former; but there are religious and social elements which they have not penetrated, and without a knowledge of these—intimate and thorough—their speculations of what England will do, or ought to do, are crude and imperfect. The English people can more easily appreciate the point of view from which these gentlemen regard public events, than those who thus assume to instruct the English mind can appreciate the point of view from which England regards continental politics, and her own relation to them. As the people of England are always ready to do justice to the opinion of M. Kossuth, we shall give a specimen of his remonstrances and arguments on the policy and conduct of the war. We extract it from his famous speech at Sheffield:—

“You should insist to attain, by your present sacrifices, a true and lasting peace. Now, neither of these aims can be attained without Poland, Hungary, and Italy be restored to their national rights; and, especially, Russia's overwhelming power cannot be reduced without Poland being reconstructed an independent nation, with its national territory; nor can the integrity and independence of Turkey be secured without a free and independent Hungary. All these aims would be subverted by England taking despotic Austria for her ally. Then you would fight for Austrian despotism, and not for freedom. If there ever was a truth striking beyond any doubt, it is the truth that, except Finland, it is only in Poland, and by Poland, that Russia is vulnerable. Bombarding Odessa, Sebastopol, Cronstadt, taking Russian prizes, burning the Russian fleet (if you can get at it), nay, burning St. Petersburg

itself;—all this may be very noisy, good food for the newspapers; but it is merely a palliative—nothing of a permanent effect. The Russians might, perhaps, themselves burn St. Petersburg, as they have burnt Moscow: you will not be the better by it. If your purpose is to fight Russian despotism—if your aim is to check Russian ascendancy, and to reduce Russian preponderance—it is in Poland and by Poland that you must act, or you will never attain your aim—never. . . . Remember the campaign of Napoleon to Moscow, in 1812. Napoleon undertook to check the crowning ascendancy of Russia, just as you do now. And with all due regard for the Lord Raglans and Maréchal St. Arnauds, be it said, ‘the little corporal’ knew something about war. He knew that Russia, though not very formidable abroad, is anything but weak in defence at home. The force which he employed amounted to 600,000 men, 182,000 horses, and 1372 guns. What is the Anglo-French army in the East compared to this?—a Chobham camp-parade! He knew that it was not on sea that a decisive battle could be fought against Russia: he went on by land. He knew that, without a large cavalry, there was no possibility to hold a bivouac for twenty-four hours against a Russian army, and he took care to have much cavalry. He did not even neglect the pitiful expedient of substituting to Polish nationality the idea of Polish legions, just as you begin to do now in the East. Besides, he also looked for alliances, just as you do. Only, less a politician than a soldier, he addressed himself to wrong quarters; he addressed himself to Austria and Prussia, precisely as your government does. But he had stronger claims on the fidelity of Austria than you have. Having to dispose of the existence of Austria, he just pardoned her, saved her, and, to make the alliance sure, he married the daughter of the Emperor Francis Joseph of Austria. Both Austria and Prussia yielded to the courtings of the mighty Cæsar, became his allies, and gave him two cavalry armies against Russia. You know the rest. Napoleon lost 552,000 men, 167,000 horses, and 1222 guns. One of his allies betrayed him on the battle-field; the other compromised him by inactivity; both turned against him, and sent him to die—a fettered giant, on the rocks of St. Helena. You have been taught by superficial professors in your schools, that it was the generals Frost and Famine which defeated Napoleon. No: he was defeated by having taken Austria and Prussia for allies.”

We concur with M. Kossuth, that the two great pathways to the heart of Russian power are Poland and Finland. We would place Finland first. To wrest that fine province from her, and constitute it a federal state with

Norway and Sweden—*tria juncta in uno*—would be the surest policy for the safety of western Europe. To reconstruct the kingdom of Poland would be to secure Germany from the rapacity of the Russ, and to render aggression upon Turkey by way of Europe impossible. But Russia would still remain a gigantic empire, and with numbers and resources sufficient to approach the Dardanelles through Asia. The Caucasian barrier against her should be preserved, and the littoral of the Euxine wrested from her for ever. Were the whole of the Dacian provinces—Bessarabia, Wallachia, Moldavia, Podolia—constituted an independent state, we are not sure that it would not prove as effectual a bulwark against her as reconstituted Poland, and at the same time subvert Austrian designs to grasp the entire course of the Danube, and enter Bulgaria. A cordon of independent nations, strong enough to resist her with such combinations as their positions would naturally create, would be the best preservative for Europe and Asia against the plague of Russian encroachment. No doubt this will arise out of the throes and heavings of nations which we now see upon the politically convulsed earth; but any attempt on the part of England to anticipate what the present workings of Providence appear ultimately to design, would be futile, and react in ruin upon herself. As well might Louis Kossuth preach to the United States of America a naval and military crusade against the feudalism of Europe. America is acting upon that feudalism by commerce, by intelligence, by her own moral grandeur, and increasing greatness; she might strengthen, but could not overthrow, European feudalism by any other action against it. God has not allowed it to be a part of the moral system he adopts in the government of the world, that any one nation can pursue a course of social and political propagandism, promoted by arms, even for the most righteous principle. It is absurd for M. Kossuth to denounce England for accepting the alliance of Austria because her government is despotic; it would be as wise for Turkey to refuse the alliance of the Western powers because they are Christian, or, as she deems them, infidel. England does not propose a treaty, offensive and defensive, with Austria; but she would willingly accept her aid for a specific purpose, and pursue her objects so far as Austria would unite with her, thereby making their attainment comparatively easy. Besides, France, the greatest continental power, not excepting Russia, must be consulted; and France refuses to exclude Austria from the consideration of the great questions now pending in the cabinets and on the battle-fields of Europe. England seeks not to be the dictator to the family of European

governments; she desires to act in harmony with them, observing international law, and preserving European order; but she hails with satisfaction the efforts to be free which the revolutions of oppressed nations display: her own government is founded upon the glorious revolution of 1688. The throne of Victoria rests upon a basis formed by that successful and legitimate revolt; and neither queen nor people can refuse their sympathy when Hungary and Italy rise in arms for liberty, although it may neither be right nor possible to interfere. Whatever her error in the past as to the progress of Russia, or the suppression of nations, there is now too much of the popular element in the English legislature for these things to have their like again. This very war has enlightened England, painfully but thoroughly, to the magnitude of such questions, and the dangers of such neglects.

The eloquence of M. Kossuth in contrasting the war of Napoleon I. with that of Napoleon III. against Russia is, we think, quite thrown away. Each acted according to the alliance naturally arising from the state of the world and the course of events. *Napoleon I. forced Germany on before him in his march to Moscow, as a tyrant and a dictator alike to Germany, to Russia, and to Europe; Napoleon III. invites all nations, of their own accord, to join issue with the despot who claims for his church, and himself, as its ecclesiastical head, the right to march through Europe on a crusade of fanaticism and oppression. Napoleon III. profits by the failure of Napoleon I. The former wars with his basis of operations on the sea, his ally being the greatest of naval powers; Napoleon I. acted with his basis of operations upon Germany, because Germany was to him conquered territory, practically a province of his empire, and his great enemy was that predominating naval power which is his nephew's ally. Russia could afford to burn Moscow, for while England was her ally, Napoleon could never conquer St. Petersburg. English generals guided her armies, English gold fed them on their own territory. But the czar cannot afford to burn either Moscow or St. Petersburg now, for both are menaced, slowly but surely, by the fleets and armies of the allies. If the two great capitals of Russia were now to be destroyed, either by aliens or by the torch of her own incendiary barbarians, and this were done before advancing fleets on the one hand, and advancing armies on the other, Russia would then be conquered; her fertile provinces and her resources lost, she, as an empire, would herself be lost. The allies would then only require to arm and help the vanquished nations which begirt the Russia which existed when Peter the Great ascended the barbarian throne. Thus deprived of her*

border provinces, Russia might be left with Archangel and Tobolsk for her capitals, the Arctic Ocean for her outlet, and the snow-clad steppes the home of her barbarous hordes. Tribes of Cossack robbers might roam over these at will; but for all the purposes of civilisation, and European independence, Russia might be considered as no longer a power. Truths put in partial and *ex parte* aspects, and adorned with a certain earnest and innate eloquence, characterise the Sheffield oration of M. Kossuth, but it enunciates nothing for which England need feel indebted to him, or by which England need be guided.

An event which deeply moved the compassion of the allies, occurred in the loss of the *Europa* transport. It left England with stores and ammunition for the Bosphorus, and a party of the Enniskillen Dragoons, under the command of Lieutenant-colonel Moore. About ten o'clock on the second night after her departure, when about 180 miles from England, a startling cry was raised, "Fire in the forehold!" Captain Gardener ran below, and found the fire spreading in the "forepeak," where a large quantity of ship's utensils, cords, ropes, sails, tar, pitch, &c., had been stowed away. He immediately ordered the ammunition to be thrown overboard. The pumps, which had been fitted under the direction of government to obtain water from the tanks for the soldiery, had hose attached to them, and volumes of water were incessantly directed upon the flames. The soldiers and crew laboured with order and energy; but it was all in vain, the flames gained upon the ship rapidly, until no hope of saving her any longer remained. The scene at this juncture was most appalling. No one can describe a burning ship at sea except he who sees it. Let any person peruse the graphic and heart-stirring account given by the Rev. W. Blood, Vicar of Temple Grafton, of what he saw on the dreadful night he escaped from the burning *Amazon*, and he may form some conception of the scene of horror on board the *Europa*. Within half an hour from the moment the cry of fire rang through the vessel, the ship may be said to have been wrapt in flames. The conduct of Lieutenant-colonel Moore in this emergency was heroic. We remember nothing comparable to it except the conduct of the Rev. Mr. M'Kenzie, a congregational minister of Glasgow, on board the *Pegasus*, wrecked on her way from Edinburgh to London some years ago. Colonel Moore determined to remain on board the burning ship until the last man was saved. There stood the veteran, firm against all importunity to leave the ship, superintending with a noble dignity the embarkation of his men in the boats by which their only hope of safety was provided. The soldiers were like their chief;

the brave fellows remained as perfectly under his control, in the face of the most appalling death, as if in the barrack square. The life-boat bore five-and-twenty persons away in safety; during the night it was taken up by the barque *Marawam* of Dundee. Another boat, with twenty-six persons on board, rowed in the direction of a distant light, found to be on board a Prussian schooner, which received the distressed boat's crew on board, and treated them with great humanity. A third boat, bearing Lieutenant Black, the admiralty agent, the second mate, and some soldiers, was equally fortunate with its predecessors. But the largest boat of all could not be disengaged from the ship, for the usual reason on such occasions in British ships—previous mal-arrangement; and to this cause is to be attributed the loss of the manly and generous Colonel Moore and twenty-one others, whose courage, like that of the colonel, merited their country's deepest regret. It is remarkable that on board British ships, either warlike or mercantile, such bad arrangements exist in connection with the boats. The sailors of no other nation neglect so recklessly the precautions proper in this particular. Scarcely a British wreck occurs—particulars of which reach us—that we do not hear of the difficulty of disengaging the boats from the ship, because of the mode in which they are slung, and the want of practice on the part of the sailors in this matter. The providential escape of the Rev. Mr. Blood from the *Amazon*, already referred to, strikingly exemplifies this fact. This was one of the causes of the great loss of life then experienced. With proper arrangements few ships need be lost at sea by fire; and in case of vessels striking, or springing a leak, the crews should be all so well exercised in the rapid disengagement of the boats, as to secure whatever chance of safety boats may furnish. Loss of life at sea is caused mainly by the recklessness of our crews, the want of discipline in merchant ships, the neglect of boat arrangements, and the defective education and want of sobriety on the part of the masters in our mercantile navy. Lieutenant-colonel Moore, unable to make the large boat of the *Europa* available, was driven by the violence of the flames into the mizen channels, and there perished. Captain Gardener escaped, when the wind blew hard and a very heavy sea was on, by clinging to the mainmast with a number of soldiers. They were afterwards picked up in a most exhausted state. Truly it is not in the thunder of war only that our sailors and soldiers show their unrivalled fortitude:

"The wide-spread ocean with its solemn surge,
Lashing a thousand miles from shore to shore,"

has received into its depths from the wreck, hearts that beat as bravely in that awful mo-

ment as those who, when borne proudly on its bosom, perished in the battle.

In the latter end of May, the Emperor of the French addressed his senate in reference to his alliance with the Queen of England, and presented to them a copy of his treaty with the Britannic Majesty and his Imperial Majesty the Sultan. Reference has been repeatedly made to this treaty in the foregoing pages; this is an appropriate opportunity of presenting it to our readers.

Paris, May 2

Napoleon, by the grace of God and the national will, Emperor of the French.

To all present, and to come, greeting:

On the report of our Minister the Secretary of State for Foreign Affairs,

We have decreed and decree as follows:—

ART. 1.—A treaty of alliance, destined to guarantee the integrity and independence of the Ottoman Empire, having been signed at Constantinople on the 12th March of the present year 1854, between the French Empire, the United Kingdom of Great Britain and Ireland, and the Sublime Ottoman Porte; this treaty having been ratified, and the respective ratifications having been exchanged on the 8th of May, the said treaty, the tenor of which follows, will receive its full and entire execution.

TREATY.

His Majesty the Emperor of the French, and his Majesty the Queen of the United Kingdom of Great Britain and Ireland, having been invited by his Imperial Majesty the Sultan to aid him in repelling the aggression directed by his Majesty the Emperor of All the Russias against the territories of the Sublime Ottoman Porte—an aggression by which the integrity of the Ottoman Empire and the independence of the throne of his Imperial Majesty the Sultan are menaced; and their said Majesties being fully persuaded that the existence of the Ottoman Empire, within its actual limits, is essential to the maintenance of the balance of power between the States of Europe, and having, in consequence, consented to give to his Imperial Majesty the Sultan the assistance he has asked for this object, it has appeared fit to their said Majesties, and to his Imperial Majesty the Sultan, to conclude a treaty, in order to declare explicitly the intentions, agreeably to that which precedes, and to regulate the manner in which their said Majesties will lend assistance to his Imperial Majesty the Sultan.

With this view their said Majesties and H. I. M. the Sultan have named as their plenipotentiaries:—

Baraguay d'Hilliers, Viscount Stratford de Redcliffe and Mustapha Redschid Pasha.

ART. 1.—His Majesty the Emperor of the French, and her Majesty the Queen of the United Kingdom of Great Britain and Ireland, having already, at the request of his Imperial Majesty the Sultan, ordered powerful divisions of their naval forces to repair to Constantinople, and to extend to the Ottoman territory and flag the protection that circumstances would permit, their said Majesties engage, by the present treaty, to co-operate still further with his Imperial Majesty the Sultan for the defence of the Ottoman territory, in Europe and Asia, against the Russian aggression, and employing for this end such a number of their land troops as may appear necessary for attaining this object; which land troops their said Majesties will forthwith dispatch towards such and such points of the Ottoman territory as shall be judged expedient; and his Imperial Majesty the Sultan agrees that the English and French land troops, thus dispatched for the defence of the Ottoman territory, shall receive the same friendly reception, and shall be treated with the same consideration as the French and British naval forces already employed for some time in the Turkish waters.

ART. 2.—The high contracting parties engage, each on his part, to communicate reciprocally to each other without loss of time, every proposition that one of them might receive from the Emperor of Russia, whether

directly or indirectly, with a view to the cessation of hostilities, of an armistice or peace; and his Imperial Majesty the Sultan engages, moreover, to conclude no armistice, and to enter into no negotiation for peace, nor to conclude any preliminary of peace, nor any treaty of peace, with the Emperor of Russia, without the knowledge and consent of the high contracting parties.

ART. 3.—As soon as the object of the present treaty shall have been attained by the conclusion of a treaty of peace, his Majesty the Emperor of the French, and her Majesty the Queen of the United Kingdom of Great Britain and Ireland, will make arrangements at once for withdrawing immediately all their military and naval forces employed for realising the object of the present treaty, and all the fortresses or positions in the Ottoman territory that shall have been provisionally occupied by the military forces of France and England shall be restored to the authorities of the Sublime Ottoman Porte within the space of forty days, or sooner, if possible, to date from the exchange of the ratifications of the treaty by which the present war shall be terminated.

ART. 4.—It is understood that the auxiliary armies shall preserve the faculty of taking such part as may appear suitable in the operations directed against the common enemy, the Ottoman authorities, whether civil or military, not claiming to exercise the least control over their movements; on the contrary, all aid and facility shall be afforded them by these authorities, especially for their disembarkation, their marching, dwelling or encampment, their subsistence and that of their horses, and for their communications, whether they may act together or may act separately.

It is understood, on the other hand, that the commanders of the said armies engage to maintain the strictest discipline among their respective troops, and will cause to be respected by them the laws and usages of the country.

It is of course understood that property is to be everywhere respected. It is, moreover, understood on either side that the general plan of the campaign shall be discussed and agreed upon between the Commanders-in-Chief of the three armies; and that if a considerable part of the Allied troops should be in line with the Ottoman troops, no operation can be executed against the enemy without having been previously concerted with the Commanders of the Allied forces. Lastly, due attention shall be paid to every requirement, relative to the wants of the service, addressed by the Commanders-in-Chief of the auxiliary troops, whether to the Ottoman Government through the medium of their respective embassies, or, in case of urgency, to the local authorities, unless paramount objections, distinctly explained, may prevent its execution.

ART. 5.—The present treaty shall be ratified, and the ratifications shall be exchanged at Constantinople within the space of six weeks, or sooner, if possible, to date from the day of signature.

In faith of which, &c.

NAPOLEON.

A report was spread in America, and in England, that the czar was anxious to form a commercial treaty with the United States, and to concede Sitka (referred to in our last chapter), and, we presume, the remainder of Russian America, for a moderate sum. The czar wanted the sinews of war, and he knew that the United States was anxious to exclude all European powers from the American continent; but if he seriously intended the sale, it was as much to conciliate the good wishes of the Union, as to supply his exhausted exchequer. Dr. Cottman (referred to in the chapter on the operations in the Baltic) was alleged to be the accredited agent of the czar for this negotiation. It was also alleged that the doctor was to intimate to the presidential government that Russia acquiesced in the reported designs of the States against Cuba—"that Cuba belonged to the

Union by right of geographical position." This loose political morality is rejected by millions in the United States. That the people of the Union are, for the very reason the czar insinuated—*necessity* of geographical position (not "*right*")—anxious to see Cuba in federal political relation with the States, there is no doubt. Apart from any desires of the proslavery party, this feeling very extensively prevails. But the Americans do not desire to possess Cuba after the czar's fashion—to plunder it from its rightful owners, and then rob and oppress it. They would gladly enough promote a Cuban revolution, and if the revolted and independent Cubans wished for annexation, the Americans would hail the circumstance as relieving themselves from a peril—the occupation of Cuba by an energetic European government, a circumstance injurious to American power, and threatening to her independence. The czar's proposed negotiation, through Dr. Cottman, resembled his overtures to Sir Hamilton Seymour, in 1853. He offered a *quid pro quo*—the cession of Sitka, and his countenance, moral and physical, to the seizure of Cuba for a certain number of dollars, a loan in the American market, and neutrality, or privateering, during the war with Turkey and western Europe. The doctor, however, proved himself to be a very bad envoy. Russian negotiators know well when to bluster and when to persuade; the American did not; he was all bluster. Russian diplomats study more than other men the *suaviter in modo* and the *fortiter in re*. But Dr. Cottman was all force, and no suasion. The doctor, too, overlooked the necessity of a good memory to persons of a peculiar tendency; for while he represented himself as spending a considerable time at St. Petersburg, Cronstadt, Helsingfors, &c., the American press proved the impossibility of his being in those places at all during at least a portion of the time, by the simple process of demonstrating that he was elsewhere, far away from the empire of his beloved friend, the amiable and liberal czar. Not only did Dr. Cottman indulge in rodomontade and abuse towards the allies, he made misstatements where (unfortunately) the truth would have even better served his purposes. There are few forms of the *suppressio veri* or of the *suggestio falsi* through which he did not run in his more specious and credible narratives; generally, however, the Russian agent was transparent in his attempts to assume the impartial American: the mask was so badly drawn on, that, irrespective of its own exaggeration, it betrayed what it was. One or two specimens of his style, quoted from a letter to the American minister in England, will suffice to give our readers a correct idea of the negotiator, the spirit in

which he conducted his pro-Russian negotiations, and the desperation of the attempt on the part of the czar, through Dr. Cottman and a few other Americans, to prejudice the great and free people of the United States against the allies and their righteous cause. Had this agency been successful, and the arms of America been enlisted on the side of the czar, from any jealousy to the alliance of western Europe, the result might have been disastrous to the cause of freedom all over the world. Writing of the English in the Baltic, Dr. Cottman remarks:—

“True, there is some reason for jealousy of the French—they have not committed a dishonourable act since they have been in the Baltic. The *prestige* of a Briton's name has fled from the Russian dominions. Fishing-boats, nets, tar-barrels, and deal boards have been burnt, simply because they trusted to English professions of respecting private property. The much-vaunted capture of prizes reduced to the comprehension of ordinary individuals, consists in a few Finnish smacks laden with salt, for curing fish on the coast of Finland; and these are the means employed for revolutionising Finland. Wherever there is a cannon the allies have slunk away like a sneaking dog from a sheepfold on the discovery of the shepherd. Witness the attack on places of so little consequence that no man in England ever heard of them until he saw the report of their being attacked by the allied fleets, which have been invariably repulsed, notwithstanding the gallantry of Eckness, Gamla Karleby, and Bomarsund, which tell a mournful story for Britons' pride. Old Bodisco, brother of the late Russian minister at Washington, commands Bomarsund, with about a dozen cannon, and, for fear he might use them if they approached too near, the fleet contented themselves by firing all day into his apple-orchard and among his trees, entirely out of reach of the old man's guns, but not of his wrath. More than one English flag has been brought to St. Petersburg as a trophy. I had expected to find in London a Russian flag at every corner of the street, captured by the fleet so much vaunted here before I left for Russia. I think there is an axiom, or a proverb, or something of that kind, which runs—‘A merciful man is merciful to his beast.’ England is frenzied with commiseration for the slaves of the United States of America, and consequently devotes her whole time to ameliorate the condition of the collier, who rarely sees the light of the sun from the 1st of January to the 31st of December. In a moment of excess of this humane consideration, she declined doing anything more at Odessa than burning a few hovels on the mole, and the deal boards in the lumber-yard, which were very convenient for exercis-

ing the Congreve rockets upon. They had no intention of injuring the city by the 2000 asphyxiant bombs thrown into it. The officers well knew that the asphyxising principle contained in the bomb would decompose the explosive principle in the capsule, and prevent the bursting of the shell, and, as they were useless, they concluded to rid the fleet of them.”

It is unfortunately too true that these sneers at the uselessness of many of the projectiles furnished to the Black Sea fleet had foundation. Mr. Woods, the correspondent of the *Morning Herald*, made terrible declarations as to the disgraceful negligence, or criminal connivance, with the impunity of Russia, of certain officials at home. He proclaims it, as an indisputable fact, that shells were sent out, “*not ten per cent of which exploded!*” Some of these were made, he alleges, a quarter of a century ago, some before the conclusion of the last great war, and some even before that war began! The utterly unserviceable condition of these shells must have been obvious to any official under whose observation they came in their selection, embarkation, or transmission to the seat of war. There must have been extraordinary ignorance everywhere, or the most treasonable designs somewhere, within the range of official rank at home, in our government offices. True or false, the statements of Dr. Cottman failed to enlist America under the banner of the czar. The purchase of Sitka was not made; no American dollars flowed into the czar's exchequer. Cuba was not attempted upon the faith of his support; privateering was not encouraged nor adopted by the American people; nor did they wage against their natural allies suicidal battle for the deliverance of the man who in all the world would soonest betray them, who most hated their liberties, and envied their prosperity and greatness.

The question opened by Dr. Cottman, however, received the attention of both American and British politicians; and a considerable party in America discussed the propriety and policy of ultimately making this purchase from Russia. As it cannot be a matter of indifference to England what power possesses it, remote although it be, and inhospitable as are its shores, we give an extract from an article in the *New York Herald* on the subject, which will sufficiently indicate to our readers the light in which many Americans look at the question:—

“The Russian territory extends along the shore from a point near longitude 64° in the Arctic Ocean to Observatory Inlet, on the Pacific, being bounded on the south and east by the British possessions occupied by the Hudson's Bay Company. It comprises all the best

whaling stations in the Northern Pacific, and, if annexed to the United States, would give our whalers an advantage which would at once enable them to defy competition. Again, in a political point of view, its acquisition would make us masters of the whole western coast of America, from the Arctic to the Mexican boundary, with the exception of that portion lying between 49° and $54^{\circ} 40'$ —say some 350 miles. We should thus surround Great Britain; and if, as seems likely to occur in process of time, the Hudson's Bay Company were dissolved, it would be manifestly for the interest of Great Britain, as well as the United States, that this intervening tract should be transferred by sale from them to us. In this event, our territory would stretch in one undivided line from the icebound oceans of the north to the line 32° , such a coast as no nation in the world possesses, and one which the natural tendency of the events now occurring in Asia cannot but render extremely valuable. Even if Great Britain refused to part with Vancouver's Island and the vicinity, the military value of these possessions would be manifestly diminished, to a very considerable extent, by our occupation of the coast, both north and south, including the whaling depot at Sitka, on the one side, and the mouth of the Columbia, on the other. We make no question, therefore, of the course which our executive should pursue in the present conjuncture. Our surplus funds could not be better employed."

About this time the terrible tidings of the cholera, ravaging fleets and armies at Varna and elsewhere in eastern Europe, arrived, and caused dismay amongst statesmen and citizens. The Emperor of the French addressed to his troops a proclamation of sympathy and encouragement, which increased his popularity at home, and cheered his troops abroad:—

"Soldiers and Sailors of the Army of the East!—You have not fought, but already you have obtained a signal success. Your presence and that of the English troops have sufficed to compel the enemy to recross the Danube, and the Russian vessels remain ingloriously in their ports. You have not yet fought, and already you have struggled courageously against death. A scourge, fatal though transitory, has not arrested your ardour. France and the sovereign whom she has chosen cannot witness without deep emotion, or without making every effort to give assistance to such energy and such sacrifices.

"The first consul said, in 1797, in a proclamation to his army:—'The first quality required in a soldier is the power of supporting fatigues and privations. Courage is only a secondary one.' The first you are now displaying, who can deny you the possession of

the second? Therefore it is that your enemies, disseminated from Finland to the Caucasus, are seeking anxiously to discover the point upon which France and England will direct their attacks, which they foresee will be decisive; for right, justice, and warlike inspiration are on our side.

"Already Bomarsund and 2000 prisoners have just fallen into our power. Soldiers! you will follow the example of the army of Egypt. The conquerors of the Pyramids and Mount Tabor had, like you, to contend against warlike soldiers and against disease; but, in spite of pestilence and the efforts of three armies, they returned with honour to their country. Soldiers! have confidence in your general-in-chief and in me. I am watching over you, and I hope, with the assistance of God, soon to see a diminution of your sufferings and an increase of your glory.

"Soldiers! farewell till we meet again.

"NAPOLEON."

During the autumn an immense army, entitled "the Camp of the North," was assembled along the coast from Boulogne to St. Omer. This army was evidently intended as a menace both to Belgium and Germany, in case of any treachery from these quarters. It was well known that the King of Belgium, married to a daughter of Louis Philippe, who is said to inherit the intriguing spirit of her sire, did not sympathise with the Napoleon dynasty; and connected as the King of Belgium is by family ties with the Emperor of Russia, and the leading German sovereigns, he was not likely to show France any sympathy in the war. In fact, Brussels had been, from the beginning of hostilities, one of the foci of Russian and Austrian intrigue. It was only second to Vienna in this particular. Berlin could not compete with it as a place of Russian spies, and the Belgian court was rather more in the interest of Austria than of Russia. It was thence such influences were expected to come, as popular jealousy attributed in England to the British court. The presence of a large army encamped along the northern shores of France, with the ships of England ready to convey them whithersoever the allied policy might ordain, brought King Leopold to his senses, and he became very desirous, in company with his nephew (the husband also of his niece), the consort of the Queen of England, to pay court to the subtle emperor whose orders that army was ready to obey. Napoleon, believing that he could turn the visit to account, made splendid arrangements to receive the husband of his ally, the Queen of England, and his *quasi* well-wisher, the King of the Belgians. On the 2nd of September, the august guests, and the still more august host, met. On that day the emperor

arrived at Calais: the King of the Belgians, accompanied by his son, the heir of his throne, the Duke of Brabant, was there received by him. The two royal personages remained for nearly an hour *tête-à-tête*, when it was said sundry explanations were given by his Belgian majesty of certain doings at Brussels, which had not been particularly palatable to the emperor, and these explanations were with much frankness of manner accepted. On Sunday the 3rd, their majesties proceeded to Boulogne, and the emperor issued the following proclamation to his troops:—

“Soldiers!—In coming to take the command of that army of the north, a division of which has so recently distinguished itself in the Baltic, I ought already to address you in the language of praise; for you have now for two months gallily supported the fatigues and privations inseparable from a similar agglomeration of troops.

“The formation of camps is the best apprenticeship to war, because it is the faithful image of war; but it will not profit all if the reasons of the movements to be executed are not brought within the comprehension of every soldier.

“A numerous army is obliged to divide itself in order to subsist, so that it may not exhaust the resources of a country; and yet it ought to be able to reunite itself promptly on the field of battle. Here is one of the first difficulties of a great concourse of troops. ‘Every army,’ said the emperor, ‘that cannot reunite itself in twenty-four hours upon a given point is an army badly placed.’

“Ours occupies a triangle, of which St. Omer is the apex, and of which the base extends itself from Ambleteuse to Montreuil. This triangle has a base of eight leagues upon twelve of height, and all the troops can be concentrated in twenty-four hours upon any point of the triangle whatsoever. These movements can be effected with facility, if the soldier is accustomed to march—if he carries with ease his provisions and ammunition—if each *chef de corps* maintains on the march the severest discipline—if the different columns which direct themselves by different routes have well reconnoitred the ground, and never cease to maintain a communication with each other—in fine, if each army does not obstruct the march of the other, notwithstanding the immense hindrance of a great number of horses and vehicles. The troops once arrived at the place indicated, it is necessary that they should understand each other, that they should protect themselves by a military position, and bivouac.

“This is what you are about to be called upon to put in practice. Without at present speaking of the engagements and manœuvres

of military tactics, you see how all is linked together in the art of war, and how much the most simple detail must contribute to the general success.

“Soldiers! the experienced chiefs whom I have placed at your head, and the devotion which animates you, will render the command of the army of the north easy to me. You will be worthy of my confidence, and, if circumstances should exact it, you will be ready to respond to the appeal of our country.

“NAPOLEON.”

“Boulogne, September 2.”

His Belgian Majesty could not await the arrival of his highness the Prince Consort of England, affairs of importance requiring his departure. The same evening on which the above proclamation was issued (which bore date the previous day), the King of Belgium embarked for his own dominions, accompanied by the Duke of Brabant.

The next day, the King of Portugal, with his brother, the Duke of Oporto, arrived *via* Paris. This visit was also said to be one of political import; and expectations were entertained in Great Britain and France that Portugal would join the alliance, and furnish a contingent of troops in the pay of England. This idea was also entertained in Spain, and much jealousy in the court, and in political circles, was manifested at Madrid. In the evening of the same day, the royal guests and imperial host visited the camp at Honvault, and the ordinary manœuvres of a review were performed by the troops, grandiloquent descriptions of which crowded the columns of the Paris and London press. The king, like his predecessor in these royal visits, went away the very day he arrived, and directed his course to his royal relative at Brussels;—for where is the European king with which his Belgian majesty has not some matrimonial connexion or affinity?

The next day Prince Albert arrived. As the English were very numerous at Boulogne, the demonstrations of welcome were particularly cordial, and the French took every occasion, politely and heartily, to show their sympathy with their allies. On the afternoon of the same day, the emperor and prince, on horseback, visited the camps at Ambleteuse, Wimereux, and Honvault. The next day a grand review was held in honour of the prince. The most remarkable incident of the day was the brief address of the prince to the French staff at its close. His readiness of manner, and facility of expressing himself in French, as he complimented the French officers and army, was very gratifying to our polite neighbours, and won “golden opinions from all sorts of men.” The evening of the succeeding day, the emperor

gave a grand ball in honour of his guest, which was as brilliant as the presence of kings and princes was likely to make it. The day following this, the troops, to the amount of 25,000, were engaged in a sham battle. The emperor himself and General de Schramm were the antagonists. The general menaced Boulogne from the direction of Calais; the emperor defended it. The emperor, of course, drove back the invading general, after a hard-fought and brilliant battle, which chiefly displayed, as it was intended to do, the emperor's military skill. The prince departed the same night, and his departure was the most imposing spectacle that had been presented to the multitudinous sight-seers who thronged Boulogne and its neighbourhood. The streets brilliantly lighted; the rich cavalcade, with helmets and arms gleaming in the thousand lights; the ceremony of departure; the booming of cannon in the darkness, as the little squadron of steam yachts attendant upon the prince bore away from the shore, were well calculated to excite the imagination of the soldiers and the multitude.

Thus terminated a series of royal visits at the Boulogne camp, which were calculated to give an aspect of solidity to the emperor's dynasty; to leave an impression of his power in Europe, as well as upon the minds of his own subjects; to engage the attention of other nations; to send afar off to the czar, in his cold palaces, the intimation that there was might elsewhere in Europe as well as in St. Petersburg; that the war into which rash counsels and ambition had plunged the Cæsar of the North, was not merely with the inheritors of Byzantium, and of its decline as well as its glory, but with the thrones and peoples of the energetic and mighty West—the most civilised, wealthy, and yet warlike nations in the world.

The encampment at Boulogne led to many critical comparisons, in England, of the armies of the two nations; and while much confidence was expressed in the superiority of British troops, on the whole, points of unfavourable contrast were seized upon and discussed. One of the subjects which engaged the attention of the British public in this way was the inferior military education of the officers of our army, especially of the staff. Dissatisfaction was felt at the mode in which the staff appointments were almost invariably made; and many persons acquainted only superficially with military things were, nevertheless, able to predict ultimate misfortune from these appoint-

ments. Lord Raglan, instead of selecting men of superior military education, surrounded himself with his own relatives, and young men of family and fortune, many of whom proved to be utterly incompetent to perform what they undertook, as might have been easily foreseen from their previous habits and attainments, of which Lord Raglan could not have been ignorant. Officers of superior military knowledge, and who had received the highest testimonials from our military academies, and from foreign military colleges, were disregarded or refused employment, while young men of "good connexions" had assigned to them appointments of responsibility. A place on the staff was the sure road to promotion, and hence influence was exhausted to obtain such, merely to make it a stepping-stone to increased personal advantage—advantage gained at the expense of the army and the nation.

The incompetency of the subaltern officers became also a matter of discussion: strange reports were current in France about the incompetency of this class, and especially in the Guards; and these reports found their way into English society, and awakened serious apprehensions. The evil might be remedied by the promotion of non-commissioned officers; but to this the commissioned officers offered systematic opposition, from contempt for the humble origin of this most useful class of public servants. On all these matters, "that indomitable man" (as Sir William Napier calls him), the Duke of Wellington, warned the army and the country a quarter of a century before. His words were:—"The name, the character, the conduct, the family and relations, the fortune, the situation, the mental acquirements of his men, are the sole thoughts of the Prussian subaltern, who carries into execution the discipline of the company to which he belongs, with the men of which he lives as companion, friend, and adviser."

We must now turn our attention to an uninviting field of contemplation—to the diplomatic world, and the intrigues which prevailed at the German courts. He who reads the history of this war will, however, have perused it to little purpose, as to any penetrating view of its origin and the causes of its continuance, if he neglect the study of this department of its records. Navies and armies were, after all, in the hands of the diplomatists; and in the protocols and conventions of the powers we see their motives and aims reflected.

CHAPTER XXX.

DIPLOMACY.

"It is now too late to save European freedom by mere diplomacy."—NEWMAN'S *Crimes of the House of Hapsburg*.

THE history of the diplomacy of the summer of 1854, in connection with the war, affords no very favourable exemplification of human nature. In France, ministers are not called to popular account as in England, but intrigue was busy there. Strong dissatisfaction with the French Minister for Foreign Affairs existed among the more liberal sections of the emperor's supporters; and the ultra-liberal sections of the community were furious against him for his real or seeming sympathy with Austria.

In England the people supported the government, although public confidence in Lord Aberdeen and his cabinet rapidly waned. The noble lord at the head of the government had an unfortunate tendency, in debate, to utter *mal à propos* eulogies of Russia, and expressions of confidence in the czar, which inflamed the public mind against him. Lord Lyndhurst denounced, in eloquent language, in the Lords, the inadequate character of the measures taken for the prosecution of the war; the reply of the premier was ill-tempered and undignified, and he enunciated principles which deprived him of all public confidence as a minister of her majesty in time of war with Russia. From February to August, during which the session of parliament lasted, the Commons supported the existence of the government, but perpetually blamed its acts. Lord Dudley Stuart, Mr. Hume, Mr. Roebuck, and other popular members, in patriotic and loyal language, denounced the shortcomings of the government; and called upon its members, by appeals to their honour and patriotism, to gird themselves for the conflict before them, and to wage the war of their country in a mode becoming its greatness. These appeals were in vain; the government was not in earnest; it professed much, and did nothing well. The common people nick-named it the "half-and-half" government; and the Lords and Commons afforded it a reluctant support. Changes were made in its distribution of members and offices in conformity with public demands; and Lord John Russell, who had no functions, accepted the important post of President of the Council. The departments of war and colonial administration being separated, the Duke of Newcastle, the Colonial Minister, retained the ministry of war, and Sir George Grey became the very inefficient administrator of the affairs of the Colonial Office. Intrigues in favour of a dishonourable peace were con-

stantly attributed to influential persons connected with the government; and the public lost confidence in the foreign agents of England, as well as in her cabinet at home. This state of feeling, well known abroad, no doubt weakened the influence of the English government in the diplomatic contests of the period.

Exertions were made by the allied governments, during the summer of 1854, to draw Austria into the alliance. At times these efforts seemed on the point of being successful, but something always happened which checked the apparent warlike aspirations of the young emperor. At one time it was the tone of the English parliament, at another of the English press: again, certain proceedings of both governments, which appeared like a desire to form a Polish legion, wounded the young emperor's sensitiveness. The indulgence given to Kossuth and Mazzini in England, and the freedom of speech and publication allowed to them, offended the Austrian army, government, and court; then the dissatisfaction was with the influence the allies exercised in Italy: anon, the Porte gave offence. At last, after sulking with the allies, some faint tint of promise would appear in the manner and expressions of the Vienna diplomatists—hopes that might be said to resemble in their faintness "the photographs of delicate marine plants." After all this versatility, the emperor would make some bold speech, or perform some gracious act; and Prussia would take alarm, and call upon Germany to remonstrate against the bellicose tendencies of the great southern power. This would bring the Austrian diplomatists with a whining tone to the allies, as though Austria was very much injured, very much to be pitied; and, instead of the Western powers manifesting any indignation, they should administer some sweet anodyne for the pains of an ally whose repose all were so willing to disturb. Then recriminations and explanations would take place between the Austrian government and the other governments all round, beginning with that of St. Petersburg, which would assure it that the aggregation of troops in Galicia and Poland were not intended as a menace to Austria, but only strategical, or precautionary, or for their easier support, or to repress some indications of a disposition friendly to the allies. Thus Austria was literally

"Everything by turns, and nothing long."

There was much to be said on her behalf as to her difficulties with Germany: the jealousy of Prussia, the seditious state of her provinces, the perils of an exposed frontier in presence of the best legions of the czar, the ruined state of her finance, and the pro-Russian spirit of her army; but, with all these allowances, her mode of procedure was artful, disingenuous, and selfish. She was ever grasping after special advantage, heedless of the general weal; full of empty bravado, yet constantly debasing herself by cowardly apprehensions. No great state, not actually at war, was ever beset with more real difficulties; and none ever met difficulties with less boldness, dignity, or honour. A specimen of these repeated tergiversations may be studied by the reader in the following picture of Austria, as seen through a Berlin medium, during the month of June:—

“All the news we receive from Austria coincides on one point, viz., that a sudden halt has intervened in the apparently energetic measures which the young emperor gave the world to believe he was about to take. The details of the cessation of the military preparations, and the marching of troops towards the north-east frontier, will doubtless, by the time you receive this, have been reported you from Vienna. One cause of a somewhat altered feeling on the subject of the war has been traced to a certain Bavarian influence, which the young emperor has very much at heart—but no great stress need be laid on this. Russia's assurances that the movements of her troops in Poland, and along the frontier of Galicia and the Bukowina, have no reference to Austria, and further, that her troops in the Danubian Principalities will not for the present advance beyond Silistria and Trajan's wall, but observe a defensive position along the Danube, seem to have met with some credence, backed as they are by the fact that the Russians are taking up a position on the Pruth and Sereth, and strengthening it. But more urgent ground for holding hands at present is to be found, according to Austrian views, in the general bearing of Prince Napoleon at Constantople, more particularly his advocacy and patronage of the plan for forming a Polish legion in Turkish Servia. The remonstrances made to him on the subject by Baron Bruck have been met by the prince in a very cavalier manner, and the result is a considerable advantage to the Russian cause, by this fit of Austrian paralysis.”

Justice demands that the character of the Austrian relations to the allies should not be read in the light of Frederick William's lamp only. Her defence against the imputation of time-serving, put in her own way, is necessary to impartial history. The *Triester Zeitung*, a publication in her interests, under the question of “Why does Austria delay?” written when

the allied armies were at Varna, thus puts the case *ex parte* for Austria. No maxim more just than that so often quoted, “*Audi alteram partem*,” the quotation of the *Triester Zeitung* fulfils that obligation:—

“At the commencement of the conflict, everybody believed and feared that Austria would go with Russia. It did not take place. Hereupon the very opposite extreme was demanded of Austria. This demand, however, required but little consideration of particular circumstances, in order to render its unreasonableness easily comprehensible; the more so, as even in England and France, a tedious state of transition became necessary until the real, or at least the ostensible friendship, was transformed into enmity. With regard to the object, Austria was perfectly agreed with the Western powers; and in respect to the means she adopted during the first stage of the question, precisely the same as was done by France and England. When the fleets of these latter powers approached the scene of hostilities, Austria assembled an armed force on the same point. At first, however, it was only a corps of observation, but the combined fleets had, during the whole of this period, themselves done no more than observe. Nay, more than this—the fleets had not, in the slightest degree impeded the operations of the Russian forces, whilst the exhibition of a large Austrian armed corps had an influence upon their actions which was of decided importance. The principle was unanimously laid down, that the struggle should—nay, must—be confined to the smallest possible space. For the interests of Europe at large, no less than for her own, it was held to be indispensable that Austria should uphold this principle as long as possible; for France and England could assist the Turks without the struggle necessarily exceeding the limits of the Turkish dominions. Even after the independent declaration of war issued by the two Western powers, it was held that the flames of war might still be restricted to the Ottoman and Russian dominions at least. The instant, however, that Austria takes an active part in the war against Russia, this limitation ceases. For the latter would at once transfer the fearful contest across to the Austrian territory; Germany would be also drawn into it; and thus it would gain an immense but an indefinite extension, and might lead to entirely unlooked-for results. England and France are now in the happy position of being able to fight the battle out on foreign ground, without having anything whatever to apprehend for their own territories; whilst Austria, on the other hand, has the painful certainty of having to see the dangers and horrors of the war introduced into her own dominions. To all this must be superadded the fact that Russia can employ against Austria weapons which would not be available against

England and France. On this head we need only remark, that there are living in Austria, at present, several millions of orthodox Greeks, and there are also no less than 16,000,000 of Slaves (or Slavonians) there."

In the fifteenth chapter, the reader will find copies of the conventions between Austria and Prussia, offensive and defensive; and also of the protocol formed at the Vienna conference of the 23rd of May, in order to reassure the allies, whose confidence had been shaken by the private treaty between Austria and Prussia. The Vienna and Berlin governments addressed a memorandum to the German Diet, which neutralised in a great measure the moral effect of that protocol; and showed that the policy of both courts was to confederate all Germany, for the purpose of sustaining either, in case events should lead it to proclaim a final neutrality, or to offer, on some pretext, an armed resistance to the allies.

The following is a true translation of the identical and collective memorandum relative to the Eastern question and Austro-Prussian Convention, which the Vienna and Berlin cabinets transmitted to their envoys at the Diet:—

The Envoys are charged with the following communication:—When the complications that had arisen in the East were discussed (*besprochen*) in this high assembly upon the 10th of November last, war between Russia and Turkey had, it is true, already broken out: but the Cabinets of Vienna and Berlin were still entitled to cherish and express the hope that the united efforts of European powers would succeed in bringing about an understanding between the belligerent parties, and in maintaining the blessings of peace for the rest of Europe.

This hope has not, unfortunately, arrived at fulfilment. France and Great Britain have taken part as allies (*Bundesgenossen*) of Turkey in the war against Russia; and Austria, which had then (*damals*) strengthened its pacific hopes, even by readily reducing its army, has deemed it necessary now to place a considerable military force upon the southern frontier of her empire.

The High Diet (*Bundesversammlung*) will not accept a wearisome (*erschöpfende*) detail of negotiations and facts which have preceded the present state of affairs. These appertain partly to general publicity, or have been partly brought to the knowledge of individual governments.

Few observations will suffice to indicate and justify the point of view whence Austria and Prussia think they must make (*machen zu müssen glauben*) the present communication to their high allies.

Both Cabinets have agreed with (*sich begegneten*) those of Paris and London in the conviction that the conflict between Russia and Turkey could not be prolonged without affecting (*berühren*) the general interests of Europe, and those also of their own States. They acknowledged in common that the maintenance of the integrity of the Ottoman Empire, and the independence of the Sultan's government, are necessary conditions of the political balance, and that the war should, under no circumstances, have for result any change in existing territorial positions. The respective declarations and assurances of the belligerent parties offered a prospect of success to the mediatory activity of the Four Powers represented in conference at Vienna. The particulars of these negotiations, and the grounds of their failure, are apparent from the five protocols of this conference, which are herewith laid before the High Diet. The last of these shows that, albeit France and Great Britain have meantime entered into the war against Russia, the four Cabinets invariably

adhere to the principles proclaimed heretofore by them in common, and have united in regard to the basis (*princip*) on which to deliberate in common as relates to the appropriate (*geeigneten*) means for attaining the object of their endeavours (*einvernehmens*).

The august Courts of Vienna and Berlin have acknowledged, under these serious circumstances, an augmented summons to avail themselves conscientiously of the relations of most intimate confidence and long-preserved friendship, which bind one to the other, to test the dangers which have emanated from existing circumstances, within the circle of their power, and which require persisting (*nachhaltigen*) remedies. They have not been able to disavow (*erkennen*) that the prolongation of the development of military force on the Lower Danube is inconsistent (*unvereinbar*) with the most important neighbouring interests of Austria, and also with those of Germany. Not only will existing political state relations (*macht verhältnissen*) be menaced in a manner detrimental to Germany, but will most acutely prejudice the development of its material welfare (*materiellen Wohlfahrt in empfindlichster weise beeinträchtigt werden*).

Impressed with this conviction, the Courts of Austria and Prussia address themselves with confidence to their German allies.

They have already expressed to individual governments their intimate conviction, and they hold it to be their duty so to do also within the circle of the Diet, that the interests for which they answer in the midst of pending complications are, according to their very essence (*wesen*), also the interests of entire Germany.

It seems to them to be a requirement (*forderung*) of the political position of Germany—an element of her conservative (*erhaltenen*) policy—a condition of natural development for her national wealth—that in the countries of the Lower Danube there should exist a well-regulated (*geordnete*) state of affairs suitable to the interests of Middle Europe.

The industry and commerce of Germany open for themselves in the East a wider and more fruitful field for competition with other nations—a territory which must acquire greater importance for the estimation of German intelligence and manufacturing strength the more quickly articles of general cultivation and relations of traffic are extended. The material interests of Germany are susceptible of most powerful elevation through the great water channels to the East, and it is thence generally incumbent (*ein allgemeines Anliegen*) on Germany to secure, as much as possible, the freedom of Danubian commerce, and not to witness (*zusehen*) the material animation of water communications with the East repressed by restrictions (*durch Beschränkungen zurückgeedrängt*).

But the two Powers not only regard it to be the essential (*hohe*) general interest, but also the inviolable political duty of German federal governments to take care (*zuvahren*) that the pre-existing state relations of European great states shall not be altered to the prejudice of Germany by the present war. If the German Confederation was constituted in order that the national link of Germans should be maintained, and Germany exist in regard to external relations as a united global power in a political point of view, then will the strength of the Confederation have principally to prove itself amply sufficient against all local dangers within its range, and to determine the rank which people (states?) are henceforth to take among themselves.

The closely allied Courts of Austria and Prussia, while they maintain as European powers their point of view in its present position, think they have at the same time faithfully fulfilled their duties as members of the German Confederation. They therefore may (*dürfen*) entertain firm confidence that their high federal allies will all (*insgesamt*) be ready to adhere to the position assumed in common by them. Their mission is still at this moment that of preparation (*vorbereitung*) for all eventualities; and both august monarchs will certainly esteem themselves fortunate should coming events not entail the necessity of further intervention (*weiterer einschreitens*). Final decision still belongs to the future, and Austria and Prussia cannot intend to anticipate the judgment of their allies upon that which already, in the present state of affairs, calls for mature caution in favour of the general interests of Germany.

A double object, however, forms, under all circumstances, the groundwork of their present communication. They entertain for themselves (*junsich selbet*) the liveliest wishes to obtain the tranquillising assurance that the attitude which they have observed during the constantly increasing gravity or configuration of pending questions will meet with the approbation of their German allies. It has thus become a case of most urgent necessity that the decision of all members of the Confederation should be made known (*sich kund geben*) through the constitutional organ of its will and proceedings (*handelns*), and that they stand firm and true by each other under the probations which the approaching future may bring upon our common fatherland.

The more Germany shows itself in assured (*verburghter*) unity and undivided strength, with so much greater emphasis will she maintain the honourable position appointed for her, and contribute effectually to the promotion of universal peace.

Shortly after the two great German governments presented the foregoing memorandum to the Diet, their sovereigns met at Tetschen, and discussed the great subject *visà voce*. It is unnecessary even to conjecture the issue, but it became currently believed that much of the apparent opposition between the cabinets of these sovereigns was subsequently assumed the better to cover their real policy, and to evade the pressure of the Western powers upon them, to take their part in the general defence of Europe. About this time the governments of several of the minor German states drew up a memorandum of their opinions upon the war, and its bearing upon the interests of Germany. The document was wholly in the interest of the czar, and notoriously instigated by his agents. This document was called the Bamberg Memorandum, having been drawn up and signed at that place. The citizens of the inferior German states repudiated the whole affair, and it had no other influence than to draw down the ridicule of Europe upon the heads of its ostensible authors. To avoid the tedium of the document, we give instead an able analysis which had the reputation of being inspired by the English Foreign-office, and which places the whole affair in the light in which it was the policy of both the French and English governments to have it regarded.

"In that impertinent document, Bavaria, Saxony, and certain other states even more insignificant, assume the right of pronouncing an opinion on the colossal struggle in which they are neither able nor willing to take a part. The petty German governments recommend that Austria and Prussia should assume a more conciliatory and deferential tone towards Russia; and they declare that the demand for the evacuation of the principalities ought to be accompanied by a summons to the Western powers to effect a simultaneous retreat from the Black Sea and from the Turkish territory.

"It is an old saying, that reasoning is like a bolt from a crossbow, while opinion derives its force, like an arrow, from the strength of

the archer. And it is certainly true that, in international transactions, theory holds but a secondary place. In estimating the weight and value of a diplomatic declaration, the question is not, speaking generally, whether a proposition is sound, but whether it expresses the policy of a power capable of giving effect to its decisions. The late manifesto of the German Caucus is, however, equally insignificant in either point of view. No analogy can be more transparently false than the comparison between the czar's hostile occupation of the Danubian provinces, and the presence of the French and English forces in Turkey, for the aid, and at the request, of the sultan. It seems to be completely forgotten by the authors of the Bamberg note that the tripartite treaty between the Porte and the Western powers expressly provides for the withdrawal of the allied armies within six weeks after the conclusion of peace. The assumption that Russia has a right to the exclusive possession of the Black Sea is even more ignorant and offensive; and if the Dardanelles are hereafter to be closed to ships of war, England and France must first be satisfied that a renewal of the former treaties will conduce to their own advantage. The absurdity, however, of the suggestions offered to the two great German powers is almost lost in the extravagance of the pretensions which such an interference involves. Austria and Prussia, with large armies ready to take the field, necessarily command a hearing when they express an opinion on the affairs of Europe; but Bavaria and her confederates, who can neither aid nor thwart the belligerents, are merely transgressing their proper province when they affect to advise or to mediate.

"The contempt which these ill-judged proceedings irresistibly provoke, in no degree applies to that part of the German nation which has the misfortune to be parcelled out amongst petty and powerless states. The people of Saxony and of Suabia are equal, in all respects, to the inhabitants of the most civilised portions of Europe; but circumstances deprive their governments of all political weight, and lead them to favour a cause which is universally odious among their subjects. It is understood that the resolutions of the Bamberg conventicle have been directly suggested by Russia; and, in acknowledging the services rendered to Germany by the court of St. Petersburg, the minor courts virtually declare that they are supported by foreign protection, irrespectively of the wishes and feelings of the people. To the German nation Russia has rendered no service, except to threaten its independence, and to paralyse its action.

"The petty governments assert, in sounding phraseology, that the union of Germany would

render it impossible for the allies to continue the war. It would have been more to the purpose if, instead of making a statement which is both untrue in itself and replete with false assumptions, they had said that England and France would have been relieved from their painful and glorious task, had the great central nation of Europe been ready to do its duty. It is not by any wish of the Western powers that they have undertaken alone the office which no state could decline without sinking—temporarily, at least—into a secondary rank. There was no difference of opinion, in any quarter, as to the merits of the quarrel which Russia has forced upon Turkey. It was the interest of all governments to prevent a wanton violation of the peace by rendering war dangerous to the aggressor; and the destruction of the Ottoman Empire would be more immediately injurious to Germany than to the remoter nations of the West. Unfortunately, however, dynastic scruples paralysed Prussia, and Austria was, in the first instance, hampered by the untoward results of former transactions. The minor German states were helpless in their chronic insignificance, while their governments were, with few exceptions, dependent upon Russia. Under these circumstances, England and France assumed the post of honour and of danger, and they will certainly wait for no permission to accomplish the work which they have begun."

As a fruit of the conference at Tetschen, between the two great German potentates, the King of Prussia invited his imperial brother-in-law to meet him in one of the frontier towns of their dominions, for the purpose of a conference in the interests of peace. The *Suabian Mercury* thus notices the invitation:—"The last and most decisive step for the solution of the Eastern question has just been taken. The Count de Beukendorf is the bearer of an autograph letter from our sovereign to his august brother-in-law, in which he earnestly invites him to an interview on the frontier. All the non-official and semi-official refutations of this intelligence merit no confidence. It is on account of the projected interview that the Prince of Prussia is to be with the king at Königsberg. The inspection of the regiments of infantry in Prussia, and in the grand duchy of Nassau, is only a pretext. If the Emperor of Russia does not accept the invitation, and if the reply to the Austrian note of the 3rd be negative, the mobilisation of 150,000 men will take place immediately after the return of the king."

The czar did not accept the invitation, ill health really preventing him; but he sent a distinguished general of his staff to felicitate the king upon his good health, and to compliment his majesty in the name of his relative

and ally. It was supposed that the meeting was not one of mere ceremony, and that the general had authority to discuss with his majesty or his minister the topics in reference to which the czar was invited to the meeting. The Austrian summons to the czar to evacuate the principalities (elsewhere already referred to) was presumed to be the subject of the proposed conference. On that point the czar was advised by his physicians to hold no personal discussion, as the irritability into which all allusion to it threw him, acted injuriously upon his brain, and serious symptoms were occasionally manifested. Meanwhile troops were concentrated upon the Austrian frontier, and, to all appearance, Nicholas was determined, *per fas aut nefas*, to wage war for the glory of the orthodox Church, and his orthodox self, against the world. As his Prussian majesty could not discuss matters *viva voce* with the great emperor, he employed himself in replying to the Bamberg Memorandum, in terms apparently conciliatory, but bearing a *couchant* rebuke. The despatch amounted to a declaration that whatever Austria and Prussia agreed together to perform, the self-constituted Bamberg monitors of those powers had better consider as matters for conformity rather than criticism or counsel.

These memoranda from the great German powers to the small ones, and from the latter to the former, engaged the attention of the British legislature; and Lord Lyndhurst insisted in the House of Peers, that the object of the German powers altogether was to involve the allies in a guarantee for the integrity of Russian territory, whatever might be the issue of the war. Lord Derby supported Lord Lyndhurst in demanding from the government what was their policy in that particular. Lord Clarendon replied, in terms ingenious and plausible, but unsatisfactory; and Lord Aberdeen, without even the doubtful merit of being plausible, was still less satisfactory than his Minister for Foreign Affairs. The proceedings of the German governments, great and small, excited in England the uttermost distrust, and the supposed acquiescence of their own government in these measures still more crowned the unpopularity of the British ministry.

At last the reply of the cabinet of St. Petersburg to that of Vienna, touching the evacuation of the principalities, saw the light. In recording events connected with the expulsion of the Russians from Wallachia and Moldavia, such reference was made to the czar's reply to the Austrian summons as bore upon these transactions. But the document was intended by the St. Petersburg government as a pronouncement full and final upon the whole question of the war, and as to what terms of peace

would be admissible by Russia, it is therefore given below :—

COUNT NESSELRODE TO PRINCE GORTSCHAKOFF, ENVOY FROM RUSSIA AT VIENNA.

St. Petersburg, June 17 (29), 1854.

PRINCE.—Count Esterhazy has communicated to me the despatch in which his Cabinet invites us to put a stop to the actual crisis, by ceasing to extend our trans-Danubian operations, and by evacuating the Principalities at the earliest period possible.

Count Buol, pleading as the reason for this desire the Austrian and German interests, which would be compromised by the prolongation and extension of the struggle on the Danube, goes upon the assumption that our occupation of the Principalities has been the principal cause of the war. We must request him to make some qualifications to this assertion.

The occupation of the Principalities did not prevent negotiations from being commenced and carried on. It did not provoke the abandonment of the Vienna Note, the rejection of the propositions made at Olmutz, with the concurrence and approbation of Austria, any more than it prevented the complete alteration of all the anterior bases of negotiation; and, although all the endeavours after conciliation have since then failed, the Austrian Cabinet cannot be ignorant that this has resulted from incidents and motives more complicated; on the subject of which we prefer being silent at present, in order to avoid unpleasant recriminations. We have replied by our silence to the summons of France and England, because it came in an insulting shape, preceded by open provocation, and was destitute of all conditions of reciprocity. If war has resulted, it is but just to impute the cause less to the nature of our answer than to the tone and the terms which provoked it.

However this may be, if, in the opinion of the Austrian government, the prolonged occupation of the Principalities has been the cause of the war, it should follow that, upon the cessation of the occupation, war will cease by the very fact, seeing that hostilities will be suspended.

Is the Cabinet of Vienna prepared to give us satisfactory assurance on this point?

It cannot escape the attention of the Cabinet that, from the moment when the Porte declared war against us, and particularly since, the circle of the war, being transported beyond Turkey to our seas and shores, has been immensely enlarged; the occupation of the Principalities, whatever may have been its original character, has now become nothing else than a *military position* for us, the maintenance or abandonment of which must be wholly subordinate to strategic considerations. It is self-evident, therefore, that before depriving ourselves out of regard to the situation of Austria, of the sole point from which, pushing forward on the offensive, we have some chances left of re-establishing in our favour the equilibrium, which is universally against us elsewhere, we should know what securities Austria can offer us. For if hostilities continue—if the powers, freed from all apprehension in Turkey, are left at liberty either to follow us up on the evacuated territory, or to carry all their disposable forces elsewhere for the future, to invade our European or Asiatic shores, in order to impose upon us unacceptable conditions—it is evident that Austria will have asked us to weaken ourselves morally and physically by a sacrifice for which no equivalent is offered.

To demand of Russia to give herself entirely up to the mercy of her enemies, when they do not pretend to conceal their intention to destroy or diminish her power; to expose her to all the attacks which it suits their convenience to make, reducing her everywhere to the defensive; to take away from her, in short, every means of procuring a peace without ruinous or dishonourable conditions, would be an act so contrary to all the laws of equity, to all the principles of military honour, that we cannot but believe that such a thought could never enter into the mind of his Imperial Majesty Francis Joseph.

In communicating to us the protocol of the 9th of April, the Court of Vienna lays stress on the positive engagement which it has made with the Western Powers, to bring about by all its means the final evacuation of the Principalities; but, in making this engagement, Austria could

not give up the privilege of choosing the means best calculated for the fulfilment of her obligations, and this would be to place Russia in a condition to proceed to the evacuation with honour and security. The obligation even which she has contracted, gives her, on the contrary, the right of insisting that the other powers shall not hinder the success of her efforts by their demands. The same thing holds with respect to the Austrian and German commercial interests, which have been pleaded against the extension of our military enterprises. They authorise the Cabinet of Vienna to make use to the two Powers of the same reasons as those which she urges against us; for, if the interests of Austria and all Germany suffer for the moment by our operations on the Danube, *à fortiori* they will suffer, and still more heavily, like those of all neutral states, by the condition of things brought on by the maritime operations of France and England in the Euxine, the North Sea, and the Baltic.

Let the Austrian Government then, after weighing these considerations, come to an explanation with us on the subject of the guarantees of security which they can give us; and the Emperor may then, in deference to the wishes and interests of Germany, feel disposed to enter into negotiations touching the precise period of the evacuation. The Cabinet of Vienna may be assured beforehand that his Majesty shares, in the same degree as itself, the desire of putting as soon as possible an end to the crisis which hangs over all European affairs at the present moment. Our august master still wishes, as he always has wished, for peace. He does not wish, we have repeated, and we repeat again, either to prolong indefinitely the occupation of the Principalities, or to establish himself there permanently, or to incorporate them into his states—still less to overthrow the Ottoman Empire. With respect to this, he has no difficulty in subscribing to the three principles laid down in the protocol of the 9th of April.

(1.) *Integrity of Turkey.*—This point is only in accordance with all that has been enunciated by us up to the present time; and the principle will not be threatened by us as long as it is respected by those who are now occupying the waters and territories of the Sultan.

(2.) *Evacuation of the Principalities.*—We are ready to begin with this on receiving fitting guarantees.

(3.) *Consolidation of the Rights of Christians in Turkey.*—Setting out from the idea that the civil rights to be obtained for all the Christian subjects of the Porte are inseparable from religious rights—as is stipulated by the protocol—and would, in fact, become valueless to our co-religionists if in acquiring new rights they should lose the old, we have already declared that, if this were the case, the demands made by the Emperor on the Porte would be fulfilled, the cause of the dispute done away with, and his majesty would be ready to give his concurrence to a European guarantee for these privileges. Such being the disposition of the Emperor on the principal points indicated in the protocol, it appears to us, Prince, that it would not be difficult to accomplish a peace on this triple basis; or, at least, prepare negotiations for it by means of an armistice.

Your Excellency will be so kind as to express a hope of this kind to the Austrian Cabinet in communicating these despatches.

NESSELRODE.

That such a representation of the quarrel between the great powers should be permitted to go forth before Europe was impossible. This despatch of Count Nesselrode's was one of the most artful of his diplomatic papers, possessing the air of candour and dignity which that accomplished diplomatist knows so well how to maintain in the state papers and despatches committed to his management. The French Minister for Foreign Affairs was equally gifted in detecting the peculiar artifices of his Muscovite antagonist, in unveiling his designs, and unravelling his sophisms. To him the allied governments consigned the task of a reply,

designed to circulate throughout Europe and the world, and intended to confute the arguments and pretences the Russian minister had so ingeniously set up. The insertion of this document is not requisite; it is only necessary to say that it produced throughout Europe a strong conviction as to the justice of the allied cause. Austria also delivered an answer to the Russian despatch; and the following translation of the reply of Count Buol to the Nesselrode note of the 29th of June, shows that Austria had been doing its best to keep back the Crimean expedition:—

TO COUNT VALENTINE ESTERHAZY, AT ST. PETERSBURG.

Vienna, July 9.

Prince Gortschakoff has communicated to me a despatch of M. the Chancellor of the Empire, which contains the answer of the Russian Government respecting the invitation which we felt called to address to it with the object of procuring the withdrawal of the Russian troops from Wallachia and Moldavia. In this answer Russia exhibits an inclination to enter into negotiations respecting the precise execution of this evacuation, on the understanding that we guarantee that the Russian troops shall not be molested in their homeward march, and that the powers shall not employ their disposable forces in an attack upon the Asiatic or European coast of Russia. The Russian Cabinet urges on us the consideration that it cannot voluntarily give up the only military position in which, supposing it to act on the offensive, there would be a prospect of restoring the balance in its favour. In one word, Russia desires that the evacuation of the Principalities shall have a general cessation of hostilities as its result. We cannot, of course, but regret that the Russian Court should have thought fit, in opposition to the remarks which we were compelled to introduce in our communication to it, to make the reception of our proposition dependent on circumstances obviously not under our control. Since, however, in our opinion, the request of Russia has its reasonable aspect, and his Majesty, our exalted master, holds it desirable to exhaust even the last means which appears calculated to bring about an understanding, the Imperial Cabinet will take pains to utilise this communication with the Maritime Powers, and the more so as in its connection it appears to convey an earnest desire to attain to an adjustment. But while you bring this to the knowledge of Count Nesselrode, be good enough to make him understand very clearly that, notwithstanding the conciliatory spirit which compels us to make this effort at London and Paris, we are compelled to insist upon the request in its fullest extent which we have directed to Russia, although we may not succeed in obtaining for our proposal that acceptance which we shall seek at the Maritime Courts. Please further to urge that, since the position which we have taken up in this affair does not empower us to exert a direct influence upon the military operations of the two Powers, our action is limited to recommending to their deliberate consideration the consequences which their decision may entail, and to represent to them that in our opinion all governments appear to us to be equally called to join together in their endeavours after peace, by making all sacrifices not positively irreconcilable with their honour and their interest.

(Signed) BroL.

Before completing this weary round of diplomatic logomachy, it is necessary to inform our readers that "another note" was presented to Russia by the Austrian government, recommending "the four points" as a basis of negotiations for peace. The Austrian note is a verbose document, and the recommendations it contains were weakly supported; yet it is

necessary to encumber our pages with it, as the after conduct of the war turned upon its demands. The following is the despatch addressed by Count Buol to Count Esterhazy, setting forth to the cabinet of St. Petersburg the four points laid down as a *sine quâ non* basis for an arrangement with Russia:—

Vienna, August 10.

I had the honour to make known to you, by my despatch of the 9th ult., the impression which has been produced on the Imperial Cabinet by the communications which Prince Gortschakoff was charged by his Government to make to it, as well as our intention to make known to the Maritime Powers the elements contained in those communications, which might serve as the bases for negotiations for the re-establishment of peace. Although we do not conceal from ourselves the difficulties of this mission, since the overtures of Russia only imperfectly respond to the demands which we ourselves had addressed to her, we have not yet considered it our duty to point out to the Maritime Powers in what spirit the Emperor, our august master, desired to see them received, in attaching a particular importance to the resolutions which those Powers might come to. We have reminded the Cabinets of Paris and London that the common efforts of the Powers ought to be invariably directed towards the re-establishment of a solid and durable peace. We have expressed to them the opinion that no Power ought to expose itself to the reproach of having neglected any means calculated to put an end to the horrors of war; and we have concluded that the Maritime Powers would conscientiously weigh the question as to whether the reply of the Cabinet of St. Petersburg did, or did not, contain the germs of an understanding which might lead to a definitive pacification. The Cabinet of the Emperor endeavoured to procure for the overtures of the Court of Russia a reception by the Maritime Powers, so that happy results might be obtained from them. We are, nevertheless, compelled to state that the first effect produced on the French and English Governments by the communication of the Cabinet of St. Petersburg, has not answered our expectation. The French and English Cabinets persist in considering the evacuation of the Principalities as the preliminary condition of any understanding; and they are astonished that Count de Nesselrode should pretend that the integrity of the Ottoman territory will not be threatened by Russia so long as it shall be respected by the Powers who occupy the waters and territory of the Sultan. These Cabinets have warmly rejected the analogy which the despatch of the Chancellor of the Russian Empire seeks to establish between the presence of the allied troops, which was demanded by the Sublime Porte, and which took place in virtue of a diplomatic document, the effects of which must cease by common accord, and the fact of the entrance of the Russian troops on the Ottoman territory. As far as regards the religious question, the Courts of Paris and London think they see that, in the opinion of Russia, the religious protection which she pretends to exercise over the Greeks of the oriental rite ought to be founded on a European guarantee; and they cannot understand how the independence of the sovereignty of the Porte could exist with such a system. The Courts of France and England, while proclaiming the interest which they take in the amelioration of the condition of the rayahs, nevertheless think that the reforms which are to be introduced in the administrative regulations should emanate from the initiative of the Ottoman Government, and that any foreign action on that subject can only be in the form of good advice, and not by an intervention based on treaties which no power could sign without renouncing its independence. The Cabinets of Paris and London have, in fine, observed that the Russian Cabinet had avoided touching on that point of the protocol which ought to have excited its particular attention, and which was, in the opinion of those Cabinets, of the greatest importance, as it implied the necessity of sufficient guarantees against any fresh attacks upon the balance of power in Europe. The Governments of France and England think that the sacrifices which they have made are too great, and the objects they have

in view too important, for them to allow themselves to be stopped until they are certain of not having to recommence the war. From all these motives the Maritime Powers have thought it their duty to reject peremptorily any proposition which might lead to a suspension of hostilities on their part, and they have even hesitated to declare their opinion on the conditions of a treaty of peace, because those conditions depend too much on eventualities for them to be determined on at present. On our urgent representations, these Powers have, however, consented to make known at present, under the reserve of such modifications as circumstances may render necessary, the guarantees which appear to them indispensable to found solid bases for the re-establishment of peace, and the maintenance of the balance of power in Europe, and they leave to us the liberty, if we think proper, of declaring our opinion on the subject in our own name to Russia. These guarantees are pointed out in the identical note, of which the copy is subjoined, and which the representatives of France and England have addressed to the Imperial Cabinet, and as they agree with the principles laid down in the protocol of the 9th of April, they are consequently in conformity with our own views. The Imperial Cabinet, which sees no other practical means of entering on the path of negotiations than the acceptance of them by the Cabinet of St. Petersburg, warmly recommends them to the serious attention of that Cabinet. In reading the present despatch to the Count de Nesselrode, and leaving him a copy of it, point out all the motives which speak in favour of an unreserved acceptance of the bases on which alone we think it possible to put an end to the calamities of war which have already cost so many sacrifices, and which must inevitably acquire increased extension. Austria sees in the free acceptance of these bases the only necessary condition for a solid peace, and the chance of a general understanding. If the Cabinet of St. Petersburg accede to the four guarantees in question, it may rely on our zeal for the serious representations which we shall address to the Maritime Powers, in order to induce them to open negotiations as soon as possible on these bases, and to obtain at the same time the suspension of military operations. We once more conjure the Court of Russia to consider the immense importance of the resolution which it is about to come to; and it is unnecessary for us to recommend you to employ all the means in your power, in order to cause that resolution to be in favour of peace. As the importance of the state of affairs will explain the impatience with which we await the reply that will be given to you by the Russian Cabinet, I beg you transmit it to us as soon as possible. Accept, &c.

BUOL.

The following letter was addressed by M. de Manteuffel, the Prussian Minister of Foreign Affairs, to Baron de Werther, the Prussian Minister at St. Petersburg:—

Berlin, August 13.

I had the honour to transmit to you, with my despatch of the 5th inst., a copy of that which I addressed on the 29th ult. to the representatives of the King at Paris and in London, in order to communicate to those Cabinets our impressions on the Russian replies of the 29th and 30th June, and to express to them our hope that they would agree with us in seeing therein the elements of an understanding and of negotiation. Although we have not received either from London or from Paris any direct reply to these overtures, confidential and verbal communications which have been made to us will not allow us to conceal from ourselves that the manner in which the Governments of France and England appreciate the Russian declarations differs essentially from ours, and that there is little of a nature to offer to us a common starting point. It was particularly the prolonged presence of the Russian troops in the Principalities which, in the opinion of the Western Powers, would prevent them from attaching any practical value to the pacific enunciations of the Cabinet of St. Petersburg. The adhesion to the principles laid down in the protocol of the 9th April, did not, moreover, appear to them sufficiently complete, since it makes no mention of the guarantees which, according to

the same protocol, were to be sought for, in order to more closely attach the existence of Turkey to the general balance of power in Europe. The Cabinets of Paris and London have not concealed from us that in their opinion these guarantees ought to contain several principal points, which, subject to modifications dictated by events, would naturally form the indispensable basis for a negotiation of peace or armistice. These points were afterwards set forth in the identical notes which the representatives of France and England sent to the Cabinet of Vienna, and to which the latter adhered in its reply. In informing us of it, it announced to us at the same time that it considered them as being founded on the principles laid down in the protocol of the 9th of April, and that, consequently, it could not too warmly recommend its unreserved acceptance to the Cabinet of St. Petersburg. I request you, Monsieur le Baron, according to the express order of the King, to give all the support in your power to this step of the Court of Austria. Our august master considers it to be dictated by a sincere desire to prepare the path of negotiations and a suspension of hostilities on all sides, and his Majesty also thinks it suitable to facilitate that result. The Emperor himself will be convinced of the necessity of obviating for the future the inconveniences and the dangers which both for Russia as well as for the repose of Europe, are attached to the institutions which form the public law of the Danubian Principalities and of Servia; and the enlightened solicitude of his Majesty for those countries will not fail to point out to him the advantages and benefits which would be secured to them by a collective guarantee of their privileges by the European Powers. The free navigation of the Danube cannot but be favourable to the real interests of Russian commerce; and although the obstacles to which it is subjected at the mouths of that river are not yet entirely removed, the enlightened spirit of the Emperor, and the reiterated declarations of his Cabinet, leave no doubt as to their firm intention to put an end to them promptly. As to the privileges of the Christian subjects of the Sultan, it is not only in adopting the protocol of the 9th of April that his Imperial Majesty has declared himself in accord with the principle of a joint and collective solicitude of the Powers for the condition of our co-religionists; the same idea had already presided over the overtures which the Cabinet of St. Petersburg made some time since on this subject at Berlin; and as the independence and sovereignty of the Sultan have been so frequently and so loudly proclaimed as being in conformity with the political views of the Emperor, his Majesty could not refuse his co-operation to the united efforts of the Powers to reconcile the amelioration of the condition of the rayahs with the interests of the Ottoman Government, by securing to the latter the initiative which it requires to maintain its independence and its dignity. The treaty of the 13th of July, 1841, was the result of such peculiar conjunctures, that its revision by all the contracting Powers cannot in principle meet with any difficulty; and Russia, as the Power adjoining the Black Sea, appears specially called on to unite in the examination of the important questions attached to it. Such, Monsieur le Baron, are the general considerations which induce the King, our august master, to desire earnestly that the Court of St. Petersburg should accept as the basis of an ulterior negotiation the above-mentioned points, such as they have been set forth by Austria, in accord with the Cabinets of London and Paris. Be pleased, therefore, to avail yourself of the kindness with which the Emperor deigned to honour you immediately on your arrival at St. Petersburg, and of the high confidence which M. de Nesselrode has testified towards you, to make the Imperial Cabinet comprehend the immense importance attached to its decisions, the broad perspective of peace which they may open to Europe, and the victorious effects which they must produce over the detractors of Russian policy, if they prove to its adversaries on which side really pacific dispositions are to be found. It is needless for me to mention, Monsieur le Baron, with what impatience we await your communication as to the reception and the effect of the present despatch, which you will please make known without delay to the Chancellor of the Empire. Accept, &c.

MANTEUFFEL.

The reply of Russia, which unhappily decided the continuance of the war, on an extended scale and with redoubled fury, was as follows:—

TO PRINCE GORTSCHAKOFF, AT VIENNA.

St. Petersburg, August 13 (26).

I have received and submitted to his Majesty the Emperor the communications which the Austrian Cabinet addressed to us on the 10th of August (new style).

In acceding to the desire which Austria has expressed to us, not to press further our military operations in Turkey, and to recall our troops from the Principalities of the Danube, we had exclusively in view Austrian and German interests, in the name of which this desire was addressed to us. The concession required, entailed the most important consequences upon us. As we have already remarked to the Austrian Government, it took away from us the only military point by which could be established in our favour an equilibrium of positions upon the immense theatre of operations in this war. More than this, it exposed us, irremediably, to the danger of seeing thrown, *en masse*, upon our coasts in Asia and Europe, in the Black Sea, the military forces of England, France, and Turkey.

Notwithstanding these inconveniences, and notwithstanding these evident dangers, we, keeping in view the interests of Austria and Germany, declared ourselves ready to retire voluntarily and completely from the Principalities of the Danube. We even renounced every condition of reciprocity on the part of our adversaries. We demanded absolutely nothing from them. We confined ourselves to expressing to Austria a desire to be informed by her what were the guarantees of security which she was individually in a condition to offer us; and, in fact, foreseeing that it was not in her power to assure us an armistice, we desired to know, if at least, after the evacuation should be completed, and that, consequently, the engagements contracted by her with the Western Powers would be fulfilled, we might reckon upon Austria ceasing to make common cause with those Powers with the object, publicly avowed, of bringing about the moral and material abasement of Russia.

At the same time, and in order to afford proof of our pacific intentions, we declared ourselves ready to adhere beforehand to the principles laid down in the protocol of the 9th of April.

In the place of replying directly to these questions, which were addressed to her directly, Austria thought it her duty forthwith to submit the business to the Western Powers, and to make her subsequent resolutions dependent upon them—resolutions which we expected from her alone.

It was evident that the sacrifice which we were ready to make, keeping in view her particular interests, and the interests of the whole of Germany, could not have any value in the eyes of France and England; and that those two Courts, whose object it is to humiliate and enfeeble Russia, by prolonging the war, would not show themselves disposed to enter upon a conciliatory course.

This, unhappily, is proved by the communication which Count Esterhazy has made to us.

In point of fact, the Austrian Cabinet now transmits to us, as the result of its conference with the Courts of Paris and London, new bases for peace, which, so far as form is concerned, have been prepared in a manner the least likely to secure an honourable adoption. And as to the meaning of them we cannot be deceived, seeing that, according to the avowal of the French Government, as it was unreservedly made by the official publication of its reply to the Cabinet of Vienna, "the interest of the European equilibrium" is made to signify nothing less than the abrogation of all our anterior treaties, and the destruction of all our maritime establishments, which, it is said, by reason of the absence of all counterpoise, are a perpetual menace against the Ottoman Empire, and the restriction of Russian power in the Black Sea.

Such are, however, the bases which the Austrian Government recommends to us; and though it exhorts us to accept them without reserve, it believes itself not the less bound to inform us, who are most concerned, that

the Maritime Powers do not consider them as definitively settled, and that they reserve the right to modify them at the proper time, according to the chances of the war. According to this, our acceptance of these bases would not suffice to afford any very certain prospect of the cessation of hostilities. The Austrian Government goes still further. It declares to us that, in its opinion, these bases result from the principles of the protocol, and that these are the necessary conditions of a solid and durable peace and, consequently, that it completely unites itself to, and has even entered into formal engagements with, the Western Powers, not to treat with us upon any other base.

Under these circumstances, it is useless for us to examine conditions which, while they are laid before us, are declared to be elastic and variable—conditions which, if they were to remain as they have been actually submitted to us, suppose Russia to be already enfeebled by the exhaustion of a long war, and which, if the force of temporary circumstances forced us ever to submit to them, so far from assuring to Europe a solid, and especially a durable peace, such as the Austrian Government appears to expect, would only expose that peace to complications, without end. In acceding as he has done to the principles laid down in the protocol, the Emperor certainly had not any intention of attributing to them the significance which has been here claimed.

The immense sacrifices which we were ready to make to the private interests of Austria and Germany, without receiving any compensation on the part of Austria, while the latter, instead of perceiving in this the means of disengaging itself from obligations incurred by it, hitherto having, on the contrary, felt it due to herself to unite with the Powers, our enemies, by yet stronger and more extensive engagements, we deeply regret that we are not able to give effect to her last communications. We consider that, in our present position, we have exhausted every measure of concession compatible with our honour; and our sincerely pacific intentions not having been regarded, it only remains for us to follow energetically the course which has been traced out for us by our adversaries themselves—that is to say, to leave, like them, the chances of war to determine a definitive base for negotiation.

The Austrian Government is already informed that motives arising solely from strategic necessities have engaged the Emperor to order his troops to withdraw behind the Pruth. Having thus retired within our own frontier, and standing now upon the defensive, we expect, from this position, that equitable overtures will permit us to concur in the desire for the re-establishment of peace, on terms consistent with our dignity and political interests, by deliberate proposals, avoiding all provocation to an increase of complications; but, at the same time, we are determined to defend with resolution our territory against all foreign attacks, from whatever quarter they may proceed.

Your Excellency will have the goodness to bring this despatch to the knowledge of Count Buol. Accept, &c.
(Signed) NESSELRÖDE.

The efforts for peace made by the German governments, in the hope of frustrating the allied expedition, and thereby leaving it still possible for them to soothe Russian pride, and by obtaining an armistice prolong the opportunities for negotiation, were now brought to a close, and other and sterner instrumentalities than protocols were about to be employed on the European shores of the Euxine. The Austrian cabinet, however, after a stormy and protracted sitting, decided that the Russian reply did not form a *casus belli*; but resolved to uphold the four points, as necessary for the restoration of peace, and the maintenance of the balance of power.

Frequent military consultations had been held in London, and at the French camp at

FIELD MARSHAL LORD RAGLAN, K.C.B. &c.

Boulogne, as to the plan of operations to be pursued with the army in Bulgaria; and when the cholera was so far abated that hope might be entertained for the returning health of the troops, it was resolved to direct them upon the Crimea, and, if possible, capture the world-renowned stronghold of the czar. We must,

therefore, conduct our readers once more to Varna, that they may accompany the great expedition thence; but before we describe that enterprise, let us give some portraiture of the men who led it, and the peculiarities of the country into which they conducted our gallant divisions.

CHAPTER XXXI.

THE LEADERS OF THE HOST.

"Gie me the plaid and the Tartan trews,
A plea that's just, a chief in the van
To blink wi' his e'e, and cry, 'On wi' me!'
Then turn the blue bonnet wha can, wha can."—*Scottish Song.*

ONCE more at Varna! The plague-stricken troops are gathering health; an earnest yet hopeful expression is on every face. The fleet is ready to receive the troops, and bear them to a new destination, where not endurance only but active valour will be required. The mustering squadrons, and the tramp of war, are heard on every side; and amidst all the crowding of warriors, and the din of mighty preparations, venerable and resolute-looking men, with plumed hats, are riding to and fro directing everything, their sense of responsibility depicted on their thoughtful brows. It is our part, in this chapter, to give some account of many of the leaders, whose names have filled so large a space in the dread records of war. It will not be expected of us to give a memoir of every distinguished officer in the separate hosts. We can only select certain prominent men in the army of our ally, and give brief notices of them. In the British army, we shall select the names most familiar to our countrymen, or most illustrious by their merits. The first name that claims our attention is that of Lord Raglan, the Commander-in-Chief of the British expeditionary army:—

LORD RAGLAN was descended from an ancient and honourable family, which was originally possessed of the title of Duke of Somerset. The Wars of the Roses were as detrimental to the house of Somerset as to that of Lancaster. In the wars of "the Stuarts," the house of Somerset adhered to Charles and James, although in the case of James II. no active support was rendered. Lord Raglan was the eighth son of the fifth Duke of Beaufort. He was born in Bedminster, in 1788, and was consequently in his sixty-seventh year when he took command of the British army of the East. In 1804, then a mere boy, he entered the army as cornet of the 4th Light Dragoons; after serving a short time in that regiment, he was promoted to a lieutenancy, and thence to a company in the

43rd Light Infantry, one of the most perfectly disciplined regiments of the day, and afterwards one of the most distinguished. On the 20th of September, 1810, he received his first wound, when, as the late Sir Robert Peel said in one of the best of his orations, "The tide of French glory was rolled back from the heights of Busaco." Very early in the Peninsular campaign, Lord Fitzroy Somerset (as Lord Raglan was then called) was placed upon the staff, and as military secretary to the Duke of Wellington was a most efficient officer, displaying always great personal daring. Few men in the army of the Peninsula had a finer courage than Lord Fitzroy Somerset. At Fuentes d'Onore, on the 3rd and 5th of May, 1811, he especially distinguished himself by brilliant valour.

Sir William Napier, in his *History of the Peninsular War*, bears this testimony to his great usefulness:—"Lord Fitzroy Somerset, military secretary, had established such an intercourse between the head-quarters and the battalion-chiefs, that the latter had, so to speak, direct communication with the general-in-chief upon all the business of their regiments, a privilege which stimulated the enthusiasm and zeal of all. For, the regimental commanders being generally very young men, the distinctions of rank were not rigidly enforced, and the merit of each officer was consequently better known, and more earnestly supported, when promotion and honours were to be obtained. By this method, Lord Fitzroy acquired an exact knowledge of the moral state of each regiment, rendered his own office important and gracious with the army, and with such discretion and judgment that the military hierarchy was in no manner weakened; all the daring young men were excited, and being unacquainted with the political difficulties of their general, anticipated noble triumphs, which were happily realised."

On the 6th of April, 1812, he distinguished

himself at the storming of Badajoz. Amongst the foremost who stormed that fortress was seen, bravely fighting and encouraging the soldiery, Lord Fitzroy Somerset. He showed on that occasion eminent presence of mind, by pushing on to the stronghold of the place, San Christoval, and, securing the drawbridge, prevented the enemy from retreating to it, and prolonging, as they then would have been able to do, their resistance. On the following morning he received the submission of the governor. He was present at the battle of Salamanca, and a distinguished actor there also. Sir William Napier pays him the high compliment of saying that he was sure to be seen with his leader, the great Duke, at every point where the presence of the latter was most required. The battle of Vittoria was fought on the 1st of June, 1813. During this engagement he scarcely left the side of his great chief, except to perform some temporary service of intrepidity calculated to encourage and sustain the men.

When the French, driven upon the Pyrenees, disputed the passes with the allied armies, Wellington, the British leader, after effecting certain dispositions against Soult, who occupied the Vals de Zubiri and de Lanz, rode in great speed to the village of Loramen; and Napier gives a graphic picture of the success of Lord Fitzroy Somerset in keeping by the Duke's side when the superior horse of the latter enabled him to distance all the other members of his personal staff. At this moment the French general, Clausel, was perceived moving along the ridge for the village. Had the French secured this position, that of the allies would have been rendered critical. The Duke wrote his orders on a slip of paper to the general of the sixth division, committing it to his only attendant, Lord Fitzroy, who galloped out at one end of the village on his mission as the French galloped in at the other, while the Duke rode up the mountain to his troops. To the circumstance of Lord Fitzroy keeping up with the Duke, the latter owed it that he had the means of communicating with the sixth division, and of saving his army from an imminent peril. Through an overwhelming storm, Lord Fitzroy succeeded in reaching the division, and bringing it by the route indicated by the commander-in-chief, so as to communicate with the seventh division: thus materially strengthened, the Duke was able to deal two successive blows against Soult's forces, by which the plans of that sagacious general were paralysed. In both conflicts Lord Fitzroy Somerset bore his part. Soon afterwards he had an opportunity of rendering a great service to his country, and the incident that gave him the opportunity was one of the most happy episodes of the Peninsular War. The fortress of Pampeluna is the bul-

wark of the Pyrenees. It is the key of France to an army attempting to invade it from the north of Spain. Soult believed that it was strong enough to hold out without any succour from the army in the field under his command, and arranged his plans accordingly. Wellington, attended by his inseparable companion, Lord Fitzroy Somerset, was riding through a lonely mountain gorge, when they suddenly came upon a muleteer, who carried a secret despatch from the governor of Pampeluna, which he was ordered to give in person to Marshal Soult. The muleteer, seeing so brilliant an officer as Lord Fitzroy Somerset treating with deference, and as a superior, the officer accompanying him, at once concluded him to be the French marshal, and taking a piece of paper from a small ball which he carried in his mouth, handed it to his excellency. The Duke could not peruse it as it was written in cipher, but, handing it to Lord Somerset, remarked, "Ah, if we could only unravel this, it would give us some information worth knowing." Lord Somerset discovered it; almost at a glance he discerned the key of the cipher, and read the despatch, which communicated to Marshal Soult the fact that unless by a certain day the governor received relief, Pampeluna must be surrendered to the English. The Duke so laid his measures that no such relief could come, and Pampeluna fell with facility to the victor by the sharpness of Lord Somerset in discovering the cipher.

Entering France, the all-conquering Duke bore on in his career of glory until Nivelles, Orthes, and Toulouse, added to his greatness and renown. Through all these memorable struggles Lord Fitzroy Somerset was at his side, and ever prompt in the performance of his duty, always sagacious, and amongst the foremost of the brave. At the peace, Lord Fitzroy married the Duke of Wellington's niece, daughter of the Earl of Mornington, and was appointed secretary to the embassy of Paris. In his early youth, while only a lieutenant of cavalry, he was attached to the embassy for Turkey. He had a strong taste for diplomatic business; and, when chief of the British army, this propensity unfavourably influenced the discharge of his military duties. When the war broke out again, Lord Fitzroy Somerset, the Duke's *alter ego*, was of course at his side in the Belgian campaign, where he was more than ever useful as the principal officer of the Duke's staff.

On the 16th of June, the bloody battle of Quatre Bras was fought. It was eleven o'clock before the Duke reached the field. Lord Fitzroy was by his side, and greatly assisted him in reconnoitring the enemy. Hence they both rode across to the Prussian position; and during their absence the battle of Quatre Bras began

On their return they were nearly captured by the French: the bullet of a brave fellow of the 92nd Highlanders brought down the nearest of their pursuers. Throughout the fierce fight of Quatre Bras Lord Fitzroy was exposed to innumerable perils, so frequently was he employed in bearing despatches across the field—the baseness of our Belgian allies causing an excess of anxiety and exertion to the Duke and his staff. Lord Fitzroy was, at last, desperately wounded. We shall give, in the Duke's own words, the catastrophe, in an extract from his letter to the Duke of Beaufort, Lord Fitzroy's brother. "I am very sorry to have to acquaint you that your brother Fitzroy is very severely wounded, and has lost his right arm. I have just seen him, and he is perfectly free from fever, and as well as anybody could be under such circumstances. You are aware how useful he has always been to me, and how much I shall feel the want of his assistance, and what a regard and affection I feel for him, and you will readily believe how much concerned I am for his misfortune. Indeed, the losses I have sustained have quite broken me down, and I have no feeling for the advantages we have acquired. I hope, however, that your brother will soon be able to join me again; and that he will long live to be, as he is likely to become, an honour to his country, as he is a satisfaction to his family and friends."

At the peace, in 1815, he was created a K.C.B., and was again restored to his early love, diplomacy, by being employed a second time as secretary to the Paris embassy. He accompanied the Duke of Wellington to the congress at Vienna as his secretary of legation. He also accompanied him in the same capacity to St. Petersburg, to congratulate the Emperor Nicholas on his accession to the imperial throne. He was on that occasion received by the emperor with almost as much distinction as the Duke himself. The czar formed a high opinion of him, and regarded him with much kindness and respect; and, in the esteem of the noble secretary, the czar was a prince of men. In 1823, being himself appointed on an especial mission to the court of Spain, he was received with great distinction, the result of his gallant services in the Spanish cause. While on his foreign mission he was secretary to the master-general of the Ordnance, to which post he succeeded in 1819, by the appointment of his old patron, the Duke. He remained secretary to the master-general until 1827, when he was made secretary to the commander-in-chief, which post he occupied for many years. While at the Horse Guards he had necessarily much influence in colonial affairs, as among the anomalies of our administrative business the Horse Guards and the colonies are brought, or

were then brought, into various undefinable relations. Lord Fitzroy Somerset was regarded with some dislike by the liberal colonial parties, his politics being always very decidedly and very obviously conservative. The evangelical church party and dissenters in the colonies were still more dissatisfied with his lordship, his leanings being very strongly in contravention of theirs. In 1818, he contested, on conservative principles, the borough of Truro, and was returned by a majority of one, but unseated on petition. He had a narrow escape of his life, for the mob smashed the doors and windows of his hotel, and handled his person very roughly. On this occasion, he showed the same cool courage and amiable temper by which he had been always characterised. He gradually rose by seniority in the army during the long period of years since he entered as a cornet, but never held any important command. On no occasion did he ever head a regiment in a detached encounter. At the storming of Badajoz he sustained the greatest amount of immediate personal responsibility. In 1830, he obtained the colonelcy of the 53rd regiment. In 1834, he was honoured by the University of Oxford with the degree of Doctor, to which his scholarly attainments entitled him. The Grand Cross of the Bath was conferred on him in 1847. On the death of the Duke of Wellington, in 1852, he was made master-general of the Ordnance; and shortly after, in the same year, was elevated to the peerage, under the title of Baron Raglan. He was also constituted a privy councillor, and appointed to the colonelcy of the Royal Horse Guards Blue. For all these honours and emoluments he was mainly indebted to the influence of the court, with which he was a great favourite. He was one whom queen and prince delighted to honour. His agreeable disposition, courtly manners, and graceful way of transacting the business of his various offices, commended him to the esteem of every one.

On the breaking out of the present war, he was fixed upon as one of the very few generals of high rank young enough, or rather not too old, for an active command. Few men could have been found who had seen more of war, or sustained less of the importance and responsibility of command. He knew better than any other officer in the British service what were the duties of an aide-de-camp, a private secretary, or a chief of the staff; but no general in the service could possibly know less by experience of what the command of bodies of men, large or small, personally involved.

Seldom have we read of a man equally simple-minded and direct than Lord Raglan. He was as merciful and kind as he was brave. In all his domestic relations he was a pattern of virtue and tenderness. He had

several children. His firstborn, Major Arthur W. Fitzroy Somerset, was killed in India, while serving on the staff of Lord Gough, and displaying a courage as noble as that of his father. His second child was the present Lord Raglan, who is in his fortieth year. Besides these two sons, he had two daughters.

For the first time in his life holding an important command, his appointment was open to severe criticism. How that command was sustained will be seen in the progress of this History.

MARSHAL ST. ARNAUD, *Commander-in-chief of the French Expeditionary Army.*—He was born in the first year of the present century, and was consequently of the vigorous age of fifty-five when appointed to the command of the army of the East. At the early age of fifteen he entered the Gardes des Corps, and was soon transferred, as a sub-lieutenant, to a regiment of the line. St. Arnaud, however, quitted the army, and did not return to it until so late as 1831. He took an active part in the war of La Vendée; and on the pacification of that province was attached as aide-de-camp to Marshal Bugeaud. He was charged at that juncture with a delicate mission to the Duchess de Berri, and won her respect by his mode of conducting it. He served in Algiers with the rank of captain. At the siege of Constantina he so conducted himself as to win the decoration of the Legion of Honour; and continued to serve in Africa, rapidly rising in rank by no other aids than those of his distinguished services, which were rendered to a government which always rewards military merit, irrespective of the lineage or wealth of the deserving officer or soldier. He was much loved in Africa, and bravely followed by his Zouaves. In 1847, he was made a Major-general, and a Commander of the Legion of Honour. In 1850, he was nominated to the command of the province of Constantina; and won much honour by the way he discharged the functions of his office, both in the civil department and in the field. Having subdued the Kabyles in a manner which augmented his already great reputation, he returned to France; and was appointed, by the President of the Republic, general of the second division of the army of Paris, and soon afterwards was made minister of war. In 1852, he was made Marshal of France, and a senator, and decorated with the Grand Cross of the Legion of Honour. He resigned the office of minister of war to command the army of the East, in a state of health which unfitted him for the gigantic task.

In a former part of this work we related that Madame St. Arnaud accompanied her husband to the East. She was in every way a person fitted to share his glory. She was rich,

and beautiful exceedingly, a person of the most fascinating manners, much attached to him, and an ardent admirer of his gallantry and genius. There were many ladies of rank, beauty, and accomplishments, who in both armies accompanied their gallant husbands; but Madame St. Arnaud was "the admired of all admirers:"

—"Velut inter ignes
Luna minores."

The assiduity of this lady in soothing the sufferings of her husband, who was literally dying of a painful disease when he assumed the command of the army, passes all praise.

GENERAL CANROBERT.—François Certain Canrobert was born in 1809, and is now (1856) in the forty-eighth year of his age. His department was that of Lot, and within a few leagues of the birthplace of another distinguished French general, Murat. He entered the military school of St. Cyr, but not until he was seventeen years of age, and remained there until he was in his twentieth year, a laborious student, and much respected, for his amiable deportment and good temper, as well as abilities and studiousness, by all his fellow collegians. He was appointed sub-lieutenant in a regiment of infantry of the line, and remained in that inferior rank four years before he succeeded in gaining his promotion as lieutenant. He remained for three years longer in garrison in France, when his regiment was ordered to Africa, in which he served for two years in the same military rank before he gained a company. During that two years he displayed in his humble position military qualities of high order. They were two eventful years to the French army and French interests in Africa. Abd-el-kader harassed the French troops; and the gallant Canrobert shared with his regiments in various brilliant exploits—combats, pitched battles, harassing marches, pursuits, retreats, victualling strong places, and assailing others, gave him opportunity to form his professional attainments in a good practical school, as at St. Cyr he had been enabled to study the theory of his profession with every advantage. When Generals Clausen and Setary directed the French operations in Oran, the regiment in which Canrobert served was most actively engaged, and the lieutenant participated in many dangers and fatigue. The same amiable, patient, and intelligent spirit which characterised him in college, endeared him also to his regiment; and his personal bravery was always as quiet and unobtrusively as it was bold and masculine. When appointed captain, his regiment was ordered to the province of Constantina, where the Duke de Nemours and General Daumémeret were ordered to avenge certain insults to French

GENERAL GARIBOLDI

1861

authority and honour. At an assault there he was wounded in the leg. He was then orderly officer to Colonel Cenilies, the old soldier of the island of Elba, who fell mortally wounded in the breach. While languishing of his wound, such was the confidence and respect entertained by the colonel for his orderly, that he recommended him to Marshal Valée as a man of very great promise, and deserving the notice and trust of that distinguished chief. He returned to France in 1839, decorated with the Legion of Honour, and was entrusted with the task of forming a Spanish legion, composed of the soldiers who had taken refuge with Cabrera upon the French territory. Sir William Napier, in his *History of the Peninsular War*, represents the Spaniards as never making good soldiers, either when drilled in separate battalions or mixed with the British. It was then too true; but Canrobert found the means of accomplishing what Napier's friends in the Peninsula found to be impracticable; and the Spanish legion which he organised, served well in the French army of Algiers. In 1840, he was called to the camp of St. Omer; and having by this time been generally recognised in the army as an officer of talent, skilled in his profession, he was ordered by the Duke of Orleans to draw up a manual for the use of officers of light troops. In 1841, he returned to Algeria, with no higher post than when he had left it years before, although practically he had enjoyed the rank of chief of battalion in the Spanish legion. He attached himself to the light infantry upon his return to Africa, and engaged in many encounters with great honour. He had the good fortune to be placed under the immediate command of two officers from whom he could make still further professional acquisitions—Colonel Cavaignac, and Colonel St. Arnaud, with the latter of whom, as second in command, he afterwards went out to the East. At last an occasion arrived to proclaim to the whole French army the dauntless valour and genius of Lieutenant-colonel Canrobert, to which rank he had slowly made his way, considering his services and his conspicuous heroism and skill; but he never sought to push his own fortunes; and even in the French army a modest man is in danger of being taken at his own price, and passed over. Canrobert was eminently disinterested, and scorned to sue for promotion which he knew he merited, and which it was the duty of the state to confer; but matters in France were then under the cold shade of the house of Orleans—a branch of the Bourbons, who added to the tyranny of their race the hypocrisy and corruption of other dynasties. At the obstinate combat of Bahl, he, with 250 chasseurs, kept at bay 3000 men. The enemy charged repeatedly, with desperate

fury, but so skilful were the arrangements with which he marshalled his little band, that his numerous enemies fell back broken as the spray of the wave which dashes against the rock. He had not fought under Cavaignac and St. Arnaud in vain. Through his instrumentality, after eight months of harassing operations, and frequent bloody encounters, the pacification of that part of the country was secured, and Canrobert was raised to the rank of full colonel. In 1848, General Herbillier confided to him the command of a strong column, with which to attack the mountaineers of the Aures. The very first movements of the column were ordered so skilfully, and their action was so prompt, and, in a military sense, so peremptory, that the mountaineers were intimidated, and much blood spared, which a less skilful commander would have shed. Indeed, it was one of the marked characteristics of Canrobert, a perfect horror of bloodshed. Ever willing to spill his own blood for his country, with characteristic generosity, his noble nature could not endure to witness cruelty; and he would undergo any amount of personal anxiety, labour, and danger, to save the lives of even a few of his men. In this respect he deserves to be held up as a model for all men who succeed in the military profession. Soon after these exploits he became commander of the Zouaves, who literally revered him as if he were a prophet. Rude, wild soldiers, by no means particular about their own lives, or those of friends or enemies, they were the Bashi-bazouks of French Africa. At first they did not comprehend their new chief: his gentleness did not comport with their ideas of a leader; but when they saw him in battle, his fearless spirit ever seeking the path of danger, and yet his reports of the most heroic exploits so modest and unostentatious, these rough soldiers almost deified him; they would have followed him anywhere, whatever certainty of destruction might seem to await him. It would be difficult to find among all the fierce Zouaves of the African army, one who would not lay down his life for the gentle and modest officer whose commands they so tardily learned to obey.

In 1849, Colonel Canrobert won that high place in the estimation of European military men which he has ever since continued to hold. He had occasion to adopt vigorous measures of repression against the Kabyles, and the tribes of the Jurjura. While under the walls of Aumale, the French army was attacked with cholera. The conduct of the troops was one of great difficulty, from the activity of the enemy and the nature of the country; but these obstacles were greatly aggravated by the visitation of the pestilence. It was not in the swamps of the Dobrudscha,

or along the slimy Lake of Devno, that Canrobert first encountered that most formidable of enemies—his Zouaves in Africa were, of all the French army, the greatest sufferers. The havoc was terrible; and the men, who feared no human foe, were in despair. Then the noble qualities of Colonel Canrobert were conspicuous. His humanity, activity, intimate knowledge of his soldiers, and sedulous concern for their health and comfort, were displayed in a manner which commanded their gratitude, the gratitude of his country, and the admiration of Europe. On one occasion, he made the presence of this plague in his army a ground of demanding the surrender of a strong place. He threatened the superstitious enemy with infection, if they did not surrender—and the threat succeeded! While his army was in this state he arrived at Yaatche, which place he assailed. He himself led the assaulting columns; sword in hand, followed by four officers and sixteen soldiers, who volunteered to accompany him, he entered the breach. Of these brave men sixteen were killed or wounded around their leader. For this daring achievement he was nominated Commander of the Legion of Honour, a distinction of which every Frenchman who possesses it is proud, and to which every brave Frenchman fighting in his country's service aspires. It was not until January, 1850, that he was promoted to the rank of general of brigade, a rank to which he had long before a just claim. He was appointed to a command in Paris suitable to his new rank, and was further honoured by the post of aide-de-camp to the Prince President of the Republic. He was promoted to the rank of general of division in 1853. Napoleon I. once said, "What can be done more for a man than make him a general of division? he is at the top of the tree." So did the first consul honour this grade; but as emperor he found other and greater distinctions to confer. Nor was the president of the new republic, when he became emperor, less dextrous in finding suitable distinctions for his faithful followers. Canrobert was not only made a general of division—he was honoured by the especial notice and favour of the imperial court; and finally sent to the East as second in command of the fine army to which France committed her fortunes in the oriental struggle. This was said to be at the especial request of St. Arnaud, but so entirely with the concurrence of the emperor and the voice of France, that the appointment to command-in-chief was placed in possession of Canrobert in case of anything happening to St. Arnaud, whose declining health gave fatal prognostication of the result. It has been whispered rather than reported through western Europe, that Canrobert holds a nearer affinity to the French emperor than the latter

cares publicly to acknowledge; that the first Napoleon and the interesting subject of this brief memoir bore a relationship which cannot fail to give the latter an influence with the emperor.

LIEUTENANT-GENERAL SIR GEORGE BROWN, K.C.B.—For two hundred years the family of which Sir George is a worthy member has given heroes to their country, but, among them all, not a braver or honest man than he who was second in command of the British army of the East. He was born at Elgin, in Scotland, and was in his sixty-sixth year when the army landed at Varna; but the language might be very appropriately used concerning him—

"In years he seemed, but not impaired by years."

His appearance is very Scottish, having the thoughtful, meditative face so peculiar to his country. Yet he is not an intellectual-looking man, but has rather an anxious and careful look. In June, 1806, a memorable year in European politics, he entered the army as a lieutenant in the Rifle Brigade, and, in 1811, he obtained a company. He began his military career in Sicily, but went thence to the Peninsula, and with a brief intermission remained there, fighting his way with that gallant army to the Pyrenees. In the first battles in Portugal—Roliça, Vimiera, Almeida—he displayed activity and courage in the subsidiary ranks then held by him, and as he rose in promotion so did he rise in the esteem of the great commanders under whose orders he acted. At the battle of Busaco, he was engaged in a fierce hand-to-hand conflict with one of the personal staff of Marshal Massena, in which he was the victor. He distinguished himself greatly in the sanguinary struggle of Badajoz, where Lord Fitzroy Somerset (Lord Raglan) behaved so gallantly. Sir George was one of the officers who led the forlorn hope. When the British army passed the Pyrenees, he was still in the ranks, even to the gates of Toulouse, sharing in every action, and always proving himself brave and determined man. His promotion was very slow. He was neither rich nor titled, and his having fought with desperate gallantry, and conducted himself as a strict disciplinarian, could not atone for the want of those qualifications; young officers bought their way over his head, or were promoted for the which his country valued much more than any thing he possessed—high connexions. Valour and discipline were very good in their way and might do very well as grounds of promotion among vulgar republicans like the French, but he was a Briton, and was not a lord or a honourable, and therefore, notwithstanding desperate hand-to-hand encounters, forlorn hopes, storms, battles, fatigue, labour, the

minutest attention to duty, and the most unquestionable and even devoted loyalty, it was not to be expected that he should be promoted where men more highly connected were in the way.

In 1814, he at last obtained a majority, and became lieutenant-colonel the same year. It was a year of peace in Europe, and he had opportunity of making interest at home, which is, in the British army, a more natural way of gaining promotion than useful and self-denying services abroad. It was not, however, while at home that the great step of lieutenant-colonel was obtained, for, joining the ill-fated American expedition, he had a fair claim to the step when his senior officer was removed. By this time he had earned a very general acknowledgment of his military virtues, and on his return from America was employed in various staff employments, which were supposed to be a sufficient requital for his gallant services. Indeed, to do the government and the Horse Guards justice, there was no opportunity for promoting him; as so many young men of higher family than he was, entered the service when peace was proclaimed, they had to be provided for, and so he remained a lieutenant-colonel for seventeen years, witnessing innumerable instances of lords, honourables, and their connexions stepping over his head—men who had never fired a shot in their country's service except at a review. However, as this state of things was satisfactory to the British people as well as to their rulers, it is only the historian's province to regret that Lieutenant-colonel Brown had not "fair play." In 1831, he became full colonel, but not in a way to recognise his merits, but by brevet. Ten years longer he remained a colonel, and then, in 1841, was made a major-general, for a reason which was also satisfactory to the British people—a brevet in honour of the Prince of Wales! During that ten years, Colonel Brown witnessed many fresh accessions to the number of juniors entitled to command him, who had neither served their country in the field nor anywhere else. In 1850, on the death of Sir J. McDonald, he obtained the lucrative and honourable employment of adjutant-general from the Duke of Wellington, simply because the great Captain believed him to be the "fittest man for the place." Lord Hill had previously introduced him to inferior posts in the adjutant-general's department. Both these great generals respected him highly, and would have interested themselves in his promotion had he routine of the service allowed, but "it is very difficult in the British army" (as the Duke's once represented to have said) "to promote a man out of course." Very soon after Lord Hardinge assumed the chief command of the army, General Brown resigned his post of adjutant-

general. Some allege that this arose from the personal interference of an illustrious prince with the details of the army, and others from the sturdy general's objections to certain military reforms urged by the government in consequence of popular pressure. Neither Lord Hardinge nor General Brown were friends of reform. To conserve all things military they seemed to consider their great vocation. Even promotion, which went on so slowly with General Brown, he is satisfied is conducted on a safe principle, and would still stick to seniority and purchase, as the good old British system. The conduct of the general at Varna has been already criticised in a former chapter relating to events there; his career afterwards in this war will be noticed in future chapters. A braver or more humane heart does not beat in a soldier's bosom than throbs in the breast of this gallant martinet. His physical energy is prodigious; he merits higher honour from his country; and while lawyers, for being ministerial hacks and good parliamentary debaters, are promoted to the peerage, it is a pity that this glorious old veteran should be left with so little of honour or reward from his country after all he has dared, and done, and suffered on her behalf. Truly we are not as a people grateful to our defenders, or, if we feel so, we are deficient in adopting those means of expressing it which justice demands. General Brown would not be a suitable officer to select for the command in chief of an army, but in the army of Lord Raglan, as second in command, he was invaluable, by his vigour, industry, attention to military business, promptitude, and daring. He was eyes, hands, and feet to his chief, both at Varna and subsequently in the Crimea.

GENERAL SIR DE LACY EVANS, K.C.B.—This distinguished officer was in the sixty-seventh year of his age at the period to which our chapter refers. He is a native of Ireland. His father was a country gentleman of obscure position and very small property, whose family came to Ireland with Strongbow. His mother was of the De Lacys, who, as soldiers, distinguished themselves in the service of France, Austria, and Russia, and whose names frequently occur in connection with military exploits in the wars of Europe. He entered the army as a volunteer, and by his dauntless bravery obtained a commission, having been nominated to an ensigny in the 22nd foot on the 1st of February, 1807. In the expedition to the Mauritius, his valour was again distinguished, and he was promoted to a lieutenancy on the 1st of December, 1808. His conduct on this occasion made some noise in England, and was the talk of the army for some time. In consequence of the notice he attracted, he re-

ceived a pleasant appointment on the staff of General Malcolm, who had a diplomatic mission to Persia; but young Evans soon relinquished this for active service in the Deccan. He remained in India until 1810, during which time, in the operations against Amer Khan, he once more made himself the subject of general notice for his talents and bravery: still he remained a simple lieutenant. In 1812, he joined the army in Spain as a lieutenant of dragoons. In the retreat from Burgos he was in the rearguard, the cavalry of which suffered severely, in consequence of the heavy German horse having repeatedly given way before the charges of the French. Mr. Evans performed his part with valour, and although a novice in the cavalry, he displayed skill and judgment. His reputation was promoted by a series of exploits throughout that most disastrous retreat. He was wounded during the action in the Hernoza, but so zealous was the gallant lieutenant, that he kept the field, his wound healing, although a severe one, without a day's retirement on his part from active duty. At the battle of Vittoria he displayed his usual skill and courage, and rendered fresh services, so as to draw from the commanding officer of his regiment an especial expression of thanks. At Salamanca he attracted the attention of Wellington himself, who never displayed much zeal in the promotion of obscure and daring officers. Evans did his *duty* in the Duke's esteem, and was repaid by the Duke's confidence and respect. During the investment of Bayonne his horse was shot, and he suffered contusion from the fall. At the siege of San Sebastian he volunteered to act as an engineer, for which, by his superior education and mathematical knowledge, he was qualified, and there he led the assault. At Badajoz he led the forlorn hope. In every battle, from Pampeluna to Toulouse, Lieutenant Evans bore a part, and at Toulouse two horses were killed under him, and he was twice wounded. Will it be believed anywhere out of the British Isles, that this intrepid man—so often wounded, in perils so numerous, and rendering services so brilliant—remained, at the end of all his achievements in the Peninsula and France, a lieutenant still? Such is the mortifying fact—mortifying alike to the justice, gratitude, and pride of the British nation. If, however, like Sir George Brown, Sir De Lacy Evans suffered such flagrant injustice, there was this difference between the two heroes—the gallant Scot was an upholder of things as they were, reform was the destruction of “the constitution,” while the gallant Hibernian felt keenly the indignity shown to him, and hated the whole system of military promotion and corruption, lifting his voice against it whenever opportunity allowed.

After the peace with France, Evans went out with the expedition to America, under the command of his countryman, General Ross—an expedition which displayed the usual heroic qualities of our troops, but nevertheless added nothing to the renown of our arms. At the battle of Bladensburg, Lieutenant Evans had two horses killed under him, while acting a quartermaster-general. The arrangement of the forces made by him, obtained for him the thanks of the amiable and brave man who commanded and won that memorable battle. On the same day (the 24th of August, 1814) he reconnoitred the city of Washington, and proposed to lead a storming party against the place. This the general-in-chief acceded to, and that night Evans led in his party, and, after a severe conflict, executed his purpose. The booty of the British was very great—ammunition, cannon, stores; besides, the total discomfiture of the American forces, and the rout of the American government, were effected. General Ross, in his despatch, thus acknowledges the lieutenant's services:—“I must beg leave to call your lordship's attention to the zeal and indefatigable exertions of Lieutenant Evans, acting deputy quartermaster-general. The intelligence displayed by that officer in circumstances of very considerable difficulty, induces me to hope that he will meet with some distinguished mark of approbation.” No promotion for the hero who had captured Washington! He was brave, intelligent, and had rendered great services, but he had not interest—not even the general who commanded the army in which he served could procure for him any reward. In the following month, the British advancing upon Baltimore, were attacked by superior force. The Americans fought bravely as they always do. The superior military experience of the British alone secured the field. The Americans were defeated. General Ross fell upon the field of his glory. His success, however, did honour to the veteran lieutenant, for by this time Evans, if not an old man, was a very old lieutenant. In his despatch he thus notices the services rendered by Evans:—“I Lieutenant Evans, 3rd Dragoons, acting deputy quartermaster-general to this army, for the unremitting zeal, activity, and perfect intelligence displayed by him in discharge of the various and difficult duties of his department, I feel warmly indebted, and I beg to solicit through your lordship a promotion suitable to the high professional merits of that officer.”

On Lake Bergue there were several armed sloops, placed there by the Americans to defend the lake. Evans, as usual, volunteered to take part in a boarding expedition; and was the only military man who was e

gaged with the sailors. The Americans fought with their usual intrepidity, but the sloops were captured. Evans was rewarded with—what would our readers suppose?—a naval medal! General Keane, assuming the command, acknowledged the genius of Mr. Evans, and did his best to gain him some promotion; and no doubt would have succeeded, if brilliant services were the kind of thing for which British officers were in those days promoted. They marched upon New Orleans. The disastrous issue of that battle to the British is well known. It is curious that both armies were commanded by Irishmen—at least, General Jackson was the son of an Irishman. The British were signally defeated, and but for the skilful arrangements of Evans, the loss in both the action and the retreat would have been far more severe. General Keane thus referred to Evans in his despatch:—"The indefatigable zeal and intelligence displayed by Lieutenant Evans, of the quartermaster-general's department; entitle him to the most favourable consideration." After various other services in the American war, he returned to England, but received no promotion; until, being nine months at home, the government, shamed by the representations of the officers under whom Evans served, offered him a promotion and an insult together. He was made captain of a West India regiment!—safer to lead a forlorn hope. The injustice was gross. War with Napoleon breaking out again, and Evans being well understood at the Horse Guards, his services were demanded: good officers were in great request. The government appointed him once more on the staff of the army, and he took the rank of major *by brevet*. At the battle of Waterloo he earned great distinction. There was scarcely any portion of the field upon which Evans did not render some service. Any of our readers who have examined Colonel Sibera's model of the battle of Waterloo, will recollect that the moment selected in which to present the aspect of the field, is that when the French attack was made upon the right of the left, and the left centre, of the British line. The infantry stationed in that part of the field consisted of Belgians, who ran away, and of Picton's division of British infantry, to which Evans was attached on the staff. A brigade of cavalry, called the Union Brigade, consisting of the 1st Royal Dragoons, the 2nd Royal Scots Greys, and the 6th Dragoons, were also placed there, under the command of Sir William Ponsonby. The French infantry advanced upon that portion of the line, and as the Belgians fled, the British infantry division poured a storm of bullets upon the enemy, just as, advancing in column, they halted to deploy. Picton, understanding this usual fault of French infantry, received them in line, "in

the old way," as the Duke of Wellington expressed it in his letter to Lord Beresford. At this juncture also, as arranged with Sir W. Ponsonby, Evans, by raising his hat, gave the signal for the cavalry brigade to charge. Ponsonby did not see the signal, and Evans, by a happy assumption of command, caused the brigade to charge at the critical moment, by which means the deploying columns of French infantry were suddenly swooped upon by the cavalry, and their formation becoming impossible, they were sabred with immense slaughter, and 2000 prisoners were captured,—the French infantry running for protection to the English infantry from the all-devouring sabres of the desperate dragoons. This heavy cavalry brigade, afterwards supported by Colonel Ponsonby (brother of Sir William), at the head of a light dragoon regiment, cut through the attacking infantry, penetrated to the French lines, and cutting the harness of the artillery, and sabreing the horses (the men fled), forty pieces of artillery were rendered unserviceable the remainder of the day. Sir W. Ponsonby did not survive to do Evans the justice that gallant soldier would have so freely rendered. Picton also perished, and the command of the infantry division devolved upon Major-general Pack, who recommended Major Evans to the Duke of Wellington for his great services. But of what use was that to Evans? He had been an old acquaintance of the Duke's, who knew his merits well; but as his promotion was no part of the system, his grace would consider him rewarded by the consciousness of having done his "duty."

General Sir A. Clinton bore also to the Duke a eulogistic testimony of the services of Major Evans. Evans lost two horses at Waterloo; one was shot under him, another bore him off the field, and fell dead from a sabre wound in the head and neck. Major Evans was rewarded for Waterloo like every other officer, as a matter of routine; but his especial services received no acknowledgment. He received the brevet of lieutenant-colonel, and remained with the army of occupation in Paris, from which he returned in 1819. He was then put on half-pay, and remained unnoticed until his election for Westminster gave him influence and power. In 1835, Lord Palmerston, ever ready to discriminate merit, and to reward it as far as the fetters of the system allow, selected him to command the British Auxiliary Legion in Spain, raised in the result of the "quadruple alliance." The Duke of Wellington, who was consulted on this occasion, gave his unqualified approbation of the selection. Never was an officer more assailed by calumny than Lieutenant-colonel Evans (General in the Spanish service) while in command of the British legion. He rose above all aspersion,

and accomplished the objects for which he was designated to the command. His services met the approval of the government of the day. He was knighted, but his promotion in the army was only one step—he was gazetted to a colonelcy in 1837, having been twenty-two years a lieutenant-colonel! The best narrative extant of the services of the British Auxiliary Legion is that written by Mr. Alexander Somerville, who served as a colour-sergeant in the 2nd Scottish regiment. Mr. Somerville is an able literary man, and better known by his production entitled, *One who has whistled at the Plough*. His vindication of General Evans is complete. He describes him truly when he says, "His only fault as a general is, he is too good a man;" meaning too kindly in his nature, and too easily imposed on by unworthy adherents and followers. In the service of Spain, General Evans had part of his ear carried away. Never in any part of his career did he perform more daring exploits. On one occasion he stood upon a wall, encouraging the advance of his men, a mark for the rifles and musketry of the enemy. His operations in Spain were frequently obstructed by the treachery of the Spaniards, and the servility and corruption of the Spanish civil officials. But, notwithstanding all obstacles, he gloriously triumphed. An eminent review, opposed to the general in politics, thus expressed itself of him:—"No officer in her majesty's army has seen greater variety of service in greater variety of command; nor has any officer served in so many different fields of action." He was not made a major-general until 1846. When he was appointed to the command of a division in the army of the East, the opponents of the war revived the calumnies directed against him eighteen years before! To these he himself replied in a letter to the Duke of Newcastle, the proper officer of the government through whom to make it. It is a model of a chaste vindication of his actions by a great general.

As member for Westminster, General Evans is very useful and popular. He speaks well, but is not an accomplished orator. He is a good citizen and an amiable man, as he is a brave soldier and a great general.

LIEUTENANT-GENERAL HIS ROYAL HIGHNESS THE DUKE OF CAMBRIDGE, EARL OF TIPPERARY, AND BARON CULLODEN, K.G.C.H., AND G.C.M.G.—His grace is well known to be the son of the first Duke of Cambridge, fifth son of George III., who married her Serene Highness Augusta Wilhelmina Louisa, Princess of Hesse. His royal highness was born on the 26th of March, 1819, and succeeded his father as Duke of Cambridge, the 8th of July, 1850. The military history of his grace is soon related. His promotion, from his position to her majesty, is a mere matter of course. His particular department

of the service is the cavalry, although he is a colonel of the Scots' Fusileer Guards, and commanded the first division of infantry (comprising the brigade of Guards) at Varna. He is esteemed a good cavalry officer, and served as Inspector-general of cavalry with acceptability to the service. He has studied his profession minutely, and is a friend to the common soldier, by whom he is regarded with great attachment. He is a good-tempered, brave, and generous officer. His command of the first division of the British army of the East did him honour. When quartered in England and Ireland, he has repeatedly subjected himself to the march, and to other duties of the common soldier, that he might familiarise himself with their difficulties and inconveniences, and make himself practically acquainted with the best mode of redressing their grievances and supplying their wants.

PRINCE NAPOLEON JOSEPH CHARLES BUONAPARTE.—This prince, cousin to the Emperor of the French, commanded the 3rd division of the French army of the East. He is the heir-presumptive of the throne. He is the son of Jerome Buonaparte (brother to Napoleon I.) by his second marriage, which was with the Princess Frederika of Wirtemberg. He was born on the 9th of September, 1822, at Trieste. He had an elder brother, Jerome Napoleon, who is dead. The youth of Prince Napoleon was spent in various countries—Trieste, Vienna, Rome, Florence, Switzerland, and the United States of America. At a later period, he resided for a short time in Brussels. He took no active part in political affairs until the last revolutionary period of 1848. On the recall of the Buonaparte family from their long exile, the prince was elected to the Constituent Assembly, where he became the leader of the extreme republican party. On the assumption by his cousin of the authority and name of Napoleon III., the prince glided gradually into an imperialist, and assumes the rank of a member of a royal house as if he had never professed republicanism. It has been generally thought that his profession of extreme republicanism was a piece of family policy, adopted to blindfold the French public, to prevent the real republican leaders from attaining influence and power, and to play into the hands of his astute cousin, by whom such a trick of policy is supposed to have been devised. A real or pretended rupture between the President of the Republic and the leader of "the Mountain"—the future emperor and future heir-presumptive—was carried out for some time; but afterwards the prince-cousin became evidently a most trusted agent of the emperor, being engaged in affairs of delicate diplomacy and imperial confidence. Upon the Eastern expedition being determined upon, the prince sought and obtained a command, and

was appointed to the third division. He is said to be a good soldier, but not so patient and enduring as is desirable in a commander. His division at Varna was kept in a high state of discipline. His camp there was well described by the pen of a lady, the wife of a British officer, quoted in a previous chapter. She thus writes concerning the prince's quarters, and gives us some glimpses of his habits and the camp opinion concerning him:—"The prince did not mix so generally or cordially, it was said, with his officers, as was habitual with General Canrobert; yet he was always approachable, and had the reputation of being a studious rather than a clever man. He was said to wake soon after midnight, and, lighting a reading-lamp attached to his bed, devote some five hours before he rose to the study of science, particularly chemistry. He is slow in manner, and not remarkable for general intelligence. In appearance, though strikingly like Napoleon I., he is heavy and stolid-looking, his eyes being deficient in the expression so remarkable in those of the great First Consul. The bands of the regiments play alternately during the evening, as the prince is said to be especially fond of music. The 'Administration,' too, regularly practise, and rehearse every morning glees and solos, which they are called upon, in turn, to contribute to the amusement of the prince after his dinner. This practice, of under every circumstance looking for and cultivating external amusement, is peculiarly French; in our camps nothing of the kind was ever heard of." The prince did not mix much with the officers of the British army, any more than with his own; but no charge could be brought against his courtesy when circumstances brought him into their society. He seemed to think a certain dignity and distance necessary to his proximity to the French imperial throne.

MAJOR-GENERAL SIR COLIN CAMPBELL.—The subject of this biographical sketch is the son of a Glasgow tradesman, who married a lady, the descendant of an old line, the Campbells of Ardnaher, in the Isle of Islay. While yet in childhood, Colin lost both his parents, but his education was provided for by two maiden aunts, his mother's sisters, whose Highland pride had been wounded because their sister had married a tradesman, and who rejoiced at the opportunity of bringing up their young *protégé* for a profession. Their means of doing so were scanty; but they were solicitous for their nephew's welfare, and did their duty by him like true women. They infused, however, a large portion of their own Highland pride and spirit into young Colin, who, nothing loth to imbibe it, became all that their hearts desired in this particular. He grew up, how-

ever, a frank, open-hearted, gallant lad, and with an intense passion for the army. In 1808, at the age of eighteen years, young Colin found himself gazetted to an ensigncy in the 6th regiment of foot, and was soon launched forth upon his career of usefulness and glory. Very few officers in the British army have been in half the number of battles in which Sir Colin Campbell has taken part. Even Sir de Lacy Evans, the late Sir Charles Napier, and the great Duke himself, could hardly have gloried in a greater number of conflicts. The first service of the subject of our memoir was in the army of his fellow-citizen, Sir John Moore. In the ill-starred advance, and terrible retreat of that army, Colin Campbell bore his part with honour; and at the battle of Corunna, by which that campaign was closed, and where so many men since famous in their country's service became notable, he too won some glory. He next went out with the Walcheren expedition, and was of course a participator in the sufferings entailed upon our army by an incompetent command, and an ill-chosen enterprise. From 1809 to 1814 he served in the Peninsula, and fought at the battles of Vimiera, Tarragona, Barossa, Malaga, and Osma. He took part also in the gallant defence of Tarifa, under the command of Colonel Gough, now Lord Gough. In 1813, the Duke of Wellington made a general order to receive volunteers for the assault upon San Sebastian; Colin Campbell joined De Lacy Evans and other heroic men in volunteering for that desperate deed. He was amongst the officers who led the attack upon the outworks; he led the "forlorn hope" against the fortress itself—an achievement perhaps as full of peril as any ever undertaken by a British soldier. He received two severe wounds, and earned a promotion which he had merited long before—that of a company. He was present at the splendid battle of Vittoria. In passing the Bidassoa, he was shot through the right thigh. After the Peninsular War he was placed on half pay, but, in 1825, he rose to the rank of major; and then a long period elapsed without promotion, for it was not until seven years later that he was promoted to the rank of lieutenant-colonel. In 1842, he became colonel and aide-de-camp to her majesty. When, in 1848, Lord Gough put himself at the head of the army directed upon the Punjab, the command of a division was given to Colonel Campbell. At the battle of Chillianwallah, in January, 1849, he commanded the infantry on the left of Lord Gough's position. He was wounded there; and his bravery elicited the highest eulogy. At the decisive and beautifully fought battle of Goojerat he commanded the same division, and fought with the same dauntless courage. He commanded the infantry in the

pursuit, under General Gilbert, for fifteen miles, in which he inflicted the heaviest chastisement upon the retreating foe. Her majesty honoured her aide-de-camp with the insignia of a K.C.B. In 1851, Sir Charles Napier solicited the assistance of Sir Colin as a brigadier. He performed many gallant exploits under the eye of Sir Charles, and won from that great general unmixed approbation. Subsequently he held a separate command in the neighbourhood of Peshawur, and had many severe contests, at the head of an inferior force, with the lawless tribes of the passes. Here he had the misfortune to differ in opinion with the political agents of the company; and refusing to command his troops in accordance with their views, he tendered his resignation to the commander-in-chief, and returned home. Upon his return many tokens of public respect were shown to him, and all were merited. Perhaps the most signal exploit in his whole history, previous to his command in the East, was at the battle of Chillianwallah. He there led the 61st regiment in a desperate charge against the enemy, which was the principal means of retrieving the fortunes of a doubtful day. The Duke of Wellington declared that it was one of the most memorable feats of arms ever achieved by the British army. When the British expedition to the East was determined upon, Sir Colin took the command of the Highland Brigade, the second brigade of the first division; how he commanded it in actual war this History will show. Sir Colin, although a lieutenant-general and a K.C.B., has not yet attained to the rank in the army his long and splendid services demand.

LIEUTENANT-GENERAL THE EARL OF LUCAN, *Commander of the British Cavalry.*—George Charles Bingham, eldest son of the second earl by the third daughter of the late Earl of Fauconbridge. He was born in Hanover Square, London, but the family residence is Castlebar, county of Mayo, Ireland, of which county he is *custos rotulorum*. He derives his title from the village of Lucan, in the county of Dublin. He married the seventh daughter of the late Earl of Cardigan. He was elected an Irish representative peer in 1840, and was appointed Lord-Lieutenant of the county of Mayo in 1845. When in his seventeenth year, August, 1816, he was gazetted a cornet in the 17th Lancers. In 1818, he became lieutenant; in four years afterwards, captain; in three years, major; in sixteen months, lieutenant-colonel. In 1841, he became full colonel, and a major-general in 1851. He was appointed to command the British cavalry in the East, with the local rank of lieutenant-general. In 1828, he joined the Russian army on the Pruth in its descent upon Turkey, and served as a volunteer under

General Diebitch: a very singular antecedent for one resisting the same power in another invasion of Turkish territory. He behaved with gallantry in that campaign, and the czar conferred upon him the order of a Knight of St. Anne. He crossed the Balkans with Diebitch, commanding a brigade of cavalry. The noble earl never saw any other active service, but has been always desirous of a distinguished cavalry command, for which honourable ambition it is alleged that he expended £30,000 in purchasing his way up to a lieutenant-colonelcy. Various opinions are entertained of his lordship's competency to command a division of cavalry. General Bacon, an experienced cavalry officer, has arraigned his fitness for any cavalry command whatever. Mr. Russell, the *Times*' correspondent, gives a picture of his proceedings at Varna, which very much accords with General Bacon's views. Yet it is alleged that the late Duke of Wellington had a good opinion of his cavalry acquisitions, and sometimes consulted him. At all events, he was posted to the great command of the cavalry of the Eastern army, and has since afforded much incident for some future pages of this History, which shall be impartially told.

MAJOR-GENERAL THE EARL OF CARDIGAN, *Commander of the Light Brigade of the British Cavalry.*—James Thomas Brudenell, seventh Earl of Cardigan, born on the 16th of October, 1797, did not enter the army until the late age of 27. He was gazetted to a cornetcy in the 8th Royal Irish Hussars on the 6th of May, 1824. He was hardly eight months in the regiment when he was promoted to a lieutenantancy; eighteen months more sufficed to make him a captain. He had none of the dreary waiting and hope deferred for many long years, through battle and bivouac, like Generals Brown, Evans, and Colin Campbell; all went on smoothly with the noble earl. He was rich, and had power—the way to gain promotion in the British army. In 1830 he became major, and a lieutenant-colonel in four months after. In 1837 he succeeded to the earldom. He was born in Northamptonshire, and represented his native county a short time before his accession to the peerage. He commanded the 15th Hussars for some time, but quarrelling with Captain Wathen, a distinguished veteran officer of his regiment, a court-martial was called, which caused his retirement from the command of the regiment. He afterwards obtained the 11th Hussars, then in India, went out and “brought the regiment home,” and by his own munificence made it the best mounted regiment in the service. He was still very unpopular both as a man and an officer, yet he was always a dashing and generous soldier. He became involved in many contests with in-

MAJOR GEN. THE EARL OF CARDIGAN.

GENERAL BESQUET

From a Photograph by R. L. Taylor

dividuals, was severely attacked by the public press, fought some duels, but eventually got clear off all the consequences of these *escapades*, and the public began at last to believe that his lordship was as much sinned against as sinning. His appointment to the command of a brigade of cavalry did not meet with the opposition which many expected. The people expected something dashing from the liberal and spirited earl; and amongst the soldiery he

had a high reputation as a brave, generous, and skilful officer, and a soldier's friend. The reconnaissance conducted by Lord Cardigan in the precincts of the Dobrudscha, already related, gave satisfaction to Lord Raglan; and while the army was at Varna confidence in the brigadier increased at home. How he fared in his future command, under more grave and urgent circumstances, will form an important episode in this History.

CHAPTER XXXII.

THE LEADERS OF THE HOST: CONTINUED.—COMPARATIVE VIEW OF THE CONSTITUTION AND CHARACTER OF THE BRITISH AND FRENCH ARMIES.

"Leaders who furnished no excuse for weakness in the hour of trial."—SIR WILLIAM NAPIER'S *Assault of Badajoz*.

GENERAL BOSQUET.—He is the youngest general sent out by the French emperor with the army of the East, in some respects the most talented; and, taken as a whole, only inferior to Canrobert, if inferiority even to him may with justice be affirmed. When a youth at St. Cyr, Bosquet was distinguished by his close application to study, and the remarkable solidity of his character. Appointed as a cadet, he at once attracted the notice of his superiors, several of whom predicted his future eminence. He served in Africa, and there formed the friendship of Canrobert, which has ever since continued. Two men of so noble and generous a temperament could hardly meet as fellow-soldiers on the field of war and not be friends. Bosquet was noted in the earlier portion of his career for his reserve towards the common soldiery—a habit very rare amongst French officers, who generally allow a familiarity impossible in the other armies of western Europe; yet he was, next to Cavaignac, the warmest republican general in the army of France. In 1848 he joined the insurgents of Paris, and fought in the revolt for the establishment of a republic. The success then achieved by his party soon placed him at the head of a division. At the period of the *coup d'état* he refused all complicity with any of the political proceedings of the Buonapartists. When the president put to the vote of the nation whether he should assume the imperial title and authority, Bosquet and his whole division returned a negative vote. He was placed for that act in retirement by the successful candidate for the suffrages of France. When the war broke out General Canrobert represented to the emperor that there was no better soldier in France than his friend Bosquet, and that; although a republican, he bowed to the national will, and recognised the emperor as the nation's choice. The emperor acknowledged his claim, and nominated him to the command of a division. No division in the French

army, or in either army, was under such perfect discipline as that of Bosquet. At Gallipoli he had charge of the landing of the French troops, and signalised his capacity of organisation there, and while the allies lay encamped in that neighbourhood. He extemporised an admirable commissariat, converting his Zouaves, tractable in his hands, into commissaries. He instituted a post-office for the French army, which was worked with more regularity than that at St. Martin's-le-Grand. The market tariff was his plan; the selection of quarters, the naming of streets at Gallipoli, and the general order that prevailed there in all that concerned the French, were the result of this general's faculty of organisation. At Varna his division suffered less than any other, through his sagacity in selecting a salubrious position, and the sanitary regulations he ordained. In the events upon which we are about to enter, no man bore a larger share of glory than General Bosquet, and no man was more singularly fortunate in all the enterprises which he undertook.

LIEUTENANT-GENERAL THE HONOURABLE SIR GEORGE CATHCART, K.C.B.—The subject of this notice was the fourth son of the first Earl Cathcart. His birth was in the year 1794. At sixteen years of age he was appointed to a cornetcy in the 2nd Life Guards, but in little more than a year exchanged for a lieutenancy in the 6th (Carbineers) Dragoon Guards. He had served about a year in that regiment when his father was sent as British ambassador to the court of St. Petersburg, and he accompanied him as his aide-de-camp and private secretary. He partook of various duties in both these capacities in Russia, Finland, and Sweden; and during the invasion of Russia by Napoleon, young Cathcart attended upon the Russian emperor in various exciting and important scenes, and also carried despatches, at imminent peril of life, from one authority to another, where dispatch and secrecy were required. The courage shown

by Lieutenant Cathcart during all that momentous period was of the highest order, and his intelligence equalled his courage. Crossing rivers—riding a succession of horses which fell exhausted beneath him—pursued by French scouts—obliged to assume disguises—and conducting secret missions of the utmost importance, engaged young Cathcart's whole energies, until the great Napoleon, baffled by British gold and Russia's snows, rather than by the arms of Alexander, was driven back a fugitive to France. Lieutenant Cathcart had a share of the peril of eight pitched battles, and twice as many combats during the campaigns to which we have referred. At times the movements of kings and generals depended upon his celerity and courage in bearing with safety the despatches entrusted to him. Until Napoleon retired to Elba, Lieutenant Cathcart remained in connection with the Russian emperor, and was present with his armies. He thus gained experience in many countries, in secret diplomacy, and in numerous general engagements. At the battle of Lutzen, and during the days previous, and subsequent to that engagement, he spent twenty hours in the saddle. We recollect no instance of a British officer enduring the fatigue and constant service which Lieutenant Cathcart at that juncture endured. The Emperor Alexander frequently expressed both his astonishment and approbation at the toil and fortitude sustained by the British ambassador's aide-de-camp and secretary. At the battle of Bautzen, Lieutenant Cathcart showed prodigious physical strength and activity; he had been ten days without changing his clothes, nor had the saddle been taken from his horse for all that time; yet during the engagement, attached as he was to the Emperor Alexander's staff, great exertions were necessary, which he bore throughout the day with undiminished energy. He ran great risks during the conflict. In the grand charge made by the French general, Macdonald, he was nearly captured; and in the retreat the French skirmishers had many a shot at him—his duty and his daring bringing him frequently within range of the *tirailleurs*.

At the battle of Dresden, he was in actual communication with one of the staff of the Austrian general, Mesko, when that general and his corps had to surrender; Cathcart escaped through showers of musket balls, grape, and canister. When Moreau fell, Cathcart was present, and assisted the wounded general, bearing him on his arms for some moments. At the close of the war, Lord Cathcart was created an earl; but his son, whose services were so brilliant and useful, was not promoted. Two reasons were assigned for that—the rank bestowed upon the head of his family, and the fact that he had not served with the British

army, but rather in a civil capacity with the British ambassador,—his staff services with the Emperor Alexander being in the light of a volunteer. When Napoleon returned from Elba, George Cathcart was again called into active service; he was placed on the staff of Wellington, and fought at Quatre Bras and Waterloo, and served with the British army in its march upon Paris and occupation of France. For the reasons above assigned he received no promotion. After the British army left France, he received a company in a West India regiment. At the close of 1819, he obtained a troop in the 7th Hussars. This gallant officer never was a favourite with the dispensers of patronage. He remained six years captain in the 7th Hussars before he attained to a majority, but in a month after he gained the great step of lieutenant-colonel, and went on half-pay. He served with the 1st Royal Dragoon Guards in Canada, in 1838; it was not until the end of the year 1841, that he attained the rank of full colonel. In February, 1846, he received an appointment of some emolument, being made deputy lieutenant of the Tower of London. In 1851, he succeeded in gaining the rank of major-general.

The disastrous colonial policy of Earl Grey involved our colonies generally in discontent, and the Cape of Good Hope in rebellion. Sir Harry Smith, a gallant and most able officer, had been unable to quell the rebellion of the Caffre tribes, from the inadequate means which the combined mismanagement of the Colonial Office and the Horse Guards left at his disposal. The government of the day treated Sir Harry Smith in the same disgraceful way they had treated the good and great Lord Gough—they sent out an officer to replace him; thereby making the implication that failure resulted from the general's incapacity, when it really resulted from their own. Major-general Cathcart was dispatched to the Cape, additional means were placed at his disposal, and he accomplished his task with distinguished success. His appointment was due to the recommendation of the Duke of Wellington, which fact alone silenced the outcry raised against him by men who had never rendered their country any very distinguished services. The late Marquis of Londonderry was the leader in the discreditable attack then made upon the experience and capacity of General Cathcart; although that nobleman, being a general officer, and well acquainted with the facts of the allied campaign from 1811 to 1814, had means of knowing that the Honourable George Cathcart merited his eulogy instead of his censure. He was as skilful in peace as brave and energetic in war; and his diplomatic experience, and the knowledge of men and of human nature acquired then, aided him in dealing with Caffres.

and colonists at the Cape. The government of Lord Derby was more prompt to acknowledge the merits of the conqueror of the Caffres than previous governments were to acknowledge his other services; he was made a Knight Companion of the Bath. While at the Cape he obtained the strange appointment, for an absent general, of Adjutant-general to the forces. He came home from the Cape just in time to receive the command of a division for the East. He had only opportunity to see the Queen and depart; and he appeared in the same tarnished uniform in the camp of the allies, which he had worn when dictating peace in the camp of the Caffres. His services in that army, and his sorrowful but glorious death, will form part of the narrative of coming chapters.

THE HONOURABLE BRIGADIER-GENERAL SCARLETT.—To this officer was assigned the command of the heavy cavalry brigade, as already mentioned in a previous chapter. This distinguished cavalry officer is the second son of the late Lord Abinger, who was so notorious as a lawyer and a judge. Mr. Scarlett was born in the last year of the last century, received his school education at Eton, and his university education at Cambridge. In the year 1818, his commission as cornet in the 18th Hussars was conferred upon him. No regiment in the service had more distinguished itself in the war with France; and at Waterloo, in the brigade of Sir Hussey Vivian, towards the close of the day, its conduct was very brilliant, capturing in the final charge many of the enemy's guns. It was such a regiment as the dashing spirit of young Scarlett would have chosen; and he was likely, in "Lord Drogheda's Horse," as the regiment was originally called, and under which designation it won its chief honours, to become a well-disciplined and efficient officer of cavalry. In consequence of some disturbance between the 18th Hussars and the 3rd Light Dragoons, when both regiments were quartered in Dublin, the former was disbanded and the latter sent to India "out of its turn." Mr. Scarlett was consequently placed on half-pay, but he very soon obtained an unattached lieutenancy in the 9th Lancers, and in December, 1822, exchanged into the 6th Dragoon Guards (Carbineers). His preference for the heavy cavalry was very decided. In June, 1825, he obtained a troop unattached, but exchanged back in about six weeks, having a passion for active service. While commanding a troop in the Carbineers he was noticed by the authorities at the Horse Guards for the efficient state in which he maintained both men and horses, and in 1830 obtained a majority, unattached. In about five months he exchanged into the 5th Dragoon Guards, commonly called "The Green Horse." The com-

mand of this regiment, as its lieutenant-colonel, devolved upon him in 1840; and in 1851 he became full colonel of the same regiment. The late Duke of Wellington repeatedly expressed his approbation of the state of Colonel Scarlett's regiment, and it was reported that the Duke honoured it so far as to declare that no other heavy cavalry regiment in the British army was equally efficient. When the expedition to the East was resolved upon, the Honourable Colonel Scarlett was requested to take command of a brigade. His regiment was then stationed in Ireland, and when called out for inspection it was numerically weak, sickness having for some time prevailed among both men and horses. This circumstance was remarkable, as the same thing occurred when the regiment was ordered to join the forces in Belgium, previous to the battle of Waterloo. At that time the corps was deprived of the honour of the campaign, but in 1854 so many men from other regiments volunteered into the 5th, in consequence of the reputation of the colonel, that the regiment soon mustered the proper strength, and joined the expedition. Brigadier Scarlett showed a noble generosity to the families of the men who thus volunteered, distributing a large sum of money among them; the sick men of his own corps, and the families of the married soldiers fit for service, received similar tokens of kindness. At Varna no cavalry regiment suffered so much as the 5th Dragoon Guards; and when the expedition to the Crimea was determined upon, the regiment, from sickness, was in an unfit state to proceed—thus a third time, on the eve of a great campaign, being pronounced unserviceable from the same cause. General Scarlett, however, brought the relics of his fine corps with him to the Crimea, where they proved their discipline and valour, as might have been expected, trained under so skilful and gallant a leader. The services rendered by General Scarlett to his country in the cavalry conflicts of the Crimea, will constitute a part of this History in an appropriate place.

BRIGADIER-GENERAL PENNEFATHER, C.B.—Brigadier John Lysaght Pennefather was born in the county of Tipperary, in Ireland, in the year 1800, and is the son of a clergyman of the Established Church. In 1818, he was gazetted to an ensigncy. He became a lieutenant, 1823; obtained a company, 1825; and a majority, 1831. In 1839, he was promoted to the rank of lieutenant-colonel; and in seven years afterwards attained to a full colonelcy.

The principal services of General Pennefather, previous to the present war, were in India. He served there against the Ameers, as a brigadier, under the late Sir Charles Napier. At the terrible battle of Meannee, he acted as

quartermaster-general, commander of the infantry, and second in command in the little army under the orders of Sir Charles. No battle in the wars of India conferred more honour upon British skill and valour than that of Meannee. Brigadier Pennefather was shot through the body, but retained his saddle, and continued to direct the troops until the conflict terminated in victory. For his services he received the thanks of parliament, was promoted one step, and was made a C.B. and an extra aide-de-camp to the queen. Sir Charles, in a speech in London, acknowledged that to his second in command he owed the victory. General Evans had great confidence in the military capacity of General Pennefather, and was particularly solicitous to have him as one of the brigadiers of his division. Subsequent events justified this confidence.

BRIGADIER-GENERAL TORRENS.—Arthur Wellesley Torrens was the second son of Major-general Sir Henry Torrens, K.C.B., Adjutant-general to the forces. He was born on the 18th of August, 1809. The prince-regent made him his page of honour when he was only ten years of age. After remaining some time in that capacity, he was entered at the Military College, Sandhurst, where he passed through a series of examinations with much *éclat*. His commission followed as a matter of course; and he had the good fortune to obtain it in the Guards, in the year 1825. He was lieutenant and adjutant of his battalion from 1829 until, in 1838, a brigade of Guards was ordered to Canada, to which he was appointed brigade-major, although beneath the rank from which majors of brigade are generally selected. During the Canadian insurrection of 1838-9, his services were most efficient, and drew the attention upon him of Lieutenant-general Sir John Colburn, the commander-in-chief. His services upon the staff of the army in Canada were very various, and very honourable to himself and his country; yet he obtained no promotion, for, in 1840, it was by purchase that he gained the step of captain. The year following he was appointed to the command of the 23rd foot (Royal Welsh Fusileers). From that time until the breaking out of the present war his services were principally in the West Indies, where he repeatedly acted with great judgment and sagacity in a civil as well as military capacity. He was offered the lieutenant-governorship of St. Lucia in 1847; but his partiality for the profession of arms led him to decline the honour and emolument of such a post, and to remain in the command of his regiment. In 1851, he became colonel by brevet; January, 1853, he received the appointment of assistant quartermaster-general; and, at Chobham camp, in that capacity, had

again the honour of marked notice from Lord Colburn. General Evans and other senior officers also acknowledged his skill upon that occasion. He was appointed a brigadier in the division of General Cathcart, and joined his brigade at Varna.

COLONEL STRANGWAYS, Commander of the British Artillery.—Thomas Fox Strangways was born on the 28th of December, 1790. His father was the Hon. and Rev. Charles Redlynch Fox Strangways, son of the first Earl of Chester. Mr. Strangways entered the Royal Artillery, as second lieutenant, in 1806. He was a youth of much promise, and, after his appointment to a lieutenancy, pursued with zeal the study of gunnery, and also of fortifications. Within a few years after entering the service he became known throughout the artillery as an officer of scientific attainments, and thorough ardour in his profession. In 1812, he was attached to the Rocket Brigade, under Major Bogue, which was sent out to join the army of the Crown Prince of Sweden, acting against Napoleon. The sensation caused by the British Rocket Brigade will be familiar to all our readers, acquainted however slightly with the events in Germany at that period. Allies and enemies were surprised by the effects produced, especially at the battle of Leipzig. Major Bogue fell early in that action, and the command devolved upon Mr. Strangways, whose conduct of the brigade gained for him the notice of the allied sovereigns and generals, and decorations from the former. From his own government he received no reward. Mr. Strangways was engaged most usefully and actively throughout the great continental contest until Napoleon abdicated. He returned home, but received no promotion. In 1815, he joined the army of the Duke of Wellington, and fought at Waterloo, where he directed a gun with great effect upon the French throughout the hottest of the battle. Wounded by a musket-ball in the hip and back, he fell by his gun, and was borne, against his own remonstrances, to the rear. Eventually carried to Brussels, he languished for months, his death expected by himself, and predicted by the surgeons who attended him. At last his constitution rallied, and he was enabled again to do duty. The brevet which followed the battle of Waterloo conferred upon him a step. It was not until 1826, however, that he attained the rank of captain, after twenty years service, and having distinguished himself in the field many times by rare heroism, and superior military knowledge; and, after having received the thanks and eulogies of foreign generals, and the decorations of foreign sovereigns, fifteen years longer did this distinguished officer re-

main without another step, when he was included in the list of majors by a brevet. In five years he attained the rank of lieutenant-colonel, in which grade he had remained eight years when the war in the East rendered his active employment necessary; and he went out in charge of the Horse Artillery, and second in command of the artillery of the army, under Brigadier-general Cater. Shortly before the embarkation at Varna, General Cater was invalided, and the command devolved upon Lieutenant-colonel Strangways. While on board the ship which bore him to the Crimea, he received his appointment as brigadier, after nearly half a century's service to his country in peace and war.

BRIGADIER-GENERAL ADAMS, C.B.—This accomplished officer commanded the second brigade of General Evans's division in the expeditionary army. He was born early in the year 1805, and was eldest son of Cadwallader Adams, Esq., of Anstey Hall, Warwickshire, at whose death he succeeded to the family estates. At the age of seventeen he entered the army, and rapidly made his way, by purchase, to the command of a regiment. The 18th (Royal Irish) regiment of infantry was commanded by him in the Chinese war, and under his orders that corps, which had seen less warlike service than almost any regiment in the line, became very distinguished. When peace with China was negotiated by Sir Henry Pottinger, Lieutenant-colonel Adams exchanged into the 49th, which was ordered home. Immediately upon his arrival in England he married his cousin, Miss Catherine Adams, daughter of the well-known Vicar of Anstey. On the breaking out of the war, Colonel Adams was selected as a dashing and spirited officer, who had proved his ability to command, and appointed to a brigade with the approval of General Evans, and the confidence of his brother officers. Brigadier Adams was a great favourite with the men of his brigade, and of the second division generally.

BRIGADIER-GENERAL EYRE.—On the 17th of April, 1823, this officer entered the 6th regiment of infantry as ensign, and had only served a year and a half when he attained the step of lieutenant. Another year and a half advanced him to the rank of captain, unattached. Within two years he exchanged to the 73rd Highlanders, in which regiment he commanded a company for ten years, after which he was promoted to a majority. Eight years service as major obtained for him the command of the regiment. The comparatively brief space of six years was passed by him as lieutenant-colonel, when he attained to the rank of full colonel. In February, 1854, he received his

command of a brigade in the army of the East. During the Caffre war, both under Sir Harry Smith and the Hon. General Cathcart, the subject of this brief sketch served his country with such gallantry that his sovereign honoured him with the distinction of a C.B. He had then given earnest of the success which, as a leader of the British army in the Crimea, he so signally achieved.

BRIGADIER-GENERAL GOLDIE.—Brigadier Thomas Leigh Goldie was a native of the Isle of Man. He was the grandson of a distinguished general, and many of his name and kin served their country in the wars. The 66th regiment had the honour of opening to him a career of military renown; he entered that regiment as an ensign in 1825. After the very short service of six months in the lowest grade of rank for an officer, he received the step of lieutenant. In less than three years he was made captain, not from any particular services rendered by him, but because he had money and interest. He indeed merited promotion for his talent and assiduity, but other officers more distinguished had to wait twenty years for the rank he obtained in three,—although, during such long period of years, receiving wounds and hardships, and securing great advantages for their country. In ten years he became major, and in less than two years more obtained by brevet the rank of lieutenant-colonel. During the period of his promotion from captain to lieutenant-colonel, he gave great attention to the study of military science, and published several works on the subject, which aided his reputation. He served a short time in the Punjaub, under Lord Gough, and was regarded as the most skilful infantry officer of his rank in the army. He was one of General Cathcart's brigadiers in the army of the Crimea, but at Varna served under General Brown in the light division.

BRIGADIER-GENERAL TYLDEN.—William Burton Tylden was a native of the county of Kent, where his ancestors for many centuries have held estates: he was brother to Major-general Sir John Maxwell Tylden, of Milsted Manor, in that county. His maternal grandfather was also a distinguished general, Sir Samuel Achmuty, G.C.B. The subject of this sketch was born in 1790, and, at the age of sixteen, entered the engineer department of the army as second lieutenant. In six months he succeeded in attaining the step of first lieutenant. During that brief period he attracted notice by his conduct while in garrison at Gibraltar, and was engaged on important services in Sicily. After spending five years in the grade of first lieutenant, he was promoted to a captaincy. Captain Tylden was the commanding engineer

at the capture of Fort Santa Maria, in 1814, and also in the battle of Genoa, under Lord William Bentinck; for his services in the latter action he was promoted to the rank of major, by the especial interposition of his lordship. In the Belgian campaign of 1815, he commanded the pontoon train; and in that service, and on the march to Paris, he merited and obtained the commendations of his great chief, the Duke of Wellington. Upon the establishment of peace, Major Tylden retired from active service, and gained no step until so late as 1837, when he was promoted to a lieutenant-colonelcy; it was not until 1850 that he obtained the rank of full colonel. On the 21st of February, 1854, he was nominated a brigadier-general. He was one of the first officers who landed in the East, having preceded the expedition, and visited Gallipoli and Constantinople "on special service," to arrange preliminaries for the occupation of those places by the allied armies. Sir John Burgoyne, Brigadier Tylden's superior officer in the engineering department, and also the commander-in-chief of the army at Varna, entertained the highest respect for his genius and character, and he subsequently proved himself to be one of the most useful officers in the Crimean army.

COLONEL WILLIAMS, C.B.—Although this hero did not accompany the troops from Varna to the Crimea, he was attached to the eastern armies, and was one of the most useful and brilliant of our officers; it is but suitable, therefore, that a brief memoir of him should have a place in this chapter. William Fenwick Williams is an officer of artillery, to which arm of the service he was appointed July 14, 1825. After a service of little more than two years he became first lieutenant; and in three years afterwards was again promoted to the rank of captain. In 1840, Captain Williams was sent to Turkey as British commissioner, and remained there until 1843. In 1847, he took part in the treaty of Erzeroum, and rendered great assistance to the Turkish and Persian plenipotentiaries. By the judgment and temper which he displayed in the conferences, he contributed decisively to the adjustment of the pending difficulties. The next year he was again employed on a matter of delicacy connected with eastern affairs. He was then lieutenant-colonel, having been rewarded for his services in his first delegation by the rank of major, and for his usefulness in the treaty of Erzeroum by the brevet of lieutenant-colonel. In 1848, he adjusted the Turko-Persian boundary, and gave such satisfaction to his government, that he was nominated a Companion of the Bath. Soon after England declared war against Russia, Lieutenant-colonel Williams was a fourth time sent

to the East, was permitted to assume the local rank of full colonel, and appointed her majesty's commissioner with the Turkish army. He visited Bulgaria and the line of the Danube, facilitated at Constantinople the military business of the allies, and rendered invaluable services by his counsels in Asia Minor. As the struggle assumed wider proportions and a more determined character, the talents of Colonel Williams became more conspicuous; until at last, as future pages of this History will show, he became one of the most prominent actors on the eastern theatre of war.

THE HONOURABLE LIEUTENANT-COLONEL PAKENHAM, *Assistant Quartermaster-general*.—The Hon. William Lygon Pakenham, heir-presumptive of the Earldom of Longford, in Ireland, was born in 1819, at Pakenham Hall, Westmeath, one of the family residences in that county. He entered the army in his eighteenth year, as an ensign in the 52nd light infantry regiment of the line. Twelve months afterwards he became lieutenant by purchase in the 7th Royal Fusiliers. After serving six years as lieutenant in that regiment, his promotion to a captaincy followed. He commanded a company in the same corps for eight years, and then attained to an unattached majority. When the war broke out he was advanced to the rank of lieutenant-colonel, unattached, and was appointed to the staff as assistant quartermaster-general. His subsequent career was brilliant, and he finally attained to the important post of adjutant-general of the army of the Crimea. His usefulness as assistant quartermaster-general was very great, and attracted the notice of the heads of the army. In this capacity he was especially efficient in the embarkation of the troops at Varna, and their debarkation in the Crimea. He was made a Companion of the Bath for his services.

LIEUTENANT-COLONEL PAKENHAM, M.P.—Lieutenant-colonel Pakenham was the eldest son of Lieutenant-general the Hon. Sir H. Pakenham, K.C.B., and first cousin to the gallant officer of whom the previous brief notice is given. He represented the county of Antrim in parliament at the period when the expedition went out from England. His address to his constituents on that occasion produced a great sensation among them, by its manly and gallant tone. He seemed to have a presage of his early fall, which occurred on the bloody day of Inkerman, to the victory at which his valour and ability much contributed. He entered the Grenadier Guards as ensign and lieutenant in the beginning of the year 1838. After five years' service, he became captain by purchase; he was recognised even then as an officer of great

ability in handling infantry. His command of a company in the Guards continued for eleven years, during which his military spirit and attention to duty gave sure earnest of the distinction he was capable of earning in actual war. When the regiment was ordered to the East, he was promoted to the rank of lieutenant-colonel. By the staff of his division he was generally consulted; and his efforts to keep his men fit for duty, by a high state of discipline, were as much to be commended as the chivalrous valour with which he led them to victory. Such men justify the motto selected for this chapter, in application to the chiefs of the army which left Varna for the Crimean peninsula.

BRIGADIER-GENERAL ROSE.—Hugh Rose, Esq., joined the army as ensign in the 93rd Highland regiment of infantry, in June, 1820. In little more than a year he exchanged into the 19th infantry regiment, becoming lieutenant by purchase, and was in the same month placed on half-pay. He exchanged back soon afterwards, and was for three years lieutenant in the regiment, when he obtained a company. Little more than two years a captain, he became major, unattached, and remained in retirement for three years, when he exchanged into the 92nd Highlanders; he continued as a field officer of that regiment for more than ten years, conducting by his vigilance and example to its high state of discipline. In 1840, he was appointed consul-general in Syria, with the local rank of colonel. In this capacity he gained great experience in Turkish affairs, and during the absence of Lord Stratford de Redcliffe from Constantinople, in 1853, Colonel Rose vigilantly watched the intrigues of Russia, forwarding to his government important intelligence, and offering such advice as only a man of profound acquaintance with Turkish politics, character, and affairs, could offer. His intelligence was slighted, and his advice disregarded, by Lord Aberdeen's government. Had Admiral Dundas, when in command of the Mediterranean fleet, entered the Dardanelles at the suggestion of Colonel Rose, Prince Menschikoff's mission to the Porte would probably have assumed a different aspect. The indecision of the sultan and his government, in the first instance, gave encouragement to the Russian envoy to make demands from which he could not afterwards recede without compromising the dignity of his sovereign and of his country. The presence of Admiral Dundas would have inspired the Porte with courage to resist from the first the haughty insolence of the czar's plenipotentiary. The counsels of Colonel Rose were all proved to be sound during the course of subsequent events, but neither admirals nor ministers paid atten-

tion to them. When war was proclaimed, the honourable post of queen's commissioner at the head-quarters of the French army was assigned to Colonel Rose, and the temporary rank of brigadier-general conferred upon him; subsequently he attained to higher honours, military and civil.

COLONEL SEYMOUR, *Adjutant-general of the Fourth Division.*—Charles Francis Seymour was the son of a gallant sire, and his grandfather was also a hero—few families more heroic and patriotic than that from which he sprung. The subject of this notice entered the Fusileer Guards as ensign and lieutenant in 1834, and took the command of a company in June, 1837. At the outbreak of the Caffre war, in 1846, the governor and commander of the Cape, Lieutenant-general Sir George Berkely, appointed Captain Seymour his principal aide-de-camp. He continued to serve in that post until the war terminated; he returned home, and was promoted to the rank of lieutenant-colonel in his own regiment. When Sir George Cathcart assumed the command of the forces at the Cape, during the next Caffre war, Lieutenant-colonel Seymour accompanied him (in 1852) as his military secretary, in which capacity he served with the greatest satisfaction to his chief. In 1854, when Sir George retired from the Cape colony, Lieutenant-colonel Seymour returned with him; and like his leader, to whom he was most affectionately attached, he tarried not to consult convenience or domestic advantage, but hurried to Varna just in time to join the fourth division as it embarked for the common destination. As adjutant-general of the division, great responsibility devolved upon Lieutenant-colonel Seymour, to which he proved himself equal. There was no man in the division, whatever his rank, upon whom General Cathcart more relied. On the fiercely-contested declivities of Inkerman he fell, pierced with Russian bayonets, over the body of his friend Sir George Cathcart, to defend whose life he in the most chivalrous manner sacrificed his own. Both were leaders "who furnished no excuse for weakness in the hour of trial."

With the notices above given we close these narratives. There were a few other officers in positions of prominence, and many who subsequently attained eminence, in the hosts that left Varna, but it is necessary to reserve our notice of them to other pages. For example, General Sir William Codrington assumed in 1855 the command of the British army before Sebastopol; but in September, 1854, at Varna, he had no other relation to the expeditionary army there than that of a volunteer, although holding in the general army the rank of colonel.

Under such circumstances, a sketch of his services and history is properly postponed.

It would be unfair, however, to pass from this chapter without some sketch of the professional history of one man from the sister service, to whom the expedition owed much of its order, safety, and success.

REAR-ADMIRAL SIR EDMUND LYONS, BAET., G.C.B., K.C.H.—Sir Edmund Lyons was born in the year 1790, and is the second surviving son of the late John Lyons, Esq., of Antigua, and of St. Austen's House, Lymington, Hants.

In 1801, he entered the navy as a first-class volunteer, and it is a curious circumstance that his first service was on board the Mediterranean fleet—a division of the British navy which in ripper years he was destined to command. His first exploit of war, it is also remarkable, was at the Dardanelles, where, as a midshipman in the squadron of Sir John Duckworth's expedition, he had an humble share in demolishing the redoubt on Point Pesquies. In 1807, while still a midshipman, he sailed for the East India station, where he served under Captain Hart, and Admiral O'Brien Drury, to the former officer he was acting lieutenant. In 1809, he was appointed lieutenant of the *Baracoutta* brig, in which vessel he also served as acting lieutenant some time before receiving his commission. In August, 1810, at the capture of the island of Banda Neira, it was necessary to escalade the walls of the Castle of Belgrea, and Mr. Lyons was amongst the first who attempted this feat. When the *Baracoutta* brought intelligence of this success to Madras, Admiral Drury made Mr. Lyons his flag lieutenant. In 1811, an expedition was fitted out in India for the subjugation of the island of Java; and Mr. Lyons proceeded there in the ship commanded by Captain Hoare, to await the arrival of the forces to which the conquest was to be committed. During this period he performed an achievement of a daring character. He attempted, at the head of thirty-five men, to surprise and storm the fortress of Marock, mounting fifty-four guns, garrisoned by 180 soldiers, and defended by two gun-boats. The hazardous attempt was crowned with success. When the expedition arrived from India, he was entrusted with the command of a flotilla of gun-boats which had been captured; and afterwards served on shore in certain batteries which were opened against Fort Cornelis. In all these services he exhibited a dauntless intrepidity, untiring activity, and intense professional enthusiasm. His health failing under the fatigue of his extraordinary exertions, he was invalided, and returned home. The promotion of Captain awaited his arrival. When his health was restored, he took the command of the *Rinaldo*, in which he escorted Louis XVIII.

and the allied sovereigns to England. Soon afterwards he was posted, but remained unemployed for fourteen years, until 1828, when he was again entrusted with the command of a ship which was appointed for service in the Mediterranean. He subsequently blockaded the port of Navarino, and then directed the naval part of an expedition in which the French, as our allies, directed a military force against Morea Castle—the only remaining place of strength then held by the Turks in the Peloponnesus. He not only performed his part on his own element, but, landing, he served in the trenches, and exposed his person most heroically. Our allies, both French and Greeks, decorated the gallant post-captain with orders of distinction. In 1829, in command of the *Blonde*, he conveyed to Constantinople Sir Robert Gordon, the British ambassador to the Porte. Shortly after, Captain Lyons took that ship into the Black Sea, the first British man-of-war that ever entered it. His services in the Mediterranean for several years gave him opportunity of becoming well acquainted with the manners, customs, and institutions of the nations on its shores. From the Straits of Gibraltar to the Tauric Bosphorus, he knew seas and shores intimately, and was therefore enabled to render the greater services to his country in the present war. In 1835, when leaving the *Madagascar*, the last ship he had commanded previous to that date, he was knighted; previously he had been made a Knight Commander of the Order of the Redeemer, by the newly-established Greek government; and the insignia of the Order of St. Louis was accorded to him by the King of the French. In 1835, he was nominated a Knight Commander of the Royal Hanoverian Guelphic Order. In 1850, he was promoted to the rank of Rear-admiral; and in 1854, at Beicós Bay, was second in command of the splendid fleet which was destined to bear the armies of his country to the perils and victories which opened upon their first campaign on the territory of the foe.

Having presented to our readers the foregoing historical portraits of the leaders of the host, this chapter may be appropriately closed by a comparative view of the two armies, British and French, of which the expedition to the Crimea was composed.

No two armies belonging to civilised nations could be more diverse in constitution and character. The classes from which the armies are taken differ much. The English soldiery are from a lower grade of the people. Few men enlist in the British army from military taste, who are of steady habits, and possess any tolerable prospects in life. This arises from several causes—one is the wretched pay; thirteen pence a-day is not likely to induce any

REAR ADMIRAL SIR EDMUND LYONS, BART G.C.B. &c.

From a Photograph sent early by Mr. Wm. H. W.

young man of sober and industrious habits, even as a servant, or town-labourer, to take up the life of a soldier. The recruit is told that he will have clothes, but these are actually paid for by "stoppages" from his thirteen pence; while he is cheated out of a portion of the money thus taken by receiving worse articles than he bargains for, and articles inferior to those which the country assigns to him. Mr. Robertson Gladstone, of Liverpool, has estimated—and based his estimates upon incontrovertible facts—that the clothes supplied to the army are £75,000 a-year worse in value than the country pays for. The author of the *Camp and Barrack-room* states that the recruits and young soldiers are subjected to impositions by the subaltern officers at Chatham. According to this authority, among other treacherous and fraudulent charges by which the poor soldier is robbed, he is made liable to a deduction from his pay for injured firelocks; the practice being to put into his hands stocks already damaged, and which must suffer more in further use, then to charge the young soldier for *all* the damage which the stock may exhibit. This author asserts, from his own experience, that having been four days in barracks at Chatham, each man was charged four pence for barrack damages. In this way, the sergeant affirms, so much as £300 per year is plundered from the men in Chatham alone. The British soldier is, on every pretence, mulcted of his pay. The country allows him too little, and that little he really never receives; robbery in various forms being practised upon him, of which the authorities are cognisant, and by which some classes of his superiors profit. Another cause of the unwillingness of the more educated and steady among the humbler classes to enlist, proceeds from the contempt with which the private soldier is treated. The meanest lance corporal must not be seen in company with a private soldier after he ceases to be a recruit. He must approach his officer as a Russian serf will approach the "Owner of souls." Even the most respectable non-commissioned officers must maintain a deference to the commissioned officers in the lowest ranks, as if they were beings of another order. It is not simply for the sake of discipline that a certain official dignity is maintained—but there is a haughty contempt among the gentlemen of the army for the common soldiers, which, in proportion as the latter have education, intellect, and spirit, must be galling. The hopelessness of promotion is a third cause of the reluctance of the better classes of the poor to enter the service. Very seldom does the non-commissioned officer obtain a commission. Recent regulations somewhat mitigate this fact, but even now it is sternly true. Men superior in *birth, education, military talent, and personal daring*, to any of the officers of their

corps have fought and bled, and frequently rendered the most signal services to their country, in the British army, without any promotion, and scarcely any notice. The late Duke of Wellington and the late Lord Raglan were conspicuous for their neglect of the brave but humble non-commissioned officers and soldiery. Sir Charles Napier, Lord Gough, and Sir De Lacy Evans used every effort to remove this ban from the humbly born, but were obstructed by the whole force of officialism at home and abroad. Never was an army composed so extensively of heroes as the British; never were men so superciliously treated.

Another cause of the unwillingness to enlist, is the general conviction that there is very little concern for the life of the poor soldier on the part of his superiors, except upon the field. The present war has tended to give to this impression greater intensity. When the colonels of regiments had the clothing of them, and pocketed large sums of money by the process, there was more ground for this feeling. In fact, horrible as the thing must appear to every Englishman out of the army, there was a direct interest on the part of the colonel in the neglect of the soldier when exposed to privation, sickness, and wounds. The Liverpool Financial Reform Association makes this statement:—"When a regiment goes abroad, becomes sickly, and is thinned by death, the clothing colonel to whom it belongs, and who remains at home, receives the money not required for sick or dead men as his own emolument." Whatever be the honour or even benevolence of our general officers, who are (or used to be before the late regulations) clothing colonels, such a system afforded a temptation that ought not to be placed in the way of any man.

When the recruit goes before the doctor to be examined, he is stripped in a cold room, and often treated with a contempt which has rankled in the hearts of some men ever after, causing desertion or insubordination. Often, when chilled with cold, leaving such examinations, the sergeant recommends the gin bottle as a remedy to the shivering novice, that he may himself get drunk out of the bounty-money. For this bounty many a recruit has enlisted, in the hope of having the sum to send to a poor mother, perhaps a widow; "to enable her to deal in a little something in her old days," as we once heard a simple and warm-hearted poor fellow say, who was plundered of nearly all his bounty to provide a "kit," which he supposed the country would provide for him, and to supply with drink the recruiting sergeants, who, when his money was spent, would hardly recognise him.

The flogging system deters recruits more than even bad pay, bad usage, and no promotion. Never was brutality anywhere more

degrading—unless indeed where the knout is used in Russia, or the cowhide with the American negro—than that inflicted upon the British soldiery. Many have died beneath the lash; very many have died of their subsequent suffering; perhaps a still greater number of the secondary consequences; for it is notorious that the organs of the chest, and the nervous system, according to the constitution of the sufferer, are generally injured by this inhuman treatment. The lash can never make a bad man a good soldier. It may inspire fear—it more frequently inspires recklessness; it may deter from certain offences—it more generally hardens the men who witness it, deprives of all self-respect the man who undergoes it, and familiarises the officers with uncompassionating tyranny.

To all these obstacles to his hopes, happiness, and honour, the poor man, who has a military taste and a good education, must add the conviction that even if he be promoted to a commission, his family, if he have one, will be treated with disdain by his brother officers. Never were the humble classes of this country, and the non-commissioned officers of the army, treated so contumaciously, in this particular, as by Mr. Sidney Herbert. In his place on the ministerial benches in the House of Commons, with that sneer which was always so ready upon his countenance when any popular interest or liberal measure was pleaded, he opposed the promotion of non-commissioned officers, by drawing a picture of gentlemen sergeants, whose wives had turned a penny by washing. Seldom has a more perilous sneer been uttered in the Commons, whether we view it as an insult to the rank and file of the army, or to the great numbers of civilians, not a few of them in parliament, who by humble industry and ability raised themselves from the humblest classes of the population. It can excite no surprise that men of feeling and spirit, who are poor, will not consent to serve in an army officered after the taste of Sidney Herbert, the late evil genius of the War-office, when it becomes necessary to arm the country against a gigantic foe.

From all the disadvantages above described, the French soldier is exempt. Although his pay is smaller than that of the English soldier, it is liable to no arbitrary deductions; and as in time of peace he is nearly always garrisoned in France or Algeria, his pay goes farther than the same amount with the English soldier. His habits too are more sober, which enables him to live with more economy. His kit is provided for him by government, and with admirable regularity and care. Flogging is never resorted to as a punishment. Mutiny would pervade the whole French army if one of those disgraceful scenes were to occur which

are so common in British regiments. Disgrace before his fellow-soldiers generally deters the Frenchman from crime; if he desert, his punishment is signal and terrible. Every educated French soldier looks forward to promotion; and if he do not secure that, he knows that after a fair term of service he will have a pension adequate to his support. The practice of discharging old soldiers a year or so before entitled to their discharge *with a pension*, so fraudulent and so common in the English army, is unknown in the French. The rule of promotion in the French army is perhaps too favourable on the whole to the inferior, or as we would call them, “non-commissioned officers.” For every cadet appointed from the military schools, two of the higher grade of sergeants are nominated; purchase is unknown. Thus the French soldiers have every incentive to duty; while ours, “under the cold shade of the aristocracy,” perform prodigies of valour, and perhaps perish unnamed, or live unrequited by the country their valour saves.

The mode of procuring soldiers in France is the conscription. Strange as the statement may appear to many who peruse these pages, the French are of a less military spirit than the British. In proportion to the population, more Englishmen voluntarily enlist than Frenchmen. Substitutes for conscripts cannot be procured at present in France under a sum of £160. Fond as the people are of military glory, and of military parade, its hardships and dangers are not so palatable as at a distance is supposed. The humble French are fond of their relatives and their homes, and are unwilling to leave them to flaunt the tricolour or in the hope of the epaulette. Even in the Polytechnic, the great majority of the pupils seek to avoid the military profession, and to enter upon the civil service to which the school introduces them.

If the English soldier were treated with the justice and liberality of the French soldier, our ranks could be manned to any extent that the severest war might require. The French will all fly to arms as national guards, to protect their cottages and little gardens; but they are not so willing as the youth of Britain to volunteer upon dangerous expeditions to foreign lands. There are no people in Europe more willing to serve their country in arms than the British, and none so willing if we except the Swiss and Hungarians. It is doubtful whether even the men of these nations would be found so ready to volunteer upon adventurous enterprises. The representations of the public spirit and patriotism of the British youth, made by Admiral Sir Charles Napier, in a speech upon the hustings of Southwark, are borne out by the history of all British military undertakings:—“If the soldier

return to his home after years of service, with rank if he have been entitled to it, with a substantial pension if disabled, there will be no want of volunteers for the army."

The systems of the British and French armies act as oppositely upon the hopes of the junior officers as upon the men. Without fortune and aristocratic influence, a British officer, however well educated and brave, has no hope of rising to eminence. Purchase and seniority rule promotion. In the French army seniority has its due share of influence, but is never allowed to impede the promotion of merit. In the British army few men reach the higher ranks until too old to act efficiently, if called on for active service in their grade—unless men of fortune or title, or who have the especial patronage of those so circumstanced. Hence, although England has a long list of general-officers, whose services have been most glorious, they are all too old for the toils of war. Her generals of high rank young enough to be useful are men who have bought their way up, and are unfit for high command.

The mode in which promotion takes place in the Guards, the aristocratic department of the army, illustrates the mischief of the excessive influence of the aristocracy. An ensign in the Guards ranks with a lieutenant in the line; this is counted quite fair, *because he pays twice as much for his commission!* A lieutenant in the Guards is a captain of the army; and a captain of the Guards ranks with a lieutenant-colonel of the army. The result of such an arrangement must be, that the general officers will mainly consist of men who have served in the Guards, and be therefore men of rank and fortune. On this whole system, the following indignant strictures were published by an able writer in the *Eclectic*, under a review of *Livret d'Homme de Troupe, Septième Bataillon des Chasseurs d'Orléans*:—

"The British purchase and half-pay arrangements, the beginning and end of our system, form a curious exemplification of the commercial spirit in military affairs—a strange combination of the Court and the Stock Exchange. The piquancy of this manifestation becomes striking in the privileged regiments of Guards. The purchase of a commission in the Guards is a good investment. A correspondent of the *Times* finds sixty-two connections of the peerage in the Grenadier Guards. In this regiment are relatives and connections of Lords Congleton, Holland, Besborough, Albemarle, Granville, Rokeby, Cardigan, Harborough, Hardinge, Raglan, Derby, Burlington, &c.; of the Marquises of Bute, and Thomond, &c.; and the Dukes of Buccleugh, Richmond, Devonshire, &c. Money and interest have been known to make men lieutenant-colonels in seven years. From a Return printed by the House of Commons in

1833, it appeared that an officer of cavalry in the Guards obtained the rank of a lieutenant-colonel in six years after he joined the army, and the command of a regiment when he had only been six years and five months on full pay in the service. The rank of lieutenant-colonel, while young, is the object of these noble soldiers; they know they cannot possibly all obtain commands, and few of them continue to serve; but they secure by this rank their promotions, and their half-pay gives them a fair return for their money. The basis of the whole business is an insurance and stock-exchange calculation. A commission in the Guards is a courtly connection and a comfortable investment. It is a beefeater's place made fashionable. They take their turns, at Dublin, Windsor, or London, and never of the frosts of Canada, or the flame-breezes of India. They roughed it indeed in the Peninsula, in Belgium, and in the Crimea; but generally they have permanent establishments in London, and they have never been subject to sudden removals, while uncertain of time and place. A battalion of the line supplies *two*, and one of the Guards (two companies weaker) *ten* to the list of generals. The Guards thus furnish more than half* the general officers; their seven battalions supplying seventy, while 106 battalions of the line give 126. The percentage of the casualties of officers in the line to officers of the Guards is four to one; and when the comparison is made between them and officers in India, the percentage of casualties is eight to one in favour of the Royal Guards. It would appear the more noble an officer is, the less he risks his life for his country; and the nearer he is to the court, the farther he is from giving the last proof of loyalty. Four thousand pounds a-year is allotted to the officers of the Guards, to enable them to entertain themselves and their friends with banquets whenever they mount guard at the Palace. Two-thirds of them are generally absent on leave; they report to the Gold Stick instead of the Commander-in-chief; and under the commanding officer and adjutant, all the duties are performed by the sergeants, the officers having only to fall into rank and walk, with their swords drawn, on parade. It is thus they play at soldiers in the courtly and fashionable circles!"

As might be expected from the comparison of the two systems, in these particulars the officers of the French army have a higher military reputation; while the officers of the British army are universally regarded as inferior to the men they command, except in personal bravery. The common soldiers (especially in our cavalry regiments), when they may speak with safety, will declare, almost to a man, that they have no confidence in the skill of their

* One-third?

subaltern officers; that the majority of them are young men of fashion, given to amusement, who pay no attention to their profession, and are unable to bring the regiment through its exercises; and that discipline mainly depends upon the non-commissioned officers, and such field-officers as are attached to their profession or have seen service. The men will bear a unanimous testimony to the personal gallantry of their officers. When the field-officers purchase their way up, they are generally as deficient as the subalterns; but it is the custom for most fashionable men, who enter the army for amusement, to sell out when they reach the rank of captain; so that officers who have experience, and remain in the service from professional zeal and ambition, are frequently found among the field-officers. With all these defects, the British regimental system, as a *plan* of discipline, is confessedly superior to the French.

We cannot resist the impression that were the whole English military system thoroughly reformed, so as to make promotion depend upon merit, and an honourable seniority where duty was adequately discharged; and were officers, professionally educated, selected for all staff appointments, instead of men of rank and property, irrespective of their capacity, the British army would soon surpass the French in military science, as it already does in fortitude, high sense of duty, and a spirit of daring enterprise. Its superiority in these particulars has often been recognised by Frenchmen. At the close of the last war, French generals were frequently heard to say, "If we had your soldiers, we could have conquered Europe."

Whatever be the political party which shall hold in its hands the destinies of this great

country, the public voice should sternly demand the immediate reform of army abuses, and the eradication of all vicious principles of military government.

There is a character of completeness in the organisation of the French army generally, which gives it a great superiority over ours *as an army*, however superior our regimental system may be. The extent to which effectiveness of detail and military foresight are carried, the following brief citation from a French military writer will illustrate:—

"Distributed throughout the collective army of France are eight companies, amounting altogether to 5000 men. In these companies are to be found handicraftsmen capable of every variety of useful labour. A colony of backwood settlers could hardly desire a more effective body of artisans and helpers to work upon a clearance, and elaborate all and everything connected with civilisation and eventual refinement. There are in each corps butchers and bakers; cooks and confectioners; carpenters, plasterers, painters, and glaziers; shoemakers, tailors, whitesmiths, locksmiths, blacksmiths, plumbers, well-sinkers, pump-makers, engineers and wheelwrights. In the general body of the 5000 are to be found civil engineers, levellers, hydrographers, draughtsmen, and designers, musicians and linguists. These constitute the *Corps de Génie*, and have everywhere proved most valuable annexations to the host of fighting men. They are all indeed in the latter category; but, certainly, he who can draw a correct ground-plan to-day, fight upon it to-morrow and write a lucid account of the redoubt's formation, and the success of the encounter which defended it, on the day after, is no mean man-at-arms."

CHAPTER XXXIII.

THE CRIMEA: ITS SCENERY, HISTORY, AND THE SOCIAL CONDITION OF ITS PEOPLE.

"But when I stood beneath the fresh green tree
Which, living, waves where thou didst cease to live,
And saw around me the wide fields revive
With fruits, and fertile promises—the spring
Come forth, her work of gladness to contrive,
With all her reckless birds upon the wing,
I turned from all she brought to those she could not bring."—BYRON.

THERE are but few good books extant which describe the Crimea. Dr. Koch is perhaps most generally quoted, but the work is superficial, and the writer allows an obtrusive and invidious nationality to deface his pages. His work is however of value for its geological and botanical information; and it contains some interesting discussions as to the probability that some of the events sung by Homer were imagined by the poet, in connection with this land of myths and traditionary stories

of wonder and terror from remotest time. Dr. Lyall, our own scientific countryman, has given some useful information as to the geological strata and superficialities of the country. Mr. Danby Seymour has written a good book concerning it. Dr. Clark is still an authority although his work is old. Captain Spence gives some light and pleasing sketches of the coasts, scenery, and general character of the country. Dr. Grant, Dean of St. Albans has written a history of the Crimea. Kohl

THE CRIMEA.

Longitude East of Greenwich

the German traveller, has produced a work, the general tone of which resembles that of his countryman Koch. Prince Anatole de Demidoff has written very elaborately and very heavily on almost every topic connected with the modern Crimea, although some of his sketches are not devoid of taste. In the year 1837, the prince projected a tour of inquiry, social and scientific, through all the countries of southern Russia. He proposed a mineralogical survey, from which he expected great results: the late emperor seems to have shared his anticipations, by the approval of his plans, and by authorising him to carry them into execution. The prince surrounded himself with a numerous staff of scientific men, geologists, practical miners, naturalists, engineers, draughtsmen, agriculturists, &c. They took with them boring apparatus and mining tools, weighing 80,000 lbs. The results were very disproportionate to the extent of the undertaking; the report as to the mineral riches of the country was utterly discouraging, and the prince proved himself to be rather a dull writer. A vein of officialism runs through the whole production; it appears like a mere report drawn up for the imperial eye. It was then a favourite spot with the emperor; he regarded the Crimea as one of the brightest gems in his diadem; to praise it was a passport to favour, and Prince de Demidoff paints everything in the colour of the rose, hinting that if the garden of Eden were not there, the place would have answered the purpose of that region of delight quite as well. The work of his highness is on the whole a very unfaithful one, and very clumsily executed, however much some parts of it are entitled to praise.

Other authorities, ancient and modern, may be consulted with advantage; but the really good works which treat on the Crimea, either scientifically, politically, or popularly, are few. Yet scarcely any geographical or topographical subject is more interesting at present. The war now raging within the small compass of the Crimean peninsula, will immortalise its associations: the words Crimea and Sebastopol will always arrest attention on the pages of the world's history. The most pleasing and popular work which we have met with, and to which we shall chiefly trust for our information while presenting to our readers the opinions and descriptions of various pens, is one that is but little known, having circulated chiefly among private friends. The work, published anonymously, is entitled *The Crimea*, and was written by a British lady, whose husband purchased property near the banks of the Alma—his sister having married the sultan, the representative of the khans of the Crimea. We believe this lady's husband, under the signature of "E. N.," afforded very valuable information to the public and the government

through the columns of the *Times*. Although the property of this family is jeopardised by this war, and their nephew, son of the late sultan, is an officer of Russian artillery, lately quartered at Simpheropol, about whose fate and that of his branch of the family they must be fondly anxious, yet throughout the book loyalty to fatherland is feelingly indicated. Our authoress describes her impressions of the country as to its beauties, drawbacks, and general peculiarities, not from a hasty survey, but from happy excursions, and *visits throughout its whole area during a long residence*. Hence, there is a vividness in her pen-and-ink sketches very enlivening and attractive; and one cannot rise from the perusal of *The Crimea*, without feeling that he really does know what sort of place it is. That sense of the actual which impresses with the idea that seeing could hardly add to the correctness of your notions, is just what Mrs. Nielson, in her own unassuming and natural manner, creates in the minds of the reader. Before presenting the descriptions or opinions of other writers concerning the country, it is necessary to afford a brief sketch of its geographical position and political importance.

A glance at the map of Europe will suffice to show the importance of the peculiar position of the Crimean peninsula. Projecting far into the Black Sea, it commands the disemboguing of the two greatest rivers whose waters mingle with those of that sea and the Sea of Azoff—the Don and the Dnieper. The Sea of Azoff and the Euxine are alike controlled by it. It seems as if designed for the standing-place of some great power, which as a sentinel should look forth towards the Danube and the Bosphorus, watch at once the shores of Asia Minor and of European Turkey, and hold in awe even the great metropolis of the Eastern world. Hence, it has always been an important position in past contests for power, from the first migration of primitive man from the table-lands of Armenia until the covenanted powers of western Europe planted there the standard of national independence, and compelled the modern Roxilani—more barbarous in many respects than their progenitors—to retire from the stronghold which their craft and treachery had secured. It is connected with the main land by the peninsula of Perekop, which is twenty miles in length, and three in breadth in its narrowest span. From this, its northern extremity, to Balaklava on the southern coast is about 130 miles, "as the bird flies." From east to west—from the strait of Yenikale, on the peninsula of Kertch, to Tarkhan, on the Gulf of Perekop, is about 210 miles. It is washed by the waters of the Gulf of Perekop on its north and north-western shores; by the Putrid Sea and the Sea of Azoff on its north and north-eastern coasts;

its other sea boundary is the open waters of the Euxine. For the purposes of either war or commerce, the power that possesses it has one of the most important positions in the world. The richest granaries in Europe are within easy sail of its shores, and the fairest provinces of the Turkish Empire may be menaced from its strongholds. As the swoop of an eagle from its eyrie upon the fold of the shepherd, so may the Russian swoop down upon Constantinople if a powerful steam navy be sheltered in the harbours of the Crimea, and armies be garrisoned there and on the neighbouring shores.

The scenery of the Crimea has not much variety of character, although very great variety of detail. Its northern portion is a steppe, often rich in soil, picturesque in spring and early summer, being variegated with the tulip, the crocus, and hosts of indigenous and beautiful flowers, and covered with grass or corn as it is committed to pasturage, or subjected to agriculture; in the late summer and autumn it is parched and burned up; and in the winter covered with snow, and exposed to the desolating northern blasts. Portions of it are also sand deserts, and others salt marshes. The southern division is a most wild yet beautiful region; huge mountains lift up their rocky brows into the sultry sun of summer, or are clothed with the accumulated snows of winter. These mountains are indented with many a glen and deep ravine, and cleft by waters which, falling in cascades from rock to rock, find their course through the lowlands, irrigating and blessing with fertility a soil the peculiarities of which so much need their presence. Where the highlands are less elevated and precipitous, the scenery is even more interesting: the country is undulated gracefully, and from the knoll to the mountain, all these undulations are clothed with beauty; within the scope of these elevations, and especially in their higher ranges, secluded nooks and deep dells are found, their sides covered with luxuriance, and within their pent up circles the huts of the Tartars and the gipseys are aggregated by the banks of some embryo river or gurgling brook. Over this part of the Crimea, within view of the shores of the Black Sea, are spread many magnificent estates and chateaux, the property of Russian nobles and officials favoured by the emperor. Some of these properties and mansions are unrivalled for beauty and magnificence: we question whether our own Chatsworth, or the proud home of our richest peer, the Marquis of Westminster, can vie with these palaces of the Russian princes in the Crimea. The lady whose book we have commended, and whose long residence by the Alma entitles her to write with authority, thus describes them:—"Leaving Yalta, the coast-road rises again, and continues its meandering course along the side of the hills through a rich and

beautiful country. Not far from the town is Livadia, the residence of Count Potolsky, with its beautiful gardens and refreshing fountains; and further on the empress's palace, Orianda, is seen nestling below, among rocks and wooded hills of every variety of shape and size. Indeed, at every turn new beauties open to view, and the huge masses of rock which overhang the road make the traveller pass in fear and trembling. Aloupka, the seat of Prince Woronzoff, stands in solemn grandeur; and the sight of it in the distance somewhat reminds one of home, but on approaching nearer its green granite walls, its orange and myrtle groves, and its clusters of dark cypress, tell of a warmer sun than we are favoured with in dear old England. The house is built in a castellated style, with numerous turrets, and is laid out to accommodate an immense number of visitors. There is an extensive library, and a large hall, in the style of the Moorish Alhambra. Exotic plants of all kinds fill the halls and covered galleries, making it really like fairyland. Terraces and shady walks lead down to the sea, where a neat little pavilion, for the accommodation of bathers has lately been built. Above the house is a garden, unique of its kind, combining within its limits grottoes, caverns, the crater of an extinct volcano, and huge grotesquely-shaped masses of rock, interspersed with fountains, cascades, artificial ponds, beds of flowers, and numerous shady walks and arbours. When the count (prince?) retreats to this his favourite residence, to rest from his labours at the Caucasus, he assembles a large party of friends at Aloupka, who spend the day very pleasantly in roaming about the gardens, or driving in the neighbourhood, while the evenings are usually spent in dancing to the music of a large band of musicians, who are always in attendance. The green-coloured granite of which this castle is built is very plentiful all along the coast, and where there are enclosures, which is not common thing, they are made of huge blocks of it, piled one upon another. Even the road is mended with it." The Prince Woronzoff referred to in the above extract is the nephew and kinsman of Mr. Sidney Herbert, and lately the official predecessor of Prince Menschikoff. A sketch of his history and character will be found in a previous chapter of this History.

With the quotation from Mrs. Nielson, Prince Anatole de Demidoff agrees in one of the best passages in his book, which is too striking and graphic for our readers not to peruse with pleasure. The road from Yalta to Aloupka and the scenes there presented to the traveller he thus describes:—"The road runs along the shore of the bay, and rises by a gentle ascent to the first hills which command the sea to the west, whence it reaches the base of the

rocks of the Yaila, which rise like a wall, 1800 feet high, extending from Yalta to Cape Ai-Todor. This road is smooth, and so easy that carriages can go at the utmost speed upon it. About midway up the mountains you meet with a number of villas on the roadside, one and all constructed with the most tasteful fancy. Here a small Asiatic palace greets you, with discreet blinds, and minaret-shaped chimneys; a little further, an elegant Gothic manor (house), or one of those pretty English cottages, covered with ivy, and surrounded with verdure that long retains its freshness. Sometimes you find a dwelling built entirely of wood, fancifully varnished, and almost hidden by its large verandahs; here a group of white and graceful turrets, there a mass of ruins; everywhere trees, grass, sparkling water, garlands of hawthorn, and beds of purple dahlias. The traveller advances thus along a road winding for a distance of fifteen versts by the side of the great ramparts of the Yaila; on his left the glittering and boundless sea; at his feet, sloping down to the shore, verdant declivities, covered with villas, beautiful vineyards, and winding pathways. Throughout its extent the road is protected, like a drive through an English park, by wooden barriers, painted white, which, though slight, prevent the head and eyes from suffering the dizziness so rapid a pace might occasion. Everywhere above are overhanging rocks, a 1000 feet high, from the crevices of which an abundant vegetation makes its way, and waves in the wind. But who can attempt to describe these lovely views as they deserve?"

The sternness of the northern section of the peninsula, beyond the Strait of Arabat, from Yenichti along the coast, he thus characterises:—"Still the same endless plain, the same tedious and flat horizon vanishing in the distance, in the midst of which how delightful a relief it is to chance upon a human being! . . . At the stations alone did we come in contact with living creatures. And what suffering did we not witness in these deserts, beneath those huts where disease exists in its worst forms, and medical assistance can never penetrate! These people, labouring under the most dreadful diseases, await without help and without hope the close of sufferings of which they cannot even calculate the extent—miserable examples of human patience and resignation. One poor old sick man, for whom we expressed our compassion, said, with honest and unaffected humility, that 'peasants were not sent into the world for their own pleasure.' And, certainly, if ever spot on earth was calculated to exercise the virtue of patience, it is this."

The greater part of the northern steppe is not, however, a desert; it is productive of

corn and herbage, and in some places richly so. Large flocks are fed upon it, and cultivation has been resorted to with success by industrious German settlers.

The climate in these two distinct regions of the peninsula is very dissimilar. In the northern department, the cold winds, sweeping from the plains of Russia, penetrate everything. No clothing, however thick, can resist it. When nearer to the pole by many degrees, travellers have not complained of a cold so penetrating and excessive. Sudden snowstorms often overwhelm the best provided travellers, as well as the Tartar marauders who make the wild steppe their home. In the rainy season, torrents descend from the skies, and the steppe is turned into a vast desert of mud, through which it would be vain to attempt to travel. From these causes, neither in the snowy nor rainy season can troops and provisions be transported from Russia, or from one portion of the Crimea to another, without prodigious labour, and great sacrifices of men, cattle, and material.

The climate of the southern portion, like its scenery, is delightful. Dr. Clarke, the justly-celebrated traveller, portrays both in one of the happiest efforts of his pen:—"If there exist on the earth a terrestrial paradise, it is to be found in the district intervening between Kutchuckoy—a village upon the most southern point of the Crimea—and Sudak. Protected by encircling alps from every cold and blighting wind, and only open to those breezes which are wafted from the south, the inhabitants enjoy every advantage of climate and of situation. Continual streams of crystal water pour down from the mountains upon their gardens, where every species of fruit known in the rest of Europe, and many that are not, attain the highest perfection. Neither unwholesome exhalations, nor chilling winds, nor venomous insects, nor poisonous reptiles, nor hostile neighbours, infest their blissful territory. *The life of its inhabitants resembles that of the golden age.* The soil, like a hotbed, rapidly puts forth such a variety of spontaneous produce that labour becomes merely an amusing exercise. Peace and plenty crown their board; while the repose they so much admire is interrupted only by harmless thunder, reverberating in the rocks above them, or by the murmur of the waves upon the beach below."

The social condition of the people is far from satisfactory. There is great want of capital either to cultivate the soil or foster commerce. The presence of rich Russian nobles in their gay summer palaces, however it may tend to create during the season pleasant social retreat, and the civilisation of the people, and although it may add to the beauty of the favoured region all the embellishments of taste, it does not

much promote the general prosperity of the peninsula. Neither have the encouragements offered by the government to foreign settlers, especially British and German, resulted in the establishment of commerce, or the melioration of the wretched condition of the people. Dr. Lyall, the celebrated geologist, an impartial narrator, and a scientific and close observer, thus records his opinion:—"The Russian government is endeavouring to re-establish the prosperity of the Crimea, which its armies have desolated, 'by instituting foreign as well as Russian colonies—by building barracks and other crown edifices—by organising tribunals and a central seat of justice—by restoring ancient names—by forming a fleet, and by building and renovating towns, as Sebastopol, Simpheropol, Kaffa, and Kertch. But the population is gone, and the most useful and industrious people—the Greeks and the Armenians—have nearly all left the peninsula. Industry and commerce are no more, though the Crimea is surrounded with ports on the Black Sea and the Sea of Azoff. Sebastopol may continue the great naval station of the south of Russia; Kaffa and Kertch may become fine small towns of crown edifices; and Simpheropol may boast of its tribunals, and its being the seat of a government administration; but the prospect of the Crimea ever regaining its importance under the Russians is very small.'"

There is a great want of skilful workmen; the Russian residents are overbearing and tyrannical, especially to the Tartars and Jews; they fraternise with the Greeks—such as are left of the Greek colony which the Emperor Nicholas encouraged at Balaklava. The Tartars prefer a nomadic life to any settled work; efforts to attach them to tillage, in a constant or extensive manner, have generally failed. They have a saying with which they always meet the most friendly persuasions and inducements, "The Jew has his bag, the Armenian his money-tables, the Frank his trade, and Providence has destined for the Tartar his waggon." The few Greeks resident in the seaports are crafty, fraudulent, and commercial. The Jews are a downcast and trampled race, except the Kairites, who have a settlement not unlike those of the Moravians in Europe. They are the most intelligent and interesting portion of all the people. They separate from the other Jews, living in a lonely district near the Valley of Jehoshaphat; their separation is religious as well as local. They reject the Talmud, and the verbal traditions of the other Jews, and hold exclusively by the written Scriptures. The origin of the word Kairite is a vexed question amongst philologists. Some derive it from roots which signify the written testimony. So many possible and im-

possible derivations have been struck out by the learned, that it would be unedifying and tedious to discuss the point. These Kairites are a most industrious, moral, and religious people. There is nothing in the social condition and the character of the Crimean population comparable in interest with the existence and social government of this strange Jewish sept by the Valley of Jehoshaphat. There they have peacefully and piously followed their tranquil avocations, only a few miles away, while the thunder of artillery reverberated around Sebastopol, and armed hosts met in deadly struggle upon the confines of their peaceful abode. In the valley a beautiful burial-place, of great antiquity and extent, receives the remains of this peaceful people. Many of them have their homes at Tchoufout Kali, a town occupied exclusively by their race. The meaning of the designation which the town receives is, the Jew's Fortress; and it is appropriately named, for it is situated on an isolated and perpendicular rock, many of the houses being built on the very edge of the precipice. The town is surrounded by a wall, the approaches to which are very steep, and defended by a gate, which is closed every night. The most treasured thing in the Jew's Fortress is a manuscript copy of the Bible, said by its possessors to be of great antiquity. The owners of the dwellings are obliged to go to Bagtché Serai to earn their livelihood, but return again to their rock. Frequently they are obliged to migrate altogether to other towns in the Crimea to earn a subsistence; but it is always their desire, go where they may, to obtain a resting-place at last in the Valley of Jehoshaphat.

The gipseys are like their race everywhere else; so are the few Armenians in the peninsula. Next to the Kairite Jews, the most interesting inhabitants of the place are the remnant of the old Gothic settlers resident among the southern mountains. At all events, the German writers lose no opportunity of holding up to general admiration these relics of the Gothic incursion upon the Crimea.

No trade or particular branch of commerce flourishes in this land. Fruit is the principal production of the soil, which is sent in large quantities to St. Petersburg and Moscow, where it is highly prized, and which makes it dear on the spot where it is grown. Almost all kinds of fruit common to either the temperate or torrid zone are grown, and are of the most delicious flavour. The inhabitants breed sheep, cattle, and horses; camels are valued on the steppe. The pastures are infested with the vulture and the eagle, while the glens and dales of southern Crimea echo with the sweet voices of the birds of song. Rivers and marshes are most prolific in frogs

which have a singular mocking croak peculiar to the species in this country.

The diseases of the Crimea are such as are common in similar climates, and in countries imperfectly cultivated. Consumption carries off many near the steppe; fever and ague infest the neighbourhood of the marshy lands. Diarrhœa, and a peculiar low fever, known as the Crimean fever, are common all over the country, and dysentery often smites as a plague.

The antiquities of the Crimea are interesting, although not numerous; some of them are thus noticed by the lady already quoted:—“At the entrance to the peninsula of Kertch are still to be seen the ruins of a wall and ditch, running across the isthmus from north to south, which are supposed to have served as a defence to the ancient kingdom of the Bosphorus. On approaching Kertch, one is struck by the immense number of tumuli, similar to those met with all over the steppes, and which, from their appearance and form, are considered to be of the same origin. Every year search is made in one or more of these tumuli, and many vases, coins, and golden ornaments, distinguished for elegance of form and beauty of workmanship, have been disinterred. Statues also have been found in these tumuli, sculptured in the purest white marble, and in a style worthy of the best days of Grecian art. Many of these now ornament the Museum at St. Petersburg, while others are allowed to be retained in the Museum at Kertch, near where they so long lay concealed.”

The old Tartar capital, and its antique palace, may be classed under the head of antiquities; for the town itself is still what it was ages gone by, and everything in it now reveals what existed in the days of the khans of Crim-Tartary. Although the extract is long, we cannot refrain from making it, so graphic and well drawn is the picture the authoress and traveller last cited gives us:—“Leaving the Alma, we traverse a large plain, which extends as far as the top of the narrow valley in which Bagtché Serai, the ancient Tartar capital, lies concealed. But how shall I convey to the reader an idea of the situation of this singular-looking town? Suppose the middle section of a hill swept away by a torrent passing through it, leaving the banks on either side sloping outwards; and suppose that along these banks are a number of excavations and huge misshapen stones, as if the torrent had swept away the surrounding earth in which they were imbedded, leaving them so balanced that they look as if a touch would send them rolling into the valley; and suppose the bottom of the ravine, through which runs a streamlet, packed full of houses without any

seeming plan, and you have the picture of Bagtché Serai. It seems as if it had secluded itself on purpose to be out of the way of the modern march of intellect, and certainly it has succeeded. Centuries have made no change in the manners, customs, appearance, and intelligence of the natives, and generations have come and gone, and yet it is exactly the same town that it ever was. The principal street, which runs parallel with the little streamlet, the ‘Djourouk Sou,’ for nearly a mile, is so narrow that two carriages pass with difficulty. In the town nothing is Russian; all is Asiatic. All along the streets, in little shops which close at night with wooden shutters, which, when folded down, serve as a counter by day, Tartars may be seen busy at their respective trades. At short intervals along the streets are fountains showering forth their clear and refreshing streams, at which are groups of Tartars washing their hands and feet, previous to entering the mosque. Further on are hungry Tartars eating their *shisliki*, equally unmindful of the eager gaze of the little ragged gipseys boys, who watch every mouthful with envious eyes, and of the passing glance of the traveller, who wends his way slowly along the rugged and uneven street. The ancient palace of the khans is situated about the centre of the town; and after entering a covered gateway, guarded by Cossacks, the residence of the former rulers, with its many gardens, its harem, and its marble baths, lies open to view. All the elegance of oriental architecture adorns the fairy-like dwelling. Groups of fantastic birds, fruits, and flowers, interspersed with talismanic inscriptions, ornament the panels, and stand out in bold contrast with the dazzling white of the walls. Among the most striking of the numerous apartments is a large reception-hall, where the khan held his councils, at the end of which is a trellised gallery for the use of his ladies, and also a small room, luxuriantly surrounded by a broad divan, in the centre of which a fountain is continually throwing up its showers of the purest water; indeed, this Palace of Gardens—as its name signifies—might have been called the Palace of Fountains, as water flows everywhere. Two beautiful fountains, artistically carved in white marble, and ornamented with gilding and light-coloured paint, welcome you with their trickling sound as you enter the large vestibule. One of these is called the Fountain of Tears, and commemorates the grief of the beautiful Christian Countess, Marie Potolsky, whose beauty so enamoured Krim Gheri, the khan, that he caused her to be kept a prisoner within these walls. It really drops tears, and the stone upon which they continually fall is hollowed out like a basin. Passing through a garden we reach the harem—silent, sad, and

gloomy, whose trellised windows, marble halls, and high surrounding walls, give no very pleasing idea of the gaiety of the life of its former inhabitants. To the left of the principal entrance to the palace is the mosque, with its domes and minarets. A private entrance from the palace leads to a gallery, which was expressly kept for the use of the khan; and beyond the mosque, within an enclosure, lie the turbaned tombs of the ancient possessors of this palace."

Any reader solicitous to study more closely the antiquities of the Crimea, may consult Dr. Koch's account of the remains of ancient cities traceable above Balaklava and Sebastopol, and on the site of Theodosia (Kaffa).

The history of the Crimea is full of romantic interest. The first highly civilised race of which we have any authentic record as peopling its shores, is the Milesian. That acute and polished people connected with ancient Greece, by commerce, colonies, and arms, the farthest shores of what in remote antiquity was called the "Axine," or Inhospitable Sea, but what the genius of their leader caused to be known as the "Euxine," or Hospitable Sea. Previous to its conquest by the Milesians, the Tauri, the Cimmerians, and other wild races overran it, and roamed throughout the neighbouring countries with the ferocity of savages. The Milesians subdued these tribes to regular government, and girded the shores of the Crimea and of the neighbouring countries with cities, populous, opulent, and refined. In the names of places may still be traced the language of that people, whose vigour and enterprise carried them not only to the Tauric Bosphorus, but to Gaul, Spain, and Ireland, there also to found settlements, and leave even to this day the traces of their lineage and their presence in the relics of a distant antiquity. The cities founded by the Milesians, both on the eastern and western shores of the Black Sea, may be identified by the student of ancient history: Sinope, Trebizond, and many others retain their sites, and some their names. On the western shores the cities founded by the Milesians antedated those on the eastern coasts, contrary to the general impression now entertained. Odessus was built on the site of Varna; the modern Odessa, much farther north, has been fantastically called Odessa by the Russians, who are fond of giving the names of the great and flourishing cities of antiquity to their own arsenals and ports, whether established upon the same site or not. Near the mouth of the Dnieper was situated Olbio, or Olbiopolis (the Wealthy City). Next to Olbio was Cherson, just above where Sebastopol now stands. Some ruins of the ancient Cherson may still be traced. The city of Panticapæum finally surpassed in opulence and splendour all the Milesian cities.

This was situated on the opposite extremity of the peninsula. Kertch is now the poor substitute for the glories of the once mighty Panticapæum. Vast ranges of mounds, the silent resting-places of the remarkable people who once filled Panticapæum with opulence and taste, now testify how great the population of the Milesian Tauric capital. Gold coins, painted vases of exquisite workmanship, gold ornaments tastefully and richly chased, medals, bracelets, and numerous other remains of a people of high civilisation, and who cultivated a luxuriant taste, are still excavated from these sepulchres and buried houses.

From the Tauric Bosphorus this people penetrated through the Sea of Azoff to the mouth of the river Don, and established there commercial relations with the wild tribes of the interior. Then as now, corn was the chief produce of these countries; and the Greeks for ages maintained this commerce, until Athens became the granary for the cereal crops gathered from beyond the Cimmerian Bosphorus. Many hundreds of years before the Christian era the Milesians flourished where now, in the allied hosts, their Gallic and British descendants display a valour not unworthy the noble race from which they sprung. It is also a curious circumstance that those of the allies who are of Gothic origin find in the Crimea a people of the same race, who have resided there for centuries beyond a thousand years, and who hate the yoke of the barbarous Roxilani. After centuries of opulence and peace, these colonies had to contend against the perpetual incursions of wandering tribes from the north of the Caucasus, and from the vast steppe north of Perekop; and finally the great Mithridates, the world-famed king of the Bosphorus, held his sway in the Tauric Chersonese. With the death of that indomitable man, who defied the arms of Rome in the greatness of its power, fell for a long period the glories of the Cimmerian Bosphorus.

The space we can devote to this subject allows us not to follow the adventurous Greeks in their commercial enterprises, founding cities and subduing peoples. On the eastern shores of the Euxine, the Emperor Justin built a city, which he called Sebastopolis; the Russians, in building an arsenal near the ancient Chersonesus, borrowed the name from the famous city of the opposite shores to grace their ambitious designs. The ancient Sebastopol was on the Circassian coast, where Dioscurios, now desolated, afterwards stood. Hence Goths, and innumerable other hordes of barbarians, eventually swept over the classic realm. The monuments of genius, taste, and enterprise were swept away, and the rude foot of the desolating northman and Asiatic trod down the fair work which brave and tasteful

hands had consolidated and adorned. So early as the tenth century the Russians made a conquest of the Crimea, under the sanguinary hypocrite Vladimir, fit prototype of the blood-thirsty and ambitious Nicholas. That tyrant did not know how to preserve his conquest: the Tartars overran the whole of the regions proximate to the Crimea, and conquered the Russians, almost extinguishing them as a race. The Genoese made a distinguished figure upon this ever-changing theatre of conquest, and once more great and flourishing cities arose. This people were, however, too selfish to establish a civilisation as refined as the Milesians, conferred upon these regions so many centuries before. When we come to notice various cities and military positions in the course of this History, we shall have occasion to refer to the Genoese, and therefore pass over for the present a more minute notice of their historical connection with the Crimea. Peter the Great commenced the modern career of Russian aggrandisement. When he ascended the throne, there was no maritime outlet except the icy shores of the Northern Ocean. In 1721, the land now occupied by St. Petersburg was acquired. In three years afterwards, accessions of territory from the Turks began rapidly to be made—a large tract of country north of the Crimea was ceded by the sultan. In 1783, the Crimea and the country between the Sea of Azoff and the Caspian, were wrested from the Porte. In 1792, the country round Odessa; and in 1812, the territory of Bessarabia, south of the Crimea. From Turkey and Persia territory was rapidly wrested on the Asiatic shores of the Black Sea from 1802 to 1829; and thus the Crimea became the advanced post of the Russian armies and fleets in the czar's designs upon Constantinople, while the shores all around it were under the shadow of his eagles.

England witnessed this progress with more or less of apprehension, according as Russia appeared to exercise her power in alliance with British policy, or in opposition to it. But no means were taken by successive governments to guard against the perils to which western Europe was at last aroused by the haughty mission of Prince Menshikoff.

In the examination before the Sebastopol Committee, it appeared from the evidence of Sir James Graham and the Duke of Newcastle that the government could glean no certain information as to the strength of Sebastopol, or the Russian forces quartered in the Crimea, before the expedition set out from Varna. Lord Raglan and Admiral Dundas sent home diverse accounts, and the government received from other quarters accounts differing from those supplied by its officers. At the very time this ignorance prevailed as to the strength and character of the fortifications, perfect plans

lay at the Admiralty, which it appears to have been no one's business, from the First Lord down to the junior clerk, to know anything about! Certainly, such plans had been deposited there, and ought to have been treasured as most precious documents until the hour arrived, which was sure to come, for their use. Dr. Clarke, the traveller, gives the following description of the stronghold, and makes the startling statement that he had himself deposited in the Admiralty complete plans which he brought away under imminent risk of detection and death:—

“The great Bay of Aktiar, upon which the Russians, in the time of Catherine II., bestowed the fantastic name of Sebastopol, also bears the name of *The Roads*, and here the Russian fleet is frequently at anchor. It is the Ctenus of Strabo.* The harbour upon which the town was built, about twenty years ago, has been appropriated to the reception of Russian ships of war. There are other ports, such as the Careening Bay, the Bay of Quarantine, &c. The Crimea does not afford timber for building ships, although there is always a sufficient supply for repairs. The fleets of the world might ride secure, and have convenient anchorage in the great harbour; and in any of the ports vessels find from twenty-one to seventy feet depth of water, and good anchorage. To the Russian navy it is one of the most important possessions, yet such was the surprising ignorance or carelessness of their government, that for some time after the capture of the Crimea the advantages of this place were not discovered. The plan of the harbour somewhat resembles that of Malta.”

The following note is appended to the text above quoted:—“Had the English fleet made a visit to Aktiar (Sebastopol) during the expedition to Egypt, which I have reason to believe was part of the instructions given to the commander-in-chief, they might have struck a blow which would have prevented all the subsequent treachery experienced from Russia, almost without firing a gun. Such was at that time the state of the peninsula. I presented to the British ambassador and to Lord Keith an accurate survey of the coast, with all the soundings in the Bay of Aktiar (Sebastopol) and the entrance to the roads, as well as the situation and quality of the magazines, artillery, and storehouses. This document was confided to my care by one who wished well to the British interest, and I brought it from the Crimea at the hazard of my life. Such a stroke at that time had been amply merited on the part of Russia; but the affairs in Egypt did not terminate soon enough to allow of its being carried into effect. I have, therefore, deposited the papers in the Admiralty-office,

* Strabo, Geog. lib. vii.

and only engraved the principal chart as a communication for the subject of these papers."

It will interest the reader to add to the foregoing description one from the pen of the world-renowned Heber, Bishop of Calcutta:—"Aktiar, so called from its white rocks. The old town stood, as we were told, on the north of the harbour, where there are no remains of any consequence. No vessels are built here, as the timber must all be floated down the Bug or Dnieper. A regulation had been made, prohibiting merchant vessels the entrance into the harbour, unless in positive distress—a strange way of proceeding, when compared with the general policy of European governments. The reason assigned was the embezzlement of the public stores, which were sold to the merchants by the government officers, almost without shame. The effect has been to check entirely the prosperity of the town, and to raise every foreign commodity to a most extravagant price. Even provisions cannot be brought by sea without a special licence. This information I derived from the port-admiral, Bandakof, and from an English officer in the Russian service. The natural advantages of the harbour are truly surprising; and the largest vessels lie within a cable's length of the shore. The harbour is divided into three coves, affording shelter in every wind, and favourable situations for repairs, buildings, &c. On a tongue of high land, between the two southern creeks, stand the Admiralty and storehouses, and on the opposite side is the town. The principal arm of the harbour runs east, and is terminated by the valley and little river of Inkerman. There are some formidable batteries, and the mouth of the harbour is very easy of defence. The old and unserviceable cannon are broken into small pieces, by being raised to a great height, and suffered to fall on a bed of masonry, and then sent, as we were told, to Lugan, to be new cast. To build a ship in the Black Sea costs half as much again as to construct it at Cronstadt, the wood coming from so great a distance."

A *minute* account of its fortifications is reserved for a more appropriate page. The names of places glanced at in the above sketch of the Crimea will all occur again in the progress of the war, and it will better diversify the subjects of each chapter if occasion be taken then to describe them.

Having given a general outline of Crimean history, it remains on this subject only to show how the Crimea came into the possession of Russia, and the general spirit in which it has been governed by that power.

In the third chapter, the occasion upon which the Crimean khans were proclaimed independent of the sultan was pointed out. The

acquisition of their independence was associated with a Russian protectorate. The *modus operandi* on the part of Russia was the same as in the case of Georgia subsequently, and the results similar; and in both cases the policy, and the mode of carrying it out, resembled the policy and proceedings of the Emperor Nicholas in his negotiations with Turkey concerning Wallachia and Moldavia, and his usurpations in those territories. After the Crimea became independent of the Porte, Russia exercised furtively and gradually more and more influence in her character of protector, until Potemkin, the nefarious agent, minister, and favourite of Catherine, planned and executed the seizure of the peninsula by Russian arms. It would be impossible for any brand of infamy to mark sufficiently to the world the base, bad character of Potemkin. There seemed no deed, however diabolical, too bad for his mind to entertain, or his hands to execute. Where a course of procedure less glaringly wicked and revolting would as well have answered the purposes of his own and his sovereign's ambition, he seems to have preferred the more evil course: and thus proceeded on his career, until, personal and political, the number of his crimes were beyond computation, and their character beyond description. Dr. Clarke records in fewest words, and with most impressive effect, the success of Russia in her designs upon the Crimea:—"By the last treaty of peace which Russia made with the Turks, prior to the conquest of the peninsula, Shahin Ghireh, of the family of the khans, who had been a prisoner and a hostage at Petersburg, was placed on the throne of the Crimea. This was the first step towards the overthrow of that kingdom. From the moment of his accession, the Russian minister in the Crimea, an artful and designing foreigner, well chosen from Potemkin's list to execute the plans he had in view, began to excite the Tartars against the khan, raising commotions among them, buying over the disaffected, and stimulating the people to frequent insurrection. In the meantime he insinuated himself into the good graces of the khan, teaching him to do whatever might be most unpopular in the eyes of his subjects. Among other dangerous absurdities, he prevailed upon the khan to place everything in his establishment upon a Russian footing; to discipline his troops after the Russian manner; to build frigates on his coast, filling his head with preposterous ideas of the navigation of the Black Sea. Thus he incurred enormous expenses, which compelled him to drain his subjects of their money, and increased their murmurs. The Russian minister, equally active on both sides, lost no opportunity to encourage the follies of the khan, or to augment the disaffection of the

Empress of Russia, born 1729, died 1796.

nobles. The work succeeded to his utmost wishes, a revolt took place, which soon became general; and the terrified khan was persuaded to fly, first to Kaffa, and afterwards to Taman. Then it was that the last master-stroke of political intrigue was effected. The khan was prevailed upon to call in the assistance of the Russian troops, who were eagerly waiting the proposal, and as eagerly acceded to it. Thus a Russian army was suffered to enter, unmolested, into the heart of the Crimea. Under pretext of punishing those who had rebelled against the khan for a revolt they had themselves excited; they put to death whomsoever they thought proper, took possession of the strongholds, and practised their usual excesses. The Tartars, some by compulsion, others by entreaty, and a still greater number by terror, were driven from their country, and compelled to seek elsewhere a residence. The khan returned to Karasubazar, where the Russian army was encamped, and there, in the presence of the Russian troops, was persuaded to order his nobles to be stoned to death; his pretended allies feasting their eyes with the slaughter of men whom they first induced to rebel against their sovereign, and afterwards caused to be butchered for having complied with their desires. Thus the deluded khan, and his still more deluded subjects, alike the dupe of designing wretches whom they had allowed to take possession of their country, began at last to open their eyes, and endeavoured to rid themselves of an alliance so fatal in its consequences. It was too late; the khan was himself a prisoner in the very centre of the Russian army: and the rest of their conduct towards him exceeds in depravity all that had preceded. A proposal was made to him to resign the crown of the Crimea, to quit the peninsula, and to attest, by his sign-manual, that the individuals of his family, in which the throne was hereditary, were for ever rightfully deposed. The khan received the insolent proposal with the astonishment and indignation which it merited; but he was reminded, that being indebted to the Russians for his kingdom, he ought to resign it whenever it might accord with their wishes. The reasoning was arbitrary, but very effectual when it is enforced at the mouth of a cannon, and an unfortunate prince, to whom it is addressed, remains prisoner in the camp of his enemies. In addition to this proposal, conditions were annexed, that instead of being deprived of his dignities by compliance, the khan should have his residence in Petersburg; that he should hold a court there of much greater splendour and magnificence than he had known in the Crimea; that he should be allowed an annual pension of one hundred thousand roubles, be enriched by all manner

of presents, enjoy the luxuries of that great capital, and partake in the amusements which the magnificence of Catharine constantly afforded; that no restraint whatever should be put upon his person, but that he should be at full liberty to act as he might think proper. The khan saw the snare into which he had fallen, but there was no method of liberating himself. He retained, however, sufficient firmness to persist in a refusal; in consequence of which force completed what entreaty was unable to accomplish. He was dragged a prisoner to Kaluga, a wretched hamlet upon the river Oka, yet ranking as the capital of a government of the same name, and a thousand versts distant from Petersburg, from which place he was not permitted to move. In this miserable condition, finding that neither his pension was paid to him, nor any single engagement fulfilled which the Russians had made, he insisted upon going to Petersburg, but was told it could not be permitted. At last, giving himself over entirely to despondency, he exclaimed, 'Let me be delivered a victim to the Turks; they will not refuse me, at least, the privilege of choosing the manner of my death, since my enemies have resolved on my destruction.' The unparalleled cruelty of the Russians suggested the propriety of acceding to this request; they rejoiced to hear it made, because it offered an easy method of getting rid of one whom they had pillaged, and whose presence was no longer either necessary or desirable. They placed him, therefore, upon the Turkish frontier, where he was taken, and, being afterwards sent to Rhodes, was beheaded. If it be now asked what the Russians have done with regard to the Crimea, after the depravity, the cruelty, and the murders by which it was obtained, and on that account became so favourable an acquisition in their eyes, the answer is given in few words. They have laid waste the country; cut down the trees; pulled down the houses; overthrown the sacred edifices of the natives, with all their public buildings; destroyed the public aqueducts; robbed the inhabitants; insulted the Tartars in their acts of public worship; torn up from the tombs the bodies of their ancestors, casting their relics upon dunghills, and feeding swine out of their coffins; annihilated all the monuments of antiquity, breaking up alike the sepulchres of saints and pagans, and scattering their ashes in the air."

Having presented to our readers the characteristics and history of the theatre upon which the armies of Russia and the allies were destined to meet in a strife so terrible, the opportunity is suitable for giving a general view of the condition and resources of the enemy which we were about to combat.

We are at war with the largest empire

upon the face of the earth; not indeed the most populous, but covering a total area of the greatest magnitude, containing the greatest variety of unworked resources, and assuming the most menacing attitude. There existed great ignorance of this empire, of its history, and of its people, among us. We were never at war with any power of which we, as a people, knew so little. Of Nepaul, Burmah, and China, we knew far more when engaged in hostilities with them than we did of Russia at the beginning of this war, or when our armies landed upon her shores. Something has been done to dispel this ignorance, so far as the character and power of its government is concerned, but we have not even yet measured the colossus in its proportions, nor examined with sufficient care the territory it bestrides. We have been alike accustomed to overrate and underrate the power of Russia: to overrate it as to its capacity for remote conquests, and to underrate it as to its capacity for developing itself upon contiguous territories, and effecting sudden swoops beyond them, always absorbing within itself some portion of the country upon which it overflowed, as the retiring wave carries back into the ocean some portion of the soil over which in its emergence it so rapidly swept. We, as a nation, certainly overrated the means of Russia as to the "sinews of war." Although her partisans in England have written and spoken so perseveringly to make us believe them more considerable, our present experience proves that, contrary to the prevailing opinion, we have also overrated Russia as to her resources in men. The men of Russia are property; the emperor cannot exhaust them without a direct impoverishment of their owners; as much so as if a slave-owner in Virginia were despoiled of his negroes, and they were driven to market for some one else's benefit, or consumed in the ranks of war for the interest of the general government. To be rich in men was far more important to a state in other generations than it is now—important although it ever must be. The Huns, Goths, and Tartars were rich in nothing but men, and such resources availed for the overthrow of Europe, and the appropriation of all other forms of wealth. The distinguished Arab captive lately liberated by the French emperor was mainly struck in his journey through France by the number of men, and exclaimed, "Had I all these men, I would do anything; I would conquer the world." The experience derived from the wars of his race and creed taught him this, and all the ravages of the heathen nations taught the same lesson; but numbers do not now bear the same relation to the means of conquest as when the art of war was ruder. All other things being equal, numerical superiority is of course deci-

sive; but, without a proportion in other warlike resources commensurate with numbers, they cease to be formidable, and may become an element of weakness and an occasion of defeat. No barbarous nation can now run over civilised territories and subdue civilised peoples, where superiority of material, and capacity to wield it, are on the side of greatly inferior numbers. The enemy we combat is not so great in available numbers as we were wont to think; and these are not composed of independent warriors, such as wandering Arab or predatory Huns: they are serfs of the soil, and cease to wield the mattock when they take the lance—thus leaving behind them untilled fields and untended lands, impoverishing the country from which supplies must be derived if they go forth at all. Unless Russian war issue in a speedy conquest, defeat most terrible is the result; the baffled armies of the czar fall back upon reserves, themselves without the necessities which make armies; and, even within the confines of their own land, they become a mere military mob, or at least an irregular force, like their own wild Cossacks, fit only for a desultory defence. If this view of the case be correct, then Russia is dangerous to Germany, Turkey, Persia, and the Scandinavian nations; and must, in the nature of things, absorb their territories, as they are weakened by natural wars, bad government, or internecine divisions, such as Russian policy is ever promoting; but in the face of any great nation really united to resist her, and possessing an enlightened system of finance, she is powerless. Even Austria, were her people patriotic, her government popular, and her resources made available, would prove an overmatch for Russia and be more likely to wrest territory from her than to become the victim of her encroachments. Another delusion under which we have laboured is, that in that vast empire there was unity. We knew that it was made up of subdued races to a great extent; but we presumed that the policy of denationalisation pursued by Russia had been effectual, and that even Poland was crushed in heart as well as fettered in limb; that the most hopeful son of that bleeding land could sing no more—

"Thou wilt not yet, dear Poland, perish!"

But recent events are teaching us that deep in the soul of all the down-trodden nations which Russia calls her provinces, there is a hatred to her yoke. Poland gasps for one more struggle—

"Too blest to be
Even for one bleeding moment free."

The Finlander rejoiced to see the flags of western Europe floating over the waters of the Baltic; the Russo-German hates the Slave

with all the hereditary antipathy of the German to that hapless race; even the Tartars of the Crimea were ready to embrace the ranks of the allies the moment they appeared on their strand; and the Cossack, the very name which we identify with everything essentially Russian, sits uneasy in his saddle with the eagle of Russia for a banner—from the Hetman to the savage who crouches on his wild horse behind his spear, the Cossacks—especially the Cossacks of the Don—hate the central government of St. Petersburg. Nor are the Russ united among themselves. The Kremlin scowls upon the newfangled glories of St. Petersburg; the genuine Muscovite regards with suspicion the mixed race of St. Petersburg; he looks upon that capital as a Germano-Russian city—and to be Germanised in any way is the one thing a true Russian would hate, if he could do more than despise it. In contending with the czar, therefore, the enemy we were about to combat was not at the head of an innumerable host; had not in his hand the treasures of a great nation; was not in his military system formidable for protracted warfare; and did not rule an empire of united and contented races. We have but to conduct the war with spirit, enterprise, dignity, and skill, and the *prestige* of his name and of his glory must vanish, to deceive and beguile the nations of the earth no more.

At the period of the expedition, the *Constitutionnelle* contained an article in harmony with these views, in which the case was thus forcibly put:—"One of the pretensions of Russia is to possess an effective military force of at

least 800,000 men, and which, according to some official returns, would even reach the figure of 1,200,000 men. It can easily be conceived with what idea the Russian government puts into circulation such figures. But if history be considered, it will be at once seen that this force never existed except on paper. At the period when Russia was attacked on her own territory, when her nationality was at stake in 1812, she had scarcely 200,000 men on foot. In 1813, she had great difficulty in sending 151,000 men into Germany, and in 1815, all the Russian troops that had passed the Rhine, concentrated at the camp of Vertus, only gave 120,000 men. It was, therefore, only under the influence of the gravest circumstances that Russia, for the last half century, succeeded in once getting into the field 200,000 men; and even then, as we have said, it was when she was attacked in the very heart of her territory. In her enterprises abroad, she has never disposed of more than 150,000 men. That is about the number, we believe, of the army charged to act in Turkey, and to meet events on the shores of the Black Sea; and as Russia is obliged to defend herself beyond the Caucasus and on the Baltic, at the same time that she is obliged to augment her forces in Poland, we doubt that the army of the Danube can easily repair its losses. Let no one, consequently, be deceived by the exaggerations of a government which is colossal only in the extent of its territory, and which is, on that very account, obliged to scatter its forces on various points to resist powers who dispose of the sea."

CHAPTER XXXIV.

EMBARKATION OF THE EXPEDITION FROM BULGARIA.—LANDING AT OLD FORT.

"War tries the strength of the military framework; it is in peace that the framework itself must be formed."—SIR WILLIAM NAPIER'S *Peninsular War*.

THE period agreed upon in the councils of the chiefs for the embarkation of the armies at last arrived; but the frequent postponements had been attended with the greatest peril, for the equinoctial gales blow fiercely over the Black Sea from the middle of September for nearly a fortnight, and while they prevail, no fleet can ride the troubled waters of that sea, nor can any description of naval operations be performed. Even during calm, it is frequently as foggy on the Euxine as in the British Channel, or the Irish Sea, when the season is far advanced.

The wisdom or folly of undertaking so great an enterprise at that season of the year has been much discussed ever since the committee of inquiry, called for by Mr. Roebuck in the House of Commons long afterwards, embraced

this among the number of subjects which it investigated. The cabinet ministers who planned the expedition were examined. They all concurred in their testimony that the cabinet at the time believed that the expedition was wise and necessary, and its objects feasible. Sir James Graham, the First Lord of the Admiralty, always dogmatical, was very emphatic in declaring his persuasion that the right time had been chosen, and that everything was conducted in the right way. The Earl of Aberdeen, the Duke of Newcastle, and Mr. Sidney Herbert, were all of opinion that had the attempt upon the Crimea been abandoned on account of the advanced period of the season, Sebastopol would have been greatly strengthened before spring, and the whole of the coasts of the Crimea placed in a state of most formid-

able defence. Their impression was that the land defences of Sebastopol were so weak that a *coup de main* on the part of the allied commanders would succeed; that the troops to defend it were numerically much weaker than the allies; and that while yet the autumn weather lasted, there was time enough to take Sebastopol. It was their intention that the armies should find winter quarters there, or so many of the troops as might be necessary to garrison it, while the remainder could be withdrawn by the fleets to the Bosphorus, and there winter.

The ignorance, infatuation, want of general concert, and of serious concern for the great interests depending, which the cabinet displayed during their examination by the Roebuck committee, is a fearful exemplification of the saying that "it is surprising with what little wisdom the world is governed." It appears to us that the expedition was necessary, and that, although late in the season, it would have answered all reasonable expectations had the army been properly supplied with the material of war, commissary, medical, and engineering requisites. Had the contingencies of a protracted siege and a winter encampment been considered by the Western governments as they ought to have been, there would have been earlier success and greater glory. It is also our opinion that the Crimea was the right place in which to strike the blow. So long as the mighty arsenal of Sebastopol existed, to protect the vast fleet which found shelter behind its granite defences, the enemy would never give in, even although Bessarabia and Podolia were wrested from him, and the Russian armies of Asia were driven back from Fort Nicholas to Tiflis; for independent of the strategical importance of cutting off the Crimea from Russia, the moral influence of such a conquest would be felt in the very heart of the Russian population, as there is no conquest of which they are so proud, nor from which they hope so much for future aggrandisement and glory. We concur with Dr. Koch when he observes, "The allies have now recognised the value of the Crimea in a political as well as a strategical sense. Severing the Crimea from the Russian Empire, in spite of its slight value in a mercantile or agricultural respect, is like cutting through the artery by which she maintains her preponderance in anterior Asia. Russia's efforts are directed to the south, and Peter the Great was the first to recognise this fact. To gain ground there, Catherine II. undertook expensive and dangerous wars. It is known only too well in St. Petersburg that the empire of the East was once offered to a Russian grand-duke."

For a short time before the embarkation, the troops were busily employed making fascines

and gabions. The brushwood which so thickly abounds along the shores of the lake, and the banks of the river near to which the troops had been encamped, supplied them with ample material for that purpose. Vast piles of these had been heaped up near Varna. The Sappers had run out piers of a temporary nature to enable the troops and material to embark with more facility. Transports were ordered up from the Bosphorus, and numerous detachments of troops, which had been still quartered there. The Bulgarian peasantry came in groups, with their wives and daughters, to look upon the spectacle; for the tidings had spread from Varna to Shumla, and along the line of the Danube near to Hirsova, among the humblest of the people, that the mightiest armament the world had ever seen was about to leave their shores to act against Odessa or Sebastopol. The problem was to be solved, which, in the opinion of these people, was a most abstruse one, whether the czar, the great political chief of the orthodox Church, was not altogether omnipotent. Preparations of a personal nature by the soldiery and their leaders might be noticed in every division; and both men and officers began to speak of the brave companions in arms which in such numbers fell upon the pestilential slopes of the encampments, and to whose graves they were about to bid a last adieu. Seventy-two of these graves were near the encampment of the brigade of Guards; the rest of the army was decimated. The cholera still lingered about the host, breathing upon the face of the sleeper, who would awake to endure the last agony; and touching with the cold finger of death the brave, active, and vigorous in the full glow of life. The tidings of embarkation checked the pestilence, the excitement of the troops had a salutary effect, and notwithstanding weakness and sickness, never was an army more eager to encounter an enemy. A distinguished Cavalier, exiled from his country, once said, that although he hated the Roundheads, he was proud of his country when he looked upon their fine line of battle, and heard their joyous shouts when they faced the enemy. The old British blood still throbbed through the veins of the pestilence-stricken soldiers of the army of Bulgaria; and the announcement that they were going in quest of the enemy thrilled through their ranks with an electric animation.

It was on the 23rd of August that the first division moved towards the sea, and they were speedily followed by all the other divisions.

The state of the army as to its health and its general fitness for a campaign on an unknown and hostile shore, may be judged by the following account of the troops as they appeared to a civilian upon the eve of their embarkation:—"On Wednesday last, the 2nd brigade of the

light division marched in, and proceeded to embark at the piers on the south side of the bay. Of the regiments composing it, the 19th seemed to be the strongest and most in working order. Many of the 88th were still suffering from illness, and dropping out of the ranks or almost tottering under the weight of their kits, but they would come on in spite of their weakness. The regiment suffered another heavy loss on the march from Aladyn to Varna. Major Mackay was seized with cholera on the route, and died in a few hours. The deceased officer was a great favourite with the regiment, and they carried his body with them on the march till they could inter it with a little decent solemnity after their halt. His remains rest in a field by the wayside, about three miles from Varna. The 19th embarked on board the *Courier*; the 88th on board the *Orient*. The Rifle Brigade, 2nd battalion, is broken up, and distributed among the various vessels carrying the regiments of the division—one company to each of the eight ships. Soon after the Guards embarked in the *Simoom*, Captain Patham, a few cases of cholera appeared among the men, and, as some of her crew and her former captain had died of that disease, it was deemed expedient to shift the Guards to other vessels. Two companies were sent on board the *Vengeance*, and orders were given to Lord George Paulet to prepare for the reception of 500 more on board the *Bellerophon*."

The process of embarkation displayed the abilities of the generals of divisions and brigades, and also of other staff officers. Among all, General Sir De Lacy Evans was honourably conspicuous. An eye-witness relates, "The 2nd division embarked in excellent order. Sir De Lacy Evans, his brigadiers, Pennefather and Adams, and his staff, were on the beach before nine o'clock. The first brigade, the 30th, 55th, and 95th regiments, and the second brigade, the 41st, 47th, and 49th regiments, constitute a very fine division, which has suffered less from sickness than any other division of our army. They moved with great regularity down to the rude piers, and embarking regiment after regiment, on board the long steamers, were soon put on board their respective transports."

The troops were well supplied with milk, eggs, butter, fowls and other products of the farm as they arrived at the bay and embarked; these were eagerly bought up and paid for—the country people comparing the British very favourably in this respect with both their French and Turkish allies. As the British embarked, they sailed directly for Baltschick Bay, where the principal part of the allied fleet awaited them. The cholera was again ravaging the fleets, and the troops experienced renewed visitations of the pestilence as the transports came up with the royal navy.

What had occurred at an early period of the ravages of the disease at Varna was now common at Baltschick: the dead bodies cast into the sea, with shot tied to their feet, rose to the surface—the feet downward because of the weight, but the ghastly heads floating upon the surface of the sea, and presenting an appearance the most appalling. Some of these hideous carcasses floated about the accommodation-ladders of the transports, as if watching the embarkation of the soldiers, and foreboding the doom to which so many of them were hastening. It was on the 5th of September that the blue jackets of the navy and the red jackets of the army began to mingle, and cordial were the greetings with which the wearers of the former received their more gaily-apparelled comrades of the sister-service. The 6th was occupied as the 5th had been—in arranging, embarking, and arriving at Baltschick. During this short time, sailors and soldiers in great numbers perished in that bay: the slopes of Aladyn were not more fatal to the men than ship-board within the waters of that picturesque inlet.

The French marched from Varna to Baltschick, defiling along the hills which overlooked the winding and devious strand, and embarked directly from their boats. The Turks followed the French, proceeding on board their own squadron. The feeling of all departments of the allied armies was an intense impatience to move on to their destination, and exchange the monotony and sickness which hung over and around them, for active campaigning and feats of arms. Moribund although the czar considered the Turkish empire to be, none of the troops of the allied hosts were more eager to meet the enemy than those of the Ottomans. On Thursday, the 7th of September, the day dawned in beauty and brightness—a day pre-saging hope and victory. Adverse winds had prevailed on the 6th, and the night of the 6th and 7th, but with the morning sprung up a favourable breeze, and the mighty armament made sail. Splendid was the scene upon which the autumn sun of that morning arose, as the white sails fluttered in the wind, or the smoke emitted by the steamers sailed aloft, as if signalling adieus to the empire of the sultan from the argosies of his allies seeking the coasts of his aggressor.

More numerous armies may have crossed the Euxine, but never such a fleet, and never such a host as fleet and army united presented on that day. Each steamer towed two transports; a squadron of men-of-war led; each flank was guarded by a martial squadron; the other vessels followed, crowded with troops of high courage and high hopes. The transports were ships of large tonnage and splendid build, unrivalled in the world. The East Indiaman, the old frigate, some old seventy-fours, and craft

of every size and name, formed the great naval crowd which hurried over the yielding and silent Euxine. It was a day of serene beauty, the breeze sufficient to accelerate the movements of the ships, but not to agitate the water, which seemed to repose in tranquil majesty, as if proud of the ensign of power it bore upon its bosom. The author of *A Trip to the Trenches* thus writes concerning the Black Sea:—"It is supposed by the learned that in Homeric days, or even later, the Aral and Caspian Seas formed an immense lake, joined to the Ποντος Εὐξείνος, or Hospitable Sea, which was then entirely excluded from the Mediterranean by a narrow isthmus formed by the Cyanean Isles across the entrance of the Bosphorus. An irruption of these volcanic isles is supposed to have opened this passage through to the Sea of Marmora, and at once to have considerably deepened the Mediterranean, and lowered the Black Sea, so as to have isolated the Palus Mæotis, or Putrid Sea, and separated the Aral from the Caspian. According to Strabo and Eustathius, this occurred about 1500 B.C. That it did occur can scarcely be doubted; but the exact date is, I should suppose, imaginary."

On the 9th the armament anchored off the Isle of Serpents, the place previously appointed for a general rendezvous. "The Isle of Serpents" is situated off the mouth of the Danube. When the vast fleet was at anchor there, the sight was most imposing, whether by day or night. The 10th of September was a Sunday, and the fleet remained at anchor. The sea was smooth as glass, not a wave rippled its surface. Never was Sabbath stillness felt more tranquilly amidst the rural scenes of peaceful England than throughout that armed host. The sun shone brightly over the mustered squadrons, and from the decks of the ships that composed them its light was reflected from many a gay and brilliant uniform. There were assembled in naval array ten English sail of the line, sixteen French, eleven Turkish, 100 frigates and smaller vessels of war of these navies, 200 steam-ships and sailing transports. Other craft attended upon them, making an armada of 700 ships. Religious service was conducted during the forenoon of the 10th on board the various ships, after which there was much visiting, and the sea seemed alive with boats passing and repassing throughout the fleet. In the evening the bands played, and as the air and water were singularly still, the music softly floated over the whole area covered by the armament, producing an effect at once soothing and exciting, and awaking associations the most opposite in the breasts of the brave men who listened and thought of homes they might never see, and future triumphs they might never realise.

At night the scene was more striking still. Lights gleamed from the portholes of the war ships, and the postern lights, hoisted at the main and fore throughout the transport service, shed over the sea a strange influence. Most writers have compared the scene to a great city, with its thousands of lamps gleaming. The comparison is unhappy, for during the night a gentle breeze sprung up, and the vessels were all more or less in motion. The lights seemed to pass and repass before the eye, to ascend and descend with most fantastic motions, as if strange meteors played around the spot, attracted by some power in the sea beneath. This meteor-like glancing and glimmering to and fro were aided in the general effect by sudden flashes of light gleaming from the decks of the ships as signals, or as aiding the occupations of those on board. On the 11th the fleet made way, the tall spars pointing to the heavens as the ships glided off upon the still, smooth waters.

There existed at this time considerable difference of opinion as to the proper place for landing. It is even alleged that the allied chiefs were not unanimous in the opinion that a landing was practicable anywhere, or that if a landing were effected, anything could be done to satisfy the expectations of Europe, or to humble the enemy. "The timid counsels" so emphatically alluded to subsequently by the French emperor certainly existed, not as some insinuated from personal fear, but from an overwhelming sense of responsibility, in view of the magnitude of the stake and the hazard of the undertaking. A conference had been held on board the *Caradoc*, between the generals-in-chief and admirals, at which it was determined that they should proceed to examine the coast of the Crimea from Cape Chersonese to Eupatoria, in order to determine where a landing was practicable. The *Caradoc* steamed forth upon this reconnaissance, carrying the council of war. So near did she sail to Sebastopol and other portions of the coast that the Russian officers were seen in front of their troops, bringing their glasses to a focus, in order to inspect the ship and the wearers of the brilliant naval and military uniforms on her quarterdeck. The British officers raised their hats, which courtesy was returned with an air of constrained formality. When the council of chiefs returned, they kept their opinions very much to themselves, for even admirals and general officers were uninformed of their intentions or speculations.

In the afternoon of the 11th, the fleet were signalled to rendezvous off Eupatoria; but its progress was much slower, as squalls arose, and a sharp head-wind impeded the advance. It is generally represented, in descriptions of the progress of the fleet, that from Varna until the troops landed the weather was uninterruptedly

calm. This is an error; the whole of the 11th of September, from early in the afternoon, was squally and threatening; the smoke from the steamers hung low above the ships, or was carried eddying away fitfully, as the gusts rose or fell, forming a new and curious spectacle to the observers. The French did not make the same steady way as the British, their squadrons fell out of sight on the 11th until towards sunset, and on the 12th at sunrise they were again invisible. Our allies managed matters on land very much better than they did at sea. Their services on shore were often opportune and important to the British, but on "blue water," the latter were able to return adequately any favours thus received.

The sunset of the 12th was particularly lovely, as that time of the day generally is in the Black Sea. No variety of colour can be well imagined comparable with those which tinted the western horizon as, from the masts-heads and rigging, men and officers gazed upon the glorious prospect, until night gradually wrapped its mantle over all. The advanced squadron arrived on the night of the 13th off Eupatoria Point, and anchored until the morning of the 14th, when the place was taken possession of. Eupatoria is a name borne by the place so designated from a remote antiquity. It is called Genlev by the Tartars, Kosloff or Korsloff, by the Russians. The population consisted of Kairite Jews, Tartars, Armenians, Greeks, Russians, Cossacks, and Germans, principally, however, of the first two nationalities named; it amounted in numbers to about 10,000. It is a very pleasant little place. To the south, low hills add to the picturesque effect, although there is but little foliage on their slopes. Northward there is a low plain, covered with rank pasturage; a good road extends across northward to Perekop; another passes southward a short distance by the sea, and then winds around the low hills that are clustered to the south, and takes the direction of Simpheropol. The town itself looks pretty from the sea. The houses are either built of a soft white stone, or of wood painted white; the tiles of the roofing are painted a bright red colour, but do not resemble the tiled roofs of Shields or Newcastle, in England, begrimed with smoke. Minarets, always effective in aiding the picturesque in eastern cities, shoot up into the skies; and away on the low hills beyond, not less than fifty windmills were counted, giving an aspect of busy life and comfort to the place, unusual to the towns on the shores of the Black Sea.

On the 14th, early in the morning, Lord Raglan sent a flag of truce on shore; and the 20th British regiment, and detachments of marines, were ordered to prepare to land. The flag of truce demanded that the garrison lay

down their arms and surrender the place. The reply was, that there were no arms to lay down; and as to the place, there it was for his excellency to do what he pleased with. It was at once taken possession of, and thus the British flag was the first of the allied standards planted on the Crimea. It has been generally represented that our French friends had that honour at Old Fort; but Eupatoria was first taken possession of by Lord Raglan, and the British flag floated above its domes and minarets. The people seemed pleased with the change; they crowded the beach to behold the squadrons, and welcomed the troops cordially. All marketable commodities were freely disposed of at fair prices, and the Muscovites beheld with rage and envy the good understanding at once established between the invaders and the Eupatorians. This easy conquest was merely intended by Lord Raglan to divert the attention of the enemy from the place in which he had concerted with the other chiefs to make the debarkation. He did not foresee how important Eupatoria might become in the future conduct of the war. Were it not for the want of water in the great steppe between it and Simpheropol, and between it and Perekop, Eupatoria would appear to be the best basis of operations for the conquest of the Crimea; and we cannot but feel persuaded that if the contest continue until force cause one of the contending parties to evacuate the peninsula, Eupatoria will occupy a more prominent place in the plans of the allies, and assume a very great strategic importance in the decision of the struggle. On the 14th, the movements of the fleet began at a little after two in the morning; as they proceeded along the coast the sunrise was singularly beautiful. At that season a peculiarly soft and rich sunrise betokens storms in the climate of the Crimea. A stormy day, also, frequently follows a more than usually gorgeous sunset. Such a sunset the allied fleets witnessed the previous evening. It was well described by an officer in a letter to his friends in the following terms:—"It was one of those rich calm evenings, clear and golden, like the masterpieces of Claude, bright and surpassing in its loveliness. Like the close of day in all unhealthy climates, not a breath stirred—not a sound broke the intense stillness. To judge by the heavy silence, every one throughout the vast fleet seemed absorbed in the beauty of the scene, till the quick heavy booms of the sunset guns re-echoed in a thousand tones from cliff to cliff, dispelled the illusion, and among the long loud notes of cavalry trumpets and infantry bugles, the flags of all the ships were struck; the striking of the 'watches' kept up a constant chime of bells throughout the fleet, now swelling into a heavy toll, now

dying away into a mere tinkling, as the French transports to leeward took up the signal, and marked how the hours flew which yet intervened between the death-struggle of the allies and the enemy. At nine, infantry bugles, in vessels three miles at sea, blew lustily to recall stragglers, and at midnight the silver trumpets from cavalry transports wound clear and long their melancholy notes, proclaiming to the assembled squadron that none of their men were absent. So the night passed on, the wind in the meantime freshening, and going round more in our favour every hour."

About ten o'clock on the morning of the 14th the debarkation commenced. The place chosen for it has been described very differently, except as to its main features; having examined a number of different accounts, and compared them carefully with maps of the line of coast, we pronounce the following to be by far the most correct as well as interesting:—"The place thus selected for our landing is a low strip of beach and shingle, cast up by the violence of the surf, and forming a sort of causeway between the sea and a stagnant salt-water lake, one of those remarkable deposits of brackish water so frequent along this shore of the Crimea, and which abound close to our present quarters. The lake is about one mile long and half a mile broad, and when we first arrived, its borders and surface were frequented by vast flocks of wild fowl. There is another sheet to the south of us, and there is another to the north, between our camp and Eupatoria. The causeway is not more than two hundred yards broad, and it leads, at the right or southern extremity of the lake, by a gentle ascent, to an irregular tableland, or plateau, of trifling elevation, dotted with tumuli or barrows, such as are seen in several parts of England, and extending to the base of the very remarkable chain called, from their shape, the Tent Mountains. Towards the sea this plateau presents a precipitous face of red clay and sandstone, varying in height from 100 to 150 feet, and it terminates by a descent almost to the sea level, at the distance of nearly two miles from the shores of the lake. Thence, towards the south, there is a low sandy beach, with a fringe of shingle raised by the action of the waves above the level of the land, and saving it from inundation. This low coast runs as far as the eye can reach, till it is lost beneath the base of the mountain ranges over Sebastopol. The country inland, visible from the decks of our ships, is covered with cattle, with grain in stack, with farmhouses, and seems capable of producing enormous quantities of live stock and fodder. The stubble fields are now covered with wild lavender, southernwood, and other fragrant shrubs, which the troops are busily collecting for fuel, and which fill the air with an aromatic perfume. As we cruised down

towards Eupatoria, we could see the people driving their carts and busy in their ordinary occupations."

Before the landing was attempted, Cossack videttes, with a mounted officer, were seen upon the shore, the officer carefully sketching the forces of the invaders, and apparently noting down the positions of the fleet in a memorandum-book. He was frequently within range of the ships' guns, but no shot or shell was thrown, and he quietly, and apparently without apprehension, continued his notation. The morning and day of the 14th were extremely favourable to the landing, which was effected by the French in great order and rapidity, who, as they landed, planted the tricolor, and sent out skirmishing parties to their front. Our allies debarked about two miles lower down the coast than the British; their naval means of effecting a good debarkation were very inferior to those of the English, but such was the skill and organisation with which everything was conducted by them, that their work was rapidly accomplished, and in the most beautiful order and complete security. On the part of the English the landing was managed, up to the point of placing the troops and material on shore, still more efficiently than by their French neighbours, but there the comparison in their favour ended. On shore there was much confusion and disorder, and had the enemy offered resistance, the British would have been placed at a great disadvantage as compared with the French. The maritime portion of the arrangements were confided to Admiral Lyons, and nobly did he execute what was committed to him. The entire responsibility rested upon him, the Admiral-in-chief, Dundas, and the General-in-chief, Lord Raglan, quietly looking on. Sir George Brown ably seconded Sir Edmund Lyons; and these two indomitable men seemed to be gifted with ubiquity, so wondrously did their presence seem to pervade every department. Sir Edmund Lyons proved himself a man of the highest order of capacity for arrangement and command, from the first signal for sailing from the Bay of Baltschick until the last soldier was placed ashore at Old Fort.

While the French were anticipating the British in the general landing, a squadron of the ships of the latter effected an important diversion off the mouth of the Katcha. The *Sampson*, *Fury*, and *Vesuvius*, which had been so active throughout the operations of the Black Sea fleet, supported by a French squadron, stood in where a camp of 6000 Russians crowned a height. The *Fury* and the *Vesuvius* opened fire, but the camp being a mile distant from the sea, and the draught of the steamers being too heavy to allow them to get close in, the shot and shell fell short. The *Sampson*, however, succeeded in throwing shell after shell

among the tents of the camp, and the officers of the squadron could perceive through their glasses that great execution attended the bursting of these missiles; several of the shells exploded among the horses, causing great confusion and destruction. Having thus engaged the attention of the enemy, as if a landing were contemplated, the squadron withdrew; meanwhile the allied armies were ascending the sandy beach at Old Fort.

A small detachment of men, in a boat of the *Britannia*, commanded by Captain Vasey, first landed under a low cliff, where they remained; while a company of the 23rd Fusileers,* with the commanding officer of their regiment, and the general of their division, Sir George Brown, landed further up. Of this party, Sir George was the first to jump on shore. He was speedily followed by his staff, and by the quartermaster-general, and at once proceeded to reconnoitre the surrounding country. While he was doing so, a curious scene presented itself to those who were on board some of the ships. The *Times'* commissioner witnessed it, and thus graphically portrays it:—"Suddenly a Cossack crouched down, and pointed with his lance to the ascent of the cliff. The officer turned and looked in the direction. We looked too, and, lo! a cocked hat rose above the horizon. Another figure, with a similar headdress, came also in view. The first was Sir George Brown, on foot; the second we made out to be Quartermaster-general Airey. The scene was exciting. It was evident the Russian and the Cossack saw Sir George, but that he did not see them. A picquet of Fusileers and riflemen followed the general at a considerable interval. The Russian got on his horse, the Cossacks followed his example, and one of them cantered to the left to see that the French were not cutting off their retreat, while the others stooped down over their saddle bows and rode stealthily, with lowered lances, towards the Englishmen. Sir George was in danger, but he did not know it. Neither did the Russians see the picquet advancing towards the brow of the hill. Sir George was busy scanning the country, and pointing out various spots to the quartermaster-general. Suddenly they turn, and slowly descend the hill—the gold sash disappears—the cocked hat is eclipsed—Cossacks and officers dismount, and steal along by the side of their horses. They, too, are hid from sight in a short time, and on the brow of the cliff appears a string of native carts. In about five minutes two or three tiny puffs of smoke rise over the cliff, and presently the faint cracks of a rifle are audible to the men in the nearest ships. In

a few minutes more the Cossacks are visible, flying like the wind on the road towards Sebastopol, and crossing close to the left of the French lines of skirmishers. When we landed, we heard that Sir George Brown had a near escape of being taken prisoner. He was the first to land, and pushed on without sending videttes or men in front, though he took the precaution, very fortunately, to bring up a few soldiers with him. The Cossacks, who had been dodging him, made a dash when they were within less than a hundred yards. The general had to run, and was only saved from capture by the fire of the Fusileers. The Cossacks bolted. The first blood spilt in this campaign was that of a poor boy, an arabjee, who was wounded in the foot by the volley which dislodged them."

As the troops landed, they were at once marched up from the sandy shore to the plateau above the lake, except the 4th division, who bivouaced for the night on the shingly beach.

Seldom have men suffered more than the British troops did on that night of rain and storm. They had no shelter. Many of them had but recently recovered from cholera, dysentery, or fever; they had but little refreshment, and no tents. Sir George Brown lay down under a waggon, and the Duke of Cambridge, who had been in ill health, but insisted on accompanying the expedition, found shelter beneath a gun-carriage. Seldom was an army less fit to encounter an enemy than the British on that dreadful night. The French had their tents all pitched, and whatever comforts may cheer the soldier's bivouac during inclement weather were brought ashore. The Turks even were handy enough, and had sufficient organisation to bring their tents; and both the allied forces were encamped with regularity and order. The sufferings to which the British were exposed cost many lives. Officers and men incurred illness and disease from which many never recovered, and perhaps there was no regiment in the army but lost some men from cholera or fever that night or the ensuing day. The men stood or lay drenched to the skin, for no ordinary covering could protect against the descending deluge. Officers of experience, and accustomed to the severest privations which old campaigners could relate, declared that the sufferings of that night exceeded them all.

The hardships and dangers were not confined to those on shore. An officer whose detachment had not landed thus describes the duty he was called upon to perform, and the perils to which he was exposed:—"At night the rain came down in torrents, and the troops on the beach were drenched. Bad as their situation was, I envied it. At eight in the evening I had left the transport with another officer in a man-of-war's boat, which, assisted by two others, towed astern a large raft,

* The *Times'* correspondent, and several others copying him, represent the regiment first landing as the 7th Fusileers. Lieutenant Peard, and other military writers cognisant of the fact, affirm it to have been the 23rd Fusileers.

formed of two clumsy boats boarded over, on which were two guns, with their detachments of artillerymen, and some horses—two of my own among them. The swell from the sea was now considerable, and made the towing of the raft a work of great labour. As we approached the shore, a horse swam past us, snorting, and surrounded by phosphorescent light, as he splashed rapidly by. He had gone overboard from a raft which had upset in attempting to land. The surf was dashing very heavily on the sand, though it was too dark to see it. Fires, made of broken boats and rafts, were lit along the beach, and a voice hailed us authoritatively to put back, and not attempt to land, or we should go to pieces. Unwillingly the weary oarsmen turned from the shore. The swell was increasing every moment, and the raft getting more and more unmanageable. Sometimes it seemed to pull us back, sometimes it made a plunge forward, and even struck our stern, while the rain poured down with extraordinary violence. It was a long time before we reached the nearest ships, which were tossing on the swell, and not easily to be approached. The first we hailed had already a horseboat alongside, with Lord Raglan's horses, and needed assistance; and two or three others which we passed were unable to help us. By this time the raft was fast filling with water, and the men on it much alarmed; and our progress was so slow, that we took at least ten minutes pulling from the stern to the stem of the *Agamemnon*. At length a rope was thrown us from a transport near, whose bows were rising on the swell like a rearing horse; and getting the artillerymen who were on board her out of bed, we hoisted in our horses and guns—but the gun-carriages, too heavy for our small number of hands, were lashed down to the raft, which was allowed to tow astern of the ship, and which presently sank till the water was up to the axles, when the *Agamemnon* sent a party and hoisted them on board, and the raft shortly went to pieces. A horse, which had been swimming about for two hours, was also got safely on board. It was a grey, said afterwards to have been given by Omar Pasha to Lord Raglan. The next morning the surf abated, and we were all landed without accident, as were a great many other guns and horses, under the superintendence of Captain Dacres of the *Sanspareil*, who was indefatigable in carrying out the arrangements of Sir Edmund Lyons, and who was warmly thanked by Lord Raglan for his exertions. Assembling from the beach to the level of the common, we saw the allied army spread along the plains in front, the French on the right. Plenty of country waggons, full of forage, driven by peasants in fur caps, with their trousers stuffed

into their boots, were ranged alongside of the artillery camp, some drawn by oxen, some by large two-humped camels."

The same author gives the following useful information:—"The army being thus landed, it will be well to describe shortly its composition and material. A division of infantry, under Major-general Cathcart, had joined us from England just before we sailed from Varna. The English army in the Crimea then consisted of four divisions of infantry, each division consisting of two brigades; each brigade of three regiments. To each division of infantry was attached a division of artillery, consisting of two field batteries; each battery of four 9-pounder guns, and two 24-pounder howitzers. The brigade of light cavalry was also embarked, the heavy brigade remaining at Varna. With the cavalry was a 6-pounder troop of horse artillery. In all, the British mustered 26,000 men, and fifty-four guns; the French 24,000 men, and I believe, about seventy guns; the Turks 4500 men, with neither cavalry nor guns. The food supplied to the English troops by the commissariat was of very good quality. A ration for an officer or soldier was 1 lb. of meat, 1 lb. of bread, 2 ozs. of rice, $1\frac{1}{4}$ oz. of sugar, 1 oz. of coffee, and half a gill of rum, for which $4\frac{1}{2}$ d. was paid. The ration of meat was at one time increased to $1\frac{1}{2}$ lb.; but when provisions became scarcer this was discontinued. The ration for a cavalry, artillery, or staff horse, was 10 lbs. of corn, and 12 lbs. of hay or straw; for a baggage animal 8 lbs. of corn.

"A number of carts of a peculiar construction had been provided at Woolwich, to contain small-arm ammunition in reserve for the infantry. These, being found too heavy, were left at Varna, and the cartridges, packed in boxes or barrels, were carried on pack-horses, a great number of which had been purchased for the British government in Tunis, Syria, and Turkey. An ambulance corps, provided with light spring-waggons, containing layers of stretchers and seats for the sick and wounded, was also left behind; and disabled men were either carried on stretchers by hand, or in arabas, the common carts of Turkey and the Crimea."

The condition in which the British army found itself when the embarkation was completed, and the march in an enemy's country began, was pitiable in the extreme. There were no tents; the officers had no horses, except a few ponies, bought by them at a nominal price from sailors, marines, Zouaves, and Turks,—all of whom, it is to be feared, procured them in marauding excursions, and by depriving the poor Tatars who owned them of their property without any compensation. These ponies were very serviceable,

not only on the march, but long afterwards at Sebastopol, when they carried ammunition and food from Balaklava to the trenches. They were shaggy stout little creatures, sure-footed, and possessing wonderful spirit and energy, they seemed never to tire. The soldiers were without their knapsacks; the medical men without proper supplies of medicine, bandages, or other adequate means of either medical or surgical treatment. Destitution and disorder reigned in the British camp, so far as any arrangements were concerned that were not directly military; while the French exhibited an organisation nearly perfect.

The main cause of all the deficiencies was an incompetent staff. Scarcely any of the staff officers had a complete military education, the great majority of them no military education whatever. They were for the most part relations or friends of the general officers, and appointed to staff situations because an easy opportunity of promotion was by that means secured. Throughout the combats and battles that succeeded, rewards were lavished upon these staff officers, who suffered little privation, and saw but little real service; while the hard-worked regimental officers, many of whom distinguished themselves nobly on the field and in the trench, were not even mentioned in the despatches. The British commander-in-chief himself set the example of nepotism and favouritism. In his recommendations for promotion, he placed the favoured staff officers high on the roll of merit, some of whom had literally rendered no service; while the most brilliant achievements of the humbler commissioned and the non-commissioned officers were frequently neither recommended for reward, nor their heroism so much as named. Even when General Evans called attention to a certain sergeant of his division, as deserving the protection of the commander-in-chief, and the favour of his sovereign, the commander-in-chief did not think proper so much as to name him in his despatch. Five of Lord Raglan's own nephews were on his staff, and all of course received rapid promotion.

Even if the system in the camp and on the field of battle did not operate unfavourably in the promotion of the deserving, and the general care for the poor soldier, whether sick, wounded, or in health, the spirit which prevails at the Horse Guards would obstruct the melioration of the soldier's condition, and the just distribution of the honours and emoluments which the country is willing to bestow. Never did unfairness predominate more at the office of the commander-in-chief than since this war commenced. When, at a later period, Lord Panmure became war-minister, that single-minded man did much to correct abuses, and

to direct the stream of royal patronage in the right direction; but even his influence, and the power vested in his office, have not been sufficient to overrule, or even extensively to counteract, the fatal bias of Horse Guards' officialism.

Lord Hardinge, the present commander-in-chief at home, has the reputation of being a gallant soldier, and of great presence of mind in the field. He merits this opinion. At Corunna, Sir John Moore died in his arms; and Captain Hardinge had on that day won the notice and confidence of his chief. The battle of Albuera was gained by Colonel Hardinge. A happy disobedience of command on his part saved for us the honour of the field; his directions to Colbourn's brigade, so well executed by Colonel Colbourn (now Lord Seaton), turned the fortunes of the day. In the Belgian campaign of 1815, he was attached as British commissioner to the Prussian army, with the rank of brigadier. He displayed intelligence, military parts, great physical endurance, devotion to the service, and a dauntless contempt of danger. In India, in the first Sikh campaign, as second in command to Lord Gough, he exhibited courage and address of the highest order, and obtained the most eloquent eulogy ever pronounced by Sir Robert Peel upon any officer. As a man of business his merits are high. His Irish secretaryship and his paymastership of the forces were additional claims to the confidence of his party, if not additional laurels to his wreath. But with all this, Lord Hardinge has one blemish which is a blot upon his fair fame—he is essentially a party-man. He has belonged to that section of the cabinet constituted by the Peelites, but is a far less liberal politician than any of them. Sometimes we notice public men who, although not liberal politicians, are liberal men, and the converse of that is often seen; but Lord Hardinge is neither a liberal man nor a liberal politician. He has the soul of a hero, and the heart of a red-tapist. He will do the most glorious deeds for his clique, his faction, his profession, exemplifying sorrowfully the line,

“And to party gave up what was meant for mankind.”

The disparagement, morally and politically, which has befallen him by his sanction of poor Perry's persecution, cannot be obliterated by deeds of arms or official efficiency. It is plain that the public has nothing to hope from him, whatever his military *éclat* may be. If our soldiers are to be fed and clad, tended in sickness, and rewarded for gallantry—if officers without fortune are to rise in the grades of their profession, because of fitness, the British people must themselves effect all this, by causing their voice to be so heard in the legis-

lature as to make it unsafe for any man, whatever his rank, to dispense to favourites and men of personal or political connexions what right and justice claim for others.

At the outset of the Crimean campaign an opportunity is presented of placing before our readers the state of military education in England,—the relation it bears to the general condition of the army,—the discouragement which educated officers meet with from the government and the Horse Guards, unless they happen also to have money or connexions,—and the almost uselessness of the expenditure hitherto incurred by the country for its military schools. An officer who has seen active service for six years in the cavalry, and six years also in the infantry, thus writes upon this subject:—

“Until the commencement of the present century England possessed no public school for the education of infantry and cavalry officers; neither had she an efficient staff, nor the means of creating one. To supply the first of these deficiencies a military school was, in the year 1810, established at Great Marlow; while to provide for the second a similar institution was, in the year 1799, founded at High Wycombe, and subsequently removed to Farnham. These two schools, now united at Sandhurst, constitute the junior and senior departments of the Royal Military College. The governor of this college is invariably a general officer; and to him, under the control of a supreme board, are entrusted its interior economy, discipline, and general direction. The supreme board consists of the commander-in-chief, the heads of the principal military departments, and such general officers as her majesty may appoint. The senior department is stated in the royal warrant to be established ‘for the purpose of instructing officers in the scientific part of their profession, with the view of enabling them better to discharge their duty when acting in command of regiments—the situation in which they can best recommend themselves to us, and be entitled to hope for advancement in the higher stations of our service, and, at the same time, of qualifying themselves to be employed in the quartermaster-general and adjutant-general’s departments.’ In earlier times the senior department had its own military staff; General le Marchant and Sir Howard Douglas were attached to it, and General Jarry—who had been on the personal staff of Frederick the Great, who had served during the Seven Years’ war, and who was a most distinguished officer—acted as scientific instructor. Professors for fortification, mathematics, and languages, were also attached to the school. At the present moment there are but two professors attached to the senior department. M. Narien, the senior professor of

mathematics, teaches, in addition to his own proper branch, fortification, gunnery, tactics, and castremetation. The other professor teaches military surveying. Languages are taught by the professors of the junior department, provided for and paid by the cadets, though there is full scope and ample demand for their undivided exertions in the junior school. The number of officers studying at the same time in the senior department was originally limited to thirty, which limit was, in the year 1820, reduced to fifteen, and each of them paid £30 per annum for their education. The conditions required of a candidate for admission are, that he shall not be under twenty-one years of age; that he shall have served with his regiment three years abroad, or four years at home; and that he shall be thoroughly versed in the tactics of that branch of the service to which he belongs. He must also be familiar with the elements of algebra and mathematics, and of the Latin, French, or German language. Those students who have been educated at the junior department of the college, are expected to complete their course of study in three terms of six months each. Those who have been educated elsewhere are allowed an additional term. Every student is examined at the end of each term, and if his progress be unsatisfactory, he is recommended to join his regiment. The final examination is held before the supreme board, at the end of the pupil’s term of residence. Those who succeed are presented with certificates, to the effect that they are duly qualified to undertake the duties of staff officers.”

Here then is an institution founded expressly to educate our officers for that all-important branch of the army, the staff. In its earlier years it sent into the service many most valuable officers who served with distinction; and during the Peninsular war, when the general staff was most efficient, the officers appointed to the quartermaster-general’s department were almost invariably chosen from those who had received the benefit of this education. Why then was the staff of our army so disgracefully inefficient at the commencement of the present war? Why did not that army benefit by the efficiency of the men thus trained for such appointments? and why did it happen that out of 221 officers thus employed in the British army in 1854, two months after we had declared war against Russia, fifteen only had been trained in the senior department of Sandhurst? The answer is disgraceful alike to our military system and to those who direct it. To the system, because, although we provide the school and educate the officers, we do not insist upon their being afterwards employed on those duties for which they have especially qualified themselves—their claims are futile and

their time is wasted, because the commander-in-chief and the generals in the field may appoint on the staff whomsoever they choose, without reference to qualification or service. To those who direct the system, because favour and interest count for everything when they should count for nothing; and because the raw lad, who has just been gazetted, is certain of winning the race against the best officer Sandhurst ever produced, if he have interest at the Horse Guards, the cabinet, or even with the general officer commanding a division or brigade.

"The officers of the staff enjoy all the advantages of the army, such as higher pay, greater promotion, distinction, superior comfort, and lighter as well as more agreeable duties. It would therefore be but fair that its appointments should be held out as prizes, to be bestowed on officers of the greatest merit, or those who have rendered the most distinguished services, and above all on those only who are fully qualified. If the staff were so constituted, no other portion of the army would grudge the advantages it must possess, and merit would be certain of meeting with its due reward. But so far is that from being the case, that although 216 officers obtained certificates of qualification at the senior school at Sandhurst, in the period from 1836 to 1854, only twenty were employed on the staff during the whole of that time, and of these twenty, many, *ex. gr.*, Sir W. Gorum, Lord Hardinge, General Bainbridge, obtained their certificates long before the first-named year. In the year 1852, there were but seven officers on the whole staff of the British army who had passed through the senior school;—when such encouragement was held out to military genius and successful industry, what wonder is it that the senior school has fallen rapidly into a state of decadence, and that, at the present moment, there are but six officers availing themselves of its advantages? Let me give two instances of the benefit afforded by the senior school during the Peninsular war, as appeared in the evidence before the Sandhurst Committee. General Bainbridge, who lately commanded in Ceylon, was sent some time before the battle of Salamanca to make a survey of three or four square miles. He surveyed this country galloping from point to point, either dismounting or not, and 'stop pointing,' and taking 'shots' as they are called on his paper by the eye alone, without any instrumental survey. In two hours and a half he had completed the survey. It was all extremely rough but sufficiently clear. He brought it to Lord Wellington, explained to him the various steps, and the plan was approved. During some portion of the time he was making the sketch he was under fire from the French skirmishers. The position was not actually taken up, but it was very near the spot where the battle of

Salamanca was shortly afterwards fought. In what position would the gentlemen of Lord Raglan's family staff have been placed had a similar service been required at their hands? When a military force was preparing for foreign service in the year 1808, a general officer, a friend of Sir Howard Douglas, then director of the senior department, came to him at High Wycombe, and said that he had been appointed to the command of a brigade, and knew not what he might have to do in the course of service; perhaps in the operations of a siege, with the nature of which he was quite unacquainted. He knew infantry might be called upon to cover the opening of the trenches, to cover the formation of parallels, to guard the trenches, to furnish working parties, to oppose and drive back sorties, and to assault the enemy's works; but he was totally ignorant how he should act in such cases, and entreated Sir Howard Douglas to give him at least some general notion of approaches, parallels, and formation of gabions and fascines, saps, and the other processes of attack and defence. Sir Howard instructed an intelligent carpenter to make one of the large models which are now at Sandhurst, in constant use for the lectures on the attack and defence of a half hexagon of Vauban's first system. He then gave his friend a very useful and considerable idea of such matters, illustrated by reference to the model. The friend soon afterwards served at a siege, and when afterwards he met Sir Howard, he told him that he should never forget the few days he was shut up with him in the model room; and that it was impossible to conceive the confidence which that instruction gave him, from a feeling that he understood something of the operations in which he was engaged. That such knowledge might have been obtained with advantage by many who have served before Sebastopol, may be inferred from Sir Howard Douglas's curt and pithy reply to a question of Colonel Dunne, who asked, 'Have not a great many of those men who have gone out without any previous knowledge of fortification acquired practical knowledge under fire in the trenches?' Answer—'Yes, and many lives have been lost in consequence.' But the whole question is virtually set at rest; the superiority of Sandhurst officers for the staff, and the practical neglect of them in time of peace, are admitted by General Wetherall, adjutant-general, the Horse Guards' witness, and himself a pupil of the senior school. He says (I put the questions and answers into a narrative form) that latterly a very great preference has been shown to staff officers educated at Sandhurst; that this preference was on account of the supposition that they were better fitted for staff appointments, which supposition arose from their having had a better education; that

this supposition was as correct ten years ago as it is now, only the Sandhurst pupils did not get the benefit of it. Surely comment on such an admission is superfluous. Thus do our

military authorities neglect to form the framework of the staff during peace. What wonder that when war tries its strength it tumbles to pieces."

CHAPTER XXXV.

THE MARCH FROM OLD FORT UPON THE ALMA.—BATTLE OF THE ALMA.—SCENES AFTER THE BATTLE.

"Was it a soothing or a mournful thought,
Amid the scene of slaughter as we stood,
Where armies had with recent fury fought,
To mark how gentle nature still pursued
Her quiet course, as if she took no care
Of what her noblest work had suffered there?"—SOUTHEY.

THE French, as already recorded, debarked about two miles lower down the coast than the place at which the debarkation of the British took place. Having thrown out skirmishers, they advanced across the plain until their left and the British right came into proximity. The light division was on the extreme right of the British position; next them the first division, and the second to the head of the marshy lake already noticed. Behind these divisions, on the ground enclosed by the lake and the sea, the remaining divisions of the British army were encamped, and the stores and material of war behind all, nearest to the beach. About two miles in front of the British line there was a handsome Russian villa, surrounded by clumps of trees and some green plots, with considerable outbuildings in the rear. The first movement of the British was to secure this range of buildings, and a detachment of the rifle brigade occupied them, supported by some French light infantry with guns. The British light cavalry bivouacked by this place, which was well suited for the purpose; they immediately threw out detachments in skirmishing order, and the officers made reconnaissance of the surrounding country. To the left of the army, beyond the lake, another outpost was promptly established by the rifle brigade, supported by some of the Fusiliers of the same division. This outpost commanded a Tartar village, and the inhabitants received their martial neighbours with every token of good will. The Tartars of the surrounding country came down fearlessly to the encampment with oxen and arabas for hire; camels and ponies also, to carry either packs or riders. It is unaccountable how little use the commander-in-chief or the commissariat made of these advantages ready to their hand. Drovers of sheep, and honey, butter, milk, and eggs, were brought in abundance by the people, who made an extempore bazaar along the lines of the allies.

On the 18th a troop of the 11th Hussars advanced some distance into the country, for

the purpose of a reconnaissance previous to the march. Seven troops of Cossacks were engaged also in observing the movements of the allies; the Hussars, preserving skirmishing order, slowly retired before them. It left no favourable impression of the valour or efficiency of the Cossacks, when so small a detachment of British light cavalry retired from the presence of so large a body with impunity. The Hussars, thanks to the liberality of Lord Cardigan, and not to "the regulation price" of British cavalry horses, were admirably mounted; and they literally played with the Cossacks, as the latter, on their rough-looking but strong and agile little horses, attempted a pursuit. These Russian irregulars sat their horses with perfect ease, and managed their fiery little steeds dextrously. They were compact, short, sturdy-looking fellows, and carried lances of fourteen or fifteen feet in length. Had all our light cavalry been mounted like the 11th Hussars, their services would have been more useful both in the Dobrudscha, when reconnoitring the corps of Luders, and in the advance of the allied armies to the lines of Alma. But amongst all the other mal-arrangements of our army, the men of the light cavalry are too large and too heavy generally for that branch of the service, and the horses are too small, and not sufficiently fed. The following paragraph from an "Ex-Hussar" embodies in a short space the reforms in dress, accoutrements, and mounting, required in our light cavalry:—"1. For the pantaloons, as at present worn, must be substituted the pantaloons buttoning or tying at the ankle, with the Hessian drawn over it. 2. The substitution of the helmet for the present shako and Busby. 3. Either getting rid altogether of the present steel scabbard, or lining it with wood in such a manner as to protect the edge of the sword from being blunted, discontinuing, at the same time, all needless drawing of it. 4. Taking away the stocks. 5. Discarding the Hussar pelisse. 6. Discarding the lance. 7. Getting rid of everything that requires much cleaning,

uch as polished steel and brass, and pipeclayed elts, substituting for the latter brown or black elts. 8. Diminishing in every possible way the weight a horse has to carry—even our light cavalry ride from seventeen and a half to eighteen stone. No horse can work to advantage under such a weight. Those only who have practical experience know what marvellous things a horse can do when put to it under a fair weight, and how little he can do when overweighted even by a few pounds. Every horse in the cavalry ought to be above his weight—a margin to make up for bad food, &c. The reverse of this is the case; most of them have three or four stone too much on them. 9. The present Hussar and Light Dragoon saddle must be exchanged for one sitting closer to the back—more in the form of the common hunting saddle. The present saddles gall the horses badly.”

The late Captain Nolan probably attained to greater perfection in the discipline and handling of cavalry, especially light cavalry, than any officer in either of the allied armies, and his suggestions have, as far as they have been carried out in the British service, done much good; for while our men are not to be surpassed as swordsmen or horsemen, the system and its administration in that branch of the army still require much improvement.

During the few days that elapsed between the landing and the march, the men suffered exceedingly from an insufficient supply of water. A solitary spring supplied them; the water was brackish; and the soft margin was trodden down by the innumerable feet which frequented it, almost turning the water into mud. Dysentery and diarrhoea were extensively created by this cause, especially after the exposure of the troops on the inclement night of the 14th. During the three days before marching from Old Fort many of the men died of cholera. The dews at night were heavy; the sun was fierce by day; and the men as ill-prepared as an army could well be for these sudden transitions, so unlike the climate of their own lands. The men generally bathed in the sea during the hottest part of the day, and in many cases cramp or cholera speedily followed; the medical men do not seem to have interposed to prevent this pernicious practice. At midnight, on the 18th, orders were given for the army to be prepared to move by daybreak on the morrow. An officer of the 20th regiment records in the following terms his experience on coming into camp the next morning:—“We now marched into camp, and when we arrived, we found all hurry, bustle, and confusion. *Uncooked* rations were served out to the men, which some were unwilling to carry, while others, in the hurry to stand to their arms, were unable to obtain their portion. This

was a great pity; for I believe half the men of our regiment started without water in their kegs, to which in a great measure must be attributed the number who fell out during the march. The well was too far from the camp to allow them to fetch it that morning before they commenced their march; and considering the total absence of water in our line of march, *it should have been provided, and boats sent ashore with it from the ships, a very few of which would have been sufficient for their wants.* Our men thus started uncomfortably, and without their breakfasts, *for which no time was allowed them.* I fortunately had a small piece of cold boiled pork and biscuit in my haversack; this, and a pull at my water-barrel, composed my *déjeuner*. On arriving at head-quarters, we found our general, Sir George Cathcart, waiting for us, and were all much inspired by his active and soldier-like appearance. As soon as the waggon-train and commissariat carts arrived, and had passed on to some little distance, we marched. It was a very hot sultry morning, and the sun struck down on our poor heads with unusual violence. Our pace in marching was obliged to be regulated with great judgment, as we were on a vast plain, without even a drop of water, or shade of any kind. A more monotonous country I never beheld, and we had fifteen miles of it. It was nine o'clock before the whole of the army was prepared to march, *being delayed by the inadequate transport provided for the stores, baggage, &c. Many of our men fell down in the ranks, attacked by cholera, or from becoming faint and exhausted for want of water.* If they recovered shortly, they followed us with the rear-guard; but if not, they were left to the tender mercies of any passer-by. It was certainly much to be lamented that we had no ambulance waggons for these poor sick fellows who fell out on the march; for had they been carried a mile or two, or had a drink of water, I have no doubt half of them would have rejoined their companies. Ambulance-carts ought surely to have attended each brigade, and each should have carried some medicine, particularly when the cholera was likely to affect the army. The medical officers in general carried a small bottle of brandy and flask of water, which they gave the men, and were thus enabled to do much good. Some of our poor fellows actually came to me, and on their knees besought me for a drink out of my flask; and I am happy to say that I managed to relieve a few of them. I found in our brigade that the men of the other regiments fell out almost ten to our one.”

When, at a later period of the campaign, the government appointed a commission to inquire into the causes of so much suffering and loss of life as befell the British army from Old Fort to the end of the first winter before Sebastopol,

Sir John McNeil and his brother-commissioner could extract no answers from Quartermaster-general Airey, and his assistant, the Honourable Colonel Gordon, son of Lord Aberdeen, in reference to these and similar disasters, except that the rules of the service only required such and such distribution of camp utensils, apparel, &c.; that the men were not, in their opinion, so badly off; and that the transport of necessaries was no business of theirs. The chief of an army, and his quartermaster's staff, who could move the men upon such an enterprise, in such a climate, without water in their flasks, medicines, conveyances for the wounded, or almost any necessary, might well be incapable of proceeding against the greater difficulties before Sebastopol.

If the opinion of Marshal Saxe be sound, that "the best general is he who best feeds his soldiers," the test will be a severe one for the reputation of the British chief. A late general of the East India Company's service, well known as a political economist, and who had seen many campaigns, once said to the author, "The first duty of a general is to provide supplies for his men; British soldiers will always fight if their generals will see that they are fed. The officer chief in command of an army should leave nothing to commissaries or contractors; he should *command* everything, and bend all circumstances to the proper supply of his soldiers with food, shelter from the weather, and prompt medical assistance in sickness and in the field. No ability for military command can ever, in the long run, make up for neglect of these duties and precautions."

The following was the order of march :—

CAVALRY—8th, 11th, 17th.

LIGHT DIVISION. ARTILLERY. SECOND DIVISION.
FIRST DIVISION. ARTILLERY. THIRD DIVISION.
CAVALRY. COMMISSARIAT TRAIN.
FOURTH DIVISION. FOURTH DIVISION.

REAR GUARD.

The divisions were composed as follows :—

LIGHT DIVISION (commanded by Sir George Brown), 7th, 19th, 23rd, 33rd, 77th, and 88th regiments.

FIRST DIVISION (commanded by H.R.H. the Duke of Cambridge), the Grenadier Guards, Coldstream Guards, Scots Fusilier Guards, 42nd, 79th, and 93rd Highlanders.

SECOND DIVISION (commanded by Sir De Lacy Evans), 30th, 41st, 47th, 49th 55th, and 95th regiments.

THIRD DIVISION (commanded by Sir Richard England), 1st, 4th, 28th, 38th, 44th, and 50th regiments.

FOURTH DIVISION (commanded by Sir George Cathcart), 20th, 21st, 46th, 57th, 63rd, 65th, and 1st battalion of the Rifle Brigade.

CAVALRY DIVISION (commanded by Lord Lu-

can), 4th, and 5th Dragoon Guards, 1st, 2nd, 4th, 6th, 8th, 13th, 17th Dragoons and 11th Hussars.

The sight of the advancing hosts was most imposing. The men marched by double columns of companies from the centre of divisions, the artillery on their right. Never did a finer day beam upon the march of a great army; not a cloud could be descried within the horizon, and the whole heavens were of the softest azure; the morning sun shone as if in sympathy with the glorious spectacle that moved beneath his smile. The steppe was studded with grassy hillocks, and many of the officers of the advance guard and of the general staff assembled there, and beheld with surprise and delight the proud military array. On it swept over the dotted plain, as if in a grand review: it seemed a holiday spectacle for kings to gaze upon. The camps at Boulogne or Aldershot could present no such scene of military pomp: for this army was invested with all the grandeur that is connected with the association of a great host advancing to battle. There was a strange stillness, which was an element in the sublimity of the scene. No military music smote the ear with the boldness of its strains; no shrill trumpets challenged the warlike spirit of the listeners—hardly a tap of the "discordant drum" broke the uniform quietness; no tramp of warlike march, or rumble of rolling guns, resounded over the plain; for wheels, and hoofs of cavalry, and tread of men, all seemed muffled in the tall wild grass that flourished on the steppe. The great host seemed as if impelled by some mighty instinct to pursue a common course to a destination where events awaited it, so momentous that nature suppressed every utterance until she should find vent for her pent-up emotions in the cheer, the charge, the shout of defiance to the foe, and at the moment of glorious victory in

"The wild hurrah, that rattled o'er the plain."

The march continued without any appearance of an enemy, except a few Cossack videttes, until the army arrived at the Baganak, which is a sluggish stream, easily fordable, and presenting no obstacle to the advance of troops. The army filed across by a bridge, the light division, as had been usual in the campaigns of the Iberian Peninsula, taking the lead of the other infantry divisions; the cavalry forded the stream in various directions, and galloped on to a rising ground which might have concealed the proximity of the enemy. Scarcely had the light cavalry ascended the acclivity, when Cossacks showed themselves on the ridge, who precipitately retreated as they saw the British approach; the Hussars quickened their pace, which assumed the rapidity of a pursuit as they mounted the crest of the rising ground,

and charged down its southern slope. The horse-artillery, perceiving this movement, a troop hastened to join the cavalry, and soon afterwards the guns opened upon the Russians. The light division, advancing at a run, crested the ridge of the ascent, and drew up in line as spectators of the scene in the wide steppe below. Two thousand Cossacks, with a numerous and well-appointed horse-artillery, drew up as if to dispute the progress of the advanced guard of the allies; their guns opened, which were replied to by the few 6-pounders which had arrived at the front, and our cavalry, just half the number of the enemy, offered battle. Some shot and shell fell among our guns and cavalry; seven men were wounded, and several horses were rolled over upon the plain. It was afterwards ascertained that twenty-five men and thirty-five horses belonging to the enemy were hit. The carbines of the 11th Hussars principally inflicted this loss, for being so well mounted, they rode in small detachments very near to the Cossacks, and fired, retiring with impunity. Lord Raglan ordered a halt, and the Cossacks kept at a distance from the guns and carbines of the British. The army took up a position behind the slopes of the slight acclivity which the light division had surmounted, the cavalry were recalled, and the troops bivouacked. Patrols of cavalry were again sent forward, and observed the Cossacks slowly ascending another acclivity, upon the ridge of which the enemy showed himself in strength. Towards dusk, the right of the Russian line extended itself cautiously; and a movement against his flank being apprehended by Lord Raglan, the divisions on his extreme left had to abandon their bivouac fires, and fall back until that wing rested upon the Bulganak, presenting a front upon the left of the line sufficient to give a satisfactory reception to any meditated attack.

The first night of the march southward was spent quietly. The soldiers on the extreme left again piled up such materials as they could collect for watch fires. Groups gathered round them until a late hour, and talked of home, and kindred, and country, of the enemy, and the morrow. Some died by those bivouac fires on that calm and lovely night, as its dews fell upon the sleepers; for the British had no tents—they lay upon the bare earth, wrapped in their greatcoats, such as had the good fortune to possess them. At this time there were good blankets in store, of which the government had provided a liberal supply, but a small portion of which ever reached the soldiery: Quartermaster-general Airey, and his assistant, the Honourable Colonel Gordon, being of opinion that the men could keep themselves warm by huddling together, and did not require extra supplies of blankets. Rugs of an excellent

quality had also been supplied by the home government, but the men never got them, for the sapient reason that there was nothing said about rugs in the regulations of the service. The next morning many men had to drop behind from sickness, and as there were no ambulances, and no arrangements for their safety, a portion of them must have perished on the steppe. This would have been the fate of others, perhaps of all, but for the generous sympathy of our allies, not only French but Turks.

The advance of the army in the way it now proceeded was a violation of all the old rules of war, but an innovation justified by all the circumstances of the case. In war it is an axiom that an army must not advance without establishing points of support, with which the communications must be sedulously preserved. The place for the debarkation of stores should, by precedent, have been entrenched and occupied in force while the army proceeded. A body of troops should also have been detached to the extreme left, to prevent the enemy from outflanking the advancing army, and throwing themselves upon its lines of communication. In the present march, the attendance of a powerful steam navy obviated the necessity of these precautions. The army had a *movable* point of support in its fleet, and therefore did not require a place of arms in its rear. Its line of communication was in fact the coast; its basis of operations was the sea. If the enemy had attacked the left wing in overpowering force, it would have fallen back, so that the army might form a line parallel with the sea, and under cover of the guns of the fleet. If a general action were fought in such a position, the vertical fire of the ships would prove destructive to the enemy, as no force of field-artillery could compete with them. Our French allies rested their right wing upon the sea, while the extreme left of the British extended upon the wild steppe; and the whole army operated in perfect confidence that it could advance or re-embark as the fortune of war, and the exigencies of its condition, might determine.

On the morning of the 20th, as day dawned, columns of smoke were seen ascending in different directions from Tartar villages burnt by the receding Cossacks; and not only were the villages destroyed, but the peaceful people were plundered and maltreated by their ostensible protectors. Colonel Beckwith, an officer of merit, was borne through the camp at early dawn to the sea-shore, and placed on board a boat belonging to the *Orinoco*, in which ship he died; cholera attacked him soon after he lay down by his watch-fire. Officers as well as men arose from the damp long grass stiffened and chilled, and the troops, officers and men,

looked haggard and worn, as if they had undergone the hardships of a protracted campaign. The first sounds, on the morning of the 20th, were those of the tools of the sappers, miners, and pioneers, as they levelled the banks of the Bulganak, to make a passage for the artillery; the hum of voices crept along the line as the men stood to their arms; rumours that a general action might in a few hours be expected ran through the divisions, and all were busily discussing its probability when Marshal St. Arnaud appeared in front of the British. He had been to the Russian post-house, where Lord Raglan held his quarters, to confer upon the expected operations, and as he rode along the British front he was enthusiastically cheered. He appeared to inspect the appearance of the troops with deep interest, and seemed struck by the sickly and chilled aspect which they bore. His own soldiers had comfortable tents, their rations well cooked, and served out with regularity and system; the British were in nearly as much confusion as the morning before, in the preparation of their hasty repast, and many marched on without any refreshment whatever. Lieutenant Peard, of the 20th regiment, returning from a picket by the banks of the Bulganak, relates that, but for a pot of coffee shared with him by the quartermaster of the regiment, he believes that he must have sunk down exhausted at the beginning of the march. Marshal St. Arnaud seemed much pleased with the reception given him by the English soldiery, and it appeared also to gratify Lord Raglan, for his fine countenance was lighted up with a glow of confidence and pleasure. Passing the 88th regiment (the Connaught Rangers), the marshal exclaimed, "English, I hope you will fight well to-day!" the expression seemed to grate upon the ears of that fire-eating corps, and a voice half angry loudly exclaimed from the ranks—"Sure, your honour, we will; do we not always fight well?"

At length the allies began their march, over ground similar in character to that which they had already traversed; the horizon, however, being more frequently bounded by the ridges of elevations gradually ascending from the steppe, but not deserving the appellation of hills. The scene of the advance was even more picturesque and brilliant than the day before; the long lines of bayonets glistening in the sun were most imposing, the sabres and lances of the cavalry flashing above them, and, out at sea, the fleets moving onward to afford support when required: the whole presented a sight most gorgeous—it was a grand moving panorama, never to be forgotten by any whose fortune it was to be spectators. As one solitary grassy ridge after another was overtopped, and the line of the river Alma approached, the

excitement of the host increased, for it was whispered throughout the army that the Russians had resolved to defend the passage of the Alma, and had occupied its overlooking heights in formidable force. The French moved along a good road by the sea-shore; the Turks marched partly in reserve of the French, and partly in advance of the British right, for the line presented an oblique front as it moved, the coast line being the most direct. A little before noon the Turks in advance of the British right approached a jutting elevation, where a sharp, steep cliff descended to the shore. Suddenly a steamer opened fire, sweeping the edge of the cliffs with its guns; there was no enemy in sight, but the vigilance of the sister-service was thus exercised, lest a concealed force might there dispute the advance of the Turks from a favourable position. The troops moving upon the Alma by its disemboisement here passed it, and took up a position upon the left flank of the enemy. Soon afterwards the British topped the last of those grassy ridges which we have already described, and the scene of the approaching conflict was at once presented to view in its natural beauty and the artificial array of war. The plain from the slopes of this ridge was level for more than a mile, where the ground dipped towards the river, forming a valley rich in vegetation, and clothed with orchards and vineyards.

On the opposite side of the river arose a double line of heights. The first were high, steep, green hillocks, covered with plateaux, upon which masses of Russian troops were posted, and powerful batteries commanded the whole of the low grounds on the southern banks of the Alma. Behind these fortified plateaux rose another range of elevations, steeper and more rugged, but communicating by paths and tracks with the smooth knolls on the range below. On this second range reserves of infantry were posted, and some batteries. Masses of cavalry occupied the knolls in support of the infantry, who were ranged behind the batteries. Along the whole front of the British this was the character of the Russian position.

From the French lines the aspect of the enemy's position was different. The double range of elevations were there also to be seen, but the lower range was more precipitous, naturally stronger, and requiring less assistance from art to resist an attack. From the steepness of the sides of these knolls, guns could not well be placed in battery by their defenders; but they occupied the plateaux with fieldpieces and infantry, without cavalry, for which the nature of the ground was not so suited as on the line opposed to the British. On the second range of heights reserves of infantry were also posted, as in front of the

English. The two ranges merged as they approached the sea, where the bank terminated in a cliff almost perpendicular, traversed only by a narrow path, up which it was impossible to pass except in single file. Along these paths the Turks crept, and found no enemy, as the Russians either deemed the summit inaccessible, or knowing that any troops posted there would be attacked by the guns of the fleet, they did not occupy it. The enemy had for three weeks been leisurely preparing these lines for a desperate defence; they were the Torres Vedras of Prince Menschikoff, the Russian commander-in-chief. He fortified to the utmost a position which nature had, as we have shown above, made most formidable to an assailing army, whatever its numbers or quality. The Russian batteries were generally armed with 24 and 32-pounders, which were supported by howitzers. The declivities to the river's bank were occupied with skirmishers, armed with two-groove rifles, carrying a solid conical ball seven or eight hundred yards. Trees were felled and laid across the track over which the troops must advance when storming the positions; and piles of wood were set on fire as soon as the action commenced, drifting clouds of blinding smoke into the faces of the assailants. How troops could conquer such a position may well excite the astonishment of all who make themselves acquainted with it. How any general of skill could lose such a position before an army storming it in front, is also justly a matter of astonishment. We feel convinced that had the allied armies been placed upon those heights, the whole force of Russia could not have expelled them.

It was remarkable that the Russians displayed no colours, as our army afterwards learned lest a single stand should by any chance be borne off by the allies. The British and French displayed their standards, and the fire of the Russians was incessantly directed upon them; hence many officers fell who had the perilous honour of carrying their country's ensigns on that bloody day. The confidence of the Russian chief and of his troops was so high, notwithstanding that he was so careful of his colours, that he had invited parties of friends from Sebastopol to witness how his batteries would sweep the enemy from the level banks of the northern side of the river. Many ladies were actually at the head-quarters of the Russian army, and witnessed the approach of the allies, which was described as magnificent from that point of view. The celerity of movement on the part of the French, and the compact and solid appearance of the red masses of the British contrasted, so as to make up the picture as a whole with the more impressive effect. When the ladies saw that the allies

were not swept from the field by Prince Menschikoff's batteries, but were pressing with determined resolution over the boundary which separated the contending hosts, they thought it time to retire and consult their safety, which soon rendered a rapid flight necessary, contrary to all the vain-glorious promises of the redoubtable Menschikoff, and the cherished but delusive expectations of protection from the holy Vladimir.

About noon the French light division came in sight of the village of Almatamak, and soon after the British light division sighted the village of Busliak, both situated on the right bank of the river. The advance of the British, as they arrived upon the ridge from which they first beheld the enemy's position, was in this order: It came on in columns of brigades; on its left the cavalry, and detachments of artillery; on its right was the extreme left of the French army: an area of five or six miles was occupied. The light and second division led; the first (the Guards and Highlanders) and third followed; the fourth was in reserve. The leading division was about a mile in advance of the heads of columns of the fourth division. The action may be said to have commenced about noon, by the French fleet cannonading the heights, which they continued to do for an hour and a half without any loss, but inflicting considerable injury upon the Russians, the shells bursting among the masses of the Russian infantry. This enabled the French light infantry to scale the heights and take the enemy in flank; and for a considerable time their advance was but little impeded by his fire. A body of Russian infantry formed in a hollow was unseen by the French, and was just about to open fire upon them, under circumstances which would have given them great advantage, when a succession of shells from the ships burst over and among them, and in their hurry to escape from the position, they were exposed to a desultory but still deadly fire from the ascending tirailleurs. So rapidly did the Zouaves clamber up the steep precipices, that the enemy was outflanked before any well organised resistance could be made to the daring intruders. Accustomed in Africa to make war among the Arab fastnesses, the Zouaves seemed quite at home in the peculiar duty that devolved upon them, and displayed in its performance the most dauntless courage. They had to encounter one very formidable obstruction. On the top of the ascent there was a small building, used by the Russians as a signal station, and which was not completely built, the scaffolding standing against the walls and near the roof. It afforded an excellent position for the defence; from the scaffolding and the eaves, from every aperture, and from behind the walls of the

fabric, the Russian riflemen kept up an incessant fire. Many of the Zouaves fell around that building as they made one desperate attempt after another to storm it. After several destructive repulses, the place was gained; it was carried by the bayonet, the Russians remaining and maintaining their fire until the Zouaves, entering the building, and climbing the scaffolding, by hand-to-hand encounter terminated the struggle in victory. The Zouaves continued to mount upward, sending before them their leaden heralds, until at last the highest point was gained, the tricolour floated over sea and cliff, and the imperial eagle of France looked proudly over the still contested heights. The appearance and costume of the conquerors have been thus described:—"The Zouave wears a sort of red fez cap, with a roll of cloth at the base to protect the head; a jacket of blue cloth, with red facings, decorated with some simple ornaments, and open in front so as to display the throat, and a waistcoat or under coat of red comes down to the hips. Round his waist a broad silk sash is folded several times, so as to keep up the ample pantaloons and to support the back. The pantaloons of scarlet cloth fit close over the hips, and then expand to the most Dutchman-built dimensions, till they are gathered just below the knee in loose bagging folds, and almost look like a kilt. From the knee to the ankle the leg is protected by a kind of greaves made of stout yellow embroidered leather, laced (with black stripes) down the back, and descending over the shoe. The whole costume is graceful, easy, and picturesque. The men (natives of France, and not Arabs, as many suppose) are young smart fellows, about five feet six inches in height, burnt to a deep copper tint by the rays of an African sun, and wearing the most luxuriant beards, moustaches, and whiskers; it is, however, hard to believe these fierce-looking warriors are Europeans."

While General Bosquet and his Zouaves were storming the face of the cliff, so as to take the Russian army in flank, other divisions of the French were fording the river, to form a junction with him, as his division soon became hard pressed on the plateau, to which they had forced their way. Canrobert, with his own division, and a brigade from General Forey's, crossed the river, where the boats of the French fleet had ascertained in the morning that it was fordable, near the village of Almatamak. Opposite the ford, as the boats' crews had also ascertained in the morning, there was a path by which men or mules could ascend, but only in single file. Up this steep Canrobert's division gallantly made their way, dragging their guns up with incredible toil, being all the while exposed to the fire of the

Russian sharpshooters, and occasionally to that of the Russian fieldpieces on the lesser plateau. Prince Napoleon's division, which was still more to the left, nearer to the British, found another ford, with a similar path ascending immediately from it, but more devious, and winding round nearly to the same spot of the heights to which the track conducted by which Canrobert pressed his ascent. General Canrobert and the Prince making good their ground, driving the Russian riflemen through the cover, Marshal St. Arnaud sent the remaining brigade of Forey's division nearer to the mouth of the river, where crossing they ascended the cliffs from the sea-shore, supporting Bosquet's fatigued and overtasked soldiers. Thus, from three different points, all converging, the Russian left flank was assailed; and, in spite of batteries, the unremitting fire of the rifles from the ravines and cover of the rocks, the volleys of musketry from the infantry drawn up in line, and the demonstrations of heavy cavalry and lancers in support of the other arms of the defence, Canrobert and Prince Napoleon made their upward progress; while Forey's second brigade, unopposed, quickly gained the summit, and poured in upon the Russian flank volley after volley of musketry; the scattered Zouaves of General Bosquet's division were enabled to reform upon the brigade of Forey: and thus the left wing of Prince Menschikoff, taken in front and flank in the most masterly manner, had but little chance of securing a victory, even if the British had been less successful. The Zouaves were still fighting around the telegraph when the first battalions of Canrobert's division arrived to their assistance; and the telegraph was stormed at the moment these battalions made their way, over piles of dead and wounded, to the assistance of their comrades. Farther on to the left, the French bravely seconded the actions of their extreme right; the river was forded, the Russian rifles were driven from beneath the shelving rocks, grap and canister showered into the gullies within which they found shelter; and up the hillsides, exposed to the fire of some splendid batteries of brass guns, 32 and 34-pounders, the French, under the immediate command of St. Arnaud, forced their way. No praise could exceed the merits of the French staff. Too ill to take a more active part himself, St. Arnaud gave clear instructions, which his staff saw executed with punctilious accuracy. These gentlemen rode among the divisions, giving directions, and preventing the slightest irregularity; so that the French moved with the celerity of deer, and with the regularity of clockwork, in the accomplishment of every order given by their chief.

According to the plan of battle agreed upon

NATIVE OF THE ALMA.

between the allied commanders, the attack by the French upon the Russian flank and left wing was to precede, in order, the attempt of the British to storm the heights of the enemy's right and right centre. When Bosquet should make good his ground, and the footing he might secure upon the heights be followed up by larger masses of the French, so as to engage seriously and anxiously the Russian left, putting Prince Menschikoff in alarm from being outflanked, then the British were to profit by the confusion and alarm of the Russians, and storm the heights in their front. Before the British moved to the attack, Prince Menschikoff attempted to execute, in reference to them, the same manœuvre which, on his left flank, the French practised upon him. He detached a powerful force of cavalry and artillery, in fact, the whole of his reserves, for the purpose, upon the left flank of the British. To counteract this danger, Lord Raglan directed the cavalry and a strong detachment of horse artillery to hold them in check; but the light division, and the Guards and Highlanders, were not entirely free from apprehension in that direction, as the enemy's cavalry were four to one in relation to the force under Lord Lucan, and the Russian artillery also possessed a great comparative preponderance. The Earl of Cardigan displayed great activity and excellent management during this operation. Captain Nolan also rendered great services by his superior proficiency in cavalry tactics. To his judicious suggestions it was mainly due that so small a force kept at bay a force so large at a conjuncture so critical. His personal courage was conspicuous; riding out sometimes unattended, or accompanied only by a single orderly dragoon, he reconnoitred the enemy, and vigilantly anticipated every movement.

We have already shown how the action gradually crept along from the sea to the centre of the allied line. While the last movements of the French which we have described were taking place, the British right, advancing, came under fire of the batteries on the knolls which formed the first range of heights in the defence. General Pennefather's brigade of General Evans's division first felt the fire of the enemy. Throwing out the light companies, the enemy's skirmishers retired, setting fire in their retreat to the hamlet which was in front of the Russian centre, but on the right or northern bank of the river. The smoke of the burning hamlet concealed the Russian position, preserved it from the more accurate fire of the British artillery, and prevented the infantry from carrying into effect with certainty any plan they might have formed for storming the heights in that direction. The enemy's artillery having previously secured the range, had

only to fire through the accumulating smoke. General Pennefather caused his men to lie down behind the burning dwellings, and by this means secured them from the overwhelming fire which was directed along the plain sloping to the river. It was the design of General Evans to pass through the village, and ford the Alma at that point; but the conflagration frustrated this plan, and the brigades, separating to the right and left, passed round the flaming hamlet, and took the stream. Pennefather took the right, nearest to the French left, dashed bravely through the eddies which at that point deepened the current, and commenced the terrible ascent under showers of destructive missiles of every sort. General Evans in person wheeled round the left of the burning houses with the other brigade of his division, stimulating the men by that display of heroic courage for which, during fifty years of active service, this most distinguished officer is renowned. The light division passed into the valley, to General Evans's left; this division moved furtively forward, making every cover available, after the manner of light troops, and springing forward when there was the least lull in the roar of the enemy's artillery. Directly in front of the light division was a terrible battery of eighteen brass guns, which had practised the range for days before, and which literally swept the approaches to the river, tearing up the ground in every direction, and sending balls through the ranks of the battalions, which now cautiously but eagerly pressed forward to the struggle. They forded the river in the most difficult place that could have been selected; the bank was abrupt, so that the men had to drop into the water, and, as they did so, sunk to the shoulders; some had to swim, and the wounded, in many instances, sunk to rise no more in life. To the left of the light division, the first division, under the Duke of Cambridge, came up in support at the juncture when the struggle was fiercest. Sir Colin Campbell, who commanded the Highland Brigade, and Sir George Brown, who commanded the light division, displayed great courage, and put forth prodigious exertion; indeed, all the generals of division and brigade rode in front of their men, waving their hats, and intrepidly encouraging the advance, their horses foaming with toil and excitement as their riders spurred them up the perilous ascent. Yet on they go—

“The wild steed's sinewy nerves still strain
Up the repelling bank.”

Both Sir George Brown and Sir Colin Campbell had their horses killed; but both heroes, although contused, led their men, like Ney at Waterloo, sword in hand and on foot, amidst

storms of fire such as seldom has been directed against an attacking host.

The contest in front of the light division assumed a most sanguinary and even doubtful character. The battery before them was covered with an epaulment, the only battery except one other on the rear of the extreme right which was so protected (a thick low bank of earth is thus technically termed). This battery swept the whole British line, and was most skilfully worked. There was not a British regiment in action that did not suffer from its fire. A wide road, lined on either side by a stone wall, separated the first and second divisions (those of the Duke of Cambridge and General Evans). This road led to a bridge, near which also a ford gave facility for the passage of the river. Upon this spot the crossing fire of the Russian batteries converged, showering incessant destruction all around; nor could the troops of either division which reached that spot have lived a moment there, had it not been that the ground suddenly slopes upward in a direction opposite to the Russian line of fire, so that the balls glanced off in the angle of accidence, smiting only those who were immediately near the spot where they fell. This formidable fire was counterbalanced to some extent by the British batteries, under Captains Franklin and Turner, which were brought up behind the village. But few men of either battery escaped the struggle. Their fire was marked by the most splendid precision, every shot falling into the 18-gun battery, and causing its fire to slacken. While the struggle was maintained by the second and light divisions, and the Russian batteries were mowing down our men as the sickle of the reaper removes the corn, Lord Raglan, whose personal courage throughout the day reflected upon him the highest honour, crossed the river between the French left and the British right, whence he could see the Russian batteries in reverse. To that position he ordered two guns to be moved, and opened upon the Russian batteries and the infantry of their centre. This occurred just as the Russian left was driven back by the united efforts of Bosquet, Canrobert, and Prince Napoleon. The effect was most telling: these two guns were worked with consummate skill, and great rapidity of fire; every shot told. Lanes were literally opened through the Russian battalions, causing the artillerymen to falter; and the batteries also suffered, several of the guns being quickly dismantled. Two British field-batteries, stationed on the left, were brought up to the second division; and unlimbering on the side of the road already described, also opened upon the 18-gun battery, and the infantry stationed to support it.

The position of the Russians on that part of

the defence now became desperate. Assailed in front by four British batteries, served in the perfection of artillery practice, taken in reverse by the guns under the immediate direction of Lord Raglan, and the French pressing forward on the left flank with a destructive fire of artillery and musketry, they began to retire. While yet they were preparing to remove the cannon from the 18-gun battery, Brigadier-general Codrington led his brigade to the epaulment under a terrible fire of musketry, and bursting in, charged the enemy with the bayonet. Captain Bell had the honour of capturing the first gun. The masses of Russian infantry in support poured in volleys of musketry; and after the brigade lost 600 men, it was forced to retire from the unequal conflict. At this critical juncture the Duke of Cambridge, with his division, arrived, and Codrington's brigade, forming under cover of its attack, advanced again to the charge. The Guards and Highlanders divided, the one entering by one flank of the battery, and the other at its opposite side. Each brigade seemed eager for the honour of the danger, but Sir Colin Campbell, waving his hat, cried aloud to his men, "We'el hae nane but Hieland bonnets here!" and his brave Highlanders, as if the words were an inspiration, dashed onward with a deafening cheer; and as the Guards secured the recaptured guns, the Highlanders, bringing their bayonets to the charge, rushed upon the Russian infantry, who turned and fled before they felt the steel. It was afterwards said by the prisoners that they took them for cavalry, because of their strange dress; and not being able to form to receive cavalry, turned and fled. Codrington's brigade was again upon the track of the enemy, and passing over the spot where so many of their gallant comrades fell, they opened a destructive fire upon the Russian infantry; and other regiments coming up, a line was formed upon the ground by the brigades of Guards, and those of Codrington and Pennefather. The Highlanders, more to the left, were menaced by cavalry. At this period the Russian infantry reserves, which had earlier in the action attempted to outflank the British left, now advanced upon the tried troops who stood panting and exhausted upon the bloody slopes their matchless valour won. The moment was critical; Lord Raglan observed it, and anxiously inquired from the commandant of artillery if some guns could not be brought up the slope so as to open fire upon the Russian column. Being answered in the affirmative, the order was given, and skilfully executed. Just as the dark compact Russian column descended the slopes where the decimated and toil-struck brigades were ready to receive it, and contend for the maintenance of the position they had won, the

guns ordered up by Lord Raglan played upon it with destructive energy, rendering it impossible for any formation to be preserved; the column ultimately turned, and, covered by the cavalry, withdrew. Another dense mass of Russian infantry seemed resolved upon an obstinate defence, when it halted in a ravine upon the British right, close to the outflanking French. This body of troops halted, as was afterwards learned, not from gallantry, but stupidity; their commander became bewildered, as he was in imminent risk of being placed between the French and British. He was not only puzzled himself, but he puzzled his enemies by the simplicity of his conduct; for Sir De Lacy Evans, who was upon the extreme right of the army, twice commanded the British guns to be silent, fearing that they were firing upon our allies. The Russians, taking heart, delivered a volley of musketry, and received in return shot and shell from the English cannon; causing terrible havoc among them. They fled, pursued by the artillery—the infantry was too much fatigued to follow; but as the body of the enemy's infantry retired from the scene of battle, they lost great numbers of men from the fire of our guns. The Russians were now swept off their positions along the whole line from their extreme left; but they made front on the rear of their extreme right, being greatly favoured in the operation by the aid of their cavalry. Our own cavalry, so useful in the earlier stages of the action, in guarding the British left flank, made no effort to harass the enemy at the close of the struggle. The honour of finishing the battle of the Alma fell to the lot of the Highland brigade; they stormed a battery of seven guns in the rear of the Russian right. This battery, referred to before as being covered by an epaulment, opposed to the Highlanders a heavy and death-dealing resistance; but it was carried by Sir Colin and his blue bonnets at the point of the bayonet. The last stand made by the Russian infantry was in front of the Highlanders, after they had stormed the 7-gun battery; it was an unfortunate attempt to redeem a lost day, for the whole brigade threw in a close volley upon them, which covered the field with the fallen where the stand was so vainly made. Yet notwithstanding the signal success of our infantry, the Russians carried away all their guns but three; this they were enabled to effect by the numbers and efficiency of their cavalry. Lieutenant Peard complains, in his interesting narrative, "that we had plenty of cavalry, but not where they were wanted." Marshal St. Arnaud, in a private letter, bitterly deplored the want of a few squadrons. The 1000 British horse might have harassed the enemy, especially as the horse-artillery pursued until

they were themselves in danger from the Cossacks. Too much was expected from Lord Lucan's weak division of troopers by his critics, but beyond doubt too little was attempted. Guns and prisoners might have been captured, and if not to any very great extent, yet the beaten foe would have been still more disheartened if any show had been made of a cavalry pursuit.

Lieutenant Edwards, of the artillery, captured a Russian general at the close of the day, who was hiding himself, crouched beside his horse, which had thrown him. Lord Raglan rode up and addressed the general, who admitted that the Russian army numbered about 50,000 men at the beginning of the action. He said no man in the Russian army believed that the position could have been stormed by the allies; and then pausing, as if to account for their success, he added, "But we came to fight men, and not devils!" The principal trophy was the carriage of the Russian commander-in-chief, Prince Menschikoff. The St. Petersburg papers have since denied that the commander had any carriage, alleging that the equipage captured belonged to a civil servant of distinction, sent with despatches to the military chief. Be this as it may, Prince Menschikoff's papers were found in it. In a copy of a despatch to the emperor, discovered amongst them, the prince assures his majesty that if his position on the heights of Alma were not altogether impregnable, it would at least detain the allies three weeks.

The battle was seen from the fleet, and the descriptions given by those who beheld it from that point of view represent the scene as magnificent. There seemed no ebb of battle; the tide rose upward until its resistless wave swept every impediment away. Mr. Layard, the distinguished Eastern scholar and antiquarian, and not less distinguished as a patriotic member of the House of Commons, was on board the *Agamemnon* while the heights were stormed. The author of *Eothen* rode with Lord Raglan's staff throughout the day; Mr. Russell, the *Times'* correspondent, and other literary gentlemen of note, also shared the dangers of the field, as military amateurs, or in the performance of their duty as correspondents to the press.

Prince Menschikoff retired from the field much chagrined and humbled, but with exclamations of furious hatred to the allies, and thirst for revenge. This bigoted and tyrannical man, in his selfwill and over confidence, committed great military faults, and thereby lost a position one of the easiest to maintain which an army ever occupied. Long after the military and naval career of the prince had closed, and that of his autocratic master had also terminated, the succeeding czar,

Alexander II., bitterly upbraided the obstinacy of judgment and general incompetency of the humiliated chief. The occasion of giving a brief notice of the Menschikoff family here presents itself. We quote an American serial of superior reputation for the literature of war and politics:—"The first Menschikoff has now been more than a century dead, yet there are those alive who can say that they have seen him face to face, fresh in colour, and in form as when he lived. After the death of Catherine I., he, with his whole family, was banished to Siberia. He died in exile at Berezov, in 1729. No stone, not even a wooden cross, marked the place of his last abode. But tradition preserved a record of it, and in 1821 the curiosity of a governor of Tobolsk caused his remains to be disturbed. At Beresow (in nearly 64 degrees of north latitude), beneath a few feet from the surface, the ground never thaws; and Menschikoff's body having been deposited in this region of perpetual ice, was found, after he had been ninety-two years entombed, perfectly unchanged. The greater part of his apparel, his eyebrows, and his heart, were transmitted to his descendants. If they could have reanimated the brain of the *ci-devant* pieman, and bestowed it upon his princely descendants, the gift might have been of some value. The first Menschikoff had some features in common with his descendant, who was lately used as an instrument to set the world together by the ears. It seems generally admitted that the rude seaman sent to Constantinople is a sincere bigot, and that craftier men, relying upon his bigotry and rudeness, employed him on a mission where such qualities were sure to provoke a quarrel. The first Menschikoff preserved, amid all his changes of fortune, the deep devotion of the Russian *mujik* to his church. During his exile at Berezov he was incessant in his endeavours, by acts of voluntary humiliation, to make atonement for the more questionable acts of his prosperous days. He worked with his own hands at the erection of the first small wooden church reared at Berezov; he officiated as sexton in it after it was finished; and, at his own request, his body was deposited before its door, where every worshipper must tread over it on entering, without any mark to show where it had been placed."

The strategic and tactical conduct of the Russian forces at the Alma, and the general incompetency of the Russian officers, have been thus criticised by another American publication of note:—"The Russian army has among its officers the very best and the very worst men, only that the former are present in an infinitesimally small proportion. What the Russian government thinks of its officers it

has plainly and unmistakeably shown in its own tactical regulations. These regulations do not merely prescribe a general mode of placing a brigade, division, or army corps in action, a so-called 'normal disposition,' which the commander is expected to vary according to the ground and other circumstances, but they prescribe different normal dispositions of all the different cases possible, leaving the general no choice whatever, and tying him down in a manner which, as much as possible, takes all responsibility from his shoulders. Any army corps, for instance, can be arranged in battle in five different ways, according to the regulations; and at the Alma the Russians were actually arrayed according to one of them—the third disposition—and, of course, they were beaten. The mania of prescribing abstract rules for all possible cases, leaves so little liberty of action to the commander, and even forbids him to use advantages of ground to such an extent that a Prussian general, in criticising it, says—"Such a system of regulations can be tolerated in an army only the majority of whose generals are so imbecile that the government cannot safely entrust them with an unconditional command, or leave them to their own judgment."

On the part of the allies the battle was conducted with equal skill and valour. Perhaps less loss of life might have occurred if the British had not attacked quite so soon. The arrangements between the two generals-in-chief required that the French should make good their ground upon the left flank of the enemy, so as to engage him in a contest of such a nature as would greatly lessen his capacity to resist the British upon his right and centre. Before the French had perfectly accomplished the task assigned to them in these arrangements, Lord Raglan, becoming impatient, ordered the troops to advance. The object of his lordship was to diminish the probability of loss of life, as the men were suffering much, where they lay upon the ground for cover from the fire of the Russian batteries, when this order was given. It is likely that had the order been delayed, the second and light divisions might have been spared many of their braves who fell in crossing the turbid Alma, and in ascending the fortified steeps beyond. The allies were greatly favoured by the weather; never did a finer day show light to warriors. Had not the morning been so serene, the boats would not have been able to go in and sound the fords, and examine the cliffs, nor the ships to direct so steady a fire upon the steeps which faced the sea. The whole field of action presented facilities for the attack, the ground being hard and dry, which conduced to success. This was strikingly exemplified by the narrative of Colonel Hamley, in the following

reference to the fact, when at a subsequent period he compared the various events and circumstances of the campaign:—"A review of the past convinces me that with the means we had the course taken was a right one, and that we may consider ourselves fortunate in having been impelled into it. Throughout the war very little foresight is apparent, if any has been used. There has been little opportunity for free action, and once begun, all seems the result of sheer necessity, like the descent of a *Montagne Russe*. The chance character of the campaign is notably illustrated by the state of the weather on the day and hour when I write this—noon, on the anniversary of the Alma. Last night, the anniversary of our bivouac on the Bulganak, was a night of winter's cold, storm, and rain; and to-day the dreary drenched plains are thick with mud, while over them still whistles a chilling wind, driving sharp showers before it. Had that season been as this, we should have advanced upon the foe, not as then, with a bright sun and a firm soil, but over boggy plains, our limbs, cramped by the stresses of the previous night, scarcely enabling us to lift our mud-laden feet to the margin of the Alma, where we should have found a turbid, swollen flood, instead of a clear stream, while the vineyards on its overflowed banks would have been a vast swamp. Such circumstances might well have changed the fate of the day and the war."

The sun set on the 20th of September upon sorrowful scenes on the banks of the Alma. The whole field of combat was strewn with the wounded and the dead. On the right bank most of the wounded British had been borne to the rear during the engagement, but in the vicinity of the stream, and close around the ruins of the burned hamlets, killed and wounded men of the light and second divisions were numerous. Ascending the slopes the red-coats lay thickly, especially in patches where the range of the enemy's guns was sure, and around the contested batteries sad havoc had been made among our brave men. About the 18-gun battery and its epaulment there lay a heap of British fallen, and on the slope ascending to the most hotly-contested spot numbers of the men of the 7th Royal Fusiliers, the 23rd Royal Fusiliers, and the 33rd, or Duke of Wellington's Own, had fallen. In some of the ravines and gullies formed by the action of the rivulets which seek the current of the Alma, might be seen small groups of our soldiers who had died in every attitude of struggle, and surrounded by generally thrice their number of Russians. These British soldiers had been fallen upon by superior force, detached from their battalions, and sold their lives dearly, as the scene of conflict proved. To the far left of the British position, where

the Guards stormed the battery, which, like the 18-gun battery to the British right, had an epaulment, there was a line of shakos marking where a whole rank of the gallant Guards were swept down beneath grape and canister as they advanced to the storm. Farther to the left, a few Highland bonnets marked the spot where the brave Scots had closed the fight, pouring the final volley upon the wavering foe. If the appearance of the field testified that the British had won a difficult victory, it also proved the severity of the Russian loss. The Russians mainly fell by round-shot and the bayonet. Our musketry did comparatively little execution, the infantry having pressed on through storms of shell and shot, relying on the bayonet, our artillery covering their approach, and tearing asunder the dense columns of the enemy's infantry when attempting to support his batteries. There was no part of the field where the British had left their killed and wounded, except the right bank and the left margin of the river, where the Russian dead, dying, and wounded, were not far more numerous. The 18-gun battery was choked with piles of Russian slain; the resistance here was desperate, and in and around this blood-stained spot the British bayonet had inflicted extensive slaughter. In one of the ravines or gullies already referred to there lay a heap of the enemy, where it would seem as if they had been caught as in a trap, and had fallen under heavy discharges of musketry. On the plateau to the extreme right of the enemy's position, where the heavy column had formed which was so opportunely broken by the guns directed against it under the immediate orders of Lord Raglan, a very great number lay about the field horribly mutilated by round-shot; and to the extreme Russian right about fifty lay dead in line, who had fallen under the last volley of the Highlanders.

Near the sea the aspect of the field was similar, except that the proportion of Russians who had fallen before the arms of our allies was not by any means so large; but on one spot—the telegraph station—the dead of both French and Russians lay thickly strewn. The entrance was barred by fallen Russians, and in every compartment of the building they covered the floor. Some hundreds of killed lay in a hollow near at hand, presenting a sight which might appal the stoutest heart. The French set up a large stone on the plain beyond the signal tower, on which they inscribed "*Victoire de l'Alma*."

The 21st and 22nd were spent in removing the wounded, or dressing their wounds where they lay. The French removed their wounded with the greatest care, in ambulances suitable for such a purpose; every surgical and medical

appliance was available; the most perfect order and organisation marked everything. In fact, our allies were ready to march in pursuit of the Russians on the morning of the 21st; Marshal St. Arnaud being of opinion that it was desirable to do so, in order to prevent them taking up a still stronger position on the heights of the Katcha river; but Lord Raglan was unable to move until the 23rd, as his army was nearly entirely destitute of all that an army ought to have in such circumstances. There seemed to have been no foresight, no organisation; many perished of their wounds upon the field where they fell, and many died on board ship, because of the delay in attending to them, and the miserable condition in which they were placed when surgical aid was at last provided. Richer in the resources of peace or war than our ally, our army felt poverty-pinched and wretchedly provided in every way, and the result was delay at a moment when, had the enemy been followed up as Marshal St. Arnaud was prepared to follow him, he would have entered Sebastopol disheartened and broken, and our army might possibly have entered with him. Lord Raglan, in a despatch subsequent to the engagement, gave the following unsatisfactory reason for the destitution of his army:—

“My anxiety to bring into the country every cavalry and infantry soldier who was available, prevented me from embarking their baggage-animals, and these officers have with them at this moment nothing but what they can carry, and they, equally with the men, are without tents or covering of any kind. I have not heard a single murmur. All seem impressed with the necessity of the arrangement; and they feel, I trust, satisfied that I shall bring up their bat-horses at the earliest moment. The conduct of the troops has been admirable. When it is considered that they have suffered severely from sickness during the last two months; that, since they landed in the Crimea, they have been exposed to the extremes of wet, cold, and heat; that the daily toil to provide themselves with water has been excessive; and that they have been pursued by cholera to the very battle-field, I do not go beyond the truth in declaring that they merit the highest commendation. In the ardour of attack they forgot all they had endured, and displayed that high courage, that gallant spirit, for which the British soldier is ever distinguished, and, under the heaviest fire, they maintained the same determination to conquer as they had exhibited before they went into action.”

It would be difficult to conceive of anything more absurd than the first sentence of the above extract. In order to bring every available man into the field, all are brought there in such a plight, as to field equipage, that a large number cannot be expected to be “available” after

the first day of hard weather, and so totally unprovided with means to succour the wounded that, upon the first field of victory, hundreds perished who would otherwise have lived to serve their country. The statement in the same extract, that no man murmured, was true as to any unmanly repining, or unwillingness to encounter the severest hardships which the service of their country required; but was far from being true as to the feeling men and officers entertained of the arrangements which left them to undergo such misery, while Frank and Turk were provided with tent and transport, and the ambulances of our careful ally showed what ought also to have been provided in the British army. If the anxiety of Lord Raglan to bring every available man into the field caused him to leave everything but men and arms behind, how deficient in zeal for his country and the allied cause Marshal St. Arnaud must have been, in taking care to secure means of transport, tents, ambulances, and medical stores! We have no hesitation in pronouncing which course was the more worthy of a great general and a zealous patriot,—the vast number of lives saved in the army of St. Arnaud, and the number of British lives saved by his assistance, sufficiently decides.

Many of the wounded Russians were conveyed to Odessa, Admiral Deans Dundas addressing to the governor of the place a letter, requesting that on the score of humanity they should be received as non-combatants until exchanged. The condition in which these poor wounded prisoners were delivered up to the governor was horrible beyond description. The St. Petersburg journals, not knowing that the British soldiers were no better off, denounced in angry and indignant terms the mock humanity of landing men whose wounds were bandaged with hay and straw, so that gangrene supervened in almost all cases, scarcely any having received any medical or surgical treatment that deserved the name. It was not, however, want of humanity on the part of the British nation, as the St. Petersburg authorities subsequently acknowledged, which caused the barbarous scenes witnessed at Odessa upon the landing of these wounded men; it was the incapacity of those to whom the British nation entrusted its affairs at home and abroad.

When the British army commenced its march from the Alma, Dr. Thompson bravely remained with the Russian wounded who lay behind upon the field, without a tent to shelter him, tending with unwearied assiduity his fallen foes. This heroic and humane man died of cholera soon after he reached Balaklava. The pestilence followed our armies to the Alma; it actually sought its victims upon the field of battle; and brave and useful men, high upon

the lists of authority and renown, perished from its stroke, who had escaped the carnage of the conflict. Among these was Brigadier-general Tylden, of the Engineers, one of the most useful officers in the British army. Numbers of the men fell victims to the pestilence on the night of the 20th, and on the two following days.

The moral influence of the victory was felt by all the armies engaged. The Russians were awed and astonished at the daring of the allies, especially of the British. The French were loud in their praises of the dauntless heroism of their English competitors for fame. St. Arnaud is represented to have said, "It was well you

English had to storm the heights in front; no other troops could have effected it in such a manner." Canrobert exclaimed, "Could I but have the honour of commanding an English division for a single campaign, I should attain my highest ambition!" These panegyrics were deserved; never men fought with finer courage, or sense of duty more stern. The contempt of danger was such, that were we to attempt to give any extensive narrative of its display, our records would read like pages of romance—

"Groom fought like noble, squire like knight,
As fearlessly and well."

CHAPTER XXXVI.

CONGRATULATIONS OF THE COMMANDERS.—TIDINGS OF THE BATTLE BORNE THROUGH EUROPE.—THE DESPATCHES OF THE GENERALS.—EXPRESSIONS OF APPROBATION TO THEIR ARMIES BY THE ALLIED GOVERNMENTS.—SPIRIT OF THE BRITISH TROOPS, AS EVINCED BY THE CORRESPONDENCE OF THE MEN.

"Oh forget not the field where they perished,
The truest and best of the brave."—MOORE.

THE congratulations of the commanders of the allied armies, of the generals of divisions, and the officers and men generally, formed an interesting episode in the events after the battle. Each host was full of admiration at the skill and bravery of the other. Perhaps the British were more struck with the skill than even the heroism of their allies, while the French expressed unbounded praise of the intrepidity of the English. In the previous chapter it was noticed that Lord Raglan anticipated the time agreed upon for the British attack. It is curious that just at that moment St. Arnaud became anxious for the division of Bosquet, and for the troops of Canrobert's and Forey's divisions which had been sent to support it, and directed one of his staff to urge upon Lord Raglan an immediate and vigorous advance, as the Russians were pouring down in support of their extreme left in numbers sufficient to overwhelm the French troops there opposed to them. Great was the satisfaction of St. Arnaud when he saw the divisions of Generals Evans and Brown rising from the ground, where they were recumbent, to escape the enemy's shot and shell, and, as he expressed it, "Like a sea of fire surging upwards against the batteries of the foe, destroying every obstacle to its course." Frequently did the French marshal revert, in conversation with the staff of both armies, "to the inspiring sight of the British advance." These encomiums were justified, especially when it is remembered that the troops were not veterans; for few of them had ever been in action before, although most of the generals and superior

officers, and many of the regimental officers, had been made acquainted with battle in India and at the Cape.

The divisions of Generals England and Cathcart (the third and fourth) having been kept in reserve, took little part, but had a complete view of the whole action; and the generals, officers, and men of these divisions, were filled with admiration at the valour displayed by their countrymen. They were also struck with the hardihood of many of the soldiers of the second, light, and first divisions, who, wounded early in the conflict, were carried to the rear, but when their wounds were dressed, limped back to follow their regiments into the thick of battle, or "falling in" with the reserve divisions, waited for the moment when they might again be brought to the charge. Several of these brave fellows crept far to the front of the third and fourth divisions, and lay on the grass watching the fight, and cheering as loudly as their weakness permitted when they saw their comrades rise from rock to rock, conquering their way up every steep, in the face of batteries and the dense columns of infantry by which they were supported. Marshal St. Arnaud, writing home to his government, expressed the highest opinion of British valour; he represented them as having fought "like gods;" the enemy represented them as having fought "like devils:" each in his own temper, and with his own view of the spirit that actuated them, bearing testimony to the fierce and indomitable courage which the English infantry and artillery displayed. The encomium passed by Marshal St. Arnaud upon

the British commander-in-chief was also deserved. "The bravery of Lord Raglan rivals that of antiquity; amidst an incessant shower of balls and bullets his coolness never forsook him." The estimate formed by the British chief of the French commander was thus expressed in a letter to the Duke of Newcastle: "I will not attempt to describe the movements of the French army—this will be done by an abler hand; but it is due to them to say that their operations were eminently successful, and that, under the guidance of their distinguished commander, they manifested the utmost gallantry, the utmost ardour for the attack, and the high military qualities for which they are so famed."

While the allies had thus new grounds for mutual admiration and esteem, the naval and military character of the enemy fell in the opinion of both. The plan of battle on the part of Prince Menschikoff was bad; the strong positions were only well defended so long as the Russian troops were under the impression, which their officers had before inculcated, that they were impregnable. As soon as they saw the indomitable spirit of the British conquering obstacles which Menschikoff deemed insurmountable, they removed their guns, to protect which they fought desperately,—as one of the maxims of the Russian army is never to lose a gun to the enemy, whatever number of men may be lost in its defence. As soon as the guns were brought off, under the protection of their powerful cavalry, the infantry became completely disorganised, and fled *en masse* at the approach of the British horse-artillery.

On the field, after the battle, the conduct of the wounded Russians was infamous. Many of our men and officers were murdered by them while engaged in assisting them by binding their wounds or offering them refreshment. A writer who made himself conversant with these circumstances, by collating a great number of different accounts, thus reviews the information furnished to him, both as to the generosity of the conquerors and the ingratitude of the vanquished:—"Nothing could exceed the kindness of the British officers towards the Russian wounded, which was in some instances responded to in the most ferocious way. One man fired at and deliberately wounded an artilleryman, who had just given him some water to quench his thirst; an indignant Guardsman immediately knocked his brains out. Another instance is mentioned of a Russian soldier, severely wounded, soliciting of a marine some water to drink, and whilst he was in the act of turning him round, the ungrateful wretch shot him dead; the marine's comrade instantly revenged it by killing him at once. But the most melancholy instance of

the sort was that of Sir A. Young, who was shot by a wounded Russian, to whom he was about to offer a cup of water. Of the Russians wounded, about 700 were placed in a vineyard near the river, and provisions were sent them by the English general, even when our men were dying from the want of proper attention."

The tidings of the battle excited the most lively joy as they were borne through Europe, except amongst the armies and in the courts of Germany, southern Italy, and the Netherlands. The officers of the Austrian and Prussian armies could scarcely be restrained from wearing some emblems of mourning. The courts of Berlin and Vienna in vain endeavoured to suppress their chagrin. In Munich, Dresden, and other petty capitals of Germany, the feeling produced among the royal circles was dismay. But in no cities in Europe did sympathy with the beaten Russ show itself so openly as in Athens, Naples, and Florence. Otho and his queen drooped in despair; "King Bomba" shut himself up, refusing to be seen even by his courtiers. The Duke of Tuscany could scarcely be restrained, by the Austrian minister reminding him of the consequences, from insulting such British subjects as were at Florence. At Brussels the court played a double game; congratulating the Western powers, but leaving the courts of Germany and Russia the impression that an imperious policy alone dictated these words of friendship, that in reality the disaster to the czar wounded deeply so discreet a monarch and admirer of legitimacy as Leopold. At the Hague a profound silence was observed by king and court, but both mourned over the misfortunes of the czar. The people of all these capitals, with one exception, rejoiced in the victory. In Germany, the Netherlands, and Italy, the courts were alarmed and scandalised at the ebullitions of enthusiastic sympathy with western Europe. At Athens the people shared the despondency of their prince, but gnashed their teeth upon the French and English in the spirit of assassins. In the defeat of Russia on the heights of the Alma they only saw the probable hopelessness of their expectations, that through Russia an intolerant ascendancy of the Greek Church in Europe and the East would be in time established.

When the news reached Constantinople, the seraglio seemed to lose its sullen aspect—its silent abodes echoed with joy. The gravity of the Turk yielded to the inspiring tale of victory, even when borne by a Giaour; and in the bazaars, and by the shores of the Bosphorus, eager groups listened while British and French detailed the events of the battle, and pointed out its results. As the wounded came

to Constantinople, they were treated with hospitality, and even reverence, almost realising Goldsmith's picture of

"The broken soldier kindly bid to stay."

The rejoicings at Stamboul were communicated to the Turkish provinces with unusual rapidity, and met with a similar response. At Alexandria, more especially, public manifestations were encouraged by the authorities; and the pasha skilfully adapted them to the tastes of Europeans. The Egyptian viceregal court, encouraged by the intelligence, sent renewed proffers both of men and money to the great padishaw; and all over the vast dominions of the sultan a revived loyalty arose upon the news of the victory of the Alma. Some dissatisfaction was felt that the Turks took no prominent part in the battle; but it was shown that not more than three-fifths of the British had been engaged, and a proportion of the French not much larger, and this satisfied the honour of the Turkish government and army.

At Malta, Corfu, Gibraltar, the Ionian Isles, in the fleets, and wherever throughout the Mediterranean, the Sea of Marmora, the Bosphorus, and the Euxine, a sailor or soldier of the allies was found, the victory of the Alma was celebrated, and the health of the men who won it toasted in terms of exuberant joy and eulogy. A graphic specimen of the feeling excited as the intelligence spread is given by the author of *A Month in the Camp*. "It was ten o'clock in the morning of the 30th of September; we had anchored in the Golden Horn, when a barge, full of red-fezzed, loose-trousered soldiers, was rowed by. 'Look at those lazy Turks!' cried somebody. 'Those are not Turks,' said a gentleman, who had just come up the ship's side; 'they are *Zouaves*, wounded at the Alma:' and, in a moment, he was telling us the glorious tale! I leave you to imagine the effect of such a recital in such a scene. There, with her rich argosies, her full-domed mosques, and spear-like minarets, lay Stamboul, coveted of czars—

• • • • • 'Teterrima belli
Causa.'

Yet no one thought of her: every eye was fixed on the narrator, or followed the receding forms of those who had bled in the conflict he was describing; while the faces of the listeners burned as if they already felt the breath of war."

The rejoicings in France surpassed those in the East. Our mercurial neighbours celebrated the event, as they have always been accustomed to honour great victories, by reviews, illuminations, processions, music, and theatrical performances. Wherever the English appeared, in Paris or the French provinces, at the fêtes

which were given to commemorate this great success, they were welcomed with enthusiasm, and the highest compliments paid to the valour of their nation.

In the British Isles, the joy was not less heartfelt, if the manner of expressing it was less tasteful. Both Houses of Parliament honoured the mighty brave. The queen manifested deep feeling on the occasion, and the whole royal house of England wept for the fallen heroes while they exulted in victory. The distinguished courage of the Duke of Cambridge, the first time he was ever under fire, gave great satisfaction to the court and to the country, and congratulations and addresses, almost too numerous to receive, were presented at Cambridge Lodge, Kew, to their Royal Highnesses the Duchess of Cambridge and the Princess Mary, the mother and sister of his royal highness, whose anxiety to hear of his safety was so happily followed, not only by the tidings they longed for, but also by accounts which proved that, in the hour of trial, their dear relative had shown himself an honour to his country. Her majesty, who shared deeply in the family anxiety for the safety of her royal cousin, also participated in the pride which his family and his country felt in the manner in which he had conducted himself upon his first field of battle. Seldom has a prince been placed, in his first feat of arms, in a situation so trying, or in a command so responsible, and his royal highness justified the confidence placed in him. Her majesty, no doubt, remembered the early morning when, from the windows of Buckingham Palace, she and her consort and children waved their kinsman and his gallant Fusiliers a tender adieu; and thankful was her kind heart to know that he had passed unscathed through the bolts of battle, cheering on to victory and deathless fame the brave men to whom the recollection of her kind adieus was an incentive to heroic deeds when, far away, her honour was to be sustained. Linked in inseparable fate, her renown and theirs was interwoven, and the majesty of her name and the glory of her standards was not committed to her gallant Guards in vain. It has been represented by some writers, who seem eager to bring high rank into contempt whenever an apparent opportunity may be seized upon for so unworthy a purpose, that the Duke's courage faltered upon the field, and that he meditated a retreat, from which he was only prevented by Sir Colin Campbell momentarily assuming the command. This is a faithless perversion of what occurred. The line of the brigade of Guards was much broken in ascending the heights, to storm the epaulmented battery on the Russian right, and the Duke for a moment contemplated doing what Brigadier Codrington

had to do a short time before at the 18-gun battery, to retire and re-form, and what General Bosquet's division had to perform under the protection of the brigade of General Forey. Sir Colin Campbell perceiving that, as there were no immediate supports, such a policy would have been unwise, advised his royal highness to preserve the advance; and, addressing himself to his brigade in terms calculated to stimulate his Highlanders, he led them on, sword in hand, to the desperate assault. The experience of Sir Colin was of course much greater than that of his grace, who showed his discretion in attending to the counsel of such an adviser in so great an emergency; but Sir Colin himself could not have shown more personal courage than his royal highness, who, hat in hand, cheered on his men with the most dauntless bearing in the face of every peril.

The metropolis and the provinces vied in alacrity to bestow honour upon the achievement, and the men who performed it. The civil authorities proclaimed the victory in the chief places of public resort in the City; the Duke of Newcastle communicated with the London daily papers, furnishing the telegraphic despatch in the first instance, and afterwards the more detailed intelligence. In the several cities, groups of men were gathered at every public place of resort, to hear what any had to tell or to read of the great event. The area of the Liverpool Exchange had never before been so crowded on occasion of the intelligence of a victory. The metropolitan cities of the sister countries displayed similar eagerness for the news, and exultation in the joy it brought. In the Dublin Theatre, boisterous cheering indicated the popular satisfaction. It was natural that the Dublin and Edinburgh populations should join their acclamations to those of the great metropolis, as the most conspicuous heroes among the generals were from Ireland and Scotland: Evans and Pennefather are Irishmen; Brown and Campbell, Scotch. This circumstance also gave pleasure in England, as it tended to equalise somewhat the honour of the three countries, and soften down any little jealousies which the superior power and wealth of England may create in the sister lands.

Pervading the congratulations and rejoicings throughout the British Isles, there was a religious feeling that did honour to the country. While due homage was rendered to British courage, there was universal acknowledgment of the providence of God, and on the Sabbath which succeeded the arrival of the telegraphic announcement of victory, thanksgivings were offered up in the churches of every, or almost every, denomination of Christians. No appointment of a day of thanksgiving was required—the spontaneous gratitude and religious feeling of the churches made one. We cannot but

believe that the prayers offered and the public addresses delivered on that Sabbath had great influence in causing the people to feel that the war was a just one, and ought to be prosecuted with fortitude, self-sacrifice, and an humble dependance upon the approval and assistance of God. This feeling of thankfulness throughout the country, as well as the sense of triumph was sustained and increased upon the arrival of the despatches, in which the magnitude of the victory was made more apparent than it had been by telegraphs, or other fragmental and desultory news. The first despatch written was by the commander of the French army, who, pitching his tent upon the spot where the carriage of Prince Menschikoff was captured, dated his report from the field of battle. The next day the marshal sent a more full and complete despatch, dated from the bivouac of the Alma; and the day following supplemented this intelligence by another despatch from the head-quarters at Alma. These accounts were received in England with intense satisfaction. The brilliant tone of the marshal, his warm tribute of praise to his British coadjutors, and the fact that these graphic and spirited compositions were written by a man dying of a torturing disease, drew the attention of all classes to them. The following are accurate copies of these most interesting papers, followed by the scarcely less interesting despatch of Admiral Hamelin, Commander-in-chief of the French Black Sea fleet. As Admiral Hamelin is commonly represented to have been born a British subject—a native of the county of Louth, in Ireland, our readers will take the more interest in the distinctions he so honourably won in the service of our ally, and in the accounts transmitted by him of the operations of the allied forces:—

Field of Battle of Alma, September 21.

SIRE,—The cannon of your majesty has spoken; we have gained a complete victory. It is a glorious day, sire, to add to the military annals of France, and your majesty will have one name more to add to the victories which adorn the flags of the French army.

The Russians had yesterday assembled all their forces, and collected all their means, to oppose the passage of the Alma. Prince Menschikoff commanded in person. All the heights were crowned with redoubts and formidable batteries. The Russian army reckoned about 40,000 bayonets, from all points of the Crimea; in the morning there arrived from Theodosia 6000 cavalry and 180 pieces of heavy and field artillery. From the heights which they occupied, the Russians could count our men, man by man, from the 19th to the moment when we arrived on the Bulganak. On the 20th, from six o'clock in the morning, I carried into operation, with the division of General Bosquet, reinforced by eight Turkish battalions, a movement which turned the left of the Russians and some of their batteries. General Bosquet manoeuvred with as much intelligence as bravery. This movement decided the success of the day. I had arranged that the English should extend their left, in order at the same time to threaten the right of the Russians, while I should occupy them in the centre, but their troops did not arrive until half-past ten. They bravely made up for this delay. At half-past twelve the line of the allied army, occupying an extent of more than a league, arrived

on the Alma, and was received by a terrible fire from the tirailleurs.

In this movement the head of the column of General Bosquet appeared on the heights, and I gave the signal for a general attack. The Alma was crossed at double-quick time. Prince Napoleon, at the head of his division, took possession of the large village of Alma, under the fire of the Russian batteries. The prince showed himself worthy of the great name he bears. We then arrived at the foot of the heights, under the fire of the Russian batteries. There, sire, commenced a real battle along all the line—a battle with its episodes of brilliant feats of valour. Your majesty may be proud of your soldiers; they have not degenerated: they are the soldiers of Austerlitz and of Jena. At half-past four the French army was everywhere victorious. All the positions had been carried, at the point of the bayonet, to the cry of “*Vive l’Empereur !*” which resounded throughout the day. Never was such enthusiasm seen; even the wounded rose from the ground to join in it. On our left the English met with large masses of the enemy, and with great difficulties, but everything was surmounted. The English attacked the Russian positions in admirable order, under the fire of their cannon, carried them, and drove off the Russians. The bravery of Lord Raglan rivals that of antiquity. In the midst of cannon and musket shot, he displayed a calmness which never left him. The French lines formed on the heights, and the artillery opened its fire. Then it was no longer a retreat, but a rout; the Russians threw away their muskets and knapsacks in order to run the faster. If, sire, I had had cavalry, I should have obtained immense results, and Menschikoff would no longer have had an army; but it was late, our troops were harassed, and the ammunition of the artillery was exhausted. At six o’clock in the evening, we encamped on the very bivouac of the Russians. My tent is on the very spot where that of Prince Menschikoff stood in the morning, and who thought himself so sure of beating us that he left his carriage there. I have taken possession of it, with his pocketbook and correspondence, and shall take advantage of the valuable information it contains. The Russian army will probably be able to follow two leagues from this, and I shall find it to-morrow on the Katcha, but beaten and demoralized, while the allied army is full of ardour and enthusiasm. I have been compelled to remain here in order to send our wounded and those of the Russians to Constantinople, and to procure ammunition and provisions from the fleet. The English have had 1500 men put *hors de combat*. The Duke of Cambridge is well: his division, and that of Sir G. Brown, were superb. I have to regret about 1200 men *hors de combat*, three officers killed, fifty-four wounded, 253 sub-officers and soldiers killed, and 1033 wounded. General Canrobert, to whom is due in part the honour of the day, was slightly wounded by the splinter of a shell which struck him in the breast and hand, but he is doing very well. General Thomas, of the division of the prince, is seriously wounded by a ball in the abdomen. The Russians have lost about 5000 men. The field of battle is covered with their dead, and our field hospitals are full of their wounded. We have counted a proportion of seven Russian dead bodies for one French. The Russian artillery caused us loss, but ours is very superior to theirs. I shall all my life regret not having had with me my two regiments of *army chasseurs*. The Zouaves were the admiration of both armies; they are the first soldiers in the world.

Accept, sire, the homage of my profound respect and of my entire devotedness.

MARSHAL A. DE ST. ARNAUD.

Head-quarters, Bivouac of the Alma, Sept. 21.

M. LE MARÉCHAL.—My telegraphic despatch of yesterday gave you a brief summary of the results of the battle of the Alma. The accompanying sketch, hastily done as it is, will give you a more complete idea of it. From it you will be enabled to judge of the difficulties which we have had to overcome in the capture of those formidable positions. The course of the river Alma is winding, with steep banks, and with fords few and difficult of passage. The Russians had posted in the bottom of the valley, covered with trees, gardens, and houses,

and in the village of Bouliouk, masses of sharpshooters, who were well covered, armed with rifles, and who received the heads of our columns with a galling and continuous fire. The flank movement of General Bosquet, commanding the second division, and which that officer executed on the right with much intelligence and vigour, had fortunately prepared the forward and direct march of the two other divisions, and of the English army. Nevertheless, the position of that general officer, who for a long time found himself alone on the heights with a single brigade, might be endangered, and General Canrobert had, in order to support him, to make a vigorous turn in the direction indicated in the sketch. I had him supported by a brigade of the fourth division, which was in reserve, while the other brigade of the same division, following General Bosquet, proceeded to support him.

The third division marched right to the centre of the position, having the English army on its left. It had been arranged with Lord Raglan, that his troops should make on their left a flank movement, analogous to that which General Bosquet effected on his right, but, incessantly menaced by the cavalry, and with great numbers of the enemy’s troops posted on the heights, the left of the English army had to give up the execution of that part of the plan.

The general movement began at the moment when General Bosquet, protected by the fleet, appeared on the heights. The gardens, from which an incessant fire of Russian sharpshooters poured, were before long occupied by our troops. Our artillery moved in turn up to the gardens, and began to cannonade the Russian battalions which were *echeloned* along the declivities in support of their retreating sharpshooters. Our troops, pressing on with incredible boldness, followed them along the slopes, and I lost no time in moving my first line across the gardens. Each man passed where he could, and our columns ascended the heights under a fire of musketry and of cannon which was powerless to arrest their march. The crest of the heights was crowned, and I sent out my second line to the support of the first, which dashed onward to the cry of “*Vive l’Empereur !*” The reserve artillery was in turn carried along with a rapidity which the obstacles presented by the river and the steepness of the ascent rendered extremely difficult. The battalions of the enemy, driven back upon the plateau, soon opened their guns and musketry on our lines, but which terminated in their definitive retreat, effected in very bad order. A few thousand cavalry would have enabled me to convert that retreat into a regular rout. The night came on, and I prepared to establish my bivouac with water in our neighbourhood. I encamped on the field of battle, while the enemy was disappearing from the horizon, and leaving the ground strewn with his dead and wounded, besides the large number he had already taken off. While those events were passing on the right and centre, the lines of the English army crossed the river in front of the village of Bouliouk, and advanced to the positions which the Russians had fortified, and where they concentrated considerable masses, for they had not judged that the steep declivities comprised between that point and the sea, and covered by a natural ditch, could be occupied in force by our troops. The English army encountered therefore a strong and well organised resistance. The combat which it opened was of the warmest, and does the highest honour to our brave allies. In short, M. le Maréchal, the battle of the Alma, in which more than 120,000 men, with 180 pieces of cannon, have been engaged, is a brilliant victory, and the Russian army would not have recovered from it if, as I have already observed, I had had cavalry to pursue the disorganised masses of infantry who were retiring from before us loose and scattered. This battle proves, in the most striking manner, the superiority of our arms at the very commencement of this war. It has in a great degree weakened the confidence of the Russian army in itself, and especially in the positions long previously prepared, and on which they awaited us. That army was composed of the sixteenth and seventeenth divisions of Russian infantry, of a brigade of the thirteenth, of a brigade of the fourteenth division of reserve of the foot chasseurs of the sixth corps, armed with rifles throwing oblong balls, of four brigades of artillery, two of which were mounted, and of a battery drawn from the reserve park of

siege artillery, comprising twelve pieces of large calibre. The cavalry was about 5000, and the whole force might be estimated at about 50,000 men, commanded by Prince Menschikoff in person. It is difficult for us to estimate the loss of the Russian army, but it must be considerable, if we may judge by the killed and wounded that they could not take off, and who remained in our hands. In the ravines of the Alma, on the plateaux in front, on the ground forming the position taken from the enemy by the English troops, the earth is strewn with more than 10,000 muskets, haversacks, and other articles of equipment. We devoted the whole day to burying their dead in all directions where they were found, and in attending to their wounded, whom I have ordered to be transported with our own men on board the ships of the fleets, to be conveyed to Constantinople. All the Russian officers, generals included, were clothed in the coarse great-coat of the soldiers; it is, therefore, difficult to distinguish them in the midst of the dead or of the few prisoners we have been able to make. Yet it appears certain that there are two general officers among the prisoners made by the English.

The battle of the Alma, in which the allied armies have reciprocally given pledges which they cannot forget, will render closer and more solid the bonds which unite them. The Ottoman division, which marched to the support of General Bosquet's in its turning movement, performed prodigies of rapidity to reach the line along the road on the sea-shore, which I had traced out for them. It was not able to take an active part in the battle which was going on in front of it, but these troops exhibited an ardour at least equal to our own; and I am happy to be able to tell you the hopes I found on the co-operation of those excellent auxiliaries.

Every one has gallantly done his duty, and it would be difficult for me to make a selection between bodies of troops, officers, and soldiers, who have shown most vigour in action, and who deserve to have particular mention made of them. I have already noticed the important part taken by the division of General Bosquet in its turning movement, during which his first brigade, established alone on the heights, remained for a long time exposed to the fire of five batteries of artillery. The first division mounted the heights by the steepest ascents with an ardour of which its chief, General Canrobert, gave it the example. This honourable general officer was struck in the chest by the bursting of a shell; but he remained on horseback till the close of the action, and his wound will have no disagreeable consequences. The third division, led on with the greatest vigour by his Imperial Highness Prince Napoleon, took the most brilliant part in the combat fought on the plateau, and I have had the pleasure of addressing to the prince my congratulations in presence of his division. General Thomas, commanding the second brigade of this division, was severely wounded when leading on his men to the attack of the plateau. The second brigade of the division of General Forey, when advancing to the support of the first division, under the orders of General d'Aurelle, nobly figured in the combat. Lieutenant Poitevin, of the 39th regiment of the line, placed on the telegraph building, which formed the central point of the enemy's defence, the colours of his regiment. He met a glorious death at his post. He was struck by a cannon-ball. During the whole of the battle the artillery performed a principle part, and I cannot sufficiently praise the energy and intelligence with which that select corps conducted it. In a future report, the materials of which I am now collecting, I shall lay before you the names of the officers, the sub-officers, and soldiers, who have merited the honour of being mentioned in general orders. I shall append to it a prayer for the rewards which you will certainly find to be merited.

Accept, M. le Maréchal, the expression of my respectful sentiments.

A. DE ST. ARNAUD, *Marshal*,
Commanding-in-chief.

Head-quarters at Alma, Field of Battle of the Alma,
Sept. 22, 1854.

M. LE MINISTRE.—My official report gives your excellency the details of the glorious day of the 20th, but I cannot allow the courier to leave without saying a few

words about our brave soldiers. The soldiers of Friedland and of Austerlitz are still under our flag, M. le Maréchal. The battle of the Alma has proved that fact. We witness the same impetuosity, the same brilliant bravery. One can do anything with such men whenever you inspire them with confidence. The allied armies have taken positions that were truly formidable. When examining them yesterday I saw how favourable they were to resistance, and, in truth, if the French and English had occupied them, the Russians never could have taken them. Now that we are more calm, and that the information which reaches us by means of deserters and prisoners becomes more precise, we are enabled to ascertain the loss inflicted on the enemy. The loss of the Russians is considerable. The deserters speak of more than 6000 men. Their army is demoralised. On the evening of the 20th it was cut in two. Prince Menschikoff, with the left wing, marched on Bagtché Serai; the right wing moved on Belbek. But they were without food, their wounded encumbered them, and the road is strewn with their wounded. It is a glorious success, which does honour to our troops, adds a fine page to our military history, and gives to the army a feeling worth 20,000 more men. The Russians have left on the field of battle near 10,000 haversacks, and more than 5000 muskets. It was a regular rout. Prince Menschikoff and his generals were loudly boasting on the morning of the 20th, in their camp, which I now occupy. I believe that they are rather crestfallen by this (*qu'ils ont un peu l'oreille basse*). The Russian general had demanded at Alma rations for three weeks. I suspect that he will have stopped the convoy on its way. Your excellency will be able to judge how much display there is in all Russian affairs. In three days I shall be before Sebastopol, and I shall be able to tell your excellency its just value. The feeling and spirit of the army are admirable. The ships which are gone to Varna for reinforcements of troops of all arms have left since the 18th. They will reach me at Belbek before the end of the month. My health is still the same. It keeps up, between suffering, crises, and duty. All this did not prevent my remaining twelve hours on horseback on the day of battle; but will not my strength betray me? Farewell, M. le Maréchal. I shall write to your excellency from before Sebastopol.

Adieu, M. le Ministre,
A. DE ST. ARNAUD, *Marshal*.
Commanding-in-chief the army of the East.

FRENCH NAVAL DESPATCH.

Ville de Paris, Sept. 23rd.

On the 21st of September I hastened to send you a telegraphic despatch of the brilliant victory which our troops have gained over the Russians on the river Alma. I have it in my power to-day to add some further details, and, in order that you may understand them, I enclose you two sketches. The first explains the intended plan of attack of the combined armies decided on the 19th for the following day; the other shows the positions on the Alma where our troops attacked the left and centre of the Russian army in sight of the fleet, which movement was supported by shells from the steamers. Your excellency has only to glance at the first drawing in order to appreciate the value of this plan in a military point of view. Accordingly, it was agreed on that the second division should march along the sea-shore, cross the Alma at the ford, which had been sounded by the boats in the morning, and carry the heights of the extreme left of the enemy, protected at the same time by eight steamers that I had placed in a position to bear on this point; whilst the first and third divisions, under the marshal's orders, were to attack in front the enemy's centre, and the entire English army was to turn the extreme right. This operation was executed almost as it had been planned, although our troops, after crossing the Alma, had to climb cliffs almost perpendicular, where our African soldiers gave extraordinary proofs of agility and daring. It was chiefly owing to these wonderful acts of intrepidity and speed, and, I must also add, to the terror caused by the shells from the steamers among the enemy's cavalry on the extreme left, that General Bosquet's division operated with such brilliant success, and was able to

attack the centre an hour after the commencement of the action. On the other hand, the marshal's two divisions, after a very sharp action with the enemy's rifles on the banks of the Alma, were ascending with the same boldness those natural ramparts where the enemy's centre was posted in the greatest security. In the meantime the English army, instead of turning, as at first intended, the extreme right, made a vigorous attack on the strong intrenchments of the right. The Russians, besides numerous fieldpieces placed in battery along their lines, had also on this spot twelve 32-pounders, which our brave allies succeeded in capturing after a terrible loss. In short, the attack commenced at half-past twelve, and all the positions were carried at half-past three; the Russian army was in full retreat, and the several corps of which it was composed were in the utmost confusion, covering the positions which had just been taken with their dead and wounded. The want of cavalry prevented our taking thousands of prisoners and a great number of cannon. The casualties in the allied armies were, I regret to say, very serious, in consequence of the strong positions which they had to carry; our loss, in killed and wounded, amounts to about 1500, and that of the English from 1500 to 2000. The road between the Katcha and the Alma was nearly covered with the enemy's dead, not to mention the thousands which remained on the field of battle. Three of our steam frigates have been dispatched to Constantinople with our wounded, having also on board some of the enemy, who are treated like our own soldiers. To-day we accompany the army, who are marching on the Katcha.

I am, with profound respect,
Your excellency's obedient servant,
HAMELIN.

It was not until the 23rd, when the army had begun its march upon Sebastopol, that Lord Raglan wrote his despatch, when his head-quarters were established upon the Katcha river. He was anticipated by the commander-in-chief of the British fleet, who dated his on board the *Britannia* the morning after the battle. The communication of Admiral Dundas, although dated before Lord Raglan's, is in reality supplemental, as the admiral had chiefly to do with events after the conflict was over; we therefore present first that of the military chief. There is one passage in it which we quoted and commented upon in a previous page, but which it is necessary, in order not to mar the completeness of the despatch, to preserve. His lordship refers to an enclosure of the nominal lists of killed and wounded, which we omit, as unnecessary to the records of history, and occupying an amount of space which our pages cannot afford. The orders of the day, of both the French and British chiefs, and the minor divisional reports, we also omit, so as to preserve for a more general record of events, the space which we can command. The despatch of the British general is longer than such documents usually are in the British army. It is, however, a masterly *exposé* of the plan and general character of the conflict, and it is said that the Emperor Nicholas pointed it out to his generals as a model. Happily their victories were not sufficiently numerous to give them occasion for its use. The despatch of Admiral Dundas, written on the 21st, was followed on successive days by others, which furnish much light as to the

movements of the allied armies, and the *rationale* of their proceedings. On the 23rd, Admiral Dundas dispatched intelligence from on board the *Britannia*, while off the Katcha, which contained the important observations of Captain Jones, of the *Sampson*, made the previous day at the entrance of the harbour of Sebastopol. The reader is presented with correct copies of all these important papers, in the order indicated above.

Head-quarters, Katcha River, Sept. 23rd, 1854.

MY LORD DUKE,—I have the honour to inform your grace, that the allied troops attacked the position occupied by the Russian army, behind the Alma, on the 20th inst.; and I have great satisfaction in adding that they succeeded, in less than three hours, in driving the enemy from every part of the ground which they had held in the morning, and in establishing themselves upon it.

The English and French armies moved out of their first encampment in the Crimea on the 19th, and bivouacked for the night on the left bank of the Bulganak, the former having previously supported the advance of a part of the Earl of Cardigan's brigade of light cavalry, which had the effect of inducing the enemy to move up a large body of dragoons and Cossacks, with artillery. On this the first occasion of the English encountering the Russian force, it was impossible for any troops to exhibit more steadiness than did this portion of her majesty's cavalry. It fell back upon its supports with the most perfect regularity under the fire of the artillery, which was quickly silenced by that of the batteries I caused to be brought into action. Our loss amounted to only four men wounded. The day's march had been most wearisome, and under a burning sun; the absence of water, until we reached the insignificant but welcome stream of the Bulganak, made it to be severely felt.

Both armies moved towards the Alma the following morning, and it was arranged that Marshal St. Arnaud should assail the enemy's left by crossing the river at its junction with the sea, and immediately above it, and that the remainder of the French divisions should move up the heights in their front, while the English army should attack the right and centre of the enemy's position. In order that the gallantry exhibited by her majesty's troops, and the difficulties they had to meet may be fairly estimated, I deem it right, even at the risk of being considered tedious, to endeavour to make your grace acquainted with the position the Russians had taken up. It crossed the great road about two and a half miles from the sea, and is very strong by nature. The bold and almost precipitous range of heights—of from 350 to 400 feet—that from the sea closely border the left bank of the river, here ceases, and formed their left; and, turning thence round a great amphitheatre or wide valley, terminates at a salient pinnacle, where their right rested, and whence the descent to the plain was more gradual. The front was about two miles in extent. Across the mouth of this great opening is a lower ridge at different heights, varying from sixty to 150 feet, parallel to the river, and at distances from it of from 600 to 800 yards. The river itself is generally fordable for troops, but its banks are extremely rugged, and in most parts steep; the willows along it had been cut down in order to prevent them from affording cover to the attacking party; and, in fact, everything had been done to deprive an assailant of any species of shelter. In front of the position on the right bank, at about 200 yards from the Alma, is the village of Boulouk, and near it a timber bridge, which had been partly destroyed by the enemy. The high pinnacle and ridge before alluded to were the key of the position, and, consequently, there the greatest preparations had been made for defence. Half-way down the height, and across its front, was a trench of the extent of some hundred yards, to afford cover against an advance up the even steep slope of the hill. On the right, and a little retired, was a powerful covered battery, armed with heavy guns, which flanked the whole of the right position. Artillery, at the same time, was posted at the

points that best commanded the passage of the river and its approaches generally. On the slopes of these hills (forming a sort of table-land) were placed dense masses of the enemy's infantry, while on the heights above was his great reserve, the whole amounting, it is supposed, to between 45,000 and 50,000 men.

The combined armies advanced on the same alignment; her majesty's troops in contiguous double columns, with the front of two divisions covered by light infantry and a troop of horse-artillery; the second division under Lieutenant-general Sir De Lacy Evans, forming the right, and touching the left of the third division of the French army, under his Imperial Highness Prince Napoleon; and the light division, under Lieutenant-general Sir George Brown, the left; the first being supported by the third division, under Lieutenant-general Sir Richard England, and the last by the first division, commanded by Lieutenant-general his Royal Highness the Duke of Cambridge.

The 4th division, under Lieutenant-general Sir George Cathcart, and the cavalry, under Major-general the Earl of Lucan, were held in reserve, to protect the left flank and rear against large bodies of the enemy's cavalry which had been seen in those directions.

On approaching near to the fire of the guns, which soon became extremely formidable, the two leading divisions deployed into line and advanced to attack the front, and the supporting divisions followed the movement. Hardly had this taken place when the village of Bouliouk, immediately opposite the centre, was fired by the enemy at all points, creating a continuous blaze for 300 yards, obscuring their position, and rendering a passage through it impracticable. Two regiments of Brigadier-general Adams' brigade, part of Sir De Lacy Evans' division, had, in consequence, to pass the river at a deep and difficult ford to the right under a sharp fire; while his first brigade, under Major-general Pennefather, and the remaining regiment of Brigadier-general Adams, crossed to the left of the conflagration, opposed by the enemy's artillery from the heights above, and pressed on towards the left of their position with the utmost gallantry and steadiness.

In the meanwhile, the light division, under Sir George Brown, effected the passage of the Alma in his immediate front. The banks of the river itself were, from their rugged and broken nature, most serious obstacles, and the vineyards through which the troops had to pass, and the trees which the enemy had felled, created additional impediments, rendering any species of formation, under a galling fire, nearly an impossibility. Lieutenant-general Sir George Brown advanced against the enemy under great disadvantages. In this difficult operation he nevertheless persevered; and the first brigade, under Major-general Codrington, succeeded in carrying a redoubt, materially aided by the judicious and steady manner in which Brigadier-general Buller moved on the left flank, and by the advance of four companies of the Rifle Brigade, under Major Norcott, who promises to be a distinguished officer of light troops. The heavy fire of grape and musketry, however, to which the troops were exposed, and the losses consequently sustained by the 7th, 23rd, and 33rd regiments, obliged this brigade partially to relinquish its hold.

By this time, however, the Duke of Cambridge had succeeded in crossing the river, and had moved up in support, and a brilliant advance of the brigade of foot-guards, under Major-general Bentinck, drove the enemy back, and secured the final possession of the work. The Highland brigade, under Major-general Sir Colin Campbell, advanced in admirable order and steadiness up the high ground to the left, and in co-operation with the Guards; and Major-general Pennefather's brigade, which had been connected with the right of the light division, forced the enemy completely to abandon the position they had taken such pains to defend and secure. The 95th regiment, immediately on the right of the Royal Fusiliers in the advance, suffered equally with that corps an immense loss.

The aid of the Royal Artillery in all these operations was most effectual. The exertions of the field-officers and the captains of troops and batteries to get the guns into action were unceasing, and the precision of their fire materially contributed to the great results of the day.

Lieutenant-general Sir Richard England brought his division to the immediate support of the troops in advance, and Lieutenant-general the Honourable Sir George Cathcart was actively engaged in watching the left flank.

The nature of the ground did not admit of the employment of the cavalry under the Earl of Lucan; but they succeeded in taking some prisoners at the close of the battle.

In the detail of these operations, which I have gone into as far as the space of a despatch would allow, your grace will perceive that the services in which the general and other officers of the army were engaged were of no ordinary character; and I have great pleasure in submitting them for your grace's most favourable consideration.

The mode in which Lieutenant-general Sir George Brown conducted his division, under the most trying circumstances, demands the expression of my warmest approbation. The fire to which his division was subjected, and the difficulties he had to contend against, afford no small proof that his best energies were applied to the successful discharge of his duty. I must speak in corresponding terms of Lieutenant-general Sir De Lacy Evans, who likewise conducted his division to my perfect satisfaction, and exhibited equal coolness and judgment in carrying out a most difficult operation.

His Royal Highness the Duke of Cambridge brought his division into action in support of the light division with great ability, and had, for the first time, an opportunity of showing the enemy his devotion to her majesty, and to the profession of which he is so distinguished a member.

My best thanks are due to Lieutenant-general Sir R. England, Lieutenant-general the Hon. Sir George Cathcart, and Lieutenant-general the Earl of Lucan, for their cordial assistance wherever it could be afforded: and I feel it my duty especially to recommend to your grace's notice the distinguished conduct of Major-general Bentinck, Major-general Sir Colin Campbell, Major-general Pennefather, Major-general Codrington, Brigadier-general Adams, and Brigadier-general Buller.

In the affair of the previous day, Major-general the Earl of Cardigan exhibited the utmost spirit and coolness, and kept his brigade under perfect command.

The manner in which Brigadier-general Strangways directed the artillery, and exerted himself to bring it forward, met my entire satisfaction.

Lieutenant-general Sir John Burgoyne was constantly by my side, and rendered me, by his counsel and advice, the most valuable assistance; and the commanding royal engineer, Brigadier-general Tylden, was always at hand to carry out any service I might direct him to undertake. I deeply regret to say that he has since fallen a victim to cholera, as has Major Wellesley, who was present in the affair of the previous day, notwithstanding that he was then suffering from severe illness. He had, during the illness of Major-general Lord de Ros, acted for him in the most efficient manner. I cannot speak too highly of Brigadier-general Estcourt, Adjutant-general, or of Brigadier-general Airey, who, in the short time he has conducted the duties of the Quartermaster-general, has displayed the greatest ability as well as aptitude for the office.

I am much indebted to my military secretary, Lieutenant-colonel Steele, Major Lord Burghersh, and the officers of my personal staff, for the zeal, intelligence, and gallantry they all, without exception, displayed.

Lieutenant Derriman, R.N., the Commander of the *Caradoc*, accompanied me during the whole of the operation, and rendered me an essential service by a close observation of the enemy's movements, which his practised eye enabled him accurately to watch.

I lament to say that Lieutenant-colonel Lagondie, who was attached to my head-quarters by the Emperor of the French, fell into the enemy's hands on the 19th, on his return from Prince Napoleon's division, where he had obligingly gone, at my request, with a communication to his imperial highness. This misfortune is deeply regretted, both by myself and the officers of my personal staff. The other officer placed with me under similar circumstances, Major Vico, afforded me all the assistance in his power, sparing no exertion to be of use.

I cannot omit to make known to your grace the cheer-

business with which the regimental officers of the army have submitted to most unusual privations. My anxiety to bring into the country every cavalry and infantry soldier who was available prevented me from embarking their baggage animals, and these officers have with them, at this moment, nothing but what they can carry, and they, equally with the men, are without tents or covering of any kind. I have not heard a single murmur. All seem impressed with the necessity of the arrangement, and they feel, I trust, satisfied that I shall bring up their art-horses at the earliest moment.

The conduct of the troops has been admirable. When it is considered that they have suffered severely from sickness during the last two months; that, since they landed in the Crimea they have been exposed to the extremes of wet, cold, and heat; that the daily toil to provide themselves with water has been excessive, and that they have been pursued by cholera to the very battlefield, I do not go beyond the truth in declaring that they merit the highest commendation. In the ardour of attack they forgot all they had endured, and displayed that high courage, that gallant spirit, for which the British soldier is ever distinguished, and under the heaviest fire they maintained the same determination to conquer as they had exhibited before they went into action.

I should be wanting in my duty, my lord duke, if I did not express to your grace, in the most earnest manner, my deep feeling of gratitude to the officers and men of the royal army for the invaluable assistance they afforded the army, upon this as on every occasion where it could be brought to bear upon our operations. They watched the progress of the day with the most intense anxiety, and as the best way of evincing their participation in our success, and their sympathy in the sufferings of the wounded, they never ceased, from the close of the battle till we left the ground this morning, to provide for the sick and wounded, and to carry them down to the beach—a labour in which some of the officers even volunteered to participate; and at which I shall never cease to recollect with the warmest thankfulness.

I mention no names, fearing I might omit some who ought to be spoken of; but none who were associated with me spared any exertion they could apply to so sacred a duty. Sir Edmund Lyons, who had charge of the whole, was, as always, most prominent in rendering assistance, and providing for emergencies.

I enclose the return of the killed and wounded. It is, I meant to say, very large; but I hope, all circumstances considered, that it will be felt that no life was unnecessarily exposed, and that such an advantage could not be achieved without a considerable sacrifice. I cannot venture to estimate the amount of the Russian loss. I believe it to have been great, and such is the report in the country. The number of prisoners who are not hurt is small; but the wounded amount to eight or nine hundred. Two general officers—Major-generals Karnoff and Shokanoff—fell into our hands. The former very badly wounded.

I will not attempt to describe the movements of the French army—that will be done by an abler hand; but it seems to me to say that their operations were eminently successful, and that under the guidance of their distinguished commander, Marshal St. Arnaud, they manifested the utmost gallantry, the greatest ardour for the attack, and the high military qualities for which they are so famed. This despatch will be delivered to your grace by Major Lord Burghersh, who is capable of affording you the fullest information, and whom I beg to recommend to your especial notice.

I have, &c.,

His Grace the Duke of Newcastle, &c.

RAGLAN.

ATTACK OF THE RUSSIAN INTRENCHMENTS ON THE ALMA BY THE ALLIED ARMIES.

Britannia—off the Alma, Sept. 21st.

SIR,—In my letter of the 18th inst. I reported to you, for the information of the lords commissioners of the Admiralty, that the allied armies were ready to move, and I now beg you will acquaint their lordships that, on the morning of the 19th, they marched to a position about 10 miles north of the Alma river, where they halted for the night; the French and Turks on the right, close to

the sea, and the English to the left, about four miles inland. The Russians, with some 5000 or 6000 cavalry and artillery, and 15,000 infantry, made a demonstration north of the river, but retired on the approach of the armies, and recrossed the river at sunset.

About noon on the 20th the allies advanced in the same order to force the Russian position and intrenchments south of the Alma. This was effected by four o'clock, the Russians retreating apparently to the eastward of the main road to Sebastopol. The Russian left fell back before the French very rapidly, and their batteries on the right were carried by the bayonet by the English. Our loss has necessarily been severe, and is estimated at about 1200 killed and wounded; that of the French at about 900. The Russian loss has also been great. Two general-officers and three guns were captured by our men; but we have few prisoners beyond the wounded, in consequence, it is believed, of our deficiency of cavalry.

Lieutenant Derriman, of the *Caradoc*, accompanied the staff of General Lord Raglan during the action, and I also sent Lieutenant Glynn, of this ship, to convey any message to me from his lordship.

All the medical officers of the fleet (excepting one in each ship), 600 seamen and marines, and all the boats, have been assisting the wounded, and conveying them to the transports that will sail for the Bosphorus as soon as possible.

I believe it is the intention of the allied forces to move to-morrow; and the *Sampson*, which I detached last night with the *Terrible*, off Sebastopol, has signalled that the Russians were retreating on Sebastopol, and that they have burnt the villages on the Katcha.

I have, &c.,

J. W. D. DUNDAS, Vice-admiral.

The Secretary of the Admiralty.

MOVEMENTS OF THE FLEETS AND ARMIES.

Britannia—off the Katcha, Sept. 23.

SIR,—I beg you will inform the lords commissioners of the Admiralty, that since my letter to you of the 21st instant, the men and boats of the fleet have been employed in bringing from the field (about four miles distant), and carrying on board the transports, the English and Russian officers and men wounded in the battle of the Alma, as well as the sick of the army. All the medical officers of the different ships have been zealously and usefully occupied in attending them, and I have been obliged to send several assistant-surgeons in the vessels with the wounded to Constantinople.

The *Vulcan* and *Andes*, with 800 wounded and sick, sailed for Constantinople yesterday, and to-day the *Orinoco* and *Colombo*, with 900, including some sixty or seventy Russians, will follow. Another vessel (by the request of Lord Raglan) with about 500 wounded Russians, will also proceed under charge of the *Fury*, to land them at Odessa.

On the night of the 21st inst. the Russians made a very great alteration in the position of their fleet in Sebastopol. I enclose a report made by Captain Jones, of the *Sampson*; and I propose attacking the outer line the first favourable opportunity. Captain Jones also reports that great exertions appear to be making to strengthen the land defences, as well as those by sea. New batteries on both sides of the port have been erected, defending the entrances and line of coast. One to the north has heavy guns of a range of 4000 yards, two shots having passed over the *Sampson* when nearly at that distance.

Provisions for the army have been landed, and the forces move on to-day towards Sebastopol, accompanied by the fleets, which have anchored off the Katcha.

I have, &c.,

J. W. D. DUNDAS, Vice-admiral.

The Secretary of the Admiralty.

OBSERVATIONS ON THE FLEET IN SEBASTOPOL,

Made on September 22nd, 1854, by Captain L. T. Jones, C.B., of her Majesty's ship Sampson.

Moored across the entrance of the harbour, from north to south, are the following vessels:—

1, a frigate, at northern extreme; 2, a two-decker; 3, a three-decker, with round stern; 4, a two-decker; 5, a two-decker; 6, a two-decker without masts, quite light, and appears to be newly coppered; 7, a large frigate.

ARTILLERY CREEK.

The topgallant-masts of these are on deck, and sails unbent.

The ship without masts is lying across Artillery Creek; inside is a two-decker ready for sea, and bearing an admiral's flag at the mizen.

HEAD OF HARBOUR.

The ships at the head of the harbour, which had hitherto been lying with their broadsides to the entrance, are now lying with their heads out.

1, on the north a two-decker; 2, a two-decker; 3, a two-decker; 4, a two-decker; 5, a two-decker; 6, a three-decker at the entrance of the Dockyard Creek; 7, a three-decker bearing an admiral's flag at the fore.

Above these are two ships; one appears to be a line-of-battle ship, and the other a frigate.

STEAMERS.

Five steamers under the northern shore. Three small steamers at the head of the harbour, and four in Careening Bay.

GENERAL OBSERVATIONS.

Dockyard Creek shuts in with Northern Fort bearing S.E. $\frac{1}{2}$ E. Observed about 500 infantry marching towards the town from the direction of Balaklava.

Noticed about sixty men employed on brow of signal hill, and carrying mould from brink of cliff to Square Fort. 3.45 p.m.—Cape Constantine and ships in one bearing, S. $\frac{3}{4}$ W.

On the day after Admiral Dundas's despatch was written, he transmitted another to the Admiralty, conveying the extraordinary intelligence of the sinking of the Russian ships at Sebastopol. On the 22nd the admiral had learned from a deserter that the vessels were bored and plugged, ready to be sunk at a moment's notice on the withdrawal of the plugs; and as the allied fleet moved along the coast, in line with the army, Prince Menschikoff's order was obeyed, and several ships of the grand Black Sea fleet of the czar were sunk across the entrance of the harbour, effectually preventing the entrance of a hostile fleet. On the south side of the harbour the remaining squadrons were moored, so as to open fire in defence of northern Sebastopol, which it was supposed the allies would attack. Captain Drummond, on the morning of the 24th, ascertained the truth of this bold stratagem, for he saw the mastheads of that portion of the Russian fleet barely appearing above the water. The captain reported that the entrance was completely closed, except a narrow space under the north shoal battery. The ships thus voluntarily destroyed were, one fine vessel of 120 guns, two 84's, two 80's, two 40-gun frigates, and a number of smaller craft, frigates, brigs, and schooners of war. Captain Drummond persevered in his reconnaissance after he had made himself sure of the destruction of this portion of the Russian navy, and discovered that within the barrier of sunken ships there were two powerful booms, and that

eight sail of the line were moored east and west within the inner boom, of which three had been "heeled over," to give their guns elevation to sweep over the land northward of the harbour. This intelligence was communicated from Admiral Dundas to Lord Raglan, and materially influenced the determination to attempt the celebrated flank movement which we shall hereafter record. Admiral Dundas's despatch (which for brevity's sake we omit) conveyed in detail all these particulars, which the Admiralty made known to the country, exciting great surprise amongst all, regret amongst many, that our tars were not likely to come into collision with those of the enemy, at all events at sea; yet the general public rejoiced that the Russians, with their own hands, had demolished so large a portion of the fleet it cost them so much to construct, and that without bloodshed, or loss of a single ship of ours, the navy of the foe was already vanquished.

In answer to these despatches, the French Emperor sent a spirited address to his valiant army, expressing his unbounded admiration at their heroism, his sympathy with their sufferings, his anxiety to mitigate those sufferings, and his complete satisfaction with their deeds. This address was followed by the distribution of medals and badges in great profusion, and an extensive promotion throughout the French army of the East. Queen Victoria did not content herself with the manifestation of sympathy and satisfaction at home, she also sent to her noble army the expression of her admiration. The Duke of Newcastle conveyed to Lord Raglan what was well known to be her majesty's real feeling:—"The patience with which the regimental officers and men bore without a murmur, the unusual privations to which they were necessarily subjected after they landed in the Crimea, has elicited her majesty's warmest sympathy and approval. Their sufferings from disease before that time were such as might have subdued the ardour of less gallant troops, but have in their case only proved that in the hour of battle they remember nothing but the call of duty. Her majesty feels additional pleasure in thus recognising the noble daring of her soldiers, and sympathising in their victory, when she reflects that that courage has been evinced, and those triumphs won, side by side with the troops of a nation whose valour the British army has in former times admired and respected in hostile combat, but which it has now, for the first time, tested in the generous rivalry of an intimate brotherhood in arms. Her majesty trusts that the blood of the two nations, so profusely shed on the banks of the Alma—a subject of deep regret to herself and her people—may consecrate an alliance which shall endure for

the benefit of future generations, when the remembrance of this battle-field is hallowed by gratitude for the consequences as well as the glories of victory."

Many instances of individual heroism occurred at the battle of the Alma, rivalling the most glorious days of English chivalry. The correspondent of a French paper relates that an English sergeant, having just planted a camp flag, in order to mark the position to be taken up by his corps, a Russian soldier sallied out, shot the sergeant, and bore off the flag as a trophy; another British sergeant, who happened to have armed himself with a revolver, pursued the Russian, shot him, recovered the flag, and ran back to his regiment under the fire of the enemy, which was magnificently directed upon him; he reached the advancing line of English infantry, and fell before it pierced with seven balls. He saved his flag, avenged his comrade's fate, and having cast the flag into his own ranks, fell down dead, a noble sacrifice to nationality and duty.

Lord Raglan was so pleased with the personal courage of Sir Colin Campbell, and the gallantry of his brigade, that he rode up to him on the field at the close of the engagement, thanked him for his zeal and bravery, and inquired if there was anything he could do to gratify him. The reply of the gallant Highlander was characteristic—"Let me wear the Highland bonnet instead of the general's cocked hat." The permission was granted with a smile of surprise and pleasure, and the next day Sir Colin appeared with the bonnet and plumes, exciting in his Highlanders the wildest expressions of astonishment and delight. Sir Colin afterwards wore the bonnet throughout the campaign.

The 23rd Royal Welsh Fusiliers suffered more than any other British regiment. Both Sir George Brown and Brigadier Codrington were in front of them through the hottest of the fight; it was while cheering them on Sir George's horse was killed. The brave old chief went down suddenly in a cloud of dust and smoke, but leaping up cried, "Twenty-third, I am all right, follow me; I will remember this day to you!" Major Norcott of the Rifles seemed to have a charmed life. When the brigade got over the stream, they crept up the abrupt sides of the southern banks in a crowd—any formation was impossible. Here he displayed activity and intelligence, meriting the encomium of Lord Raglan in his despatch. This officer, while a young lieutenant on service in the West Indies, and at a time of peace, attracted universal attention by his military taste and capacity, when his father, Major-general Sir Amos Norcott, commanded in Jamaica, where Mr. Norcott's battalion of the brigade was quartered. At the

Alma he justified the remark of one of his own poor soldiers—"His honour was like a flame, shooting in every direction." Another poor soldier described his brigadier, Major-general Pennefather, as "riding in front, with a wall of lightning before him." The escape of General Pennefather from either death or wound is one of those extraordinary instances of how the bravest frequently escape, as if the dangers they courted respected and shunned them. Some, however, seemed as if fortune had reserved all her frowns for that day. One officer, whose foot was shot off, retired to the rear, had his leg bandaged, insisted on remounting and again riding to the front, and was ultimately shot through the heart. A poor soldier of the Connaught Rangers went to the rear with his left hand hanging by the skin from the arm; presenting himself to the surgeon, he said, "Be quick, docther, and dress my hand, for I want to have another poke at the Rooshins!" The hand was amputated and bandaged; seizing his musket with the other hand, he hurried to the front, and fell amongst those who stormed the redoubt crowned by the 18-gun battery. Lieutenant-colonel Chester, seeing that Ensign Anstruther had fallen, took up the colours, and was waving them above his head, when he was severely wounded by a musket ball; falling backward into the arms of his servant, the latter bore him to the rear, when another shot extinguished life, while yet in the arms of his brave and attached retainer.

A private soldier of the 7th Fusiliers, leaping out from the front of his regiment, bayoneted two Russians in their leading column, and escaped unhurt. This regiment was principally made up of recruits who had been a short time previously enlisted at Manchester. However prevalent peace principles may be with the inhabitants of that city, the Russians had no reason to concede to it such a reputation, for the Manchester men in the 7th Fusiliers fought with desperate valour on the bloody day of Alma. Many of them were from the labouring Irish, who are very numerous in that city. Captain Monk of this regiment was fired at from a musket so close to his head that he with his hand turned the muzzle of the gun, he then ran his enemy through the body; a Russian officer cut at him with his sword, which he parried, and with a blow of his fist knocked this antagonist down, while his sword parried a bayonet thrust from a Grenadier, whose rear rank man shot the captain through the heart.

Time would fail us to particularise the deeds of individual daring which marked the progress of that desperate fight. The spirit of the British may be best seen in the letters written by officers, non-commissioned officers, and sol-

diers who took part in the conflict. The following letter, from a private of the Welsh Fusiliers, shows how extensively that regiment suffered, how bravely its soldiers fought, and what a fine *esprit de corps* pervaded it:—"Our regiment belongs to the light division. We (the 23rd) were in front of the rest. The Russians were on the hill before us, and there was a river at the foot, and a large village. The hill was so high above the village that they could fire over it at us. They set the village on fire, which caused great smoke between us and them, which prevented us seeing them well; but they were too far from us to fire at them, so the artillery opened fire upon them. There were Russian foot soldiers who kept up a brisk fire upon us, but we could not see them because of the smoke. The French and Turks were on the right of us, but the fleet fired at the Russians that were on the hill close to the sea, and so the French got a good chance of getting up to the top, and there they worked away properly, driving them towards us. We then made a charge on the village, ran through the river, and got under the hill. We now crept a little way up the hill, then held up our colours, gave a loud cheer, and began firing at them. We all got up together, and drove them back. We then took one of their forts, with three brass guns, and two general officers, and won the battle in spite of them. Dear mother, I am shot through the thigh, but by luck the ball has not touched the bone. Burrows is shot through the calf of the leg. Bill Evans has lost his right arm. Blever was not hit, and was quite well when I left him. I wish I were well again, that I might join my regiment. There will be some hot work at Sebastopol. Our lads are longing to be there."

Some of the private letters of men and officers narrate the most touching scenes. An officer, describing the field after the battle, saw in one spot a Russian officer, in a sitting posture, stiffened in death, and a little dog between his legs, which refused all kindly overtures, and could not be tempted from its dead master's feet. Near this spot another Russian officer, quite a boy, had died in the attitude of prayer, with clasped hands and kneeling.

A medical officer, describing the death of two British officers, brothers, paints the following affecting scene:—"You have heard of the melancholy death of poor Captain and Lieutenant Eddington, of the 95th. They were brothers, and so attached to each other, that the whole regiment respected them—I may rather say, loved them. Lieutenant Eddington exchanged into the 95th a few months ago, that he might share danger and risk death by his brother's side. Captain Eddington fell first, with a ball in his chest, and was left for a few

moments on the hill side, whilst the regiment which had been thrown into disorder, fell back to re-form. The whole troop witnessed his brutal murder. A Russian rifleman knelt down beside him, and whilst pretending to raise his canteen to the wounded man's lips, deliberately blew his brains out. A shout of rage and hatred burst from the whole regiment, and at the same moment they again charged up the hill, Lieutenant Eddington many yards in advance, crying for the men to follow, and apparently mad with grief and excitement. He fell beneath a perfect storm of grape-shot and rifle balls; his breast was absolutely riddled. The same grave holds them both; and their spirits, let us hope, have entered upon an eternal peace in the presence of God."

The exposure of the 33rd regiment (the Duke of Wellington's) may be judged of from the fact that their flag was riddled with musket balls and grape; fourteen sergeants fell defending the regimental and queen's colours. A sergeant, writing to his wife, thus describes his hair-breadth escapes:—"I was on the colours; when the regiment advances in line three sergeants advance six yards in front, so as to keep a good line; therefore, you see, we were on the top of the hill first; and, to tell you the truth, I thought I should have been blown off the face of the earth, such a storm of grape and canister was directed against us from the batteries. I think I was on the hill for about forty minutes before I was knocked down. The first shot I felt was a musket ball that struck my bayonet, which split the ball, and one part of it hit me on the middle finger of the right hand, and the other on the third finger of my left hand, but they did me no harm. Another ball struck the rosette of my black cap, and carried it away, and half of the strap, and split my cap down to the peak. Another ball cut a piece out of my pocket, but never hurt me, thank God. I got struck on the elbow with a bit of a shell; it did not hurt me, but burnt me a little; I have a blister on my elbow about the size of a sixpence. Another ball cut a bit off the leaf of my pouch, and another I got in front of my black cap, a little to the right of the cap-plate, and rather below it; I was in the act of kneeling down when it struck me, and turned me completely over." It must not be supposed by the reader that this was a singular case of marvellous escape; numbers of men and officers were the true relators of the like; and among the wounded many had been hit repeatedly, and portions of the clothing of hundreds of soldiers were torn away who escaped without a wound.

The following letter from an officer of the Guards to a relative at home gives an eloquent view of the dangers incurred, and the heroism displayed:—"I hasten to write a few lines to

tell you that I am safe and well, knowing how anxious you will be after hearing that we have had an action with the Russians. Accounts of the battle you will see in the papers, much better describing it than any I could give, as I could see nothing beyond what was going on in my own brigade. That, you will see, was in the thickest of it, as the returns of our casualties will prove, our loss being very severe. The march from Kamischli to Bulganak, where we bivouaced on the night of the 19th, and again from Bulganak to Alma, was the grandest spectacle I ever saw. The whole army, French, English, and Turkish, advanced in battle array for that distance over a plain as smooth almost as a lawn, and with just sufficient undulation to show one at times the whole force at a *coup d'œil*. My division was on the left, and we were about three miles from the sea; the fleet, coasting along abreast of us, completed the picture. About twelve o'clock, on the 20th, on crowning a ridge, we came all at once in sight of the Russian army in an intrenched camp beyond the Alma, distant about three miles. Immediately we appeared they set fire to a village between us and them, so as to mask their force by the smoke. We continued advancing steadily, halting occasionally to rest the men, till half past one, when the first shot was fired, and soon after the rattle of musketry told us that our rifle skirmishers were engaged. Our divisions then deployed into line, and we stood so for about twenty minutes, an occasional round-shot rolling up to us, but so spent that one was able to step aside from it. Wounded men from the front soon began to be carried through our lines to the rear, and loose and wounded horses began to gallop about. At last we were ordered to advance, which we did for about 300 yards nearer the batteries, and halted, and the men lay down. We were now well within range, and the round-shot fell tolerably thick, an occasional shell bursting over our heads. After standing steady for about twenty minutes, the light division (who were in line in front of us) advanced again, and we followed. The Russians had put posts to mark the ranges, which they had got with great accuracy. We now advanced to within 200 yards from the river, and 700 from the batteries, and halted under a low wall for five minutes, till we saw the light division over the river, when we continued our advance in support of them. On crossing the wall we came into vineyards, and here the cannonade was most terrific, the grape and canister falling around us like hail—the flash of each gun being instantly followed by the splash of grape among the tilled ground, like a handful of gravel thrown into a pool. On reaching the river, the fire from a large body of riflemen was added—

but the men dashed through, up to their middle in water, and halted on the opposite side, to re-form their ranks under shelter of a high bank. At this moment, the light division had gained the intrenchment, and the British colour was planted in the fort; but ammunition failing them, they were forced back. The Scots Fusiliers were hurried on to support them before they had time to re-form themselves, and the 23rd retiring in some confusion upon them, threw them for a few minutes into utter disorder. The Russians, perceiving this, dashed out of the fort upon them, and a frightful struggle took place, which ended in their total discomfiture. For a minute or two the Scots Fusiliers' colours stood alone in the front, while General Bentinck rallied the men to them, their officers leading them on gallantly. At this moment I rode off to the Coldstreams, through whose ranks the light division had retired, leaving them the front line. They advanced up the hill splendidly, with the Highlanders on the left, and not a shot did they fire till within 150 or 200 yards from the intrenchments. A battery of 18 and 24-pounders was in position in our front, and a swarm of riflemen behind them. Fortunately, the enemy's fire was much too high, passing close over our heads; the men who were here killed being all hit on the crown of the head, and the Coldstreams actually lost none. When we got about fifty yards from the intrenchment, the enemy turned tail, leaving us masters of the battery and the day. As they retired, they took all their guns except two, and a great many of their wounded. In spite of this, the ground was covered with the dead and dying, lying in heaps in every direction on what may be called the glacis, and inside the intrenchments they were so thick that one could hardly avoid riding over them; but the excitement of the victory stifled for a time all feeling of horror for such a scene, and it was not till this morning, when I visited the battle-field, that I could at all realise the horrors which must be the price of such a day. Most fervently did I thank God, who had preserved me amid such dangers! How I escaped seems to me the more marvellous, the more I think of it. Though on horseback (on my old charger), my cocked hat and clothes were sprinkled all over with blood."

An assistant-surgeon of the Rifles thus strikingly conveys his experience, professionally, and as a soldier:—

"A few lines: that must be all. The papers will tell you about the victory. I cannot describe to you my own feelings on being in battle for the first time. I went up the hill with the men as they were ordered to advance. The Minié balls showered past us like rain, coming with a whistling wind; they dropped round us, twisting in the ground, or carried off

an epaulette, or knocked out a tooth, or cut off a finger or an ear; now and then a brave fellow dropped down with a bullet in the heart, or the brain, but it was perfectly miraculous that any man escaped alive out of such a fire. . . . In less than ten minutes my place was back again at the hospital of the brigade. It was called hospital by courtesy. There was besides myself, Surgeon —, and we had the charge of over 200 wounded comrades. The poor fellows were brought in one after the other, and there they laid waiting their turn to have balls extracted and limbs amputated. You know what is called field-day at the hospitals in town. Perhaps an amputation or two, with half-a-dozen surgeons to assist, if necessary, and a hundred surgical eyes looking on. Can you imagine our field-day on the banks of the little river Alma?

"If God spares me again to see old England, I shall probably never more witness as much practise in my whole lifetime as I saw there in two hours. The pluck of a soldier no one has yet truly described. They laugh at pain, and will scarcely submit to die. It is perfectly marvellous, this triumph of mind over body. If a limb were torn off or crushed at home you would have them brought in fainting, and in a state of dreadful collapse; here they come with a dangling arm or a riddled elbow, and it's, 'Now, doctor, be quick, if you please! I'm not done for so bad but I can get back and see!' And many of these fellows with a lump of tow wrung out of cold water wrapped round their stumps, crawled to the rear of the fight, and with shells bursting around them, and balls tearing up the sods at their feet, watched the progress of the battle. We had no time to get the mangled limbs out of sight as they were cut off, and the grass was completely covered with them by three o'clock in the afternoon. They were the first objects the wounded saw as they were brought in. The steamers are now off with hundreds of the wounded men to Scutari and Constantinople. May God go with them half the way. You may think this a strange wish, but nearly half of them *must* perish before they get so far. Many are being shipped off who are mortally wounded; and they have not medical necessaries on board sufficient for five out of every fifty sufferers."

In the letters of our poor privates a spirit of noble devotion to queen and country is breathed, and some of them, in rough but expressive language, afford a clear insight to the dreadful realities of a battle. We subjoin a letter of this character:—

"The last letter I wrote I thought I should not go further up the country, but in two or three days after I wrote we were on board the ship *Simoom*. We stayed in harbour eight days, until all the troops were on board, and

then we sailed across the Black Sea for Russia, and we were nine days going. We did not sail fast; we joined the remainder of the fleet at Baltschick Bay, stopping one night there for fresh water, and cruised about the sea to see if there were any of the Russian fleet out, but we saw none all the way. They were afraid to come out to us, for our shipping looked like a little town across the sea. We all landed safe on Russian land. On the 14th of September we marched four miles, and then halted for four days until all were ready, and on the 19th we marched to meet the enemy. We marched from four in the morning until five at night, and then we met with a few of the Cossacks. A few of our cavalry had a slight skirmish with them, but they soon made the best of their way off. Very good judgment. There were two or three men wounded and one horse killed. All was quiet very soon, and we began to make a little fire as soon as we could, without wood or coal, to cook our meat and tea. It was on a large mountain, and there was no tree or hedge in sight, as in England; but there were thick-stalked weeds and thistles, so we cut them down. The remainder of the night I spent, as usual, in smoking, and not drinking, sleeping as well as could be expected for we have no tents now to keep the weather from us. We lay down dressed, with our firelocks by our side, ready to meet the enemy in a moment, and the next day was a regular killing day with us. We marched early on the morning of the 20th; we marched a long distance, and then we could see the Russian on a mountain, and then we took a good march to be within gunshot of them. They commenced firing, I think, first, but we were soon exchanging shot with them, and we kept firing at each other for about four hours. There were two brooks to cross when firing, and they had built two bridges for us to go over, so that they could play sweetly on us going over; but we had travelled too far to be caught in that way. We formed a line, and all went through together; we got very wet, but I didn't mind that, and the shot came by me almost as thick as the plums in my sister's pudding at Christmas; but I kept loading and firing until we drove them away from the place they had made and fortified, which they thought of keeping us from for three weeks. When they saw we were gaining the day and the victory they set fire to a village, because we should not shelter there. We drove them away, took the place where they were, and one of their large brass guns (eight inch bore). We followed them and drove them, in about half an hour off another mountain, and took one of their colours from them, and then they made the best of their way off. They ran like madmen, and we have not seen many of them since.

What we have seen we have taken prisoners. The same night, after the battle was over, we formed up, and the roll was called; several were missing. That was a silent moment to those who did not answer to their names. After we were dismissed to go where we liked, I thought I would take a view of a battle-field. We had run over the poor dead and wounded, but not to look all round. You must know, my dear friends, that the battle-field is not like a field in England; it is a large plain, hundreds of miles round—no trees, no hedge to be seen: but we had just got to very large mountains. I took a stroll over the field of battle, and then saw above 4000 bleeding, groaning, and silent men, and most of them young men! That was a scene; and from all that lot I was spared. I bound some of their wounds up, Russians, English, and French. Some I gave a light to smoke, and some water; some I raised for ease, some I lowered; some gave me money, and some gave me tobacco and whiskey. I spent that night as usual, cooking my rations and smoking, for that is the chief comfort I have out here. I spent the night happily and comfortably, as I always do. Although difficulties in this life are often met with, I always meet them with pleasure. I don't expect to meet with sweets out here, but sometimes meet with them unexpectedly. But I must tell you a little more about the battle-field. The next two days we were gathering the wounded together in one place, and the dead in another. We buried the dead in two days, and the wounded we took on board. We burnt all the Russian firearms and clothing that were being thrown about. The next day, after burying the dead and lending our best assistance to the wounded, we marched to overtake the enemy again; but they were not to be found, and we have not seen them since, only a few, whom we took prisoners. Last Sunday we marched, thinking to meet some of them, but they fled; and we took all their provisions, about fifty waggon-loads, and blew up a magazine in a small town. We are now about five miles from Sebastopol, and we shall be in there very soon. Before you get this letter I think the war will be over. I should like to write and tell you more of what I have seen and done, but I have not time now. I must tell you that we were highly praised by all our commanders for our gallant and brave actions in the field. But I will tell you all the rest if I am spared to come home."

A private soldier in the artillery writes the following short but tender and tasteful letter to one dear to him at home:—"I have sent you a small flower off the heights of Alma, and when you read in the papers of how we forced the passage to those heights, look upon this flower, and think of me."

An eye-witness of the whole encounter on the British line of action relates the following incidents:—

"In the list of killed and wounded is the name of Lieutenant W. L. Braybrooke, a volunteer, serving with the 95th regiment. This gallant and promising young officer was a lieutenant and adjutant in the Ceylon Rifles; and, being on leave of absence from his regiment, his professional ardour prompted him to seek the opportunity for seeing active service offered by the expedition to the Crimea. He had obtained leave from Lord Raglan to serve with the 95th regiment, and it was in charging with his regiment that he met a glorious death. He was the son of Colonel Braybrooke, the colonel of the Ceylon Rifles.

"The fourth division, it appears, was not engaged; the roar of cannon was first heard when it was at some twelve miles distance from the scene of action. Double quick march was instantly commanded, and when at length it became necessary to take a moment's repose, the sick and exhausted were ordered to step out of the ranks. Although the whole division might have been comprised under the latter category.

"Before rushing to the attack, the first division lay down in one of the Russian trenches to load and close up. While here, the Hon. Major Macdonald, aide-de-camp to the Duke of Cambridge, scrambled out of the trench on horseback to reconnoitre the enemy's position. The instant he showed himself, a shower of balls and musket bullets was directed against him. One of the former struck his charger full in the chest, and hurled both horse and rider to the ground. Fortunately, Major Macdonald was only slightly hurt by the fall, and some officers who saw the occurrence, rushed to his assistance and extricated him from his mangled steed. With great coolness, the major mounted a horse which was offered him, and rode back to the trench unscathed, though the bullets were whistling around him in all directions.

"Among those who distinguished themselves was Mr. Charles Lane Fox, nephew of the Duke of Leeds. He retired some months ago from the Grenadier Guards, in which he held a commission; but followed them to the East, and became aide-de-camp to Brigadier Beatson, who undertook to train the Bashibazouks. Upon their disbandment, however, he landed with the brigade of Guards in the Crimea, and appeared upon the battle-field in a shooting-jacket; catching the first stray horse in his path, he was indefatigable in getting up ammunition, and was complimented for his conduct by the Duke of Cambridge on the field. At the close of the action he was shot through the ankle; and in that state bore Captain

Charles Baring, of the Coldstream Guards, who had lost his arm, off the field. Mr. Fox is now lying at Constantinople, anxiously hoping his wound will permit his appearance in good time at Sebastopol."

One of the most graphic accounts of the repulse of a portion of the light division, and the fierce conflict attending it, was given by Lieutenant-colonel Unet, of the 19th regiment, in a letter to his father.

"Sept. 20th.—Moved on the whole army in same order as the day before, by grand divisions from centre of brigades, artillery between, protected by all our cavalry on our left flank. On looking round, while on the move, it was a glorious sight; the green plains seemed swarming with armed men. Moved steadily on until we approached some hills, when we observed some movements, and a line of cottages on fire, and evidently a river, or rivulet, between us. We halted now occasionally. At last our light division deployed into line, the rifles in front began to fire, and as soon as we got closer, or well within range, 100 great guns bellowed out at us from the hills on the other side of the rivulet. We pushed on, and many round-shot came rolling through our ranks, wounding and scattering a few. Wardlaw had part of the flesh of his leg carried away; another man, close to me, never spoke; the ground was covered with his blood. The fire now became much hotter from all their batteries in position, and we were ordered to run for shelter under the walls of the line of the burning cottages and ditch, where we lay more than an hour securely. My gray mare all the time would show herself, turning round, and being very uneasy at the firing. Another division deployed in our rear, and advanced to us, the shot falling among them, with a shrill hissing noise, over us. Other divisions deployed and advanced on our right. We were ordered to advance, and did so, to the best of our ability in line, across stone walls and a vineyard. Here the plunging fire, from grape, round-shot, shells, Minié muskets, &c., was awful, and also across the stream, through which we made our way with the greatest difficulty, more particularly us mounted officers. My mare got into a hole in the water, and was all under for some time, except her head and neck. I dismounted, and got her to the side, and attempted the high bank, which was nearly perpendicular and very slippery. I struggled to get up, sticking my fingers into the grass, and she by desperate struggles came up by my side as I had hold of the bridle, the shot falling all this time very thick. I mounted and pushed on, and we got into something like a line under the crest of a hill. Our regiment now took ground to our right, and were ordered to advance against the intrenched camp at some distance. The firing now was in-

cessant, and many of our men were hit. Our line was not well formed under such a plunging fire; it was impossible to form line. Sir George Brown came and said to Colonel Saunders, 'Go at them!' He rode in front of the line and waved his sword. The line got more confused. I was on the right of the line to which they seemed to crowd, and instead of being two deep, we had become fourteen or fifteen deep, all crowding together. During this pause of half-an-hour we were all being scattered by the round-shot, canister, Minié, and shells, which continually burst over us. We were next to the 7th Fusiliers. They retired gradually; we did the same. I saw a French general tumbling from his horse, and his horse rearing up. Saunders's horse I saw also rearing. My mare was now struck twice in the front part of her head, in the shoulder, and in one of her fore-legs. I felt myself struck slightly in two or three places, leg and thigh. The regiment retired gradually, firing as well as they could. We got under the hill, and formed them again there. We remained ten minutes to get our scattered men together and tell off, during which time we heard of many of ours being killed and wounded; Colonel Saunders was badly wounded in the leg. I now took the command, and told off the regiment. I abandoned my mare, as she had become faint, and looking at me as I dismounted, she snorted me all over with blood, which was streaming from her nostrils. My face and hands were covered, and all thought I was badly wounded. I marched the regiment up again to the intrenched camp, in line and in order, but in the meantime the Guards had supported us and taken the position. Afterwards we bivouaced for the night. Slept well, all round a fire, and got a little hot tea and biscuit.

"Sept. 21st.—This morning crossed over the scene of our fight to bathe with Sidwell and Thompson. We refreshed ourselves greatly with a good wash opposite the vineyard, now all tranquil. What a change! Visited our wounded and did all I could for them. An awful sight in all directions—2000 killed and wounded."

The treatment and condition of the wounded soldiers is an important feature in the narrative of these events. Ten days after the battle, an official report was made of the wounded who were admitted to the general hospital at Scutari, from the 22nd to the 28th. In the two days which followed the 28th, 500 more were admitted with wounds of almost every conceivable description. And after that date others arrived. The sick were also brought thither, and swelled the number, making the hospital itself a place of pestilence and horror. The following is the report:

Total..... 582

The following letter confirms the poor soldier's account; it is from a young lady then residing at Constantinople:—"A lady who is here at present, the sister of an officer now in the Crimea, was talking to me to-day about the poor wounded soldiers here. You cannot imagine anything so fearful; to think that there are 3000 lying in the barracks, and there are not even doctors enough to take care of them, and no nurses; for the few Greeks they tried to have were either not strong enough to bear the operations and the dressing of the wounds (for it was only very old women who could be procured), or else they drank so dreadfully that there was no depending on them. You will understand better the state these poor creatures are in when I tell you that many of them were brought down here three days after the battle, without their wounds ever having been washed even, and some were full of maggots; and most of them that have died since have done so after the amputation, from want of proper care. I have not told you half the misery there is here, but you may imagine it. The French have

Another writer from the hospital at Senturi thus describes the arrival and spirit of the wounded:—"It was a moving sight to see the long trains of wounded borne from the *Andes* and *Vulcan* to the hospital. From dawn to evening the labour was incessant, and the officers and medical men seemed perfectly worn out with fatigue. The men carried down mattresses to the beach; the wounded were lifted on them and were slowly borne along. Every one who could work lent a hand with eagerness to this duty, which the convalescents of the hospital, bearing on their faces the marks of recent suffering, discharged to the new comers. A few of the wounded were well enough to walk, and crept along supported by a comrade, one with his arm in a sling, another with his trousers cut open from the hip to the knee, and the thigh swathed in bandages, another with his hair clotted with blood, and a ghastly wound on the face or head. On many the marks of approaching death were set; every now and then there was one too far gone to be carried to the hospital, or who asked to be laid down for a few moments' rest on the wayside. A Catholic priest was active among the dying, and might be seen bending over the ghastly forms, and whispering to the ears which were fast closing to earthly sounds. He was an Irish monk of Galata, who had presented himself on the first arrival of the wounded, and had been eagerly received by his dying fellow-countrymen. The surgeons within were fully engaged, for the unfortunates brought under their care had been taken four miles from the place where they had fallen to the beach, and then transported over 400 miles of sea, so that whatever may have been the care of their former attendants, yet there was much to be changed on their arrival, and many operations to be performed which had not been necessary before, or which had been omitted through want of time, space, or opportunity. About 700 were brought down by the *Andes* and *Vulcan*, and the remainder are expected in the *Simoom*. It is believed and hoped that the first are the worst cases, and that no small number of those expected will be able to resume their duty, if not this year, at least in the ensuing spring. All that the vigilant attendance of

devoted officers can do is being done; for, though only actively employed since the return of the first sick from the Crimea, many of the surgeons seem, through excess of work, almost as exhausted as those under their care. For forty-eight hours many of them have had scarcely a moment's relaxation from their labours. It is easy to discover by a walk through the barracks how much the unfortunate 23rd and 33rd regiments have suffered. It seems that almost the half of those who are lying on every side in mortal agony belong to one of these ill-fated corps. The 23rd, it is said, has lost more than 400 men. It is with pride that an Englishman observes the appearance of these sick and wounded soldiers. Although the barrack is a vast hospital, and everywhere the eye encounters pale faces, forms bending with weakness, fever-stricken spectres creeping along by the support of the walls, or crouching in corners with listless countenances, too weak to take notice of the scenes passing around—although everywhere there are noise and discomfort, with that admixture of dirt and unclean smells which are unavoidable in such a place, yet the men have a soldierly look, and an appearance of energy and determination which are hardly to be found among the invalids of any other service. As the wounded were brought from the vessels, each man was asked his name and regiment before the litter entered the gates. Some were too far gone to reply; in others, delirium had taken away all consciousness of external things. But wherever the poor fellow had strength to answer, he spoke with a military promptness, as if on parade, and tried to make a salute and raise his head in respect to his questioner. In conversation with a Russian prisoner on the subject of the battle, it was observed by some one to be singular that, though the loss of English officers had been very great, yet no general officer had received a hurt, although they are conspicuous by a white plume, and the Russians confessedly singled out the officers while the British were advancing across the river and the valley in a clear day, and free from smoke. The Russian replied that the generals were not aimed at, because they were thought to belong to the commissariat. In the continental armies the higher officers are surrounded on all occasions by a brilliant staff, but our own generals ride attended only by one or two aides-de-camp. They were therefore in this case indebted for their safety to the unobtrusiveness of their habits."

We have now closed the details of the battle of the Alma. It was, as compared with other battles gained by the arms of England, neither so sanguinary nor so glorious as many; but it had great glory, and there was heavy sacrifice.

Never was the shock of arms so great, unless upon the ever-famous fields of the Spanish peninsula and of Waterloo, as it was upon the declivities of Alma. This battle was, on the part of the allies, one of the most audacious enterprises of war. We cannot honestly subscribe to everything written about it in the enthusiasm of "own correspondents," nor said about it in the speeches of cabinet ministers, who share the honour, as well as the responsibility, of appointing hosts and fleets, and the chiefs who conduct them. We do not think that the skill or daring of the allied chiefs is to be compared to that of the hero of Assaye and of the passage of the Douro; nor that the skill or bravery of the officers by whom M. Arnaud and Lord Raglan were so ably seconded, surpassed those qualities in degree as they were exemplified in the passes of the Pyrenees, or on the field of Waterloo. Our dauntless soldiers are all the same; as in the battles of the Spanish peninsula, the majority of the fallen have been the brave and impulsive sons of unhappy Ireland. The plaided and plumed soldiers of Celtic Scotland evinced a chivalry and coolness unsurpassed by any other troops. The 42nd were well disciplined at the Alma; they were a mob from the streets of Glasgow at Quatre Bras, and the only difference was in the superior discipline evinced in the Crimea; their hardihood was the same as when, in the corn-fields and by the wood-side at Quatre Bras, their predecessors bravely died. The Guards bore themselves with the same majestic soldierhood in defending Houguemont, receiving the last charge of the French Guards upon the slopes of Waterloo, unsuccessfully storming the breach of Burgos, or mounting to victory upon the rocks of the Alma. As General Chatterton said at a public dinner, "Peace had not subdued their valour, nor enervated their arm." It is inexplicable why contemporary writers should represent the Alma as the scene of unexampled suffering and slaughter on the part of the British. The British army seldom, perhaps never, achieved so formidable an undertaking with so little loss. When rolling down the tide of French valour from the heights of Busaco, as many men were lost as in storming the heights of Alma. Are the names of Ciudad Rodrigo and Badajoz so soon forgotten, or the bloody field of Salamanca? No victory ever achieved by us was more complete than that of Vittoria, Waterloo excepted; and yet at Vittoria our troops, as compared with their allies, suffered far more than, with the same comparison, they did upon the acclivities above the river Alma. When the minds of men cool down, they will not regard it in the light of an unusual slaughter, but as a great success, judging comparatively, cheaply won. Comparing it with subsequent conflicts

in the Crimea, it was the least bloody. The attack of General Liprandi soon after upon the British flank at Balaklava was, in proportion to the extent of the contest, the nature of the combat, the time occupied, and the numbers engaged, far more sanguinary.

It is painful to think that where war spared, pestilencesmote; and what man could avert, neglect and tardiness invited. We have read carefully, *pro* and *con.*, what has been written as to the state of our army from the landing at Eupatoria and Old Fort to the march from Alma, and we say with regret that the evidence of want of promptitude and foresight at home and in the Crimea was beyond confutation. That there was every disposition with the home authorities to do right, we allow; but either they did not know how to order or to do what was required, or they were deficient in that dispatch which, in great emergencies, is everything. Hannibal fell because of the impromptitude of Carthage. The illustrious Wellington owed the highest proofs of his genius to the opportunities afforded to it by the pro-

crastination of the ministry. In this campaign hitherto there was not only want of promptitude, but also of energy, diligence, and sympathy. A sufficient number of surgeons were sent out when half the sick were lost, and the remainder perishing for want of surgical assistance, while the profession was crowded at home, and medical practitioners could be had for nothing. While all Europe resounded with rumours, and Germany parleyed and procrastinated,—under the influence of false despatches published to the world through St. Petersburg, when it was quite possible to organise at home the means of rapid, certain, and correct communication,—our army was almost exhausted before they left the field of their recent victory, if British troops can be exhausted while they yet live, and there is anything to dare for their country; and when the tidings of so many fine soldiers slain, wounded, and invalided, arrived in England, reinforcements were sent out in manner and degree unworthy a great occasion, a great nation, and truth requires it to be written, a great want.

CHAPTER XXXVII.

ADVANCE OF THE ALLIES TO SEBASTOPOL.—FLANK MOVEMENTS OF LORD RAGLAN AND PRINCE MENSCHIKOFF.—MOVEMENTS OF THE FLEETS.—VIEWS OF THE ARMY FROM THE SEA.—OCCUPATION OF BALAKLAVA.

“Quo fas et gloria ducunt.”—*Motto of the 97th regiment.*

THE 21st and 22nd of September were occupied in refreshing the troops, in removing the wounded, and burying the dead. Marshal St. Arnaud was urgent upon the British general to march at once upon Sebastopol, and before the Russian army could recover from its surprise and disorganisation, to take the place by a *coup de main*. Whether the British general would, under other circumstances, have been willing to risk everything upon so bold an undertaking it is now impossible to say; but his reply to the urgent entreaty of the French chief was, that he was unable to move his troops for want of commissariat appurtenances, provisions, and almost every requisite for the march of an army. The clothing of the men was already so deteriorated that many were shoeless and shirtless, while the cloth of which their coatees and great coats were made, rent and gave way on every strain.

On the 23rd, however, Lord Raglan saw the necessity of an advance. Notwithstanding the sickness which prevailed, and the numbers that were struck down by cholera on the day of battle, and the two succeeding days, the men hailed the tokens of the intended movement with delight. At dawn, the tap of the French drum and the note of the French bugle were heard in the British lines; our

allies, the more prompt, were first on the march. The British arose from their bivouac chilled with the heavy dews common to the climate, and, as on their way to the Alma, numbers of the men dropped out of line immediately after the onward movement commenced, in consequence of the effect of this exposure. It was observed, both by men and officers, that coffee was the best stimulant and restorative after these chilling nights; but although coffee was plentiful in the army, it was distributed in the berry unroasted, and our soldiers were not expert in submitting it to that process; and there was probably not a single coffee-mill in the whole army, or anything that would pass for one. The morning was bright and beautiful, and on no spot, amidst the fairest scenes of Asia or Europe, can a softer or serener morning be enjoyed than in the Crimea. On that memorable morning the air was balmy, the sky clear and serene, and the prospect, as the army looked towards the heights of the Katcha river or to the sea, was commanding. The country preserved the same character as from Old Fort to the scene of the late struggle. Wide but not sterile plains stretched away inland; the grass was rich and high, and in some places rank and coarse; these plains were marked by undulations similar to those over which the army

passed on the 19th and 20th, but with rather more marked elevation. In some places clumps of oak saplings crowned the ridges of these elevations, otherwise the country was naked of trees. As the Katcha was approached, the country assumed a hilly and rugged, but most picturesque character. Through the hills winded the high-road to Sebastopol—if road that might be called which was no more than a heavily-beaten track. Traces of the flight of the enemy were found at every step; many of the horses had been wounded at the Alma by the shot and shell of the artillery, and these were left behind, and were already in a high state of putrefaction, tainting the air with their noisome odour, especially along the line of the British advance. Helmets, knapsacks, accoutrements of all kinds, many of them stained with blood, were picked up and cast away by the troops. Even arms were left behind, as if the retreat of the enemy was conducted in a state of perfect terror. They had literally *fled*, probably expecting a hot pursuit from our cavalry. The advance of the allies was slow; entangled in the long coarse grass, they could not move rapidly, and a large number were sick; scarcely two miles an hour was the rate of their march; it was not until the afternoon that they reached the valley of the Katcha, the most lovely and picturesque spot north of Sebastopol. The little river wends its way to the sea, irrigating a vale rich and variegated. Through orchards, the fruit-trees of which were heavily laden—by vineyards where the large black grapes were ripening for the vintage—along the slopes of gardens, laid out with taste and profusely gay in flowers and foliage, sped the peaceful Katcha, glistening in the light, and reflecting flower and shrub and mellow fruit as they bowed over its stream, and often kissed its waters, gliding onward to the little picturesque bay where their disembogement is effected. Here and there a handsome villa, with its English-looking lawn sloping to the water-side, delighted the eyes of the warriors, who did not expect to look upon such home-like scenes. Some hamlets also dotted the river's banks, embosomed in the hills. The pretty village of Eskel gave a hospitable appearance to the vicinage; and although its inhabitants had fled, corn and hay in considerable quantities were found there—a useful supply for the horses of the force. This little place escaped the burning brand of the Cossacks, who set fire to houses and hamlets everywhere else—a useless and barbarous act, as they could have rendered no supplies, and furnished no shelter to the armies, of any account in the magnitude of such a contest. There was a mean, petty, and revengeful spirit displayed in this proceeding, unworthy the soldiers of a great nation warring with nations equally great. The

Katcha was the first bivouac of the army. It was a very delightful one. Comfortable quarters were engaged by the officers in the village and in the hamlets. The soldiers found poultry and eggs in considerable quantities, and almost every description of fruit regaled and refreshed them; of this, however, many of them partook so injudiciously that cholera increased, and dysentery made its appearance in several of the regiments of both armies. The English, however, suffered much more than the French from this indulgence, as the latter had been more accustomed to pluck the vine and the fruit-tree in their own sunny France. The furniture of the houses was in the state it might be supposed it would be left by persons whose flight was precipitate. This the men put to every conceivable use, and to many purposes previously inconceivable. Overalls of sheets, blankets, quilts, rugs, &c., might be seen awkwardly covering uniforms very much out of keeping with such novel and extempore garments. Mirrors, some of them elegant and costly, were piled with the arms, or propped against heaps of stones, and afforded constant amusement to the heroes who had not seen the reflections of their own faces for so long a time; and many were able to test the extent to which their good looks suffered by the freedom taken with their countenances by the defenders of the trenches on the steep slopes of Alma. The poor Tartar inhabitants had fled from their houses, and were concealed in the bushes and by the river's banks: a deserter gave this information, and Lord Raglan directed him to carry assurance of protection to the fugitive population, who returned, and soon made themselves at home again with their strange if not unexpected guests. These poor people seemed to have no fear of the allies after the first interview, but seemed to be in terror of the Cossacks, to whose brutality they bore a very earnest, and, we fear, a very correct testimony. There was a handsome little Greek church in the village, where sentries were placed to protect it from pillage. The Russian army had intended to occupy this post if driven from the Alma; but not expecting to lose that position so soon, if at all, no entrenchments were formed or batteries erected. Menschikoff, however, halted in his retreat, and bivouaced upon the heights on the night of the 20th; but the Tartars having reported that the British cavalry were at hand, followed by the rest of the army in full march, the resolution of the prince to occupy this vantage-ground gave way, and he again took to precipitate flight long before dawn of the morning of the 21st. The position of the Katcha was a still finer line of defence than that of the Alma, and in some respects resembled it. As in the latter case, there was a village on the northern bank and a wide plain beyond; but there was this dif-

ference, the plain, instead of sloping upwards towards the lines of defence, was perfectly flat, affording a better scope for the fire of the defence. Besides this advantage, the lower line of heights was not so high as the knolls at Alma, so that the cannon could have swept the level plain with sure and deadly range. There was a good ford at the Katcha, but, except at that spot, the banks of the river were steeper than at the Alma. Had not Menschikoff lost his judgment, or all reliance upon his troops, he must have occupied this post; and had he done so, a battle, far more bloody than that which he had so recently lost, must have attended his resistance to the allied advance. It was alleged by the Tartars, and deserters subsequently confirmed their account, that so great was the alarm of the Russian soldiery on the night of the 20th, that had Prince Menschikoff not abandoned his intention of defending the passage of the Katcha, his troops would have deserted him, and fled in disorder to Sebastopol.

On the night of the 23rd, the British first, third, and light divisions bivouaced on the heights, and the second and fourth divisions at their base, on the river's banks; the French on the southern slopes. The men bathed, and did not generally resort to the merriment so usual among soldiers round the camp fires; they sought rest and found it; the night was fine and balmy, and the morning of the 24th saw the armies much refreshed. The 57th regiment of infantry here joined the British, and a very welcome reinforcement of cavalry—the Scots Greys. A smart light cavalry regiment, well horsed, would have been better suited to the duties which the troops had to perform; and had a dozen such regiments arrived, they would have been still less than the requirements of the army for that description of force. A division of irregular cavalry, such as our India government finds so useful, would have been of great value. The French also received reinforcements to the amount of 9000 men. The advance from the field of their recent victory to the Katcha, as viewed from the fleet, was magnificent exceedingly. The following description by a naval officer is worthy of what it describes. Every object is presented with reality and vividness:—

“*Saturday, Sept. 23.*—Going twelve knots, lighthouse bearing north. Saw two camps of Russians to the south of Sebastopol. Passed within one mile and a half of the lighthouse; stood close into Sebastopol; saw the houses distinctly, and the vessels lying in the harbour with the Russian flag flying; the dome of the church shone brilliantly in the sun, as did the reflection of the glass windows of the houses. Outside the harbour was a three-decker, with her gallant masts struck, and another large

ship close to her. Had a fine view of the forts, the day being beautifully clear. Saw two other Russian encampments, and tents looking very white against the green country; very rich, pretty farmhouses, trees, &c., spread about, not unlike the south part of England, but if anything prettier. In the distance, the hills rose very high. As we passed the fort heard the sound of very heavy guns. A steamer was under weigh, and came a short distance. At ten we saw the army advancing on the heights from Alma; could see the whole of the three armies spread out like a panorama before us—the French on the extreme right, with the Turks under their command. The extreme right I call the sea-shore. Leading to Sebastopol, on the inside of them, say from three to four miles from the shore, saw our own fine red-coats, with occasional glimpses of the bonny Highlanders. We passed through the whole of the French fleet, advancing rather ahead of the army on the extreme right; first, a small steamer; then ten war-steamers in double line; then their glorious line-of-battle ships; also, in two lines, the *Napoleon*, *Charlemagne*, and a screw three-decker, each with another liner in tow: in all twelve liners. The ‘Greys,’ from the colonel down, cheered and were cheered as we passed each ship; and most exciting it was. It was impossible to have a finer view; the ground appeared like a gentleman’s well-kept park. We then passed through the Turkish squadron, and last the English. Both are anchored at the mouth of the Alma, right in front of the battle-field of the heights of Alma. At one, ordered to get under weigh from Alma, and proceed with the Greys to the mouth of the Kaza, or Katcha river, where the army was to rest for the night. Followed some distance astern of the *Agamemnon*, then passed ahead, but very close to her, and went in shore closer than any other. Though the *Himalaya* was the largest ship, and the whole of the steam squadron was under weigh with us, Captain Killock handled the ship as if she was a small boat instead of the largest vessel we have. Lord Burghersh came off, and directed the captain where to effect a landing for the horses, and gave us a most graphic account of the battle. Captain Killock offered to beach the *Himalaya* gently, so as to lower the horses into the sea, and then let them walk on shore; his offer was however declined. It is wonderful the zeal he displays. However, we went close into a beautiful beach, close to the mouth of the Katcha, which empties itself here into the sea, running through a valley of about two miles wide, on either side of which are gentle green slopes. On the top of the one nearest Sebastopol, the French were encamping, and all along the slopes, for several miles into the country, we could see the various corps

coming on, and taking up their positions for the night. As we anchored, Lord Raglan and staff came riding along the beach. The Greys ashore gave him three hearty cheers; he rode into the water, and took his hat off, and rode on. In a few minutes some fifty boats, French and English, were filling up their horses and landing rapidly. We dined at four p.m.—champagne, &c.—capital dinner, and all in good spirits. All sorts of good wishes for the Greys, the sound of the cannons being our music. I had great difficulty in getting on shore, which I at last effected in a horse-boat, and set off for the headquarters of the English, after I had walked through the French camp.

"I got to head-quarters at about eight p.m. Lord Raglan and staff were dining in a ground-floor room at a very pretty house, with gothic windows and coloured glass, with the rooms nicely furnished, piano, easy chairs, &c., and the room itself garnished with gilt mouldings round the top. I had some difficulty, but at last I saw an officer with whom I was desirous of speaking, and had a chat with him. Lord Raglan's staff appeared to be very comfortable, and were singing and pianoforte playing as cheerfully as possible. The house was surrounded by an immense number of bullocks, servants, and retainers, the latter being located in the out-houses, or in the beautiful grounds among the noble avenues of trees. Hearing that the 68th were on guard, I walked down, and in a few minutes found some of the officers seated under a tree, with a very pretty table and good chairs, but drinking from tin pannikins. After half-an-hour's chat, they persuaded me to stop, saying it was dangerous to pass through the camp. I took a turn among the muleteers, to see if I could hire any sort of a conveyance. After an unsuccessful ramble of an hour, and meeting some old acquaintances who offered me a share of all they had, which amounted, generally, to a share of the turf, I set off to the boat, some six and a half miles away. The night was very dark, and the camp fires rather dazzled than assisted me. I more than once regretted having started, for I was wandering repeatedly without any path to guide me; and some of the watch-dogs which had been burnt out of house and home made some savage attacks on me, as though they wished to convert me into food. It was very melancholy to see the farm-houses still smouldering from the recent burning, and the house-dogs howling most dreadfully among the ruins. The dew very heavy, and I felt cold and chilly, even previous to getting soaked in wading the river, which I had to do more than once. Every now and then I followed a road for some time, only to find it abruptly terminate at the ruins of some house that was still burning. The bullfrogs and insects kept up a continual hum. At

last I reached the ferry, and was challenged by the French pickets, but found a boatman who for five shillings took me on board."

On the 24th the allied armies marched from the Katcha towards the Belbek, the country retaining the same character, but the undulations becoming more abrupt, and the general outline of the country more bold and hilly. The space in which the armies advanced was more confined than on the previous days, so that the allies mingled, the red-coats and the blues almost mingling together, and the officers riding side by side in many cases. The first British division was nearest the French, and was greatly admired by them; all the exaggerated epithets of the French vocabulary were exhausted in their praise. This division was certainly the most picturesque of those which constituted the British infantry. The Guards, tall of stature, and with the fine manly bearing characteristic of the household infantry, and the Highlanders, with their brow bonnets and bonny plumes, their plaids, and manly mien and faces, charmed the French. Perhaps the old Celtic blood of France warmed to this offshoot of the great Gallic race; but account for it who can, there was a strong inclination on the part of the gallant Franks to embrace their Highland *confrères* as true brethren. There was a vast difference in the bearing of these two branches of the same race; the gay and buoyant spirits of the modern Gaul were not wholly accordant with the temper of the Highlandmen, who manifested a steadiness superior to any other portion of the army. Still they returned the greetings of their allies in their own fashion. The Duke of Cambridge rode beside Prince Napoleon, and Sir Colin Campbell and General Canrobert fraternised.

The heights of the Belbek are separated by a chasm of at least half a mile in width, through which the river flows. Hills, ravines, rocky abrupt knolls, and ridges which seem to have been tortured and torn by innumerable cataclysms in some bygone age, are the characteristics of the country of the Belbek. The line of march to the river was by a steep road, or rather broad beaten grassy track, where the artillery of the two forces met and descended together. The French artillerymen were as liberal in their encomiums upon the appointments—especially the horses and harness—of the English artillery, as the division of Prince Napoleon had been in praise of the division of the Duke of Cambridge. As the horse-artillery descended the sloping road to the water's-edge, they found two large green-painted Russian waggons in their track, which the Russians had abandoned. They were filled with various camp utensils and munitions of war, strangely jumbled, as if huddled together in a hurried flight, and as

riedly abandoned. There were many hundreds of copper plates and vessels for the soldiers, and 20,000 rifle cartridges. Our soldiers were much struck with the superiority of manufacture in the cartridges to those of our army; they were especially constructed for rapidity of use, the powder becoming exposed on a slight twist of the cartridge end. The river being passed, the way up the southern bank was by a long, narrow, and winding road, which conducted to an elevated plain, studded with oak coppice and clusters of poplar-trees. The scenery on the south is as beautiful, as on the north of the river it is coarse, rugged, disjointed, and abrupt. Indeed, seldom is an army taken up its bivouac amidst lovelier scenes than those on the southern Belbek—gardens, orchards, vineyards, spread away in every direction. The gardens blooming with dahlias, which, although an officer described as of inferior floricultural value, presented an aspect of beauty, and gave an air of civilisation to the scene delightful to contemplate. We have seen accounts from officers of every division in the army, and all express the delight and enjoyment they experienced in the bivouac of the Belbek. An artillery officer thus graphically describes his arrival on the ground, and his experience there:—"Passing the valley to the river, we came upon a small villa which had been plundered by the retreating Russians. I rode up and entered the house. On the steps of the porch were some broken arm-chairs, covered with yellow musk. In a room on the right were broken sofas, chairs, tables, and a piano, from which the front board was torn, exposing the keys; this piano was in tolerable tune, and had evidently been recently in use. Upstairs was a small library, chiefly filled with French books. Portraits of a lady and gentlemen, in every sign-board style of painting, were torn from their frames. In front of the house was a garden laid out in flower-beds, with fruit-trees in the midst of them. I climbed into a tree laden with large yellow plums, and found them delicious, but rather over-ripe. On the right of the garden was a vineyard filled with grapes. An orchard of apples, pears, and peach-trees was beyond the vineyard; the fruit here lay thick on the ground, and before riding off I filled my haversack to furnish a dessert. We were now so close to the great object of the expedition, that by riding up a mile and a half we could see the towers and fortifications of Sebastopol in the plain below. This was the north front of the place, to strengthen which all the efforts of the Russians had been directed since the allies landed in the Crimea. The whole of the ground there was supposed to be rendered inviolable by batteries and mines, and the next

move in the game was anxiously awaited. While halted here, the cavalry and artillery had a hard life who were on outpost duty. The horses had neither forage nor water for forty-eight hours, all which time they remained accoutred and harnessed; and the men and officers for four days did not taste meat."

About noon on the 25th orders for an advance were given, and then commenced the most remarkable military movements of ancient or modern times—the flank movements since so celebrated. There were *two* flank movements going on at the same time. The allies, finding that the preparations for defending Sebastopol had been made against an enemy assailing it from the north, were desirous to pass round the city, leaving it (in passing) to the right, and to take up a new position to the south, where the defences of the place were presumed to be weakest. Besides, in order to maintain easy communications with the fleet, whence all their supplies were derived, such a proceeding was necessary, for the enemy had fortified the mouth of the Belbek with great strength; and as Balaklava furnished a safe and well-sheltered anchorage, that place was chosen by the British commander as his point of support. Prince Menschikoff's army was divided, part of it garrisoning Sebastopol, and the remainder encamped within easy distance. He also determined on a flank movement to Bagtché Serai, so as to threaten the flank and rear of the allies in the position he supposed they would take up to assail northern Sebastopol. It was also the object of the prince to keep open by this movement the communications between Sebastopol and Simpheropol, the capital of the Crimea, to which point, from Perekop, munitions of war would be transmitted. In these two flank movements the armies executing them at the same time must cross one another's path somewhere, and most probably at Kutar M'Kenzia (or M'Kenzie's farm), a pleasant plantation established by a Scotch admiral of that name, who had served in the Russian fleet. Before we describe the execution of these strategical operations, it is necessary to allude to a rumour which reached London only a few hours after the arrival of the tidings of the battle of the Alma, and which excited the public not only in London, but throughout Europe, more than even the news of that glorious victory. On Saturday night, September 30th, the evening newspapers contained a telegraphic despatch from Vienna, announcing how the newspapers there had just published a statement that Sebastopol had fallen by a *coup de main*; that a steamer had been dispatched from the Crimea to Constantinople with the tidings; that the steamer had met with another *en route* from Constantinople to Varna, and having spoken her, communicated

the tidings; that from Varna it was communicated by "a Tartar" to Omar Pasha at Shumla, who by another sent it to the Austrian frontier; thence it was by especial post conveyed to Vienna, whence the electric telegraph flashed it on to western Europe. Thanksgivings for the fall of Sebastopol were offered up in many places of worship the next day, and on Monday morning authenticity was given to the report by the Turkish ambassador, who thus gave to the public the information which he had received:—

Bryanston Square, October 2.

"The Turkish minister presents his compliments to the editor of the *Times*, and begs to transmit to him herewith a telegraphic despatch which he has received to-day from the Turkish ambassador at Vienna, and which is an unquestionable confirmation of the fall of Sebastopol.

Vienna, October 2.

"The French embassy and the Austrian government have received from Bucharest, under date six P.M., September 30, the following telegraphic despatch:—

To-day, at noon, a Tartar arrived from Constantinople with despatches for Omar Pasha; his highness being at Silistria, the despatches had to be forwarded to him at that place. The Tartar announced the capture of Sebastopol: 18,000 Russians were killed and wounded, 22,000 made prisoners; Fort Constantine was destroyed, and other forts, mounting 200 guns, taken. Of the Russian fleet, six sail of the line were sunk, and Prince Menschikoff had retired to the bottom of the bay with the remaining vessels, declaring that he would burn them if the attack continued. The allied commanders had given him six hours to consider, inviting him, at the same time, to surrender for the sake of humanity. A French general, and three Russian generals, all wounded, have arrived at Constantinople, which city was to be illuminated for ten days. We expect to-morrow the official report of the above intelligence from Omar Pasha."

Universal credence was given to intelligence thus authoritatively put forth. The English minister sent it to Boulogne to the French emperor, who was with his camp there. Baron Hubner, the Austrian ambassador at Paris, was charged by Count Buol to offer to M. Drouyn de Lhuys his congratulations and those of his imperial master. As time passed without any details of so great an event, or even any confirmation, the truth became obvious that a hoax had been played off upon the credulity of Europe, or that the stock-jobbers had forged the intelligence, speculating for a rise in the funds. By degrees the British public became reconciled to the true state of the case, and convinced that a long and formidable struggle must be maintained, before the stronghold of the czar should become a prize to the prowess of the allies.

We now return to the flank march of the opposing armies. Concerning the details of that effected by Prince Menschikoff we can

know nothing, except from his own despatches, as they appeared in the press of St. Petersburg. Our space does not allow of giving documents so cumbrous and of so little value. The prince took great credit to himself for his movement from the Belbek to Bagtché Seraj, and the journals of his government commended it as a master-stroke of military genius, rivalling, not surpassing, that of the allied commanders; but still it could not be denied that, while the movement of the prince issued in nothing, that of the allies enabled them to gain a great advantage; for, as before noticed, the mouths of the Belbek and Katcha, being heavily fortified by the prince, the allies could not have landed their supplies there, whereas the change of position from the north to the south enabled the allied chiefs to outflank the Russian batteries, to secure a harbour admirably adapted as a place of support, and having the communication of a good high-road with Sebastopol itself. The despatch of Lord Raglan, dated the 28th of September, from Balaklava, gave the first authentic intelligence of the event received in England; his account of the events from the 24th to the 28th is of course a mere outline, but it indicates the correct order of the incidents that occurred, and exposes the designs of the great actors. We shall first present the despatch, and then fill up the outline. The despatch is directed, as a matter of course, to the British colonial secretary.

MY LORD DUKE,—I have the greatest satisfaction in acquainting your grace that the army under my command obtained possession of this important place on the 26th instant, and thus established a new and secure base for our future operations.

The allied armies quitted their position above the Alma on the morning of the 23rd, and moved across the Katcha, where they halted for the night, and on the following day passed the Belbek.

It then appeared that the enemy had established a work which commanded the entrance of the river, and debarred its use for the disembarkation of troops, provisions, and material, and it became expedient to consider whether the line of attack upon the north side should not be abandoned, and another course of operation adopted.

It having, after due deliberation, been determined by Marshal St. Arnaud and myself that we should relinquish our communication with the Katcha, and the hope of establishing it by the Belbek, and endeavour by a flank march to the left to go round Sebastopol and seize Balaklava; the movement was commenced on the 25th, and completed on the following day by the capture of this place by her majesty's troops, which led the advance. The march was attended with great difficulties. On leaving the high-road from Belbek to Sebastopol, the army had to traverse a dense wood, in which there was but one road that led in the direction it was necessary to take. That road was left in the first instance to the cavalry and artillery; and the divisions were ordered to march by compass, and make a way for themselves as well as they could; and, indeed, the artillery of the light division pursued the same course as long as it was found to be possible, but as the wood became more impracticable, the batteries could not proceed otherwise than by getting into the road above-mentioned.

The head-quarters of the army, followed by several batteries of artillery, were the first to clear the forest, near what is called in Major Jarvis's map "McKenzie's Farm," and at once found themselves on the flank and

MARSHAL DE ST ARNAUD.

ear of a Russian division, on the march to Bagtché Serai. His was attacked as soon as the cavalry, which had diverged a little into a by and intricate path, could be brought up. A vast quantity of ammunition, and much valuable baggage, fell into our hands, and the pursuit was discontinued after about a mile and a half, it being a great object to reach the Tchernaya that evening. The Russians lost a few men, and some prisoners were taken, among whom was a captain of artillery.

The march was then resumed by the descent of a steep and difficult defile into the plains, through which runs the Tchernaya river, and this the cavalry succeeded in reaching shortly before dark, followed in the course of the night by the light, first, second, and third divisions; the fourth division having been left on the heights above the Belbek till the following day, to maintain our communication with the Katcha.

This march, which took the enemy quite by surprise, as a very long and toilsome one, and, except at McKenzie's Farm, where two wells, yielding a scanty supply, were found, the troops were without water; but they supported their fatigues and privations with the most cheerfulness, and resumed their march to this place on the morning of the 26th.

As they approached Balaklava, nothing indicated that war was held in force; but, as resistance was offered to the advance of the Rifle Brigade, and guns were opened from an old castle as the head of the column showed itself on the road leading into the town, I deemed it prudent to occupy the two flanking heights by the light division and a portion of Captain Brandling's troop of horse-artillery. The left-movements terminated by the surrender of the place, which had been occupied by very inconsiderable numbers of the enemy.

Shortly after we had taken possession, we were greeted by Captain Mends, of the *Agamemnon*, and soon after by Edmund Lyons himself. His co-operation was secured by the activity and enterprise of Lieutenant Maxse, "her majesty's ship *Agamemnon*, who reached my camp at the Tchernaya on the night of the 25th with detachments, and who volunteered immediately to retrace his steps through the forest, and to communicate to Sir Edmund the importance I attached to his presence at the mouth of the harbour of Balaklava the next morning, in such difficult service (from the intricacy of the country, frequented by Cossacks) he accomplished so effectually, that the admiral was enabled to appear off this harbour at the very moment that our troops showed themselves upon the heights. Nothing could be more opportune than his arrival, and yesterday the magnificent ship that bears his name entered this beautiful harbour, and the admiral, as is his invariable practice, co-operated with the army in every way possible.

We are busily engaged in disembarking our siege-train and provisions, and we are most desirous of undertaking an attack of Sebastopol without the loss of a day. I ordered up two divisions yesterday to its immediate neighbourhood, when I was enabled to have a good view of the place: and Lieutenant-general Sir John Burgoyne, and General Biset, the French *chef de génie*, are occupied in reconnoitring it closely to-day.

The march of the French army on the 25th was still more fatiguing and prolonged than ours. Being behind our columns, they could not reach Tchernaya till the next day, and I fear must have suffered sadly from want of water.

I regret to have to acquaint your grace that Marshal St. Arnaud has been compelled, by severe illness, to relinquish the command of the army. I saw him on the 25th, when he was suffering very much, and he felt it his duty to resign the next morning. I view his retirement with deep concern, having always found in him every disposition to act in concert with me. He has since become much worse, and is, I fear, in a very precarious state. Fortunately he is succeeded by an officer of high reputation, General Canrobert, with whom I am satisfied I shall have great pleasure in acting, and who is equally desirous of maintaining the most friendly relations with me.

I have, &c.,

RAGLAN.

To: Grace the Duke of Newcastle, &c.

On the memorable 25th (not on the 26th, as Lord Raglan relates in his despatch), Marshal St. Arnaud resigned the command of the French army to his second in authority, General Canrobert. On the 26th he addressed to the French army a touching farewell, lamenting that disease incapacitated him from any longer leading them to victory, but expressing his confidence that his successor would have the good fortune to complete the success of the Alma by conducting them into Sebastopol. This confidence, although not misplaced as to the skill and heroism of the chief to whom he committed the great trust, was not prophetic, as Canrobert was not destined to plant the eagles of France upon the gloomy earthworks of the arsenal. On the 29th the marshal breathed his last; his body was taken to Constantinople, on board the *Berthollet*, and thence it was borne to France. On the 16th of October he was buried at Paris, in the Chapel of the Invalids. Every demonstration of respect which the court, the army, and citizens could show to his remains was made. The emperor addressed a letter of condolence and compliment to "*Madame la Maréchale*," which was not conceived in good taste, being a sort of Buonapartist political epistle, in which the emperor makes the zeal of the departed marshal for his dynasty his chief virtue; and his attachment to his cause in suppressing the republic, as making him the champion of order and authority, which his majesty assumed was re-established by himself. Yet whatever diversity of political sentiments existed among the vast multitude that thronged the way to the Chapel of the Invalids, all paid a respectful homage to the bravery and genius of the departed.

In accomplishing the celebrated flank movement the task mainly devolved upon the British chief, the illness of St. Arnaud rendering it impossible for him to influence any part of the plan. The chief anxiety of Lord Raglan respected the covering of his rear, and the sending of timely information to the fleet of his stratagem. He placed the fourth division in such a position as to secure his communications with the Katcha, and then directed the mass of his army to proceed by compass through the dense forest and brushwood which covered the country from the Belbek to the Tchernaya. While on his march, he directed an intelligent messenger to proceed to the rear, and instruct Sir George Cathcart to dispatch an officer to the shore with tidings for the fleet of the manœuvre which the armies were affecting; so that the ships should steam round Cape Chersonese, and be at the entrance to the Bay or Cove of Balaklava, to meet the arrival of his army and co-operate with it. The messenger easily gained access to the division of General Cathcart, but the difficulty was considerable for

Sir George to convey the desire of Lord Raglan to the fleet, as the intermediate country was infested with Cossacks, and the allied cavalry was numerically contemptible. Other light cavalry of the enemy, as well as the Cossacks, scoured the country in every direction. General Cathcart committed the perilous task to Colonel Windham—afterwards the principal hero of the Redan—and he accomplished it, escaping all the dangers which beset his path. When Lord Raglan had extricated his troops from the jungle, and they began to enter the hamlet of Traktar, he became uneasy lest Sir George Cathcart had failed to open a communication with the fleet; and as his army was exhausted with fatigue and thirst, should the fleet not appear, the consequences would be most serious. His lordship therefore sent for Lieutenant Maxse, of the royal navy, who attended him by order of Admiral Dundas, and committed to that officer the formidable undertaking of retracing his steps to the Belbek, and ascertaining from Sir George Cathcart if he had succeeded in conveying Lord Raglan's request to the fleet. Lieutenant Maxse executed this most dangerous commission satisfactorily, and also undertook to execute the same dangerous performance which Colonel Windham had undertaken. Sir George, not sure that Windham had reached the shore, or, reaching the shore, had been able "to speak the ships," requested Lieutenant Maxse, he being a sailor, to make his way if possible to the admiral. On arriving, he found that the colonel had accomplished most gallantly the mission previously assigned to him. Much controversy was afterwards mooted upon the comparative merits of these two officers in this important affair—some maintaining that the glory was Colonel Windham's, who first reached the fleet; others that the honour belonged to Lieutenant Maxse. The above account places their respective deserts in their proper light. Windham first brought the tidings to the fleet; Maxse performed a far more dangerous task, which included the duty of traversing the ground over which Windham had passed. The person who evoked this controversy in England was Lord Albemarle, by a speech delivered in Norfolk to the following effect:—"In the early part of the war, Lieutenant Maxse, of the *Agamemnon*, got great credit, and was promoted for a certain night march, by which he was said to have succeeded in summoning the fleet round to Balaklava; but it was Major-general Windham who really deserved this credit, for he arrived at the fleet two hours before Lieutenant Maxse. Captain Maxse was an able and deserving officer, and well deserved promotion, but not for being the first to carry the intelligence of the march on Balaklava from the army to the fleet. Windham arrived two hours before him, and when

he reached the fleet the ships had got steamed up, and were about to proceed to Balaklava. This speech was made by his lordship after Colonel Windham behaved so gloriously at the Redan, and when all England was ringing with his name. Lieutenant (then Captain) Maxse replied to it in a tone and spirit becoming a brave man, anxious to concede the honours to another, unwilling to be deprived of his own so severely won. The letter was addressed to the great redresser of wrongs, the Editor of the *Times*, and was as follows:—

40, Rue Basse du Rampart, Paris, October 2

"SIR,—Will you permit me through your columns to explain a few circumstances relative to myself, referred to in a speech made by the Earl of Albemarle, at the Norfolk sessions last Friday, which would harm me if I were silent.

"I got a good deal of credit from the papers and public generally, at the period of the Balaklava flank march, in consequence of my having conveyed from Lord Raglan a message through the enemy's country to the admiral, which was considered of great importance. It was to request Sir Edmund Lyons to send some steamer immediately to Balaklava to co-operate with the army. A message had already been sent in the early part of the afternoon, while the army was on its march, to Sir George Cathcart, who had been left behind on the Belbek with his division, telling him to communicate to the admiral Lord Raglan's wish that a steamer should be sent there; but there was a doubt in his lordship's mind as to whether the wrong day had not been named, and he feared the steamer would arrive one day too late. In order, therefore to insure their arrival, he sent for me (being then bivouaced on the Tchernaya) at ten p.m., and asked me whether I could find my way back to the Katcha river, where the fleet were with the necessary message. I was, of course, too glad to be selected, and immediately proceeded to take it.

"My orders were, on reaching Sir George Cathcart's division on the Belbek, to communicate with him as to the advisability of my continuing. I got to him at about half-past two o'clock in the morning, and he immediately told me there was no necessity for my proceeding, as he had already dispatched Colonel Windham with the message, in consequence of an officer having come from Lord Raglan about it. I was surprised at another officer having been dispatched after me, and feared that my own journey must have been slow to have allowed him to get before me; but in the course of conversation I found that the message was thus sent by Lord Raglan in the afternoon, but which had been long coming. I mentioned this to Sir George Cathcart, and he immediately urged my proceeding the remaining five miles

and giving to the admiral likewise the last message. I did so, but found Sir Edmund Lyons already preparing to steam there, and that, therefore, my mission had been useful but for confirmation.

"Credit and promotion were given me for traversing rather a precarious route in the execution of my duty. How that is diminished, because Colonel Windham performed also the third or fourth part of the distance I did, I cannot conceive; and am sure that, though Lord Albemarle would take my small honour and heap it on the top of Colonel Windham's large ones, he would not wish to do so himself. I hope that you and the public will forgive these details being inflicted on them, but Lord Albemarle's speech might be detrimental to me, if unanswered; so I have overlooked the difficulty and delicacy of defending one's own exploits, and endeavoured to defend reputation, which is so dear to all of us.

"I remain, Sir, your obedient servant,

"FREDERICK MAXSE, *Commander, R.N.*"

The march of the army, on the 28th, was led by the artillery of the first division—Captain Maud's troop had the honour of being in advance; their track lay through the forest, and after passing on some miles, finding themselves unsupported by cavalry, they hesitated, and the hesitation was soon extended to the troop which came next in the route. At this juncture, Lord Raglan and Quartermaster-general Airey overtook them, Lord Raglan demanding, with some severity of tone, why they had not proceeded according to orders which he had personally given a short time previously, as they passed him on the road before entering that portion of the wood. His lordship rode smartly on, and desired them to follow. After he troops proceeded about three miles, the commander-in-chief galloped back again with great speed and much excitement in quest of the cavalry, some of whom coming up, were ordered to the front. These consisted of about twenty men of the Scots Greys, and a small body of Hussars. The cause of Lord Raglan's excitement and haste became speedily apparent—an open space skirted the wood, and through that space a mass of nearly 15,000 Russians were marching. The British general was himself the first to see them. The few troops of horse-artillery and the straggling detachments of cavalry came suddenly upon the flank and rear of the Russians, marching from Sebastopol in the direction of Baghtché Serai. The commander of the British had not taken into account the possibility of such a movement, and had not the artillery delayed, they would have come out of the wood when the Russians had only passed half-way, who must then have discovered the weakness of the force opposed

to them. In that case, the enemy's infantry would have entered the wood, against whom neither the British cavalry nor artillery could have acted. The small force of cavalry would have been shot down, and twenty pieces of cannon might have been captured before the arrival of any of the British infantry; and as these would have come up in small bodies,—straggling, in confusion, fatigued, and many of them ill,—it is impossible to believe that the issue would not have been fatal to the English army. The Russians were, however, too much terrified by the apparition of a British general officer and staff, immediately followed by several troops of horse-artillery and detachments of light and heavy cavalry, not to suppose that they were attacked by the allies in force, and in their flank and rear to great disadvantage; they accordingly took to flight, some along the way to Baghtché Serai; the rear of the column was cut off from that body, and retreated back to Sebastopol. The former body was attacked by the Hussars, who cut down and made prisoners of some of them; many of the Russian infantry took to utter flight before the light cavalry, and dispersed in the wood. In seeking its shelter, they were exposed to a fierce charge from the small body of the Scots Greys, who cut down a considerable number, and then dismounting, pursued them, carbine in hand, through the thicket. A number of the Russians lay down, in attitudes cleverly imitative of men who had fallen from the fire of small arms, and as soon as the Greys passed, rose and fired upon them; but some of the British infantry coming up, these men were repaid for their dexterity by being shot down without mercy.

The Russians are, of all soldiers, the most patient and obedient for *ruses de guerre*, and in this instance some feigned death until only a few stragglers of the rifle brigade remained near them, upon whom they suddenly rose and fired, fleeing further into the bush for security. Meanwhile the horse-artillery limbered up, and discharged case-shot upon the fugitives along the road, and upon those who, in their flight diverging from it, fled among the trees. Immediately beyond the line of march of the Russian column was a steep cliff, at the bottom of which a narrow road winded into Sebastopol. One or two of the British guns, brought to the edge of the cliff, were directed upon that portion of the fugitives who returned back to Sebastopol. Booty was captured from both sections of the divided column of the enemy—carriages, baggage, and ammunition; the ammunition was blown up, the carriage horses used by the artillery and the officers of the other arms of the service. The baggage was divided among the captors in a summary and by no means orderly manner. Riflemen might be seen attired in hussar-jackets richly

embroidered; and all sorts of military apparel and appliances were put to the oddest uses, as the whim of the soldiery dictated. The most curious matter amongst the spoils was an altar-piece, in a very large tabernacle or wooden case, with folding doors. When the doors were unfolded, there was a numerous array of saints displayed, carved and gilt elaborately. There was some unseen machinery, by which these sacred puppets were moved. This afforded infinite amusement to the men, who, like children, began to pull it to pieces to see how it was made.

The captain referred to by Lord Raglan as being made prisoner, was asked by the Duke of Cambridge some questions concerning the opposing armies; he replied, "Ah, our men fought well enough, but it is of no use, your infantry are the best in the world." By detachments, or rather groups, the army made its way through the forest; Guards mingled with Highlanders, or with the Rifle Brigade, and one regiment of the line mingled with another. As they emerged from the wood they extricated themselves, falling into line with what celerity and order they could upon the small plain over which the alarmed enemy had just passed. Upon this plain stood the British rendezvous, M'Kenzie's Farm. A road crosses the plateau at right angles with the track by which the British passed through the wood, so that when they came upon the rear flank of the Russian column, the enemy naturally supposed that the English were in ambush, and that ingenuity and rapidity of flight were their only chances of escaping great slaughter. Some of the prisoners taken by the Greys and light cavalry were taken on with the army, and served as guides; others were liberated upon their promise not to serve against their liberators, a promise to which they were not faithful.

After the discomfiture of the enemy, the march of the British was resumed; evening was approaching, miles of country remained to be traversed before they could reach the Tchernaya, the way was stopped by overturned waggons abandoned by the enemy, clouds of dust arose from the chalky loose soil over which the troops proceeded, and many fell out from fatigue and sickness. The march was a weary one, until the bank of the Tchernaya was at last approached. Night had fallen when the advanced guard arrived in the valley of Inkerman, through which the Tchernaya passes, and hour by hour the rest of the army arrived; it was midnight before the rearguard took up its bivouac. Some of the officers, and especially the staff, had tents; the rest of the troops bivouaced in the vale without shelter. During the night the whole heavens were lurid with the glow of the camp-fires lighted up by

the French, who encamped upon the height on which the Kutar M'Kenzie stands. This ended a movement which will long bear prominent place upon the pages of history, and the execution of which showed as little skill as the execution of any great conception ever displayed. It was a random, haphazard affair; the troops pushed forward without plan or order. Artillery, cavalry, infantry "steered" (as the sailors say) S.S.W., and each arm of the service scrambled through the forest as best it could. Had there been an management, plan, or system, when the troops debouched from the wood upon the plain near the M'Kenzie Farm, the surprised Russian would have been destroyed. As things were the trepidation into which the battle of the Alma threw the Russians alone saved our army from destruction. The French conducted their march more slowly; their course was more fatiguing and circuitous, but every thing was managed with good generalship, no surprise could have disorganised their army, and they suffered less than their allies from the inconveniences incidental to the enterprise.

The next day was a sad one for the British notwithstanding the triumph which crowned it. The exhaustion consequent upon the fatigue of the previous day showed itself in the number of men unable to proceed. Cholera also ravaged both hosts, especially the British—it was supposed in consequence of the exposure of the men to the dews and night air. An artillery officer, who was with the advanced guard, had occasion to return upon the line of march, and he describes the state of the first division as most deplorable. The Highlanders seem especially to have suffered from the march of about four miles from the Tchernaya river; the officer referred to declares that from fifty to sixty men of the Highland Brigade lay exhausted upon that short extent of road. The Guards also had many cases of cholera, and Colonel Cox, of that brigade, was seized with the disease; he was taken up on one of the gun-limbers, and the same evening, being put on board ship, died there. About noon the first division halted at the mouth of a gap, surmounted on either side by a lofty and rugged hill. The light division quickly advanced, throwing out skirmishers. In the valley to which this gap conducted was a low conical hill, surmounted by a white house; the Rifles, running forward, took possession of this place. The guns of the light division also advancing, opened upon the enemy in occupation of the heights of Balaklava. The Russians replied promptly to the fire of the light division with a few shells. The Guards moving forward in the direction of the fire, passed through the mountain gorge, and took

possession of a small village at its termination. From this village there was a view of the harbour of Balaklava, and of the old forts which once commanded its entrance with imposing appearance and power. Scarcely had the Guards had time to look down upon the scene beneath them, when the guns of the fleet opened upon the place. These were from the *Agamemnon*, which threw shot and shell against the walls, upon which also the guns of the first and light division played from the land. The garrison ceased to reply, and ran along the wall towards the sea. The Rifles by this time had reached the slopes, and entered the place, pursuing the fugitives, until a white flag was hoisted, which occurred before a life was lost on either side. A steamer bearing the English flag appeared at the same moment upon the tranquil sheet of water beneath. The place surrendered to the British, and the communication between fleet and army—to secure which the flank march was attempted—was re-established.

The delight of the soldiers at the prospect of some repose, and of fresh provisions, was unbounded. From the mountain-pass to the sea—a mile in distance—the valley was covered with orchards and vineyards; the grapes were ripe, and grew in great clusters, and fruit of every kind common to England enriched the trees. Interspersed among the fruit-trees there were luxuriant growths of vegetables, some of descriptions known to the British soldiery, and others which they were not well acquainted with, but which they found to be excellent esculents, such as pumpkins and tomatoes. The garrison only consisted of eighty men, who were of course made prisoners. The place was unprepared for defence, and no notion was entertained by the officer who acted as governor, or by Prince Menschikoff himself, that a British force by land and sea was about to descend upon the little harbour of Balaklava. There was only one mortar to protect the town from an enemy. When the officer who had been in command was asked why he replied to the fire of the assailants with a force so small, he answered that it was his duty to fire until summoned to surrender.

Having shown the progress of the main body of the army to the Tchernaya, and the capture of Balaklava, it is necessary, in order to complete the narrative, to return to the fourth division, which was left with some other detachments upon the heights of the Belbek, to protect the rear of the allies and the embarkation of the sick, and also to preserve, so long as might be necessary, communication with the sea near the disemboguing of the Katcha. While this division remained on the heights, some of the ships shelled the northern side of Sebastopol, but at such long range that no harm could be

inflicted, neither could any be received by the ships. The object was to draw off the attention of the enemy from the execution of the flank march, and especially from the division of General Cathcart, whose position was critical; as, if the enemy had had the spirit to sally out upon them in force, the destruction of the division must have been certain. General Cathcart, aware of the danger, made the most excellent dispositions, and exercised an untiring vigilance. The view of the sea, and the movements of the fleet, from the position occupied by the 68th regiment, was interesting and picturesque; the manœuvres of the steamboats, as they threw shells into the northern forts, were distinctly visible, and the passage of the ships as they doubled Cape Chersonese in support of the flanking march of the allies. From the position of the 20th regiment, the country presented a most varied and remarkable landscape. An officer of that regiment described it thus:—"It is impossible to imagine a much more delightful place, or to see greater luxuriance, or more abundant vegetation, than we now saw around us; there is a constant succession of gardens, small houses, lawns, and charming little villas. I observed with my glass, in a most picturesque spot, shaded by lofty and wide-spread trees, a monument walled round, apparently the tomb of some grandee. The whole place was lined with poplar-trees." After spending a night of watching and anxiety, the troops under Sir George followed the rest of the army; the objects that met their sight at every step were most distressing—men dying of wounds, they having refused to go on board ship, wishing to share the fate of the army, and believing that they had the strength to do so; many dying of cholera, some of fatigue: dysentery had caused others to fall out. The troops of the fourth division could render little aid to their comrades; they were without wine, medicine, or even a sufficient number of surgeons for their own men—what could they do for their comrades or allies? The shako was the cause of much suffering to the men; many of the Fusileers of the light division were found lying upon the road, who attributed their inability to proceed to the dreadful heat engendered by this article of dress, under the influence of a hot sun and a new climate. It was alleged that some lost their reason from this cause. The fourth division found some of the spoils left behind by their predecessors, such as rich furs, jewellery, and provisions; they also came upon some wounded Cossacks, who, coming too near to the French in a reconnoitring expedition the night before, fell under the fire of case-shot from a 6-pounder which our allies opened upon them. Short as was the time since the British army had passed

the plateau upon which M'Kenzie's Farm is situated, the Cossacks had been there in the interval, and poisoned one of the wells and filled the other with stones. Some wounded Russian infantry were found in the long sheds which constitute the farm; they had crept thither out of the wood where they had been wounded by the carbines of the Scots Greys. These men declared that if the British had had a sufficient light cavalry force, and kept up the pursuit, thousands of Russians must have fallen, thousands more have been made prisoners, and the army of Prince Menschikoff dispersed and demoralised; few would have reached Bagtché Serai. A dead Russian lay in the middle of the road, the wolves and vultures which fed upon him being scared by the approach of the guns of the horse-artillery. He was a civilian, and appeared to be a person of some position, and was probably murdered and plundered by his own friends, the Cossacks. Descending from the M'Kenzie heights (as they have ever since been generally called), the prospect was very fine; the movements of the British and French below were varied and characteristic; the landscape was a strange mingling of the soft and rugged—the country open in front, steep mountains on either side crowned with low woods: here and there a picturesque view added great interest to the *ensemble*. The inhabitants came forth with presents of fruit and flowers, both rich and beautiful; but where the soldiers showed any disposition to plunder, the Tartars made some display of valour, defending their cottages and gardens with their implements of agriculture, for which they received the encouragement of the other soldiers who were not participators in the raids, and who were amused at the discomfiture of their comrades in several of these predatory attempts. When this detachment arrived upon the level ground overlooking Balaklava, the *Diamond* and *Caradoc* were in the harbour. Sir Edmund Lyons had come on shore to congratulate Lord Raglan upon his perilous achievement, and to consult with him as to the future measures which it might be necessary to take.

The next morning the fourth division crossed the "Black River," and advanced upon Balaklava. In crossing the bridge, it was necessary to give place to a large detachment of French with their ambulances and wounded men. The British division was filled with astonishment at the ease and comfort with which the wounded French were carried. The ambulance mules bore on either side a sort of folding chair, in which was placed an invalid, who sat up or reclined as he pleased, or as their health or wounds constrained, the chair yielding freely to every motion of the sick soldier. Each mule had a driver, but as the animals

are sagacious and surefooted, the muleteer was enabled to pay every attention to his sick charge. An officer of the division, who stood and watched the French as they passed, followed by the Turks, thus graphically depicts the scene presented:—

"Over rough ground these mules went in the easiest and most careful manner, picking their road like cats. On two or three I saw English soldiers. The poor fellows on their backs seemed very comfortable, quite different from the Turkish invalids who followed just after, in wretched, rough, creaking arabas, drawn by clumsy oxen, and who looked as if they would die at every jolt, or have their heads shaken off. When they had all passed by, we moved on slowly towards Balaklava, and General Canrobert rode along our line. He was greeted by a hearty cheer, at which he looked highly gratified. He is a fine, soldier-like looking fellow, having his arm in a sling from a wound he received at Alma. He was followed by a large escort, principally of Spahis, and our men had their usual laugh at the 'old women,' as they called them in joke. A long line of French skirmishers, consisting of those active fellows, the Chasseurs de Vincennes, came sweeping across the plain, passing through our line, and finding more hares than Russians in the long dry grass. At length we entered a long valley, at the bottom of which could be seen the town and harbour of Balaklava, full of our noble ships. Several of these had come in that day, and were busily engaged in disembarking their monster guns belonging to the heavy artillery and siege train. These were fifty in number, composed of 32 and 64-pounders, together with Lancaster guns, which throw a solid 90-pound shot. We placed great reliance in the latter, having heard so much of their wonderful range. Scattered houses extended some little way up the valley towards us. We were not, however, to halt here, but, taking a sweep, wheeled round to our right, and got into the Sebastopol road. When we had gained the heights, we could plainly see the sea; and we passed some deserted farmhouses, which had stacks of hay and straw in the yards. Our line of march now took us over an undulating plain, without a tree, except an occasional orchard and a few poplars. Some of the men were actively employed in sucking pieces of honeycomb from beehives which they had knocked over in the valley we had just left. Soon, however, all eyes were intently gazing in that quarter where Sebastopol was expected to be seen. At last we came to a halt, and walking on a few yards to the edge of the ridge, we saw the domes and batteries of this wonderful city before us, standing out in bold relief from the dark blue sea beyond. It did not strike us as

being a fine city; for only a few good houses or buildings are to be seen from where we were on the south side. We now took a turn to the right, being about two miles and a half from Sebastopol, and crossed a valley, where was a deserted market-gardener's cottage, surrounded by a fine garden. This was soon full of soldiers, who helped themselves to fruit and vegetables of the choicest description. General T—, however, made his appearance, and ordered them out. An amateur friend of ours, however, in his cap and shooting-jacket, remained until the last, busily employed in filling his pockets with carrots and onions for his dinner. Observing him, the general, with a voice of thunder, pealed forth, 'Whose servant are you, sir? If you don't come out immediately, I'll send you to the provost-marshal, and have you flogged.' Our friend, as you may imagine, looked rather astonished at this, and went up to the general, when an explanation took place. The Russians, in great numbers, were seen at Sebastopol, hard at work at their mud batteries, which they had just commenced. I fancy that our appearance in this quarter was the last thing they contemplated."

The rearguard of the British became now in effect the advance-guard, as they were placed between the rest of the army and southern Sebastopol. Their place of bivouac the first night was a quarry. There was a small stone house, which had been used by the quarry-labourers, and this was set apart for the quarters of the general of the fourth division, who humanely surrendered it to the sick, and was content with his own little picket tent, his table being outside. Every precaution was taken by the experienced officer in command to secure the encampment. The guns were drawn close up to the lines, and unlimbered towards Sebastopol; the horses were all ready saddled, and every arrangement made for the men to stand to their arms, if necessary, in a moment. The position of the division was almost as precarious as upon the heights of the Belbek after the flank movement had begun. The number of men under Sir George Cathcart's command scarcely exceeded 8000; and the nearest division to his was that of Sir de Lacy Evans, which was two miles distant. Sir George, however, expressed his conviction that he could hold the position against 30,000 Russians. The night was cold, the dew descending in amazing quantities, saturating the blankets of such as had them; but many had none, even officers. Yet it is acknowledged by officers and men that whatever other evil effects followed this exposure, no one caught cold. The weather had, however, with exception of the one dreadful night of rain, been beautiful every day and night. Perhaps never was finer

weather known in the Crimea than was experienced during the September of 1854. The first night of bivouac south of Sebastopol, for the fourth division, passed without incident; the repose so much required was obtained and enjoyed, and the men were not disturbed from it until late the following morning. About eight o'clock a large body of Russian infantry came out of the south-west corner of Sebastopol, advanced some distance, halted, and made a demonstration, as if about to attack the camp. The first brigade was immediately under arms, and drew up to receive them on the slope of the ridge, in a very advantageous situation; the second brigade was in support. As soon as the enemy saw that the British general was so well prepared for him, they returned to the city, and appeared immediately to join the parties who were so actively erecting the earthworks. The number of sick was very considerably increased. All night the officers heard the moans and calls of those who were attacked with cholera or dysentery; some cases of ague also appeared, and as the men arose from the bare earth, wet with dew, they looked pale and sickly, and many, both men and officers, were evidently bearing up with characteristic manliness against suffering.

The quarry in which the troops found shelter was well adapted for a defensive position had the enemy so used it. From the elevation the country round for two miles might be swept by heavy guns. The excavations were extensive, and full of large square stones piled one on the other. The chips and dust were thrown up in vast heaps, between which were intervals left for the carts; these heaps and intervals were in remarkable regularity, and would have afforded excellent means for establishing batteries on the spot. All day the cavalry outposts of both armies were busy: small parties of Cossacks would steal up quietly towards the lines, until observed by the British light cavalry patrols, who would make a dash at them, and the Cossacks would disappear as if by enchantment, to return the moment the patrols retired. The manoeuvres of these Cossacks were very harassing to our cavalry, for although the former were no match for the British horse in an encounter of sabres, they were much superior for outpost service, by their celerity of movement, practised sight and hearing, the sagacity of their wiry little steeds, their familiarity with the local peculiarities of the neighbourhood, and their being acclimated, men and horses. Their officers also were an intelligent body of men, particularly trained for outpost duty and for reconnoitring, in which services they showed celerity, courage, keen observation, and a perfect knowledge of light cavalry movements. This is a suitable place in which to present to our readers a description of

the irregular cavalry of the Russian army, by a gentleman who himself served as a captain, and who has written this description expressly for the author's use:—

“At your request I will run over a few remarks concerning the peculiarities of the Calmucks, Bashkires, Cossacks, &c. Tamerlane and Islingis-Khan, the leaders and rulers of the Mongols, once the scourge of Europe, are names familiar to Englishmen of education, as the narratives of the astonishing deeds of those two great chieftains will not have failed making a deep impression upon the minds of those who have perused their history. It may almost be said that the Mongols and Tartars, in their hundredfold different tribes, are *born* on horseback, are *living* on horseback, and are *dying* on the backs of their horses. Their horses are of a very small stature, but strong, stalwart against weather, satisfied with little and coarse food, and know nothing about stabling, grooming, washing, &c. They are swift, nimble, and can endure very fatiguing marches of fifteen, twenty, or twenty-five English miles, without food. They are not shod, and have an almost noiseless walk, sliding gently above the surface, without lifting high their feet or stamping them vigorously down, as do the European horses, which thus exhaust their strength. What the dog is to the hunter, the horse is to these people. The Calmucks and Bashkires are not fit for European warfare, but, along with the Cossacks, they are the best light cavalry in the world, and the eyes and ears of the Russian armies. Living in the immense steppes in Asia, and the Cossacks in the steppes along the Don, Dnieper, Bug, and Volga, they are all practically acquainted with astronomy, inasmuch as they know how to find their way in every country of the globe, being guided by the stars. Their eyesight and hearing are wonderfully acute, and it might almost be said, they see in the dark, like the cats, and hear like a fox or hare. They throw themselves upon the ground, laying their ear to the surface, and will thus discover approaching men and horses at an almost incredible distance. They likewise see distinctly at a distance where other human beings in civilised countries cannot discover any object whatever. Their habits and peculiarities, in all these respects, will prove that these horsemen, by their kind of life, are made to be the very best light cavalry.”

The want of a sufficient light cavalry force on the part of the allies, which proved such an impediment on the march from Old Fort to Alma—which permitted the Russians to effect their retreat with safety, and carry off all their guns after the defeat they experienced there—which necessitated so much vigilance on the part of the infantry during the bivouacs of the Katcha and the Belbek, and rendered unavail-

able the surprise of the Russians at Kutar M'Kenzia—proved, on the first days of the occupation of Balaklava and its vicinity, a serious obstacle to the efficiency of two as fine armies of infantry as ever encamped before the fortress of an enemy. A harassing instance of this occurred to General Cathcart and his division on the first day of their encampment. An orderly dragoon rode hotly down to the general's quarters, declaring that a force of at least 20,000 Russians was marching upon their rear. Of course it was presumed that a sally from the fortress would have been made at the same time, and there appeared every prospect of a desperate and hopeless struggle for the small division of infantry before succour could arrive from General Evans. Sir George Cathcart moved the men back a short way, to protect their commissariat, and calmly awaited the expected attack. No enemy appeared, however; and after some hours of anxiety, it was presumed that the troops seen by the dragoon were proceeding to Sebastopol. The nature of the country, and the expertness of their irregular light horse, favoured such surprises. Had Lord Raglan a light cavalry,—not what in the British army is called so, which is constituted of regiments of heavy men upon bad horses, but light men, upon fleet and well-trained horses,—no such mistakes and false alarms would have worn out the infantry as was so frequently the case subsequently; nor would the unfortunate fourth division have been obliged, sick and anxious, to stand for hours beneath a burning sun in momentary expectation of an attack from greatly superior numbers.

“Cavalry,” says Marshal Saxe, “should be lightly mounted: the horses should be accustomed to fatigue; they should carry little baggage, and we should never aim at having very fat or finely proportioned horses.” In a work lately published by Colonel Beamish,* there are many original remarks concerning the uses and qualities of cavalry, with all of which we cannot concur, and some of which, such as the use of the lance, are at variance with the opinions of Captain Nolan, the highest authority on all cavalry subjects:—“Colonel Beamish recommends that the various descriptions of cavalry should all be assimilated—excepting only the household troops; and that they should have for their main arms the lance and revolver. He proposes to attach to each squadron a fifth division, armed with light needle-rifles, and destined to act as skirmishers. The maximum height of the cavalry soldier he fixes at five feet eight; and his weight at ten stone. He considers that the horses should be ‘light, strong, swift, hardy, and of high courage, not exceeding fifteen hands high;’

* On the Uses and Application of Cavalry in War.

and that the bits should be varied in severity according to the sensibility of the charger. His remarks as to clothing and equipment are equally clear, precise, and forcible. The utility of the changes he suggests is so obvious, now that he has brought them forward, that it would be unpardonable not to give them full consideration. Our cavalry has been made too much a show force, when it ought, from the superiority of its elements, to be considered susceptible of the highest organisation. It has always signalled itself in action, and we are glad to have the testimony of Colonel Beamish as to its unequalled capabilities. It requires only that these capabilities should be understood, seized, and developed. This bequest of the age of chivalry may be made an ornament, but it can only be maintained for use; and the first consideration must be, not its holiday costume, but its practical efficiency. More attention should be paid to the education and training of cavalry officers; and Colonel Beamish's project for the establishment of a college for this purpose offers many advantages. Cavalry officers should be perfect masters, not only of the art of equitation, but of the whole economy of the horse: and should know how to treat their charges in every situation, and under all circumstances. They should also have a knowledge of mathematics, fortification, and military drawing, and be thoroughly expert in the use of the lance, sword, and carbine."

There has perhaps never been a great commander that did not rely much upon this arm of war. Napoleon told O'Meara at St. Helena, that if he had had Murat to handle the cavalry at Waterloo, he would have gained the victory. Wellington paid more attention to this description of force in the Peninsula than to any other. Hannibal, whom Wellington considered the greatest of all military geniuses, relied chiefly on his campaigns upon the judicious use of his horsemen. Charles XII. of Sweden brought his troopers to great perfection by unremitting personal care; and most great commanders have made their cavalry the object of especial concern. This has never been the case in the British army, and in the Crimea the French were still more culpable than the British. The remark of Kossuth upon the Crimean expedition was just, that a large light cavalry force was essential to successful operations, if he allies hoped to conquer the Crimea.

It cannot fail to strike every reader of this history, that from the landing at Old Fort to the occupation of Balaklava, the Russians displayed little sagacity, enterprise, or resources. Bourrienne represents Napoleon the Great as laying upon his invasion of Russia, that he had then encountered a more daring and skilful foe than he had ever met in battle. In the

Crimea, whatever *éclat* the genius of one officer of engineers may have thrown around the Russian arms by his defence of Sebastopol, there occurred nothing to redeem the military name of Russia from disgrace, from the moment the English flag was planted at Eupatoria—before the general landing—until the white flag was hoisted by the Russians above the heights of Balaklava. Nor did the numbers brought into the field then, or subsequently, comport with the boasts which all Europe had heard of the countless soldiers of the czar. Every occurrence so far confirmed the impression entertained by many at home, that a zealous ministry and competent commanders would dissipate the delusion of the incalculable military resources of Russia, especially in men. "At Borodino," says M. Cole, "in the heart of their vast empire, retiring on their resources, and resolved at last to make a final stand to save their capital, and fight for independence, 120,000 was the fullest extent of their muster-roll. Neither did they ever exceed this aggregate in the successive invasions of France in 1814 and 1815. Moreover, the Russian contingent would never have arrived at all, but for the subsidies of England. M. Schnitzler, whose work is generally correct and authentic in facts, as it is often sound in opinions, has been misinformed, or is tinctured with prejudice, when he represents that 'the assemblage in the Plaine des Vertus (10th September, 1814) of a Russian army of 160,000 men, ready for the field, struck with amazement the diplomatic corps of Europe, who were present at the imposing spectacle; but such an exhibition of the military strength of a vast empire alarmed them much less than the invisible power and perfect moral influence which the greatness of soul and well-known principles of the monarch who now reviewed his troops had created.' I cannot tell what were the impressions of civilians and diplomatists, to whom I had no access, but happening to be an insignificant unit among many hundreds of military men of all nations who were looking on, I can testify that as a mere military display, we were neither petrified with amazement nor awe. No mistakes are so easily made as calculations on the number of troops estimated from a *coup d'œil*; the general belief was that on this occasion they did not amount to 90,000; and the entire Russian contingent which marched up to Paris, subsequent to the battle of Waterloo, and the second abdication of Napoleon, I was assured by an officer of the Russian staff, never exceeded, even on paper, 110,000. At this vaunted review, which had been long preparing, and lasted three days, little or nothing was done to illustrate strategy or capability of rapid movement. Three days previous to the commencement of the display

were required to place them on the ground. On the first day of action, the operations consisted in marching past in review order; on the second they were confined to performing worship according to the rites of the Greek Church; and on the third the whole force marched off again to the cantonments from whence they had been summoned. Not long after this, in an after-dinner conversation, arising incidentally, the Duke of Wellington proposed to the allied sovereigns, or they suggested to him, to show them the British army, with their allies in British pay, including the Hanoverian and Danish divisions, amounting in all to more than 80,000 men. A representation of the principal manœuvres and incidents of Salamanca, as nearly as the ground permitted, was afterwards stated to have been the programme agreed on for the evolutions of the day. There was no previous announcement or rehearsal. At nine at night the orders were sent round to the different brigades, and by eight on the following morning the whole were drawn up in two lines, the left resting on Montmartre, and the right on the Seine, with St. Denis a little in the rear. The sovereigns, with a gallant escort, comprising many of the leading generals of the day, rode hastily along the front. All were then put in motion: the entire day was occupied in a series of complicated movements, and at seven in the evening the corps marched past the assembled potentates, and returned to their several quarters. The quickness and precision of their evolutions, the martial bearing and exact discipline of the men, and especially the equipment of the horse-artillery, excited the loudest approbation. It was a proud day for Britain, as showing a solid exhibition of her power. Thousands still live who will recollect the impression it produced, and the reminiscence will not incline them to join the ranks of despondency. We have not at this moment the same numerical amount of men, for we have not hitherto required them; but we possess a substantial nucleus of similar materials, which we can increase at pleasure, now that a necessity for the supply has arisen. The Russian Imperial Guards, during the occupation of Paris, in 1815, were chosen troops, well appointed and imposing in appearance; but their ordinary infantry of the line were anything but formidable—they had neither muscle nor stamina. Sir William Napier, speaking of this same army, says, 'If we believe those writers who have described the ramifications of the one huge falsehood of pretension which, they say, pervades Russia, her barbarity—using the word in its full signification—would appear more terrible than her strength. Nor can I question their accuracy, having, in 1815, when the reputation of

the Russian troops was highest, detected the same falsehood of display without real strength for, from the imperial parades on the boulevards of Paris, where—oiled, bandaged, and clothed, to look like men whom British soldiers would be proud to charge on a field of battle—the Muscovite was admired, I followed him to his billet, where, stripped of his disguise, he appeared short of stature, squalid, and meagre, his face rigid with misery—shocking both sight and feeling—a British soldier would have offered him bread rather than a bayonet.' The average pay of a Russian soldier is about twelve shillings per annum. In some corps it is a little more or less, but the difference only amounts to a few pence per month. Instead of the substantial broth and beef which constitute the daily mess of the British regiment, his food consists of coarse rye-bread, fermented cabbage, and buck-wheat grits, to which a little hempseed-oil is added. In the picked regiments of the Guards, where the men are supposed to live like fighting-cocks, they receive half a pound of meat either twice or thrice a week."

When the intelligence arrived at St. Petersburg of the double flank march, the emperor, the court, and the public were intensely amazed that Lord Raglan should have been permitted to pass unopposed over positions that might have been so easily held against him. The *St. Petersburg Journal* was, however, ordered to make the best case out of the despatches of Prince Menschikoff, on the one hand, and of the allied generals, on the other, that could be manufactured by its ingenious editor. It will at least gratify the curiosity of our readers to peruse this essay at turning defeat into success, and a succession of blunders into a specimen of superior strategy. The journal thus puts it:—

"The Anglo-French have moved their united forces before Sebastopol, from the north of that city to the south, thereby entirely changing their base of operations. They have effected this object by a flank march round the city. Their organs in the foreign press cannot find language to praise sufficiently the thankfulness of this manœuvre. Without wishing to detract from its merit, it is only just, also, to mention and to explain the operations of Prince Menschikoff in face of the enemy.

"After the combat upon the Alma, the prince, finding no position upon the Katcha or Belbek sufficiently strong to enable him to offer battle again to the enemy, passed the Tchernaya, and concentrated his forces in a position to the east of the city, after having garrisoned the forts on the north with an adequate number of troops. The enemy advanced, crossed the Katcha and the Belbek, and arrived as far as the heights which surrounded the

forts upon the north. The position of Prince Menschikoff had this inconvenience—that he saw the enemy placed directly upon his communications with the interior of the empire. It was necessary to get out of this situation, and the prince effected that object by a brilliant conception which was boldly executed. He proceeded, in the night between the 24th and 25th September, towards Bagtché Serai, after having crossed the Tchernaya by a single bridge. He executed this flank march in the course of the night, and he found himself on the 25th in the valley of Bagtché Serai upon the flank and rear of the enemy, with his communications with the interior of the empire open, and open also with the reinforcements about to reach him. This new position of the prince would have annoyed the enemy if he had ventured an attack against the forts upon the north. But he did not even attempt it; on the contrary, he took the resolution of transferring his point of attack from the north to the south of Sebastopol, by turning the city to the east.

“We must be permitted here to explain some circumstances which will enable us impartially to consider the operations of the two parties. Prince Menschikoff had to march across mountains, by a single rode which, from the point where M’Kenzie’s Farm was situated, was no further from the advance posts of the enemy than four versts. Their bivouac fires could be seen. The prince could not hope to cover his march by the means which are commonly taken under such circumstances, for it was above all things expedient for him not to attract the attention of the enemy. In his position it became his duty to avoid a combat which might have prevented the movements of his column. The prince marched with his baggage and artillery. All difficulties were however overcome, and our troops were posted on the morning of the 25th where the enemy did not expect.

“Our adversaries were also executing, almost at the same time, a flank march, but under much more advantageous circumstances. From the Belbek, and the plain where they were placed on the 24th, they had only to reach M’Kenzie’s Farm in order to find themselves upon the road which leads, by a descent, upon the Tchernaya. The enemy executed this movement without being perceived by us, for the point on which M’Kenzie’s Farm is situated is sixteen versts distance from the place where our forces were disposed; and further, it was covered by wooded hills. If Prince Menschikoff had desired to attack the enemy during the march, he could only have done it by a single route, which, for a distance of ten versts, is a continual ascent from the Belbek to M’Kenzie’s Farm. It would have been sufficient for the enemy to have placed some

batteries in an excellent position upon the heights, in order to delay our attack long enough for the movement of the column to be terminated without danger. The enemy had the immense advantage of marching without baggage or artillery, which were being quietly conveyed by sea to Balaklava. Any one who has ever marched with troops, whether with an army or a battalion, will be able to appreciate the difference in marching with or without baggage.

“Prince Menschikoff had to avoid a battle during his movement, because the enemy was too advantageously placed. Our adversaries, on the contrary, marched in a manner which did not permit them to be annoyed by an attack upon their flank—an attack in which the prince could not, owing to the nature of the ground, engage except under unfavourable conditions.”

The steps taken by Prince Menschikoff when he found his plan of operating upon the flank and rear of the allies from Bagtché Serai defeated by Lord Raglan’s stratagem, could only be known by intelligence from the Russian camp or metropolis. Our generals were very ill informed upon all Russian movements; no systems of scouts or spies, such as the Duke of Wellington so effectually organised in Spain, and such as Napoleon invariably connected with his operations, was as yet adopted by the allies. Indeed, not only at the juncture of which we write, but all through the war, the allied commanders laboured under the disadvantage of defective information. The *St. Petersburg Journal*, professing to write upon the authority of Prince Menschikoff himself, thus describes his first movements for the defence of the fortress:—“Prince Menschikoff, in a report made to the emperor, and dated the 30th of September, states that after having executed his flank movement from Sebastopol towards Bagtché Serai, he was ready to take the offensive on the first favourable opportunity. This plan promised to be still more successful, because the allies had divided their forces. While the French approached the fortifications on the north of the Bay of Sebastopol, the English troops betook themselves to Balaklava by sea, where they effected a landing. Prince Menschikoff, informed of what was taking place, made a movement in advance, but the French declining the combat, also abandoned the north of Sebastopol, and effected a junction with their allies on the south. On the 30th Prince Menschikoff had arrived, with the greater part of his troops, at the fortifications on the north, and established himself there, waiting till the intentions of the allies were more plainly manifested. Up to the 30th no movement had been made.”

The information thus given, however correct as to the movements and plans of Prince Men-

schikoff, was erroneous in all respects as to the allies. Prince Menschikoff knew well that the English did not go by sea to Balaklava, for his troops felt their sabres on the plateau of the Kutar M'Kenzia; nor could he suppose that the forces of the armies were divided, for the French followed in the rear of the British. It is just possible that Menschikoff, when he recovered from his alarm after encountering Lord Raglan on the M'Kenzie heights, might have been deceived as to the force of the English which fell upon his rear, and have taken up the impression that they had been merely the cavalry and light infantry, the rest of the army going by sea to Balaklava. The tarrying of the fourth division and the other regiments with Sir George Cathcart on the heights of the Belbek, and the communications kept up with the sea, might have further contributed to the mystification of the Russian commander. He must have known that the artillery was not brought seaward, as Captain Maud's battery opened upon his flying columns, as did some other troops of horse-artillery following the captain's. Nor was it correct to represent the British as having made no movement from the time they reached Balaklava on the 26th to the 30th, when Prince Menschikoff made his report; for authoritative intelligence arrived in England, bearing only a few days later date, thus describing the first operations of the British army:—"On the 28th of September, the second, third, and fourth divisions of the army were ordered at once to move up to the heights about Sebastopol, where they encamped. The light division also moved forward on the following day, and now occupies a position in the line of the besieging army. The engineers and artillery proceeded at once to land the siege-train, and on the 29th some of the guns were already dragged up the heights, and temporarily placed in a field about one mile in the rear of the position occupied by the troops. From this elevated encampment, which was occupied by our troops without any opposition on the part of the enemy, a view may be obtained of the whole port of Sebastopol, with its harbours, arsenals, ships, and forts lying within a circle of three or four miles, at the feet of the vast armament which already threatens the devoted city. The Duke of Cambridge's division, consisting of the Guards and Highland Brigade, remained in the rear of the army near Balaklava until the 2nd of October, in order to cover the base of operations from the possibility of an attack. Meanwhile, the roads and tracks through the hilly country south of the Kutar M'Kenzia, by which the allied armies made their flank march on Balaklava, have been broken up and put into a state of defence by the British forces."

The *St. Petersburg Journal* does not, how-

ever, seem to have itself relied overmuch upon the accounts of the amphibious chief—half sailor, half soldier—by whom the Russian army was so wretchedly mismanaged; for immediately after publishing Prince Menschikoff's opinions, it furnished a representation of the position of the allied armies, before Sebastopol at the close of September, in the following terms, which it professed to have derived from a Vienna source,—probably the correspondence of an Austrian officer in the Russian service, sent on to Vienna and St. Petersburg at the same time. Throughout the war German officers in the Russian army were permitted to write letters of this sort, the object generally being to mislead western Europe by plausible and quasi-candid communications from officers of inferior rank, and not under the influence of Russian nationality. "The position of the allied armies completely covers every point of their rear from which an attack in that direction might be apprehended. The Tchernaya, or Black River, runs into the Gulf of Sebastopol from its sources in the mountains beyond Kamara, at which place the main body of the right wing of the allies is posted. The extreme of the right wing rests upon these mountains, and commands the whole line of road between Kamara and Alusta. Outposts are stationed along the course of the Tchernaya, or Black River, and at Kadikoi, where the roads from Balaklava, Kamara, and Alusta, on the south and east, and from Simpheropol and Sebastopol on the north, join, the centre of the allied armies is placed, extending along and covering all the roads from north, east, and south that lead to Sebastopol. The left wing occupies and rests on Karani, some short distance west of Balaklava and Kadikoi, with outposts at Khutoi. Thus, with Balaklava as the base of operations, the allied forces occupy every possible route by which the Russians from Bagtché Serai could attack them, and their position would appear to be quite as strong as that of the Russians on the heights of the Alma. Covered as the country is with dense forests and mountain ranges, the points said to be occupied by the right and centre of the allied armies, make their position before Sebastopol as strong as if they were entrenched behind a line of impregnable fortresses."

As soon as the allies could make the arrangements for communication with the fleet complete, sailors, marines, and stores, were disembarked. Sixty large siege guns were landed on the 28th of September; and by the 3rd of October the military orders for the siege of Sebastopol were actually published. It was prepared by a council of the allied generals on the evening of the 3rd, and the trenches were opened, not a shot disturbing the progress of the men.

THE ORDER.

THE trenches will be opened this evening against Sebastopol; a working-party, consisting of —, furnished by the —, will be marched to the engineers' depot at — P.M., where they will receive tools and directions from the engineers' officers and sappers, who will guide them to the works; they will be without arms and accoutrements. The guard for the protection of the working and ground will consist of —, furnished by —, and will parade in their camp at — P.M., be conducted to their positions, posted, and receive instructions from staff-officers who will be assembled for the purpose.

All the movements of the parties must be, if possible, kept out of view of the place.

After moving from their last place of assembly, which will be after dark, the *utmost silence must be preserved*, and the least possible noise of any kind made. The working-parties will be arranged in proper order by the engineers, but will not commence work till ordered, after which it must be carried on *with the greatest energy*.

The engineers will be charged with the arrangements, but the officers of the troops must be responsible for the maintenance of order and attention to the directions given by the engineers, and for the amount of work done; on diligence and regular conduct of the working-parties will depend more rapid and complete success of the enterprise. The working-parties must not quit the works on slight alarms. If the enemy make a sortie, the guard will advance and drive them in, and before they reach the work, if possible; should the working-party be absolutely obliged to retire, they will take their tools with them, and reform a short distance in rear, to return to the work when the sortie is repulsed.

The guard will be posted in rear of the working-party, and near to it, if possible, under cover from the fire of the place; if not, they must lie down in order of battle, with accoutrements on, and each man with his firelock close by him—one party, not less than one-third, of the forces abso-

lutely on the alert all through the night, taking it alternately, ready for an immediate rush on the enemy.

A sortie is out and on the works in a very short time, and therefore the guard must be in immediate readiness to attack it without hesitation; nothing is so easily defeated as a sortie if charged without delay.

After the repulse of any sortie, the guard will return under cover as soon as possible, and resume their position.

All working-parties and guards will be composed of entire regiments, or parts, and not of detachments, made up of different corps.

On the very same day that the allied generals were putting forth the order to break ground before Sebastopol, the czar issued a proclamation, announcing that he would remove the head-quarters of his army to Warsaw; and calling upon his nobles, clergy, and people, to support the war by their ardour, their prayers, and their contributions. To the grenadiers of his army he also published an address, full of fanaticism and boasting, calling upon them to march and beat the enemy from the soil of holy Russia. Thus both sides were preparing for a struggle, the shock of which should vibrate not only through the vast empire of the czar, and the territories of contiguous states, but throughout Asia from the Caucasus to Peking, and throughout Europe from the Tauric Chersonese to the western shores of the British Isles.

CHAPTER XXXVIII.

THE ANCIENT CHERSONESUS.—SEBASTOPOL AND ITS ENVIRONS.—BALAKLAVA.—THE GROUND OCCUPIED BY THE ALLIED ARMIES.

"It is impossible that civilised nations can allow a nation of thieves to exist on their boundary."—
SIR G. GREY, *Governor of the Cape of Good Hope, to Moshesh, Chief of the Basuta.*

BEFORE entering upon the incidents of the wonderful siege which is now to engage our attention, it is desirable to give some description of the Tauric Chersonese, the modern Sebastopol, Balaklava, and the ground occupied by the allies while conducting their operations.

The Tauri, a very ancient and barbarous tribe, seem to have held for ages the coasts of the Crimea, and to have established themselves more especially on the heights above Sebastopol. It is from that people the name of Tauric Chersonese has been derived. In later ages a famous temple of Diana occupied the rocky headland near the city of Chersonesus, on the very spot where the wires of the electric telegraph were laid, by which the tidings of war should be borne to our doors. The city of Chersonesus, or, as it was afterwards called, Cherson, was built on the west side of Quarantine Bay, occupied by the French at the opening of the siege. The ruins of this city were extensive, and were plainly traced by Clarke. Dubois de Montpéreaux, in his *Voyage autour*

du Caucase, relates, that when he visited it the ruins were fast disappearing, so that he was in haste to take account of what still remained. Dr. Koch declared that he could find nothing of what Montpéreaux had described only a few years before, the Russians having carried away the stones to use in the buildings of the modern Sebastopol. An imperial ukase was issued to prohibit this barbarous conduct; but the demolition was complete before the mandate could come into effect.

Chersonesus was not a Milesian city, but a colony from Heraclea, in Bithynia. It was among the latest Greek settlements, and became one of the most flourishing. When the Crimea fell under the Tartar khans of Kaptehak, about the middle of the thirteenth century, all the cities founded by the Greek colonists had faded away except Cherson, and it only retained traces of its former glory. It nevertheless carried on a considerable trade with Constantinople, and was regarded as a place of importance by the khans. These Tartars favoured commerce to some extent, and

listened to the overtures of the trading Genoese, who founded "a factory" at Kaffa, and carried on much intercourse between that place and Cherson; but as Kaffa grew rapidly into importance, the former city declined, and when the Turks made the conquest of the Crimea, no mention is made of Cherson in the histories of that event: it had probably ceased to be a city of any importance whatever. Certainly, in 1596, Bronovius found the place uninhabited. Since then another Cherson has sprung into existence, which we notice to prevent any confusion in the minds of our readers when the name occurs in other pages of this History. Catherine II. founded a town at the mouth of the Dnieper, to which she gave the same name, in the exercise of that fancy which the Russians display of imparting to modern places the names of cities whose glory is departed, although not erected on their site, nor in their neighbourhood, nor bearing any resemblance to them. The Cherson of Catherine was founded in 1788. In a quotation from Dr. Clarke, in the thirty-third chapter of this History, we showed that Catherine also gave the name of Sebastopol to the Tartar Aktiar. At first the name was given to the bay, and then to the town which is situated at the head of the bay, built upon the site of the old Tartar village.

Descriptions of Sebastopol, its fortifications and environs, have become numerous since the mighty siege commenced, although good works on the Crimea generally are still scarce. We shall here confine ourselves to an outline, to be filled up as events are recorded which bring more directly under notice particular features of the place, both as a city and an arsenal. The most pleasing and minute description which we have met with is by Mrs. Nielson. She describes what Sebastopol was before it ceased to be important; Clarke tells us what it was when it *began* to be important. Miss Pardoe, with her usual happy facility for graceful and compendious summary, thus depicts it:—"To leave the present exciting phase of the history of Sebastopol, and turn to the origin of the city, it may surprise some of our readers to learn that scarce a hundred years since a few wretched Tartar huts, known as the village of Aktiar, occupied the site of Sebastopol. It is to Catherine II. that the honour of founding the present town belongs. This crafty and ambitious woman was fully aware of the importance of a strongly-fortified harbour in the Black Sea, for the defence of her newly-acquired territory in the Crimea, and also to assist in her ultimate designs against Constantinople. In obedience to her instructions, the works were commenced in 1786, and, encouraged by her favour, soon acquired a pre-eminence over older parts. The houses are superior in building to those of the

generality of Russian towns, being chiefly of stone. They rise from the side of the harbour in a series of terraces to nearly 200 feet above the water, and are mostly occupied by persons connected, either directly or indirectly, with the naval arsenal and government; permission has rarely been granted for the residence of strangers, and even Russians are not at times permitted to remain. The public buildings are of the usual character, including churches, a museum, theatre, hospital, and public schools; before the present attack, many of them were said to possess considerable architectural merit."

Mrs. Nielson describes all the public buildings in detail, and represents life in Sebastopol as very gay. Forty thousand persons generally residing there, a large portion of them being seamen, soldiers, and their families, made the public promenades exceedingly lively. Bands from the ships and regiments played every evening in the prominent public places; and the best military music might be daily heard. The theatre was much patronised; the orchestra was assisted by the bands of the fleet and army, and the soldiers were always at hand for theatrical spectacles. Balls and festivities, on board ship, in barracks, and in the private residences of the civil functionaries, were perpetual. Those who loved quiet beauty could find shaded walks in the suburbs; and the environs afforded scenes both sublime and beautiful.

The docks and harbour are amongst the finest in the world. Their cost, with that of the fleet they sheltered, was estimated, when the war broke out, at twenty millions sterling. The fortifications had cost seven millions sterling. The stores and munitions of war contained in the arsenal it would be impossible to estimate, except upon data supplied by the Russian authorities; and so flagitious is the system of peculation and falsehood among Russian officials, that no reliance could be placed upon any data they might supply. The events of the siege proved that the ammunition, arms, and stores of war contained in the place were enormous, and probably exceeded the quantities of material ever before gathered within the bastions of a fortified city.

The celebrated Russian topographer, Vsevoljsky, who was better acquainted with the place and locality than any other person, thus describes the city:—"The town stands on a chalky stratum, which rises from the height of thirty feet at the extremity of the point to an elevation of 190 feet above the sea in the upper part. This elevation, with the steep coast opposite, which also consists of a calcareous rock, perfectly defends the bay, which, from the summit of the heights, appears to lie at the bottom of a deep cavity; and, indeed, at

SEBASTOPOL.

LONDON JAMES B. YERGEN

a very short distance from the shore inland, it is impossible to perceive the tops of the highest masts. Near the extremity at the point of land stands the house built in 1787 for the reception of the Empress Catherine II. Behind are situate the Admiralty, the Arsenal, and the houses of the naval officials; while higher up are the dwellings of the inhabitants of the town, the market and the Greek church; besides which there is a Russian church for the use of the sailors belonging to the Black Sea fleet. The seamen's hospital and barracks, and the magazines, are mostly situate on the other side of the harbour; and, together with the barracks of the garrison, built a short distance from the former, compose a sort of suburb. The town of Sebastopol itself is not much above a mile in length, and is nowhere more than 400 yards wide."

The same important authority gives the following description of the harbour:—"The harbour, the most important feature in Sebastopol, has been compared to that of Malta. The principal bay is about three miles and a half in length, with a width of three-quarters of a mile at the mouth, widening to nearly a mile, and then narrowing to 600 or 700 yards at the head. The entrance of the harbour is defended by strong batteries placed at the extremity of the two points of land that form the bay. Besides these there is another fronting the town, and two more on the double point, on which the town stands, with a redoubt higher up. About a mile from the north of the bay the grand port for vessels of war forms a sort of small arm, running in a south-west direction. It is upwards of a mile and a half in length, with a width of 400 yards at the entrance, and has a little narrow creek of about 600 yards in length, in which ships can be laid up in ordinary with perfect safety. On the other side of the town, in Artillery Bay, is a similar creek, used to careen vessels of war."

There is no writer more frequently quoted concerning the shores and harbours of the Black Sea than Mr. Oliphant, who, in 1852, visited the shores of the Crimea. He describes the appearance of the place in the following terms:—"Nothing can be more formidable than the appearance of Sebastopol from the seaward. Upon a future occasion we visited it in a steamer, and found that at one point we were commanded by 1200 pieces of artillery: fortunately for a hostile fleet, we afterwards heard that these could not be discharged without bringing down the rotten batteries upon which they are placed, and which are so badly constructed that they look as if they had been done by contract. Four of the forts consist of three tiers of batteries. We were, of course, unable to do more than take a very general survey of these celebrated fortifications, and

therefore cannot vouch for the truth of the assertion, that the rooms in which the guns are worked are so narrow and ill-ventilated, that the artillerymen would be inevitably stifled in the attempt to discharge their guns and their duty; but of one fact there was no doubt, that however well fortified may be the approaches to Sebastopol by sea, there is nothing whatever to prevent any number of troops landing a few miles to the south of the town, in one of the six convenient bays with which the coast, as far as Cape Cherson, is indented, and marching down the main street (provided they were strong enough to defeat any military force that might be opposed to them in the open field), sack the town, and burn the fleet."

While the allied fleets blockaded the Russian ports of the Black Sea during the early part of 1854, her majesty's ship *Retribution* reconnoitred the place, passing with impunity under the range of the batteries. Lieutenant O'Reilly, R.N., during the three hours and a half which the ship occupied in the reconnaissance, sketched the port and batteries, and sent home the sketch to the Admiralty, who have since permitted it to be published. The representations of the Russian topographer and the British traveller agree with Lieutenant O'Reilly's sketch. It was not, however, the opinion of the officers of her majesty's ships, who then and subsequently effected close reconnaissances of the place, that the batteries were constructed after the defective manner pointed out by Mr. Oliphant: on the contrary, it was their uniform testimony, as well as that of the allied generals and engineer officers, who inspected it previous to the expedition from Varna, that the granite walls were of the most solid construction, and that the most complete care had been expended in their erection. The siege proved that Mr. Oliphant was in error, and that he had allowed the fashion of depreciating everything Russian to influence his judgment.

Prince Demidoff* visited Sebastopol when the enormous docks were excavating under the superintendence of Colonel Upton, a British officer, and a gentleman of great engineering talent, civil and military; and the prince, of course, recounts with pride the number of Russian war-ships riding on the bosom of the bay; but he admits that there is a formidable enemy to Russian naval power there, to which he makes reference in these terms:—"The great destroyer of the ships in the beautiful waters of Sebastopol is an imperceptible worm, the *teredo navalis*. The ravages of this little animal reduce the time which a Russian ship of war may be reckoned to last to a period of eight years—an unfavourable condition for the Russian navy to labour under, as the ships of

* Travels in Southern Russia and the Crimea.

the English and French navy are reckoned to last an average period of fifteen years. Whatever experiments have been tried to preserve the ships from this cause of premature decay have not, apparently, been followed by the success anticipated. It is truly afflicting to think that so contemptible an enemy should thus attack with impunity those large and stately structures, so nobly resting on the waters of one of the finest ports in the universe."

According to the prince, Nicolaïeff was as important a place as Sebastopol; the latter only received the navy prepared at the former. Ships come down from the Bug and Dnieper to be armed at the "golden Chersonese." A line-of-battle ship, a three-decker, *without her guns*, can be floated down to the liman of the Dnieper, and brought round to Sebastopol, where the guns and other equipments are put on board, and the ship then lurks like a pirate within the harbour, until opportunity arrives for a sally, like that of Sinope, for plunder and aggression. The prince gives a clear insight to the spirit of the Russian government in his details of the sacrifice of life imposed by the excavation of the docks. Just as Peter the Great did not hesitate to sacrifice 100,000 lives in reclaiming the morass upon which his capital of St. Petersburg was built, so here human sacrifices must be offered to the Moloch of Russian ambition. It was said of the Tauri who once dwelt there, that they impaled human beings and offered them to their god Molkos; and the phrase Cimmerian darkness had as much reference to their bloody rites and barbarous indifference to civilisation and human rights, as to the tales of supposed fogs and gloom which ancient mariners circulated concerning the shores of the Black Sea. The Russians, in their zeal to perpetuate ancient names under new forms of civic existence, seem also ambitious of perpetuating ancient barbarity in connection with the works of civilisation. Colonel Upton had 30,000 men assigned to his charge for the purpose of accomplishing the excavations. Their labour was incredible; the soil was literally carried away in sacks on the shoulders and heads of the workmen. It was, as the prince describes it, "a perfect ant-hill, in which the infinite division of labour arrived at the same result as machinery."

Many of these men died from excessive labour and insufficient food, but their places were speedily supplied by others. At last, the heat, the glare of a Crimean sun, and the clouds of white dust from the chalky soil, brought on a visitation of ophthalmia so dreadful that, according to the prince, "twenty-four hours were sufficient for the eye to become so corrupt as to fall from the socket." Still the excavations went on, until after many fresh immola-

tions of men the masonry was completed, and the docks were ready for use. The same engineer constructed an aqueduct from the Tchernaya on a gigantic scale, for supplying the docks with fresh water, to protect the vessels from the sea-worm before referred to as so injurious to the ships.

Various opinions have been entertained as to the plan and principle of the fortifications, and as to the character of the engineering and workmanship by which they were worked out. Russian writers invariably glorify their country for having accomplished a work of military science so vast. They always proclaimed it to be impregnable, and the great military wonder of the world. On the other hand, there has been a disposition on the part of officers from western Europe to deny its defensive capabilities. M. Hommaine, a French engineer of some distinction, who spent several years in Russia, declares that the whole plan of fortification was defective, both for the sea and land defences, especially the latter. He relates a curious story as accounting for the prodigious pains taken of late years to strengthen it. He says that, in 1831, when the French Revolution which placed Louis-Philippe upon the throne of France caused the more open avowal in Europe of sympathy for Poland and hostility to Russia, a London newspaper urged the practicability of a British squadron burning the fleet in this harbour. This produced a sensation at St. Petersburg, and the czar ordered four new forts to be constructed, making a total of eleven batteries. Hommaine thus describes them:—"These four forts, consisting each of three tiers of batteries, and each mounting from 250 to 300 pieces of cannon, constitute the chief defence of the place, and appear at first sight truly formidable. But the reality does not correspond with the outer appearance; and we are of opinion that all these costly batteries are more fitted to astonish the vulgar in time of peace than to awe the enemy in war. The internal arrangement struck us as at variance with all the rules of military architecture—each story consists of a suite of rooms, opening one upon the other, and communicating by a small door with an outer gallery that runs the whole length of the building. All the rooms in which the guns are worked are so narrow, and the ventilation so ill-contrived, that we are warranted, by our own observation, in asserting that a few discharges would make it extremely difficult for the artillerymen to do their duty. But a still more serious defect than those we have named, and one which endangers the whole existence of the works, consists in the general system adopted for their construction. Here the improvidence of the government has been quite as great as with respect to the dock-basins; for the imperial engineers have thought

proper to employ small pieces of coarse lime-
stone in the masonry of three-storied batteries,
mounting from 250 to 300 guns. The works,
so, have been constructed with so little care,
and the dimensions of the walls and arches are
so insufficient, that it is easy to see at a glance
that all these batteries must inevitably be shaken
to pieces whenever their numerous artillery
shall be brought into play. The trials that
have been made in Fort Constantine have
readily demonstrated the correctness of this
opinion, *wide rents having been there occasioned
in the walls by the few discharges.* Finally,
all the forts labour under the disadvantage of
being *utterly defenceless on the land side.* Think-
ing only of attacks by sea, the government has
quite overlooked the great facility with which
an enemy may land on any part of the coast of
the Chersonese. So, beside that the batteries
are totally destitute of artillery and ditches on
the land side, the town itself is open on all
sides, and is not defended by a single redoubt.
We know not what works have been planned
and executed since 1841, but at the period of our
visit a force of some thousand men, aided by
a maritime demonstration, would have had no
sort of difficulty in forcing their way into the
interior of the place, and setting fire to the fleet
and arsenals."

This description corresponded with the con-
dition in which the allies found it when the
grand march brought them to its southern
front. The subsequent defence of the place
mainly depended upon the works thrown up
under Todleben, after the allies captured Balak-
lava, when a British engineer officer remarked
that the forts were all so placed "as to give a
mutual support to each other, which is the true
principle of fortification." When the allies
landed, the land defences were weak on both
sides of the bay; a wall without towers or
bastions, loopholed for musketry, formed part
of them. The northern side, being consider-
ably higher than the southern, and therefore
commanding it, was most strongly fortified,
and the fortifications were all erected with a
view to defend the bay and harbour. On the
northern heights, the principal work was the
Great Fort; this commanded the whole town
and docks, and the bay which separates the
northern side of the city from the southern;
and this fort could only be assailed with effect
from the land side on the north. Sir Howard
Douglas, the greatest living authority on for-
tifications, called it "the key of Sebastopol."
The following remarks of Sir Howard Douglas
will show the importance he attached to attack-
ing the place from the land side on the north:—
"The North Fort being taken, the Telegraph
and Wasp Batteries on the northern heights,
Fort Constantine, and the forts below, being
surrounded and attacked in reverse, must soon

fall; while the town, docks, arsenal, and bar-
racks on the south side of the harbour would
be at the mercy of the allies, who by the fire of
their batteries might entirely destroy them all.
On the contrary, by attacking the place from
the south, the enemy holding the northern
heights, although the works on the crest of the
southern heights should be breached and taken,
the town, the body of the place, with its docks
and arsenal, will not be tenable by the besiegers
till the great work on the northern side, and
all its defensive dependencies, shall have been
captured." Criticising the actual plan adopted
by the allies, Sir Howard says:—"Such a place
need not and will not capitulate, attacked as
it is, however successful that attack may be.
The garrison cannot be captured; since after
making the most determined resistance, it may
retire to the northern heights, or it may
evacuate the place altogether, and unite itself
with the army already in the field, after having
rendered the town uninhabitable, and destroyed
all the warlike stores it contains." It is scarcely
necessary to say that the predictions of the
general have been fulfilled.

On the appearance of the allies on the
southern side, the utmost precipitation was
seen in erecting new defences. It has been
since alleged that Prince Menschikoff inquired
of the officer superintending the engineers' de-
partment how soon he could put the place in
a proper condition of defence, and that the reply
was, "In two months, prince." The prince,
pausing with an air of dejection, perceiving
how hopeless it was in that case to think of
defending it at all, a young officer (Lieutenant
Todleben) stepped forth and offered to do it in
two weeks, a sufficient number of men being
placed under his direction. The offer, as the
story goes, was accepted, and the result was the
astounding system of earthworks by which the
allies were so long kept at bay, with all their
bravery, power, and engineering skill. Imme-
diately upon Todleben's appointment, a deep
ditch was dug in front of the loop-holed
wall already described, and earthworks were
thrown up connecting it with two tremendous
batteries, which were called by the British the
Garden and the Flagstaff. From the Quarantine
Bay to the head of the Military Harbour the
defence was thus secured. The line of
fortification was continued by the Barrack
Battery, a huge bank of earthworks joining the
Redan, a zigzag work reaching to the Malakoff
or White Tower, in front of which was a large
fortified hill called the Mamelon, and on to
Careening Bay the circle of earthworks, com-
pleted the defences of the place. The harbour
and neighbouring coast are indented with bays,
which have generally received designations in
keeping with the uses made of them. Thus
the Quarantine Bay was so called from the

erection of a quarantine building near it, and because vessels of a certain rate were obliged there "to ride quarantine" when any infectious disease was reported on board. The Military Harbour was so called because used for military purposes; Careening Bay was so named because there vessels were careened, the destructive *teredo navalis* removed from them, and any other cause of the decay of the ships. About 1200 guns were placed upon the earthworks and redoubts, and so great were the resources of the place in military material, that notwithstanding the wear and tear of cannon, and the destructive fire of the allies, there was never any deficiency in the number or quality of the ordnance. It will be so frequently necessary to notice the topographical peculiarities of the city and its suburbs, and to refer to particular batteries and features of the defence, that no further description is necessary here.

Balaklava, as the head-quarters of the British army, has become also a place often named in the military, political, and topographical discussions to which the war has given rise. It is situated a few miles east of the Monastery of St. George, and about ten miles one way, seven another, from the city of Sebastopol. The bay or harbour is completely land-locked, and is very picturesque. It is entered by a narrow opening, commanded by heights, on which stand the ruins of Genoese fortified castles, built by that enterprising people for the protection of their commerce in those parts, when, as shown in a previous chapter, the flag of their marine was ascendant in the Euxine. The harbour is scarcely anywhere 1300 feet wide, but the depth of water is in some parts 600. The harbour and the situation of the town bears some resemblance to the Cove of Cork. There are many mythic stories connected with its ancient history, as may easily be supposed when it is known that there, 2200 years ago, the Milesians founded a city. Dubois de Montpéreaux fancied he found there the spot described by Homer in the tenth book of his *Odyssey*, and Koch, noticing the fact, says—"In truth, if we visit the harbour of Balaklava with this book in our hand, we should be induced to imagine that the bard had actually visited the place. The following is the passage, describing Ulysses' first approach to the country of the Læstrigones, and which Pope thus translates:—

'Within a long recess a bay there lies,
Edged round with cliffs, high pointing to the skies;
The jutting shores that swell on either side,
Contract its mouth, and break the rushing tide.
Our eager sailors seize the fair retreat,
And bound within the port their crowded fleet;
For here, retired, the sinking billows sleep,
And smiling calmness silvered o'er the deep.
I only in the bay refused to moor,
And fixed, without, my hawsers to the shore.'

Those gentlemen who make it a point to reject every theory that does not coincide with their own, and firmly insist that the peregrination of Ulysses took place in the Mediterranean, should remember that very probably the whole Trojan war, at least in the way it is sung, one of those myths in which the pre-historic age of the Greeks is so rich. At any rate it is a highly interesting circumstance to find a place which so entirely agrees with the poet's description of localities." Catherine II. Russia encouraged the settlement of a Greek colony there, amounting to 8000 persons. They were a nest of pirates, who had given her important aid in her warfare with the Turks. In consequence of their piracies, it became a policy with the Russian government to interdict commerce to the port of Balaklava, and the lawless settlers and their progeny were obliged to betake themselves to agriculture. The present inhabitants of the place are the descendants of those unworthies, and they do not belie the ancestry,—for the allies found them as ready to lie, cheat, steal, and act as Russian spies, as the progenitors could have been. The derivation of the name is generally supposed to be Italian *bella clava* (beautiful port), but the word *bal* is the Celtic for *town*, and points to an eastern origin. Many of the ancient names in the Crimea and southern Russia indicate a Celtic affinity. All travellers praise the site of Balaklava; none commend its population or its architecture. The allies found it filthy, miserable, and poor, and somewhat in harmony with Mr. Russell's description of the first oriental town with which the allied armies made acquaintance in the neighbourhood of the Dardanelles. Balaklava is so small a harbour, that General Canrobert, then in command of the French army, decided on abandoning it altogether to the English, and seeking a separate shelter for his ships, and to some extent a separate base of operations. He chose the Bay of Kamiesch for this purpose, which is south-west, almost west of Sebastopol, and nearer to it by several miles than Balaklava. Near Kamiesch is Arrow Bay, which the general also selected for the debarkation of his stores.

The positions occupied by the allies were very strong, and the character of the country in many, although not in all respects, favoured their operations. By examining our map, the reader will perceive that Inkerman is situated at the head of the harbour of Sebastopol. If a line be drawn from the disemboisement of the river Tchernaya, near the Bridge of Inkerman, nearly due south, slightly inclining to the east, it will terminate in the Bay of Balaklava. The country to the west of that line constitutes a peninsula, which was anciently called the Heracleatic Chersonese, because inhabited in remote antiquity by the Heracians. Koch and

her writers are particular in narrating their early occupation of this little peninsula. By and from the mouth of the Tchernaya to Balaklava is about eight miles. From the former point, along the southern side of the bay to the eastern extremity of the peninsula, is not much more, as the bird flies; but Sebastopol lies in the route, also several bays, by which the coast is indented, and Kamiesch Bay, at the head of which was the French landing-place. To Kamiesch from the Tchernaya the distance may be rather more than from Balaklava to either place. The peninsula terminates on the extreme west in the bold headland of Cape Chersonese, from which, along the south shore to Balaklava, may be about twelve miles. The way from the French landing-place to the British was rugged and uneven, and did not lie along the coast. Within this peninsula the contest before Sebastopol was waged. The ground was rough, rocky, and hilly, alternating with soft and fertile valleys. Between Balaklava and the head of the harbour of Sebastopol, the country was bold and abrupt, descending steeply to the valley of Inkerman. From this description it will be seen that the British approached the fortress from the south-east, and the French from the south-west, almost due west, and that the French positions were on the left of the British.

Across the Heraclian peninsula, and nearly intersecting it from north to south, ran a deep ravine, with precipitous crags on either side, to the west of which the French took up their positions. This ravine terminated at the head of the Military Harbour. The western shores of the Quarantine Bay were held by the French on their extreme left. There they erected batteries to oppose the Russian batteries on the opposite side. The French works confronted a loop-holed wall already described, and their approaches were directed against the Bagstaff and Garden Batteries. Behind these works the French army was encamped. On the eastern side of the ravine the English completed their works, until they opposed the Russian defence with a most formidable attack. From the British left, touching the French right, at the head of the Military Harbour, to the extreme of the right attack, which completed the investment of southern Sebastopol, the English planted their batteries with skill, and with intense labour on the rocky nature of the ground. Near the head of the Military Harbour they established the Green Mount Battery. This work was very similar to another further right, and opposing the Great Redan, which was called the Crown Battery, and was manned with sailors. Between the Green Mount and the Crown Batteries, a small one, mounting only four guns, was thrown up. Further to the right than the

Crown Battery, and opposing the White Tower (Malakoff), was planted a huge Lancaster gun, and two long 84-pounders. Still further to the right, and completing the attack, a 6-gun battery was erected. The number of guns brought to bear upon the fortress by the allies was by no means proportionate to the object to be accomplished. Against the attack the Russians brought to bear an immense mass of heavy metal, and the whole garrison worked ceaselessly day and night, relieved by fresh troops from the camp beyond the city, throwing up earth-works the most formidable ever constructed. The French artillery, as was soon proved, was not of a calibre for so great an undertaking. The French officers plied their guns with admirable skill, and the gunners showed great bravery and aptitude for their arm of warfare; but the ponderous metal of the enemy soon overmatched the French attack. The British batteries were more solidly constructed, the metal of the guns heavier, the men more steady, and the officers more practical, and possessing equal science with their allies. The Lancaster gun was a weapon peculiar to the English, but it disappointed their expectations.

The lines were of great strength. The French left rested on the sea, its right on the ravine. The British left rested on the side of the ravine opposite to that occupied by the French, and their right rested on the precipitous cliffs which overlooked the valley of the Tchernaya. The French seemed, on the whole, to have chosen the best position; their left was more secure than the British right. There was a possibility of turning the latter, and of falling upon its rear; while the French left, resting upon the sea, could not be turned. Hence, so long as the right of the ravine which intersects the peninsula was exclusively occupied by the English, they suffered most. Upon them fell, in consequence of the character of their position, the brunt of the battles of Balaklava and Inkerman.

By so far anticipating events which will shortly be recorded, the reader is enabled to come to their perusal with clearer views of the objects of the enemy, and the especial dangers and trials to which the English army was exposed. The plateau upon which the armies encamped was about 250 feet above the level of the sea, overlooking the besieged town, which was built on the slopes of the high ground above the harbour, and which descended from the high ground in front of the allied positions. There was a road, called the Woronzoff road, which led from Sebastopol to Balaklava, and which was of great use to the British in bringing up to the trenches men and munitions. In this one particular the English place of support was better than that of the French. On the hills around Balaklava, overlooking the valley,

the British marines were posted, and batteries were reared. The 93rd Highlanders were encamped at the foot of the cliff, in the valley to the south of these heights. To the north of Balaklava, a low range of hills joined at a sharp angle the precipitous range that we have already described as overlooking the valley of Inkerman, and defending the British right. On those low hills three redoubts were thrown up, and committed to the Tunisians in the service of the sultan—troops unaccustomed to civilised warfare, and badly led. Some description of the Tchernaya river is necessary, both to enable our readers to comprehend the position of the conflicting forces, and to understand with more facility the battles of the 25th October, and the 5th November, now so memorable in the military annals of the English nation.

The *Tchernaya Betchka*, which in the Russian language means the Black River, is so named from the muddy character of the water near its mouth; it has not a pebbly bottom, like the Katcha and the Belbek, but winds its sluggish way, when it approaches Sebastopol, through a channel of dark-coloured mud. It steals through marshy plains for a great portion of its course, carrying with it a vast quantity of mud, which it filters into the harbour of Sebastopol, rendering dredging continually necessary. The sources of the river are among the highlands of Baidar, and it flows in a north-west direction along its whole course, passing between the upper and lower Tchorgoum, by Traktar, through the valley of Oosshakoff, where the aqueduct begins which was constructed by Colonel Upton (referred to on a previous page). In this valley the foliage is rich and varied. It was the place for Sebastopol picnics. Here, during the fine weather, the officers of the fleet gave dancing parties, and were in turn invited by the citizens. Their repasts were spread beneath the shadows of the beautiful trees that variegated the valley, and often while the yellow moonlight fell richly upon the green, the pastimes of the gay denizens of Sebastopol were continued. The 1st of May was the grand day in the valley of Oosshakoff, when all the officers of the fleet and garrison, with the officials and professional classes, were present, to dance and be gay upon the green turf. Nearer to the head of the harbour, the Tchernaya makes its way through the valley of Inkerman, and empties itself near Marsk into the southern corner of the head of the Bay of Sebastopol.

The head-quarters of Lord Raglan were established in a farmhouse about half way between Balaklava and the trenches; that of General Canrobert nearer to the rear of his encampment. From Lord Raglan's head-quarters the plateau was rent by gullies similar to

that which ran nearly across the centre, but much smaller. These continued to the harbour of Sebastopol, forming deep gorge-like clefts as they approached it. These gullies separated the different batteries on the English attack, the guns being erected upon the jutting heights between them. This circumstance in some respects made the position stronger, but others added to the difficulties of the besiegers. Although the head-quarters of General Canrobert were nearer to his lines than those of Lord Raglan, the ravine separating them here widening into a valley, the communication between the two chiefs was facilitated. Canrobert's quarters were behind the right of his lines, Lord Raglan's behind the left of his, so as to bring the positions of the two chiefs much nearer than if posted in any other manner. The coast line between Kamiesch and Balaklava needed no defence, as there was no possibility of the Russian fleet attempting anything, especially since so large a portion of it was sunk. The coast and the aspect of the plains beyond, as seen when the siege commenced, were thus described by a scientific officer who took part in the events then occurring:—"Half-way between Cape Cherson and Balaklava the bold coast-line turns back at a sharp angle, close to the site of an ancient temple of Diana, now occupied by the Monastery of St. George. It stands on the edge of a high sloping cliff, and consists of a long low range of buildings, with pillared porticoes and green roofs and domes. The cliff it stands on is of yellow clayey stone; the next headland southward, abutting far beyond it, is of extreme richness of colour—a deep pearly grey, dashed with dark red, of a tone which, even on a gloomy day, imparts to the mass a kind of sunset radiance and glow. A sergeant's guard of Zouaves is stationed in one of the buildings, and many Russian families continue to inhabit the place. Passing through the edifice by a steep flight of steps, a gallery is reached, extending along the upper face of the cliff. Terraces, connected by a winding path, jut out below; and near its base the rock is clothed with a shrubbery of small firs. There was a sound of chanting as we passed along the balcony: the Zouave who accompanied us opened a door, and motioned us in without ceremony. The place was a very small low chapel, its walls hung with sacred pictures executed with elaborate vileness. A priest in a red garment was reading prayers to some others, who sung the responses. He was bare-headed; but the rest, clad in black gowns, wore tall cylindrical caps, from which black veils descended behind. There was something strange in coming thus suddenly from a great camp into the presence of this secluded brotherhood, whose devotions, usually accompanied

only by the dashing of the waves below, were now broken by the less seemly sound of the distant bombardment. The whole of these plains are probably much the same in aspect now as in the days when Diana's worshippers crossed them on the way to her temple. A short dry turf, scarcely clothing the grey rock which everywhere pushes its fragments through, is, except the patches of coppice, the only verdure. No fields nor gardens tell of an attempt to make the soil productive, but here and there vines cling to the side of a slope where the earth is deepest, and are enclosed by walls of loose stone. A few trees, soon cut down for firewood, surrounded the farmhouses, and others grew at intervals down the course of the larger ravines. Lit by a warm sun, bounded by a blue sea, and enlivened by the view of the white-walled city, the aspect of the plains in October was fresh, and almost cheerful, while, looking inland, the tumbled masses of hills always lent grandeur to the landscape." It is to be regretted that the monks were left in such quiet possession of their monastery, for the place became a focus of spies; and its inmates showed more zeal in conveying information to the Russians than in performing their penitential obligations or conducting their devotions.

The harbours of Kamiesch and Balaklava were centres of great interest and activity during the period preparatory to the commencement of the siege. At Kamiesch the fleet presented an appearance very imposing; and the arrangements, both in the village and in the harbour, were as nearly perfect as possible. The transport fleet of our ally was vast; the masts looked like the trees of a forest when winter strips them of their foliage. An excellent wharf was erected by the French sappers and miners, aided by the sailors and marines, and every convenience provided for the prompt and rapid landing of all the varied stores which incessantly crowded the beach. The organisation became so complete that it may be said in truth "there was a place for everything, and everything was in its place." Stretching away from the beach of Kamiesch there appeared a city of tents, the streets of which were named; an excellent post-office was organised, and Parisian *restaurateurs* were to be found. The pleasant little *vivandières* might, nevertheless, be seen tripping about with that light and graceful air so peculiar to the young Frenchwoman, and they were treated with all imaginable courtesy and tenderness. Throughout the dreary siege that followed, the neatness and order of everything at Kamiesch were visible commendations of the French system, and of the faculty for organisation which characterises the French staff.

At Balaklava the crowd of transports was still greater than at Kamiesch, but the uttermost disorder prevailed in the way in which they were handled. Some were anchored within the harbour, some moored under the little town, others left outside the harbour, beating about, and perhaps never able to land their stores, or landing some portions of material or equipment of no use without other portions. Vessels were frequently ordered off to Varna, Constantinople, Malta, or somewhere else, carrying undischarged cargo to and fro over the waters of the Black Sea and the Bosphorus, as if the very genius of stupidity and folly presided over all. Many of the vessels within the harbour were injured by knocking against one another—so hopeless was the disorder in which they were permitted to lie about wherever they could get a berth. There was no wharf—nothing that could be called a landing-place; the munitions and material were piled in incongruous heaps, as chance ordered. Confusion reigned paramount from the very first day. No guiding hand was found, on land or sea, to save the English nation from the disgrace and disaster resulting from this state of things, and to preserve the unfortunate army from the direful consequences.

One of the most injurious effects arising out of the anarchical condition of matters at Balaklava, and in the transport service generally, was the loss of the knapsacks. When the flank march was determined upon, the knapsacks of the men were sent on board ship, to be brought round to Balaklava, and there meet the army. When the march was effected, and the troops took up positions before Sebastopol, no knapsacks could be had. Lord Palmerston's government instituted an inquiry into these matters after the appointment of the Sebastopol Committee; the commissioners who conducted that inquiry reported a statement of the Hon. Colonel Gordon, deputy quartermaster-general, that the knapsacks were offered to the generals of division, who, with the exception of the Duke of Cambridge, refused them; thus shifting the blame from the department of the quartermaster-general, within whose province it fell, to the generals of division. It so happened, however, that while Colonel Gordon was giving his evidence to the commissioners on the spot, the Duke of Cambridge and other officers were giving their evidence before the Sebastopol Committee at home; and their united testimony was that the generals both of divisions and brigades sent to Balaklava as the various transports arrived, and could only learn that those vessels made repeated trips to the Bosphorus, and even to Malta, with the knapsacks on board, not knowing to whom they should be delivered, and having no distinct

orders concerning them. Neither General Airey nor his assistant, the Hon. Colonel Gordon, knew what to do, or knowing, took any pains to perform what was necessary; and the soldiers continued without knapsacks and without change of linen, combs, or any of those little appurtenances necessary to personal care, which, on the bivouac and in the trench, are so conducive to comfort and health. The testimony of Lieutenant-general Sir de Lacy Evans is so clearly inculpatory of the quartermaster-general and his department, on this matter, that we give it. "Persons are not aware why it is that the question of the knapsacks is dwelt on so much. I must remind them that it was stated by the medical officers that in consequence of the troops not having a change of clothes their sufferings were aggravated; and I know the sick and wounded went down to Scutari with their shirts sticking to their backs, in the most deplorable condition, no provision at all being made for them at Balaklava. I admit that perhaps some confusion was inevitable, but I do not think that such efforts were made or arrangements concluded as prudence would have dictated."

The testimony of his Royal Highness the Duke of Cambridge is very straightforward, and bears about it a *naïve* air of truth, which carries conviction to every one not prejudiced in favour of official routine. "Is your royal highness aware at all of what was the reason of this great delay in the restoration of the knapsacks after they had been taken away?"—"The reason was simply this, that, instead of each ship, after coming round to Balaklava, entering the harbour and discharging its cargo of knapsacks, and care being taken that the regiments were informed at the time that such would be the case, a sort of circular was sent round that a ship was outside or inside the harbour, and the chance was taken of getting the knapsacks out. It occurred once or twice, on sending down for them, that the ship had sailed in the meantime to Constantinople or Marseilles upon another service, and the knapsacks were gone."—"Is the fact within your royal highness's knowledge, that ships laden with those knapsacks went two or three times backwards and forwards across the Black Sea without landing?"—"I think that that is true."—"Does not that imply great neglect in some quarters?"—"I think it a very bad arrangement."—"Would it not have been possible, after the flank march was determined upon, to have all the knapsacks collected together out of the different ships into one, and to have sent them round to Balaklava?"—"I have no doubt that some arrangement of the sort might have been made at the time. Of course, at sea it is not, perhaps, a very easy matter to shift knapsacks from one ship to

another. I apprehend the simplest course would have been to have landed the knapsacks of each regiment at Balaklava, and then to have made the ships available at once for any other duty."

The testimony of Colonel Wilson of the Guards informs us what was done with the knapsacks at last. "Do you know what steps were taken on the part of the officers to obtain their baggage while encamped before Sebastopol?"—"I know that the officers repeatedly sent down their servants to Balaklava to endeavour to discover the ships in which they had sailed to the Crimea for the purpose of getting their baggage. I did so myself; and on one occasion the *Tonning*, the ship in which I sailed to the Crimea, did arrive, and I sent my servant down, and they told him that they had been ordered at Constantinople to discharge all the baggage, and to put it into store there, so that I got nothing."

The case of the knapsacks is but a specimen of the whole business at Balaklava—*ex uno disce omnes*—we will not harass the feelings of our readers thus early in the narrative by recounting all the malversations, jobbing, neglect, cruelty, and ignorance which occurred at Balaklava before one cannon-shot was fired against Sebastopol. In the course of our siege records it will be repeatedly necessary to refer to the deeds and misdeeds of commissary and quartermaster-generals, harbour-masters, and other officials; but for the present we must leave Balaklava, and direct attention to Sebastopol, and to events more immediately connected with it.

This siege opened in a manner different from all others. It is an axiom that the place which is besieged must be invested. In this case, from the nature of the country, an investment of both sides of the harbour was impossible, so that only the side at which the allies lay could be invested at all; and the communication of its garrison with the north side and with the open country beyond remained unimpaired. It is also an axiom in conducting sieges that the assailing army ought to be more numerous than the garrison. It will of course depend upon circumstances in what proportion that superiority must be maintained, but the average is threefold. At the siege of Saragossa by the French the besiegers were actually only one-third the number of the garrison; but the latter was composed of citizens, and not well-disciplined troops. In a few other instances in the history of sieges, the besieging army has been less numerous than the beleaguered garrison; but the rule is as stated above. At Sebastopol the garrison and the Russian army in the field were one army. As fast as the troops in Sebastopol fell in the defences, others from the field took their place; and the united

forces under Prince Menschikoff when the siege began, were decidedly more numerous than those of the allies. By the 25th of October, and again by the 5th of November, the numerical superiority of the Russians was very great; so that the allies were attacked in their own positions, upon the rear and flank of the British, by powerful Russian reinforcements. It is likewise an axiom that the cannon of the attack should be superior to that of the defence. At Sebastopol the latter numbered more guns than the former when, upon the 7th of October, the bombardment commenced; and the French guns were so light, that they were to a great extent disabled on the first day. It is usual in sieges to open the trenches at about 600 yards, enclosing by the fire directed from them one or more salient points of the defence. The advantage of the assailants, in the first instance, may be understood by supposing two concentric circles drawn from a point within the fortress, the inner circle just enclosing the defences, the outer one the trenches of the besiegers: it follows that the defences being on the lesser arc—the inner circle—and the assailing batteries on the arc of a circle 600 yards apart from that of the inner one, a greater number of guns can be brought to bear in the attack than in the defence. When the fire of the assailants has proved itself superior to that of the assailed, the former push on their works by means of zigzag approaches, and open a second parallel, which, being nearer to the defence, already weakened by the fire from the first parallel, is still more destructive. The danger to the besiegers in opening their second parallel is greater than in opening the first; and its extent depends upon the skill with which they work their zigzag approaches, and the celerity of their movements. When the works of the fortress sustain additional damage from the second parallel, the besiegers proceed as before, trying their zigzags still nearer, and opening a third and final parallel as close as possible to the works. The danger increases as this enterprise proceeds, for the beleaguered may use the musket and rifle with deadly effect. Then, by the superior weight of metal brought to bear upon the walls and batteries, breaches are effected, the besiegers rush in through the breach, and, by dint of numbers, overpower the garrison. In the case before us, the space occupied by the works of the allies was so great that not less than three miles—that it enabled the garrison to bring as many guns against the allies as could by the latter be brought against the place. The hope originally entertained that the fleet would enter the harbour, and assist in the attack, was disappointed by the stratagem of Prince Menschikoff in sinking the ships at the entrance. All that could then be

expected from the fleet was to attack the forts at the mouth of the harbour.

The employment of shells in sieges gives a great advantage to the assailers, for they are sure to do some harm, if not to the garrison, yet among the inhabitants, destroying life, breaking down their habitations, and increasing the terror and confusion of the citizens. On this account the Duke of Wellington never used them in his sieges in the Iberian peninsula, because the chief destruction they would have inflicted must have been upon the Spanish and Portuguese inhabitants, which would have exercised no influence upon the French garrisons in slackening or abandoning the defence, as the inhabitants were their enemies. No such reason could prevail with the allied generals at Sebastopol, and they accordingly used shells unsparingly throughout the attack.

The first French parallel was opened much nearer to the fortress than that of the British; this arose from the ground being less rocky on the site occupied by our friendly rivals. Between the British camp and the trenches the ground sloped upward to a ridge, and then downward to the fortress. Of course, as the works were moved down the slope the men became more exposed to the fire of the besieged, and higher parapets were required to cover them from the fire. So stony was the earth on these slopes, that it was next to impossible to open trenches at all. Our first batteries were traced on certain elevations which arose on the face of the descent. Along the eastern *gradus* of the peninsula, nearly from Balaklava to Inkerman, a strong earth-work was raised by the French, with bastions and redoubts at intervals. This was useful to check any attempts of the Russian armies at a diversion upon the right flank of the allied armies. The British, especially, derived great advantage from this work.

As the material was moved up, great labour was experienced in dragging the heavy guns to the front, and here the sailors showed great spirit; making a run, they would pull up the guns with a simultaneous effort, and then give a hearty cheer, reminding one of a favourite stave with many of the groups—

“Did you hear that British cheer
Fore and aft, fore and aft?
Did you hear that British cheer
Fore and aft?”

These brave fellows seemed weatherproof and disease-proof, for while already Turks, French, and English were falling victims to the cholera, which seemed intensified by the abominably filthy state of Balaklava, and of the waters of the harbour, these rough men experienced comparative good health, and greatly enjoyed “serving ashore like sogers.” They were led by Captain Lushington, who knew the men he

had to deal with, and to whom they rendered a ready and affectionate obedience. The naval division was divided by Captain Lushington into two brigades, one of which was placed under Captain Peel, and the other under Captain Moorsam. They had tents, of which the army was nearly destitute; these they pitched with dexterity and care, and talked of "sarvin' on board tents" as something very merry and exciting; and neither the jollity nor excitement seemed at all lessened by the presence of danger, even when the enemy's ball bounded among their canvas, or the bursting shell scattered showers of missiles around them. They were as amusing to others as they were jovial among themselves, their nautical phraseology frequently applying with *à propos* and odd effect to the scenes and events in which they mingled. It was curious to see the decorations with which they, after their fashion, graced their tents; still more curious to read the inscriptions hoisted above them. The inmates of one tent were pleased to call themselves the "Bellerophon's Doves;" others, rivalling the complacent harmlessness of their neighbours, styled themselves the "Trafalgar's Lambs!" All did not seem alike to cherish the easy-going goodnature or the good-humoured irony expressed by such inscriptions: many displayed very bellicose mottoes, such as "Vengeance for Sinope," "the Tiger's Revenge." Notwithstanding the character for excessive jollity which the tars obtained from the rest of the camp, they had their serious moments; and a thoughtful and loving heart beat beneath many a rough blue jacket. At night, when there was general carousing over their grog and ration pork, and sea-songs rolled upon the breeze over the whole encampment, even to the heights before Sebastopol, there might be seen here and there a silent poor Jack, with his bit of candle stuck upon the crown of his hat, as he knelt before it, or sat and held it between his legs, while he scratched with such pen and ink as he could procure his fond words to wife or sweetheart, parent or sister, left far away, where the white cliffs of Albion guarded the home he loved and the nation for whose honour he was about to fight—perhaps to die in the conflict; or lay him down and perish when the winter's winds should sweep bleakly over the hills where now October bronzed the leaf or smiled upon the naked cliff. Bluff as the rock of their native shore, their very words of love were abrupt and eccentric. One of these fine fellows, when asked if he had a wife at home, replied, "Aye, aye, sir; and she's worthy to be an admiral!" Another complimented his sweetheart by calling her "a regular three-decker!"

During the second week of the encampment, and before the bombardment had yet commenced, an unexpected disease made its ap-

pearance among the men—one which the physicians were not at all prepared to see develop in that climate—rheumatism. Men of all the divisions, except the naval, were disabled wholly or partially from this cause. A gentleman who resided many years near the Alma (husband of the lady whose little book, *The Crimea*, we have quoted and commended), thus warned the English public of the probability of our men suffering from this cause, and gave his opinion as to the means of counteracting it, which might be found in the East, without altogether invaliding the men. We believe this gentleman also gave information to government upon the subject, to which, as a matter of course, no attention whatever was paid. In a letter to the *Times*, Mr. Neilson says, under the heading of "Plagues of the Crimea:"—"Among these rheumatism may be enumerated, from the effects of which many of the poor invalided soldiers from the Crimea are now suffering at home, though it may not, perhaps, be generally known that a remedy is close at hand to the locality where this disease has in so many instances been contracted. The hot mud baths at Eupatoria are said to be efficacious in this respect, and the island of Mitylene (the ancient Lesbos) was famed from remotest antiquity for the medicinal virtues of its mineral waters 'which,' says a recent work on Turkey, 'are of known efficacy in derangement of the spleen and liver, scrofulous tumours, gout, and rheumatism. The last-mentioned disease is, unhappily, one to which Europeans are particularly liable in these countries. Finally, the waters of Vossilica are said to have a specific action in the cicatrization of wounds.' When to this above it be added that Mitylene possesses one of the finest and healthiest climates in the world, 'invariably cool in summer, and remarkably mild in winter,' it is strange that no hospital depot should have been already established in so desirable a locality, and one moreover, so near the seat of war."

The diseases of the climate were greatly aggravated by the saltiness of the food and the mode of cooking. Every English soldier was obliged to prepare his own food, and to soak his ration pork in water before cooking, as otherwise diarrhoea was observed speedily to follow its use. The men had no bread; hard biscuit was served out to them in sufficient quantities; and occasionally the French made our men a present of a ration of bread which they baked every day in their camp. With them also one man cooked for twelve, and by giving himself wholly to the matter on the day when it became his turn, everything was properly prepared. The bands of the English regiment left their instruments behind, and the bandsmen were engaged as hospital servants, to the astonishment of the French, who prized the

bands so highly. The different effect produced in the two armies by a policy so diverse, has been well described by the author of *A Month in the Camp before Sebastopol*:—"The members of our bands are, as I have said, devoted to bearing stretchers. The French musicians, on the contrary, are at this moment playing 'Rule Britannia,' in compliment to the *entente cordiale*; and many a poor sick Briton is, I dare say, raising himself on his elbow, to catch the faint but cheering strains, as they float to our lines. Our allies argue that camp is the very place where music is wanted; that a soldier can carry a stretcher into action as well as an accomplished musician; but that, if both get knocked on the head, a month's training will replace the one and not the other. They add, that even if the musician alone will serve our turn, it would be well that he should, at any rate, play during the days and weeks that happily intervene between bloody engagements, in the most active warfare. Can you answer this Gallic view of the case?"

By degrees the whole of the troops took their posts around the fortress, and the preparations were rapidly put forth for the bombardment, previous to which various skirmishes and alarms took place, which we shall recount in another chapter. We shall close the present by a statement of the troops occupying the positions of the allied armies. On the side of our allies,

Prince Napoleon and General Bosquet occupied the posts of danger; General Canrobert displayed prodigious activity of mind and body, affording constantly by his presence in the lines encouragement to his troops. Even Lord Raglan, with all his heroic recklessness of personal exposure, did not surpass General Canrobert in dauntless bearing. On the part of the British, the troops that suffered most at Alma were in the most exposed positions at Sebastopol. At first, Sir George Cathcart's division, as shown in another part of the chapter, was placed between the rest of the army and the enemy, but as the other divisions moved up, they were placed nearer to the foe. Sir De Lacy Evans was to the extreme right, overlooking the valley of Inkerman; next him, Sir George Brown; General England still more to the left; and ultimately Sir George Cathcart on the extreme left—the left of his division resting upon the ravine; the Duke of Cambridge was in reserve, to the rear of General Evans; and the cavalry division was at Balaklava. To these must be added the 150 sailors, who were encamped between the fourth and light divisions; a detachment of sappers and miners; the troops of horse-artillery attached to each division, and the Marines at Balaklava. Behind the lines, the tents of the generals of the staff were pitched, and behind all, the hospital marquees.

CHAPTER XXXIX.

HOSTILITIES BEFORE SEBASTOPOL.—COMBATS AT EUPATORIA.—THE FIRST BOMBARDMENT.

"Where the battery, guarded well,
Remains as yet impregnable."—BYRON.

HAVING described the vicinage of the doomed city, and the positions of those who were assembled to work its fall, we proceed to narrate the incidents by which the siege was opened and continued.

One of the first hostile acts was the arrest of Mr. Upton as a prisoner of war. Lieutenant Peard thus relates it:—"On the 26th, the cavalry took a Mr. Upton, an Englishman by birth, and a son of Colonel Upton, who built so many of the batteries in Sebastopol. It was said that he remained at home on his farm on purpose to be taken; but he declined giving any information, having once been in the Russian service, and long a resident in that country. We rather hoped to obtain some useful intelligence from him. I am sorry to say that they allowed him to remain at Balaklava, for I have a suspicion that he acted against us. He was permitted to have a good deal of liberty; and from circumstances which occurred afterwards, there is little doubt that there were spies in

Balaklava who were well conversant with the English language. I never could understand why Mr. Upton was not sent to Constantinople with the other prisoners." This event has been much discussed, and generally in the spirit of the above-named officer, to whose interesting narrative justice has always been done in our History. In this instance Mr. Peard errs in almost every particular except the bare facts of Mr. Upton's arrest and nationality. His father, Colonel Upton, is represented as having built many of the batteries of Sebastopol. He did not build one; but the docks owe their construction to him. Mr. Upton is represented as having remained on his farm for the purpose of being taken. He remained there under the impression that Sebastopol was completely invested on the north as well as the south, and that he could not escape through the open country beyond. This can be readily believed when it is recollected that the Russian army, which had been watching

the British from the Alma, were surprised to find them on the south side of the city at last; and that a lady fled from Sebastopol, and took refuge at Balaklava, supposing that there she would be safe from the English, who had been advancing upon the city from the opposite side. Mr. Upton would not of course go into his house in Sebastopol, which he knew must be bombarded; no man in his senses would take a wife and four little daughters into a city begirt with besieging hosts, especially when the besiegers were the soldiers and the allies of his native land. Mr. Peard's suspicions that he was a spy were gratuitous and unfounded. No circumstances came to light which justified the gallant lieutenant's suspicions. Two things were brought against him, both of which were "trumped up" charges, and were promoted by General Airey, the Quartermaster-general, for his own purposes, and form a part of the extraordinary doings of the department over which General Airey so strangely presided. One of the charges was, that he concealed from the British the fact that a road existed by the shore of the bay from the city to Inkerman. He never knew of such a road; he did not believe then, nor has he since believed, that any such road existed. If there did, the Russians made it after the trenches were dug, and destroyed it again—an unlikely if not impossible thing; for since the capture of the southern side of Sebastopol, the gallant officer who commanded the naval division took pains to ascertain the truth, and declared that there has been no road there. The other charge was, that Mr. Upton had perfect knowledge of the enemy's defences, and concealed them to the injury of his country. The proof of this consisted in the fact that, when taken to Balaklava, and his wife and little daughters were left behind, General Airey had his house ransacked for papers; an old plan of Sebastopol was discovered, *which had never been carried out*, which had been prepared long before any of the existing fortifications were founded, and which, *because of no use* except as an engineering curiosity, was given to Colonel Upton a great many years before. Mr. Upton had no map or plan of the existing fortifications, and had never been over them. The author of this History has the authority of a distinguished general officer in stating that the plans found among Mr. Upton's papers were utterly worthless to the allies. From the moment of his arrest he was persecuted by the Quartermaster-general's department. Brought up to the lines, and paraded there in the sight of the enemy, all his property in Russia would of course be confiscated. The house in Sebastopol was dismantled; British soldiers destroyed the farm, everything it possessed being carried away; and Mr. Upton, without proof or trial to con-

vict him of being faithless to his country, was retained a prisoner of war, and, in 1856, on trod his native land on parole! A few other prisoners, all of them Greek civilians, were captured soon after.

As early as the 28th of September there was smart firing between the Russians and British Rifles, but under circumstances which allowed of but little mutual injury being inflicted. The batteries and the British ships also exchanged shots, without any damage to the latter, the Russian balls dashed up the water upon their decks; the balls from the ships dropped into the batteries with remarkable precision, and it is difficult to believe without effecting some mischief. At midnight of the 29th the besiegers were alarmed by great clamour in the town, accompanied by the beating of drums and braying of trumpets. The troops stood to their arms, but the tumult and military noises died away, and Sebastopol seemed to slumber in quietness and gloom. Early dawn on the 30th Cossack videttes approached the British camp, but retired when a few muskets were presented at them. The day had scarcely broken when several citizens attempted to escape, but the British Rifles fired upon them, they precipitately regained the city. A soldier who accompanied them was captured, and seemed to regard the British as assassins, for he immediately knelt down to perform his devotions, expecting every moment to be shot. On the 30th, also, a ship was careened in the harbour for the purpose of shelling the camp. Several nine-inch shells, some of British manufacture, fell among the troops; those of British manufacture *did not burst*, a very common case when afterwards shells were thrown from the British lines into the city. During the whole siege the allies suffered from vessels being careened for the purpose of giving elevation to their guns. It is astonishing that in the position originally taken up this was not provided against. A gentleman of great experience, a distinguished civil engineer, pointed out to a leading member of Lord Raglan's staff the necessity of counteracting the fire of the ships. The reply was, "Oh they will shell us." "Cannot you shell them also?" was the pertinent retort, to which no answer was returned; nor were any means adopted calculated to encounter the evil, although in the opinion of the gentlemen who knew the ground well it was perfectly practicable. Sir George Cathcart was eager to assault the place before the Russians had time to throw up defences, but Lord Raglan objected, on the ground of the loss of life that would be entailed. As events proved Sir George's views were correct, the place was open to assault; it is true, it may have been untenable, but it might have been fired or destroyed. Lord Raglan's "timid counsels" di-

not arise from want of personal heroism; he was among the bravest of the brave; but whether from want of military skill, or from overstrained humanity, the result of his refusal to follow Sir George Cathcart's counsel was a tenfold greater sacrifice of his army. A veteran officer, who was present, told the author that when the French retreated from Leipzig, Buonaparte left a strong body in the place to cover the retreat, who obstinately defended the cemetery, which had a high crenulated wall. The Crown Prince of Sweden, Bernadotte, ordered up the British Rocket Brigade: the Austrian ambassador, a general officer, remonstrated, on the ground that the English rockets would burn the city and injure the inhabitants; Bernadotte, pointing to a number of Swedish riflemen slain by the fire from the cemetery, replied, "If I fire the city I may injure the inhabitants, but I shall spare my soldiers: if the city is burnt, the French must retreat, and our object will be gained without fresh sacrifice of our own troops." The British artillery, however, swept away the wall which surrounded the cemetery, and the French were driven through the place. The energy and promptitude of Bernadotte, on the part of the English chief, would have won Sebastopol. Had Sir George Cathcart commanded the British on the 30th of September, there would have been no siege of southern Sebastopol; the garrison would have been driven from it by a strong force charging down the main street, and before the fire from the northern forts could have inflicted any very great injury upon the victors, they would have effected, if necessary, by the torch and the miner's axe, what was accomplished long after by the "fire infernal" of the final and successful bombardment.

On the 1st of October the *Twelve Apostles*, one of the largest of the Russian ships in the harbour, brought her guns to bear upon the camp of the fourth division with such accuracy that it was forced to retreat to a less perilous position. The spot evacuated by the 20th regiment was torn up by shells, and the colonel's tent—the only one the regiment had—was rent by the scattered fragments of the projectiles. They were Russian-made shells, not British, which were thrown by the enemy this time. The men of the fourth division, having moved about a mile to the right, halted, and made huts of boughs of trees which they had collected, but not in sufficient proportions to protect them from the burning sun by day, and the chilling dews by night. Sir George Cathcart was indefatigable in every duty, and won the enthusiastic confidence of his division. He encamped them behind a hill, which covered their new position, so as to conceal them from the enemy. On this hill (afterwards so noted in the history of the siege) was

a ruin, seated among the stones of which the officers used frequently to assemble and look down into Sebastopol, of which there was a magnificent view—its batteries and works being not only within the range of a good glass, but plainly visible to the naked eye.

On the 3rd of October the Russians endeavoured to throw a considerable succour of troops and supplies into the town; but the French defeated their intention. They, however, were able to accomplish this purpose upon the northern side. The light division had been compelled to change its position as well as the fourth, the enemy throwing both shot and shell at a very long range into their camps. On the 3rd of October reinforcements of heavy cavalry arrived from Varna. On the 4th, the progress of the enemy in erecting their earthworks became obvious, and they were allowed to continue their indefatigable exertions unmolested; not so the allies, they worked under showers of projectiles, and several men and non-commissioned officers of the 63rd perished by this means. The men all along the lines were solicitous to direct a fire upon the parties who so rapidly constructed the defensive earthworks; and our officers very generally expressed an opinion upon the desirableness of so doing, both to impede the rapid advance of the defences, and to encourage our own men; but Lord Raglan would not listen to their suggestions, being opposed to any desultory cannonade, and reserving himself for a general bombardment.

On this day General Luders arrived at the head of 16,000 men—a formidable augmentation of the garrison. The desertion of a Polish officer to the allies afforded much excitement, especially as all sorts of rumours were current concerning the information which he gave. He very minutely described the works opposed to the French attack, but could give no intelligence as to the works opposed to the British. He described the general impression of the garrison to be, that the city must ultimately fall, but that the defence might be protracted by vigorously toiling at the earthworks, and loading them with guns of large calibre. His account of the Polish part of the garrison was, that they were all eager to desert, but were watched most closely. They did not, however, in the course of the siege, desert in any considerable numbers, which most writers have attributed to the *esprit de corps*, but which really arose from the fact that the Polish soldiers were generally married men, and if they deserted, no probability remained of their ever again seeing wife or child.

The division of General Evans experienced considerable inconvenience on the 5th from 84-pound shot rolling, somewhat spent, through the camp. In the evening the light division

made an ambush, and succeeded in getting a body of Cossacks within range of their rifles, several of whom they killed, and brought down a few horses, the riders of which rose and ran for their lives. A severe loss occurred to the British army on this day. Reinforcements arrived from Varna on board the *War-Cloud* and the *Wilson Kennedy*; they consisted of cavalry, belonging to the 1st Royal Dragoons and the 6th (Enniskillens). A storm had arisen, and both ships were in imminent danger of wreck. The tempest continued for two days with unabating fury, causing the ships to labour heavily; the horses became loose on the deck, and the result was that 178 perished.

The population of Sebastopol seemed to get over their panic as the earthworks progressed, for their gaiety at this time was unbounded. Balls and picnics were their principal pastimes; and scenes of unusual revelry took place on board the ships in the harbour as well as on shore.

The exertions of Sir John Burgoyne, the distinguished officer of engineers, were of great value at this juncture. These exertions were extraordinary for a man so far advanced in life; and they were as intelligent as active. He was, in effect, the commander-in-chief of the British army. His orders were, however, sadly thwarted by the slowness and incapacity of various official persons. Among other instances of this, he had ordered furnaces for heating shot to be sent up to the trenches, and for some guns to open with red-hot shot upon the vessel which was careened across the harbour, and whose fire so annoyed the troops: all his orders were rendered abortive by the mismanagement of those upon whom it devolved to execute them.

The prevalence of cholera caused great uneasiness to the allied chiefs; several of the medical men died, and many most valuable officers. The number who perished of that pestilence, during the first fortnight from the occupation of Balaklava, was greater than that of the slain at the battle of Alma. Many, also, were invalided, especially among the British. The filthy condition of Balaklava contributed much to the spread of disease. Lord Raglan ordered it to be cleansed; but it could not be determined who was to obey the order, and Lord Raglan himself did not attend to its execution. About this time the Earl of Cardigan pleaded ill health, and went on board ship. Ultimately his lordship took up his quarters on board his yacht, which came from home, some alleged for this particular service; his lordship, however, accounted for its arrival by certain fortunate contingencies.

On the 7th, a council of war was held at the British head-quarters, and the mode of opera-

tions was decided upon. It was determined that the French should conduct the real attack on the left, opposite to the Dockyard Creek and the town, while the British should keep down the Russian fire, not advancing their works nearer for the present. The 7th of October was rendered further eventful by the appearance on the right flank of the British of the Russian army of relief. A strong body of the enemy occupied the Tchernaya to the north of Balaklava, and a brigade of Cossacks made a reconnaissance in force. A British hussar officer thus describes his experience of the events of that day, on which began the series of operations upon the British flank, so skilfully conducted by the Russians, and of which the battles of Balaklava, Inkerman, and the Tchernaya, were a part. The writer also describes the wretched condition of the troops, and their sufferings from sickness:—"This morning, at sunrise, the trumpets sounded boot and saddle, and in a short time eight regiments of cavalry and a troop of horse-artillery were trotting away to the assistance of our pickets. The writer, with the rest, after going a mile or so, came on a very large body of Russian regular cavalry. The artillery unlimbered, and sent eight or ten shells among them. They evidently had a body of infantry near, so we did nothing else but observe for a couple of hours, and then returned to our camp, where we now are with horses saddled, ready to turn out. I expect that we are not far off a battle with the relieving army, as their pickets and ours come into collision daily. General Luders and a large convoy got into Sebastopol the evening of the 5th. Something wrong, I fear. Our Lancaster guns are now in position, and it is said that we open this evening on the *Twelve Apostles*, the Russian admiral's flagship, which throws shells at us all day. The cholera is still raging; the last account I heard was that forty-five had died that day, but really the wonder is that any are left alive. We (that is the men and regimental officers) are either starved, or eat food against which our stomachs turn; and in order to live we are obliged to eat loads of grapes from the vineyards close at hand. The days are very hot, the nights very cold, and our clothing consists of one suit on our backs; the dew wets us through every night, just like rain. When taken ill we have no medicines, no place to be nursed in, no one to care a straw about us, as the immense mortality has made, and invariably so, every one more or less callous. In fact, people taken ill may recover, but by a sort of miracle. One officer of the 77th, Crofton, a man I knew, died in a ditch by the roadside, with as little ceremony as a dog. When the officers are so badly off, I leave you to guess how the men are. I am myself so weak from diarrhœa, that

I can hardly sit on horseback; indeed, I am quite prepared to see it turn to cholera, as I cannot stop it. I feel low-spirited about my sister, and I am in a bad condition to resist disease. I went to the general hospital yesterday, and the horrible sight of so many dying of cholera, and all suffering horribly, appalled me."

The following brief extract, from an intelligent sailor ashore, presents a fair picture of things previous to the opening of the first bombardment:—"The trenches are progressing; and, you may believe me, we don't pop our heads out imprudently when such whistling is shriller than usual. The Russians fire day and night on our fatigue-parties from very heavy ordnance. A bomb, that burst 150 metres off the place I was at, sent a splinter to within twenty paces from me. I picked it up, and shall use it for a weight to keep loose papers from flying about. The Russians have a very tall mast, with a scout on the top, whom our sharpshooters call the *Green Ape*. From that height the eye can look down into the trenches, and the spots can thus be pointed out for firing at. Fortunately, it is very difficult to make a shell fall and burst in a trench when well defended. Not more than twenty have been killed in this way, and most of them may have exposed themselves imprudently. For the rest, the works, which advance slowly day by day, get on very fast by night. The aim is more uncertain in the dark, and the pickaxe can then be better plied. The Russians have, however, contrived to have artificial aims; during the day they stick up small pennons, and fire over them, so that the balls are sent nearly in the right direction. On our side, night is in our favour: our boats, with muffled oars, take soundings in all the channels. To-night the *Algier* will pass under all the outside forts, and will anchor inside the Quarantine Basin, in order to destroy a Russian battery, thrown up in forty-eight hours, and which ever since noon has been raking the trenches. All is going on well: hope for the best. We reckon, please God, on soon taking Sebastopol, burning the city and ships, making prisoners of the garrison, and destroying the arsenals. After that we shall throw the fortifications into the harbour. The citadel alone will escape us. They say that General Canrobert intends then marching against Menschikoff, who is at Simpheropol with 30,000 men."

On the 8th, Lord Raglan ordered the investment of southern Sebastopol to be completed, but his orders were not very promptly carried into execution; it was felt already that the work was too heavy for the number of men, and the health of the army was such as to diminish greatly its power of labour and endurance. Besides, the want of land-carriage

was severely felt; and the miserable state of management in the commissariat and quartermaster-general's departments consigned the men to exposure, hunger, and almost every discomfort to which men could be subjected. The number of deaths from cholera on this day was most disheartening; in every regimental rank, and every arm of the service, the pestilence numbered its victims.

On the 9th, a very vigorous cannonade impeded the besiegers; and shells were continually bursting in the camps of the third and fourth divisions. The fiery storm swept over them from dawn until dark, yet very little injury was sustained by the soldiers; while our officers became better acquainted with the enemy's guns, which fact was serviceable to the allies when the bombardment opened.

The night of the 10th was formidable to our allies, whose working parties were subjected to a fierce cannonade. As they approached the trenches a strong body of Cossacks was observed lying in wait for them, upon whom a fieldpiece was brought to bear, and they rapidly retired, but not without loss. The same evening a strong body of Cossacks approached the English right flank. Colonel Yorke, with a small detachment of the Royal Dragoons, charged them, and they ignominiously fled. The proportion of British cavalry to Russian was not so large as one to five, yet so complete was the panic of the latter, that they threw away their velisses to enable them to escape with greater rapidity. On the same night General Evans' division was aroused by a ludicrous incident. An alarm was spread, the pickets having discharged their musketry; and it was not until the whole division was in order of battle that the occasion was understood. A poor cow, which had strayed in that direction, fell pierced with many balls, and died ingloriously before the fire of numerous assailants.

A subaltern in the fourth division, in his journal, under date of this night, writes—"On the 10th our tents arrived at a most opportune time, and Captain S—, 20th, K—, 20th, and I, took possession of one. It was a bitter cold day, and the wind was from the north, whistling with a chilly blast; and glad enough were we to get under canvas, and the tents were thoroughly appreciated. There was nothing to separate us from the bare ground, which was hard and cold enough; but we rolled ourselves in a blanket, and in the morning found that we were but little rested, having fearful back-aches and sore hips. There was a little creature which paid us nightly visits, in the shape of a species of mole, or, as my servant called it, a 'ground lion.' He was an extraordinary little fellow; and whenever we dared to take our boots off at night, we generally found them filled with earth in the

morning. I laid wait for him one day, and struck at him, but he made his escape: there were numbers of them about the camp. Small green lizards, about three inches long, were also in great abundance: they are harmless, beautiful little creatures, and flit about from stone to stone, under which they vanish at the approach of danger. The centipedes were the only insects we at all feared; they are about three or four inches in length, and creep in all directions in our tents."

On this day and night several French and British officers were wounded, and a considerable number of the working parties. Sickness also smote increased numbers.

From the 7th to the 14th of October the weather was unusually cold for the climate of the Crimea, except during a few hours in the day, when the sun shone fiercely; and the dews at night became increasingly injurious. It was difficult for the troops to obtain rest, so incessant was the firing from the fortress, and so frequent were the alarms of sorties. The author of *A Day in Camp* prettily describes this state of things thus:—"It certainly has a strange effect, to awake from some dream of England to midnight in camp; to stretch out one's hand in sleep against the dew-drenched canvas, and suddenly become conscious that you are on the czar's land without leave. It takes a moment or two to remember that the perfect stillness is not solitude; that the slumbering host around is encircled by hundreds of wakeful eyes; and that a single shot, a single cry, would send a shock of life through the whole mass!"

After the first fortnight, however, the roar of artillery did not disturb the sleepers. Our author refers to this fact:—"I have heard a general of division say, that while he sleeps easily through almost any amount of cannonading, the faintest report of a musket rouses him at once; for that indicates the approach of the enemy."

One of the best descriptions of life in the camp at this time has been afforded by a civilian, in a work entitled, *A Month in the Camp before Sebastopol*. Our readers cannot fail to be interested in this picture, drawn by one himself a participator in the incidents he portrays:—"Directly after sunrise the soldiers light their cigars, and chat over the night's work in cosy little groups, till the sun puts some warmth into them after the cold parade. After the *matinée fumante* comes breakfast; and then, equally a matter of course, a walk to the picket-house. No account of Crimean camp-life would be complete without mention of this much frequented lounge. It is a little ruin, appropriated, as its name imports, to one of the pickets, and is situated on the brow of the hill, two or three hundred yards in front

of the light division. Thence it commands view of Sebastopol to the left, and of the sea and fleets to the right. There is a courtyard round it, with a wall about four feet high behind which may perpetually be seen officers with double eyeglasses and telescopes directed towards the town. Sebastopol, seen from this point, is a handsome city, containing many substantial public works, constructed out of the light stone of the country. There are no walls, so the talk about 'breaching' is talk. But the place is defended on the south side by a round tower, a redan, and various earthworks. The masts of the *Twelve Apostles* are easily distinguishable. After spending the morning at the picket-house, those who have nothing better to do generally go, during the heat of the day, to their tents to read the newspapers. Of these we get a good supply, and, though they seem engrossed with what we are doing here, they often bring news. Much is said about the harm they do by conveying information to the enemy. When, however, one considers the enormous quantity of rumours in camp, that are affirmed one day, and contradicted the next, and the very few persons who can really know what is doing, and being projected, it is difficult not to believe that the estimate of the evil is exaggerated. The afternoon is always cool, and the best time for seeing the country and exploring the camp; so the day passes until dinner. There are no regimental messes here; but the officers club together in twos and threes. Everybody turns in by half-past nine. By ten the last fires have gone out, the last araba has screeched past with its load, and, but for the spectral tents that you see glimmering through the distance, as you lace up your doors for the night, you might believe yourself in the wilderness. Such is a general description of a day in camp; but yesterday the routine was broken by the impressive ceremony of an open-air church parade. Each division on these occasions has divine service performed by its own chaplain. Ours was drawn up on the rising ground, just beyond the tents, in a dense hollow square. The clergyman and officers occupied the centre. Every one was covered. Some of the men wore forage-caps, for lack of shakos; and on dit that the loss of these stiff and ugly varieties of head-gear is submitted to with great resignation by the line generally. The chaplain, with his dark velvet skull-cap, and black moustache and beard, reminding me of a foreign *padre* in canonicals. We were scarcely placed in position, before the loud rush of round-shot from the fort was heard, again and again, in our ears, causing sundry dislocations of the square, the men grinning and swaying about at each whizz in a kind of jocular disorder. Nothing was left for it but

to move off. So we took up our ground a few hundred yards lower down; and here, though a fleecy little cloudlet, which announced its birth in a thunder-clap, showed that a shell had burst above us, not very far off to our rear, the service was conducted to a close. Everybody, of course, stands upon these occasions, throughout the ceremony. To obviate fatigue, therefore, the Litany and Communion are omitted. The chaplain preached extemporaneously, and with so excellent a voice, that, though the wind was blowing his surplice about, it did not drown his tones. I was amused by his British *sang froid*. Half his congregation might perish round the walls of Sebastopol before next church parade—a theme which the threatening missiles exploding about would have served sufficiently well to enforce—but he utterly disdained such obvious rhetoric. Perhaps, indeed, it is considered undesirable to allude to subjects of the kind; and certainly they are too patent to need much insisting on. At any rate, the reverend gentleman neither noticed the pyrotechnics in his sound practical sermon, nor in his own person, but stood with his back to the fort, and preached on some everyday text, and never changed his voice, or turned his head, in compliment to shot or shell. Next day the division moved its quarters two or three hundred yards further from the enemy."

On the night of the 9th, thirty-three of the commissariat horses were found dead or disabled by the labour of the previous day, and the want of adequate transport was painfully felt in both armies.

An amusing incident occurred on the 11th, which did no credit to the Russian naval artillery, by which the forts commanding the harbour were garrisoned. This event has been variously described; but the most accurate and ample narrative of it is that by Emerson. "A scene occurred, in full observation of both armies, which showed abundantly the determination of the enemy to permit no opportunity of inflicting even the smallest damage to pass unimproved. An Austrian barque, on its way from Eupatoria to Balaklava, laden with hay for the use of the English commissariat, was driven by the current under the very walls of the forts, and within range of the guns. Heavily laden, she drifted slowly past, and the Russians opened a terrific fire upon her. At length she grounded, and then the enemy, imagining an easy victory over a merchant vessel without guns, and ashore on a reef, gallantly poured a hurricane of shot at her. So inaccurate, however, was their aim, that, out of 500 or 600 discharges, but four shots struck her. Seeing the state of affairs the *Beagle*, which had landed her only two guns, dashed fearlessly up to the rescue, fol-

lowed by the *Firebrand*, 6 guns. The *Beagle* took the barque in tow, and commenced hauling her off the reef. Then two Russian frigates steamed out of Sebastopol, and, at a safe distance, fired upon the two little steamers, one without any guns, and the other with six, and both within range of the forts. Nothing daunted, the gallant steamers brought their charge safely through the danger, the *Firebrand* being hit in four places, and the *Beagle* not at all. This brave exploit was universally voted one of the most brilliant feats yet performed by British sailors in the Black Sea."

An order from Lord Raglan, published at this time, animadverted strongly upon the conduct of the medical officers at Balaklava, who made no provisions for the sick sent down thither from the lines, many of whom died in the open street utterly unattended to. It does not appear that the exclusive blame rested with the medical officers. The chief medical authorities were neither zealous, humane, nor competent; some of the inferior surgeons followed their example in all these respects, while others manifested a noble professional enthusiasm and the highest patriotism and philanthropy. The commissariat and the department of the quartermaster-general were equally to blame for the deficiencies that existed where the sick were concerned. Lord Raglan could see faults in the medical or commissariat management, especially if complaints were made from the quartermaster-general: in the quartermaster-general's own arrangements, which were worse than either in neglect and obstinacy, the commander-in-chief saw nothing amiss.

Had Admiral Dundas shown activity and tenderness worthy of his high position, the sufferings of the sick might have been greatly mitigated; but almost every duty devolved upon his second in command, Sir E. Lyons, whose authority was but limited. It must be affirmed of the authorities generally, that their incapacity for organisation was as deplorable as their want of compassion for the soldiery. On the night of the 11th, a rumour prevailed in camp that the garrison would make a sortie, the relieving army at the same time attacking the flank and rear of the British, and the inhabitants of Balaklava setting fire to the place in the confusion of the general attack. These rumours were credited at head-quarters, for every preparation was made to resist the enemy, and the population of Balaklava was at once ordered out of the place. It was time to give such an order, for the male population had been all, or nearly all, in the Russian service as coast-guards, and being Greeks in race and religion, they were active spies of the Russian government. Their cunning and address in conveying information baffled detection, although they were suspected, and it was well known

that information to the enemy was constantly sent from Balaklava. After the Greeks were banished, circumstances transpired to confirm these views. They were allowed to take their property with them, and they took care to plunder the property of the army most extensively. The leniency with which the nest of Greek robbers at Balaklava was treated, was one of the weak points in the management of the British commander-in-chief, and of his *alter ego*, the active but not very wise quartermaster-general.

The report of a sortie was true enough, but it was discovered sooner than it otherwise would have been by an accident. Soon after dark the working parties were vigorously engaged upon the formation of the British right attack. Directions had been given that similar parties should be occupied upon the centre and left, but the sappers and miners, missing their way, wandered considerably in advance towards the Russian lines, and at last came suddenly upon the vanguard of the sortie; neither party expecting the encounter, both hesitated, but the Russian riflemen who composed the party were of course better prepared, being the advance-guard of an assailing column, and they opened fire upon our sappers quite close to them, but had not sufficiently recovered their presence of mind to make the fire effectual; not a man of our party fell. As the fire of the Russian advanced post increased, it showed by its flashes the battalions in its rear, and the sappers therefore hastily retreated, giving the alarm. Two divisions, those of General Evans and General Brown, immediately stood to their arms. The Russians advanced, their approach covered by a tremendous fire from their batteries. The covering parties of the British hastily and improperly retired; they did so, however, under a misapprehension of orders. A company of the Rifle Brigade did not retire, but preserved an obstinate contest with the approaching mass, firing into it, as was afterwards seen, with great effect. When the Russians approached so near the British lines that they could receive no aid from their guns in position, they pushed on fieldpieces, with which they opened a scattering fire of grape and canister. The reply of a few British fieldpieces was not very effective, but our musketry plied the approaching columns incessantly and destructively. Mr. Russell, in a brief paragraph, most happily and correctly describes the issue:—"The roar of shot and shell filled the air, mingled with the constant 'pingpinging' of rifle and musket-balls. All the camps went up. The French on our left got under arms, and the rattle of drums and the shrill blast of trumpets were heard amid the roar of cannon and small arms. For nearly half an hour this din lasted, till all of a sudden a ringing cheer

was audible on our right, rising through all the turmoil. It was the cheer of the 88th, and they were ordered to charge down the hill on their unseen enemy. It had its effect, for the Russians, already pounded by our guns and shaken by the fire of our infantry, as well as by the aspect of the whole hill-side lined with our battalions, turned and fled under the shelter of their guns. Their loss is not known; ours was very trifling. The sortie was completely foiled, and not an inch of our lines was injured, while the Four-gun Battery (the main object of their attack) was never closely approached at all. The alarm over, every one returned quietly to tent or bivouac."

On the 12th, the defensive works of Balaklava were completed, and Sir Colin Campbell appointed to the command. The British siege-train was divided into a left and right attack, and placed under the command of Lieutenant-colonel Gambier. The right attack was under the command of Lieutenant-colonel Dickson, Captain D'Aigular, and Captain Strange; the left attack was under the command of Majors Young, Irving, and Freese. From the 12th to the 16th each day repeated the events of the preceding. Day and night the Russians kept up an incessant fire, and they plied the mattock and the spade as indefatigably as their cannon; their entrenchments and earth-works assumed a formidable appearance; the Sebastopol, before which the allies took post after the conquest of Balaklava and the seizure of Kamiesch and Arrow Bay, was changed. Southern Sebastopol had grown as strong as the northern side of the harbour, and it became evident to all that a bloody struggle awaited the victors and the vanquished. Yet it is remarkable that neither from military correspondents nor civilians were there any severe strictures upon the generalship which allowed those mighty defences to grow up in the presence of a great army. Never before in the history of sieges has an army, flushed with recent victory, arrived before an open town, and instead of assaulting it and taking in reverse its batteries, erected only to repel an attack by sea, sat down before it, adopting regular siege approaches, when the only result of their doing so could be to give time to the enemy to erect in opposition to these approaches corresponding works. The parallels of besiegers are intended to enable an army to approach a beleaguered city protected by its batteries, but in this instance the besieged had no defences which could not be approached without cover, and taken by storm. All depended upon a bold and rapid movement, instead of which a regular siege was adopted, and not a cannon fired upon the enemy for three weeks, except a few fieldpieces used on the night of the 11th in repelling the sortie. Had it been the object

of the allied generals to save Sebastopol, by giving time to the enemy to erect defences, and then to attack them with an inferior artillery, the object could scarcely have been more certainly pursued.

Before noticing the events of the 16th and 17th, it is necessary to glance at the proceedings of the fleets. One of the duties which devolved upon them is thus described by an English naval authority:—"Four war-steamers of the allies, the *Inflexible*, *Sidon*, *Cacique*, and *Caton*, have been sent to the mouth of the Dnieper, in order to watch the march of the Russian troops coming to the help of the besieged in Sebastopol. They succeeded twice in compelling a considerable army corps to turn aside from their direct route—the first time at the height above Lake Dovynoskis, and the second time at Adlanjick. The Russians fired red-hot balls on these steamers at a distance of 5600 metres, but their projectiles did not kill any one. One ball went through the funnel of the *Sidon*."

On the 13th of October, the Admiralty wrote to Admiral Dundas, urging upon him such general directions during the progress of the siege as reveals the policy of the home government:—

*The Secretary to the Admiralty to
Vice-admiral Dundas.*

Admiralty, Oct. 13, 1854.

"SIR,—I am commanded by my Lords Commissioners of the Admiralty, with reference to the operations of the fleet under your orders, to call your special and particular attention to the necessity of exercising the utmost vigilance and care in preventing the movement of craft of all descriptions proceeding out of the Bay of Cherson and the river Dniester; and I am to signify their directions to you to take every precaution in your power to prevent communication with the Crimea from ports in that direction. My lords are further of opinion that, whenever the means at your disposal will admit, proper measures should be concerted with your colleagues in command of the allied forces for obtaining an entrance by the Gulf of Kertch into the Sea of Azoff, with a view to interrupt the communications of the enemy with the eastern shores of the Crimea, to which their lordships have always attached the greatest importance. In concert likewise with your colleagues, my lords consider that no opportunities should be lost to occupy the attention of the enemy, by frequent attacks upon all parts of the coast, extending from the mouths of the Danube to the Isthmus of Perekop, and that any proper opportunity for the bombardment of Odessa should not be omitted."

It so happened that, on the same day, the admiral addressed the Admiralty, giving an account of his operations since the occupation of Balaklava.

Britannia—off the Katcha, Oct. 13, 1854.

"SIR,—1. I beg you will acquaint the Lords Commissioners of the Admiralty that the allied armies are employed in erecting batteries to the south of Sebastopol, but I hear are much retarded by the rocky nature of the ground. The Russian fire of shot and shell, by day and night, has produced little or no effect. The naval and marine battalions are healthy, and there is less sickness in the army.

"2. Sir Edmund Lyons, in the *Agamemnon*, with the *Diamond*, and a squadron of steamers, is at Balaklava, assisting the troops. A French squadron, under Vice-admiral Bruat, is anchored between the lighthouse and the harbour, in communication with the left of the French army. A division of steam-vessels watches the mouth of the port constantly, where four or five Russian steam-vessels always have their steam up; and the large sailing vessels are with Admiral Hamelin and myself, anchored off the Katcha river, the weather having permitted our remaining in those positions.

"3. The *Sidon* and *Inflexible*, with *Cacique* and *Caton*, are still in Odessa Bay, to prevent any communication by sea with the Crimea, and I have sent a transport to them with coals and fresh provisions, which I have drawn from Sinope.

"4. On the 11th, an Austrian vessel laden with hay for the commissariat got within range of the batteries, and was deserted by her crew at the second shot; she ran on shore about 1500 yards south of the harbour-mouth, and was got off that evening and towed to Balaklava. I enclose the report of Captain Jones, of the *Sampson*, who, with Captain Stewart, of the *Firebrand*, and Mr. Boxer, second master in charge of the *Beagle*, assisted by the French launches of the in-shore squadron, got the Austrian to sea from under the batteries in a very successful and creditable manner. The *Firebrand* has four shots in her hull, but fortunately no casualties.

"5. I learnt from Captain King, of the *Leander*, of the approach of Eupatoria of a large Russian force near the town. I have sent the *Firebrand* and *Vesuvius* to assist in the defence, should it be attacked, and shall send two other vessels to-day.

"6. The French and Turkish troops sent for from Varna and Constantinople by the *Simoom*, *Vulcan*, *Cyclops*, and our transports, are hourly expected; they have been kept back and detained by the late strong north-east gales.

"I have, &c.,

"J. W. D. DUNDAS, *Vice-admiral*."

The Secretary of the Admiralty, &c., &c., &c.

Our readers will perceive that the government at home urged upon the admiral an attack upon Odessa, and as nothing was under-

taken against it, the public in England murmured. Mr. Sidney Herbert, after the dissolution of the Aberdeen government, obtained the permission of Lord Palmerston to produce this despatch of the 13th of October, and explained to the House of Commons the reason why Odessa was not attacked. From his statement it appeared that the allied generals were apprehensive the destruction of Odessa might free the Russian garrison there, which would march to the Crimea, and increase the difficulties of the allied armies. If this were the real reason, it is surprising that, long after any such apprehension must have passed away, nothing was done against Odessa. Besides, if that city were destroyed, the Russians would scarcely have left Bessarabia undefended against the Turks from the Danube, the allies from the sea, and possibly Austria from the Moldo-Wallachian provinces. The destruction of Odessa would rather facilitate the operations of the allies on the sea or the Danubian frontiers, and render the presence of Russian troops more necessary in that province; while it would destroy vast stores by which the Russian army in the Crimea received supplies, as much grain came from Odessa, by way of Perekop, to Sebastopol. If the allied generals ever used such a dissuasive to Admiral Dundas' hostile intentions against Odessa, it is only another instance of the folly which they so frequently perpetrated throughout the disastrous siege.

The operations of the fleets at Eupatoria and its neighbourhood were very useful. We have already narrated the manner in which some small naval and military detachments took possession of it before the landing at Old Fort. The occupation was found useful. The neighbourhood abounded in herds of cattle, and supplies of provisions of various sorts; these the Tartar inhabitants freely brought to market when they became assured of the friendly disposition of the allies, and the governor was enabled to send supplies of fresh provisions both to Balaklava and Kamiesch. The Russians, perceiving this, resolved to capture it; but certain Tartars informing Captain Brock of their intentions, he prepared opportunely for the contest. He informed Admiral Dundas of the menaced danger, who placed the *Leander*, *Firebrand*, and *Megara* off the port. The French and Turkish admirals sent each an equal force. The whole of these ships were ready either to operate along the coast, or land their seamen and marines, as circumstances might dictate. Contemporaneous with the sortie at Sebastopol, and the advance of a corps towards the British flank and rear there, on the 11th, the Russians appeared before Eupatoria. Lieutenant Hamilton was sent on shore with about 150 seamen and marines, and

one fieldpiece. At the back of the town a redoubt was thrown up, a precaution which our readers may see, by consulting a map of the Crimea, was necessary, and the fieldpiece on the redoubt. Captain Brock, attended by a party which he deemed adequate for the purpose, advanced upon the steppe for a reconnaissance, where he saw a large body of Russian cavalry, at least 600 in number, who opening their ranks, displayed four fieldpieces, which immediately directed their fire upon the British. The first shell from the British fieldpiece fell among the cavalry, exploding before it touched the ground, and scattering men and horses with astonishing destruction. Seldom has a single shell sent so much death and disaster among a body of troops. Captain Brock wisely declined continuing the combat, falling back into the town, and withdrawing the fieldpiece and the sailors from the redoubt. A reinforcement of British sailors promptly re-entered it; replacing the gun, they maintained the position all night. About three o'clock in the morning the Russians stealthily approached, and so noiselessly that there was some chance of their effecting a surprise; but Lord E. Cecil, a midshipman of the *Leander*, had charge of the gun; gifted with excellent sight, and vigilantly on the *qui vive*, he perceived in the dim distance the shadowy forms of the Russians furtively making their way towards the redoubt, and opened fire upon them at the critical moment: so well was that fire directed, that the ball tore through the compact mass of the advancing body, leaving a line of dead and wounded in its track. The sailors quickly lined the redoubt, and hailed the enemy with a cheer, which was returned with a volley; the tars were not slow to respond after the same fashion. The enemy's fieldpieces threw shells, which burst near and around the redoubt; and for hours the fight continued, the assailants having greatly the advantage as to the number of shots, the British as to the mischief inflicted. As dawned the aim of the British became clearer: the single fieldpiece was worked in a masterly manner, and the Muscovites, finding their attempt hopeless, and their loss considerable, withdrew. As the morning advanced, Lieutenant Pym of the *Firebrand* landed with a fresh detachment of marines and tars, another fieldpiece, and a rocket tube. A second redoubt was then constructed, and the first was put into a better state of defence. These precautions were not unnecessary, for on the 15th the enemy returned. They burned several villages to the north of Eupatoria, and made booty of the cattle of their fellow-subjects, the Tartars. They did not effect such destruction with impunity, for the *Leander* and *Firebrand* steamed along shore, throwing shot and shell

upon the moving columns of the enemy. In the execution of this service the steamers were readily assisted by the *Arrow*, a gun-boat armed with a single gun: enabled, by drawing little water, to get near shore, she could make better aim, and throw her shot with much precision among the Russians, as to compel their speedy retreat to a distance beyond her range. The enemy retired out of sight of the garrison and the squadrons before evening, and attempted nothing more for some days after the bombardment of Sebastopol.

It was at last arranged that the bombardment of Sebastopol should open on the 16th; but some delay arose from the necessity of placing some heavier guns on the French position, their batteries being deficient in weight of metal; and this circumstance deferred the long expected opening of the allied fire until the next day. On the evening of the 16th it was, however, finally determined that the whole ruin of siege guns should open; and Lord Raglan having, with Generals Burgoyne and Airey, reconnoitred the whole line, issued the following notification to his chief officers:—

October 16th, 1854.

Memorandum for generals of division, the commanding officer of artillery, the commanding officer of engineers.

The fire upon Sebastopol will commence to-morrow morning, about half-past six o'clock, from the French batteries, in co-operation with the combined English batteries. The precise moment of opening the fire, however, will be indicated by the successive discharge of three mortars from the centre of the works of the French army. The troops off duty will remain in their respective camps, ready to fall in at a moment's notice, without their knapsacks, great-coats, or blankets. The horses will be attached to the field batteries.

There will be with each division parties of sappers, consisting of twenty men and an officer of engineers, ready to carry picks and shovels, crowbars and sledges, bags of powder prepared, felling axes, and scaling ladders. Each division will also have with it a detachment of twenty artillerymen, under an officer of artillery, with sockets and spikes for guns (the latter are only to be used in the event of the troops having to retire from a battery). The arrangements for the collecting of the several articles above enumerated will be carried out by the officer of engineers and the officer of artillery.

The generals of divisions will make every arrangement for the ready communication of the troops with the reserve ammunition, which, however, need not be placed upon the lines until ordered.

Previously to the opening of the fire, all advanced pickets, with the exception of the men selected to fire in the embrasures, will be withdrawn under the direction of the general officer on duty in the trenches, and retire under cover to their respective camps.

The covering parties in the trenches will be kept clear of the batteries; and such of them as cannot find cover in the trenches will be moved to such positions in the rear (the flank as will ensure their being at hand to protect the batteries, whilst they will be themselves screened from the enemy's fire. These covering parties will be moved as the commanding officer of the party may see occasion, in consequence of the fire of the enemy. When the whole trench is occupied by guns, the covering parties must be placed, as above stated, under adequate cover in the immediate neighbourhood.

The working parties will remain in the trenches, or be

withdrawn, according to the discretion of the commanding engineer.

As it is probable that the field batteries may be required to move, the senior artillery officer of the division, and the officer commanding each battery, will make themselves acquainted with the communications to their right and left.

The cavalry, under Lieutenant-general the Earl of Lucan, and the troops of all arms, under Major-general Sir C. Campbell, British and Turkish, posted for the defence of Balaklava, will be held in readiness throughout the day, to act on the shortest notice.

The meat for the men's dinner will be cooked as early as possible to-morrow morning, in case of the army having to move forward.

In the event of an advance, the commander of the forces particularly requests the general officers commanding divisions and brigades, the commanding officers of regiments, and the officers commanding companies, to impress upon the men the urgent necessity of maintaining their formation and keeping their order. The success of any operation they may be called upon to undertake, their honour, and, indeed, their own individual safety, depend upon their being under complete control, ready to repel any attack, or to overcome any resistance that may be opposed to them.

Lord Raglan will be at the quarries in front of the third division (Sir Richard England's); General Canrobert at the Maison d'Eau, on the left of the British line, and on the right of the French position.

RAGLAN.

This order was received by the divisional authorities with satisfaction, which was speedily communicated to the troops, as the tidings circulated from the brigade staffs through the regiments. Bustle and excitement prevailed throughout the camp; and perhaps there was not a soldier who did not look forward to the morrow with heart-thrilling expectation. Sleep was banished from the eyes of even many a weary soldier; and it was remarked that men who often served in the trenches under the severest fire of the enemy, and met all forms of danger with the most perfect *sang froid*, were so filled with satisfaction at the thought of being able at last to return the fire of the Russians, that they could not compose themselves to rest. It was one of those clear bright nights so common to that climate in autumn; scarcely a breath of wind stirred, and, notwithstanding the heavy dews, there was a balmy softness in the air which dispelled the chilliness; this added to the numbers who were unwilling to seek slumber, and watched for the morning when the first fire of the allied artillery should roll over the contested lines. The dawn of the 17th of October saw few sleepers in the British camp. The Russians had received incorrect information as to the state of the trenches and batteries, and were not prepared for the bombardment on that morning, nevertheless, with their usual activity, they were at work by daybreak, and opened fire upon the allies at least half an hour before the signal was given for the latter to commence their cannonade. This circumstance was unfavourable to the assailants, as it covered the Russian earthworks with smoke, rendering it difficult to get the range of their batteries. The city

and camps were also covered with a heavy mist, such as during October and November generally attends the breaking of morning in the Crimea. There was not wind sufficient to disperse it, and the mist hung heavily over the great amphitheatre within which the terrible preparations of war were making. The smoke of the Russian batteries did not rise upon the atmosphere, but rested in dense folds above them, or sluggishly moved towards the British lines. The allies were not ready at the hour agreed upon—hardly any of the British mortars were in position; and when the fire from the English batteries opened, some of the heavy guns were being dragged up to the trenches. The French were even less prepared than the British; and the delay in opening the cannonade was chiefly attributable to them. The signal agreed upon by the chiefs was the firing of three mortars from the French right attack; but the signal was so imperfectly given, that several seconds elapsed between the opening of one battery and another; and perhaps two minutes elapsed after the shells went up before the last of the English batteries came into play. The first cannon-shot from the allies was fired by the Sailors' Battery, who thus had the honour of opening the bombardment. A loud cheer burst from the English lines, which was caught up by the French right, and was carried along to their extreme left. Yet perhaps this was not the most exciting moment to the British: several officers relate that at early dawn, when the batteries were unmasked, and the muzzles of our guns were revealed to friends and foes, was the moment when all felt most the imposing character of the scene.

At the instant of opening the bombardment crowds of British officers and men not actually engaged occupied the best positions for watching the event. This was especially the case on the picket-house hill, whence the grand staff of the British army looked upon the struggle. Lord Raglan, Sir George Brown, and the Duke of Cambridge, remained at that spot the greater portion of the day, observing with their glasses the various phases of the engagement. The first officer who arrived at the Picket-house that morning was his royal highness, who seemed throughout the day to be the most anxious and earnest spectator. The group of distinguished men occupying that point of observation was not free from danger. Before their own guns had opened, the shot from the enemy's batteries found their way thither. The peril increased as the bombardment caused the Russian fire to become more intense. While the duke and Sir George were talking behind a low wall, against which they were leaning, and over which they were looking, a round-shot fell upon it between them (they were standing some little distance apart to secure good points

of observation). The missile bounded between the building and the side of the court, and rolled against the back of the former. Another shot was seen approaching, and the staff showed the usual courtesy to messengers from an enemy, but it fell short. In the evening there were many cannon-balls lying in front of the Picket-house, which the enemy had failed to send quite far enough to do mischief.

The opening of the bombardment was irregular, after which the guns of each battery were fired as fast as the men could work them; and although the Russians were not so masters of artillery as the allies, yet they worked their guns fast and well. The Russian batteries were manned chiefly by sailors, who are better gunners than those of the army; they are also represented by Russian writers as a stouter and smarter class of men, and so proved to be the case on the 17th of October at Sebastopol. The guns of the English marine battery were the best served on the side of the allies; the rapidity and precision of fire were truly astonishing, and the injury inflicted upon the foe was proportionate. Our gallant troops, by their activity, effectiveness, and fearless exposure, brought down upon themselves the heaviest fire from the hostile trenches, and the loss was in proportion severer than in any other battery of the British attack.

From the commencement of the cannonade until darkness closed upon the combatants, the fierce battle of artillery was incessantly waged by land with very short intervals. The attack from the sea began much later in the day, but it also continued until night put an end to further conflict.

Before entering into the detail of either the land or sea operations, we shall present the despatches of the allied generals and admirals. It is customary in narrating battles to relate first the details of the conflict, and then to give the despatches: we are of opinion that such a plan is only occasionally proper. Despatches give a general view of the action fought, and sometimes they enter somewhat minutely into detail. When only a general view is given, despatches are the proper texts for the historian, in dealing with the various movements and features of the army to which they relate, and ought to precede his narrative. If there be much minuteness of detail, it is a mere repetition of the historian's story if they follow; whereas, if they precede it, time and space are saved both to author and reader, as the former will then aim rather to supply the deficiencies and omissions of the official document. Frequently a general-in-chief is himself ignorant, immediately after a battle, when a despatch is written, of the deeds of heroes in which particular corps or individuals have distinguished, and even of the consequences to the

general results of particular achievements in parts of the field of action beyond his presence or supervision. He himself learns afterwards, from the same sources as those upon which the historian draws, what was done or attempted by his army or his enemy in various departments of the hostile operations.

The first intelligence of the opening of the bombardment reached England through the despatch of General Canrobert, then Admiral Hamelin's was published; the British admiral's despatch arrived after that of the French admiral; but the public took no interest in it after perusing the more copious information and more pleasing relation of the French naval chief. Long after every other medium of information was exhausted, Lord Raglan's despatch arrived. Having come *via* France, it was lost *en route*. When it did come, it added nothing to the information previously possessed. We give these documents in the order of their arrival.

FROM GENERAL CANROBERT

MONSIEUR LE MARÉCHAL,—Yesterday, at sunrise, we opened our fire in concert with the English army. Matters were going on well, when the explosion of a battery powder magazine, unfortunately of considerable size, somewhat disturbed our attack. This explosion produced the greater effect from the number of the batteries in proximity to the spot where it occurred. The enemy took advantage of this incident to increase his fire, and the general in command of the artillery agreed with me, that we were under the necessity of suspending our fire in order to make our repairs, as well as to complete the system of attack towards our right by the construction of new batteries to approach those of the English army. This delay is certainly much to be regretted, but we are compelled to submit to it, and I am making every arrangement necessary for shortening it as much as possible.

Sebastopol has sustained the fire far better than was expected; the enclosed space, throughout its enormous development in a straight line, carrying all it can hold of heavy sea-guns, renders it capable of prolonging the contest. On the 17th, our troops took possession of the plateau that faces the point of attack, called the Bastion of the Mat; they now occupy it. This evening we shall construct there the mask of a 12-gun battery, and, if possible, that of a second battery, on the extreme right, above the ravine. All our means of attack are concentrated on this bastion, and we shall, I trust, dismantle it rapidly, with the assistance of the English batteries that are battering its left front.

Yesterday, about ten in the morning, the allied fleets attacked the outer batteries of the place, but I have not yet received information that will enable me to give you an account of the results of this attack.

The English batteries are in the best possible state: they have received nine new mortars, which will, it is supposed, produce great effect. Yesterday there was an immense explosion in the battery surrounding the tower situate to the left of the place. It must have injured the enemy a great deal. Since then this battery has fired but little, and this morning there were only two or three pieces able to fire.

I have no precise news of the Russian army. Nothing tends to show that it has changed the positions it held, and in which it expected its reinforcements. I have received almost the whole of the reinforcements I expected in infantry from Gallipoli and Varna. General Levaillant has just arrived with his staff, which raises to five divisions the effective force in infantry of the army that I have here under my orders. The sanitary state is highly satisfactory, the spirits of the troops excellent, and we are all of confidence.

CANROBERT.

FROM VICE-ADMIRAL HAMELIN.

Ville de Paris—off Katcha, Oct. 18, 1854.

MONSIEUR LE MINISTRE,—In my letter of October 13th I announced to your excellency that I was going, with all my staff, on board the *Mogador* frigate, in order to come to anchor as near as possible to the head-quarters of the French army, and plan in common with the general-in-chief a combined attack on Sebastopol by our land and naval forces. On the 14th, I had accordingly an interview with General Canrobert, whose views are in conformity with mine. On the 15th, the admirals of the allied squadrons met on board the *Mogador*, and the arrangements for a general attack were made by common consent, thereupon submitted to the generals of the land army, and most readily accepted by them.

This general attack was fixed for the 17th, the day on which the siege batteries were to open their fire. As far as the squadrons were concerned, it was to be effected in the manner following:—The French squadron engaged to approach the southern breakers, to take up its position at about seven cables' lengths from the 350 guns of the Quarantine Battery, with the two batteries of Fort Alexander, and with the Artillery Battery. The English squadron had to attack, on the skirts of the northern breakers, nearly at the same distance, the 130 guns of the Constantine Battery, that of the Telegraph, and the Maximilian Tower of the north. If, then, your excellency supposes a line traced along the entrance of Sebastopol, from east to west, this line will intersect the attacking position that devolved on each squadron. The Turkish admiral, with two ships, the only ones he had for the moment within reach, was to anchor north of the two French lines; that is to say, in an intermediate position between the English and the French ships.

On the morning of the 17th the attack by the siege batteries commenced; but it was a calm, and it was necessary to tow the ships by steam-frigates before the line of twenty-six ships belonging to the allied squadrons could be extended before Sebastopol. But notwithstanding this difficulty, and the dislocated condition of the French squadron, part of its ships being anchored at Kamiesch, and part before Katcha, I have the satisfaction of announcing to your excellency that the ships of our first line advanced about half-past twelve at noon, under the fire of the Sebastopol batteries, which they confronted the first for more than half an hour without replying to it. A few moments after they answered to this fire warmly with their broadsides, but did little execution on account of their small numbers. Subsequently the other French and English vessels arrived in succession, and the attack became general. About half-past two the fire of the Russian batteries slackened: it was silenced at the Quarantine Battery. This was the object the French squadron had particularly in view; but our fire was redoubled, and lasted without interruption until night.

At the moment I am writing to your excellency I am still ignorant of the success obtained by our siege batteries, whose fire began before ours, and which cannonaded the Russian fortifications on the land side.

If the Russians had not blocked up the entrance to Sebastopol by sinking their five ships and two frigates, I have no doubt that the ships of the squadron, after a trial of the first fire, might have entered the passes successfully, have reached the bottom of the harbour, and put itself in communication with the army. They would not perhaps have lost many more than we have now to regret; but the extreme measure adopted by the enemy, in sacrificing a part of his ships, obliged us to limit ourselves to fighting for five hours against the sea batteries of Sebastopol, with the view of succeeding in silencing them for a greater or less period, in occupying a great many of the gunners in Sebastopol, and in thus lending both a material and moral assistance to our army.

To-day, the 18th, I have only time to give your excellency in haste a general sketch of this affair, which in my opinion reflects high honour on the French navy. I join to this sketch a list of the names of the men killed and wounded on board each vessel; I shall shortly send to you a detailed report of all the phases of the attack, and of the more or less active part taken by each vessel.

At the commencement of the affair the enthusiasm was extreme; during the combat the tenacity of each man

was not less so. Before opening fire I had signalled to the squadron, "France is looking on you"—a signal that was received amid the cries of "*Vive l'Empereur!*"

I am, with profound respect, M. le Ministre, &c.

HAMELIN.

FROM VICE-ADMIRAL DUNDAS.

Britannia—off the Katcha, Oct. 18, 1854.

SIR,—1. I beg you will acquaint the Lords Commissioners of the Admiralty that the siege batteries of the allied armies opened fire upon the Russian works, south of Sebastopol, about half-past six o'clock yesterday morning, with great effect and small loss.

2. In consequence of the most urgent request of Lord Raglan and General Canrobert, it was agreed by the admirals of the allied fleets that the whole of the ships should assist the land attack by engaging the sea batteries north and south of the harbour, on a line across the port, as shown in the accompanying plan, but various circumstances rendered a change in the position of the ships necessary and unavoidable.

3. The *Agamemnon*, *Sanspareil*, *Sampson*, *Tribune*, *Terrible*, *Sphinx*, and *Lynx*, and *Albion*, *London*, and *Arethusa*, towed by the *Firebrand*, *Niger*, and *Triton*, engaged Fort Constantine and the batteries to the northward; while the *Queen*, *Britannia*, *Trafalgar*, *Vengeance*, *Rodney*, *Bellerophon*, with *Vesuvius*, *Furious*, *Retribution*, *Highflyer*, *Spitfire*, *Spitful*, and *Cyclops*, lashed on the port side of the several ships, gradually took up their positions, as nearly as possible as marked on the plan.

4. The action lasted from about half-past one to half-past six, P.M., when, being dark, the ships hauled off.

5. The loss sustained by the Russians, and the damage done to Fort Constantine and batteries, cannot, of course, as yet be correctly ascertained.

6. An action of this duration against such formidable and well-armed works could not be maintained without serious injury; and I have to regret the loss of forty-four killed, and 266 wounded, as detailed in the accompanying lists. The ships, masts, yards, and rigging, are more or less damaged, principally by shells and hot shot. The *Albion* has suffered much in hull and masts; the *Rodney* in her masts, she having tailed on the reef, from which she was got off by the great exertions of Commander Kynaston, of the *Spitful*, whose crew and vessel were necessarily exposed in performing this service; but, with the exception of the *Albion* and *Arethusa*, which ships I send to Constantinople to be repaired, I hope to be able to make my squadron serviceable in twenty-four hours. Foreseeing from the nature of the attack that we should be likely to lose spars, I left the spare topmasts and yards on board her majesty's ship *Vulcan* at this anchorage, where I had placed her with all the sick and prisoners.

7. I have now the pleasure of recording my very great satisfaction with the ability and zeal displayed by Rear-admirals Sir Edmund Lyons and the Hon. Montagu Stopford, and all the captains under my command, as well as my sincere thanks to them, and to the officers, seamen, and marines employed, for their unremitting exertions, and the rapidity of their fire, in the absence of a large number of the crews of each ship, who were landed to assist in working the siege batteries, &c., on shore, and to this circumstance I attribute the small loss of killed and wounded.

8. The gallant and skilful conduct of our French allies in this action was witnessed by me with admiration, and I hear with regret that they have also suffered considerable loss.

9. I beg to express my gratitude at the manner in which Ahmed Pasha, the Turkish admiral, did his duty.

I have, &c.,

J. W. D. DUNDAS, Vice-admiral.

The Secretary of the Admiralty, &c.

FROM GENERAL THE LORD RAGLAN, G.C.B.

[This despatch was lost in its passage through France but was ultimately received by his Grace the Duke of Newcastle, to whom it was transmitted by his Excellency the Lord Cowley, G.C.B.]

Before Sebastopol, Oct. 18, 1854.

MY LORD DUKE,—It was arranged between General Canrobert and myself that the batteries of the two armies should open immediately after daylight on the morning of the 17th, and we invited Admiral Dundas and Admiral Hamelin to attack the enemy's works at the mouth of the harbour with the combined fleets, as nearly simultaneously as circumstances might permit. Accordingly, upon a signal being given from the centre of the French lines the batteries of the two armies commenced their fire about a quarter before seven yesterday morning. On this occasion we employed about sixty guns of different calibres the lightest being 24-pounders.

It may here be proper to observe that the character of the position which the enemy occupied on the south side of Sebastopol is not that of a fortress, but rather of an army in an entrenched camp on very strong ground, where an apparently unlimited number of heavy guns amply provided with gunners and ammunition, are mounted.

The guns having opened, as above stated, a continuous and well-directed fire was carried on from the works of the two armies until about ten o'clock, A.M., when, unfortunately, a magazine in the midst of one of the French batteries exploded, and occasioned considerable damage to the works, and I fear many casualties, and almost paralysed the efforts of the French artillery for the day. The British batteries, however, manned by sailors from the fleet, under the command of Captain Lushington and Captain Peel, and by the Royal Artillery, under the superintendence of Lieutenant-colonel Gambier, kept up their fire with unremitting energy throughout the day to my own and the general satisfaction, as well as to the admiration of the French army, who were witnesses of their gallant and persevering exertions, materially injuring the enemy's works, and silencing the heavy guns on the top of the loop-holed tower, to which I adverted in my despatch of the 13th instant, and many of the guns at its base, and causing an extensive explosion in the rear of a strong redoubt in our immediate front; the enemy, notwithstanding, answered to the last from a number of guns along their more extended line.

The fire was resumed this morning at daylight by the British sailors and artillery, and responded to, though in a somewhat less degree, by the Russians; but the French troops, being occupied in the repair of their batteries, and in the formation of others, have not contributed to the renewal of the attack, except from a work on their extreme left; they expect, however, to be able to do so tomorrow morning.

I beg to lay before your grace a return of the loss sustained by the royal navy, and the army under my command, between the 13th and 17th instant, and to this I am deeply concerned to add that of Colonel the Honourable Francis Hood, commanding the 3rd battalion Grenadier Guards, an excellent officer, whose death in the trenches this morning has just been reported to me.

The English, French, and Turkish fleets moved towards the mouth of the harbour about noon, and kept up a heavy fire upon the enemy's forts for several hours. I am not fully acquainted with the details of the attack, or its result, but I understand that Rear-admiral Sir Edmund Lyons, with the *Agamemnon* and *Sanspareil*, assisted occasionally by the *London*, *Queen*, and *Albion*, gallantly approached to within 600 yards of Fort Constantine, the great work at the northern entrance, where he maintained himself till late in the afternoon, and succeeded in exploding a magazine, and causing considerable injury to the face of the fort.

Since I wrote to your grace on the 18th, six battalions of Turkish infantry and 300 Turkish artillery have been added to the force in front of Balaklava. These troops have been sent from Constantinople, and placed under my command by the government of the Porte, and I feel greatly indebted to her majesty's ambassador, Viscount Stratford de Redcliffe, for the ability and energy with

which he brought under the notice of the Sultan the importance I attached to an immediate reinforcement of the imperial troops.

I have, &c.,

His Grace the Duke of Newcastle, &c.

RAGLAN.

In the foregoing despatches a general outline of the events of the day may be traced; the issue is distinctly made known. It will be observed that the defence was greatly superior to the attack, both in the number and calibre of the guns. This was more especially the case on the French lines, where the small brass guns of our ally were no match for the ponderous cannon of the foe. From half-past six until half-past eight the battle raged with perfect fury. The men on both sides were fresh, and evidently stood to their guns *con amore*. The scene during these two hours, as witnessed from the Picket-house, was well described by a civilian who mingled with the generals and staff assembled there. This gentleman, not being connected with any portion of the press as a correspondent, had no desire to describe events so as to produce excitement or amazement in the reader; he wrote simply conveying the impression produced on his own mind, and for the purposes of private friendship:—"A quarter of an hour before the time of opening the bombardment, I found myself in the court of the Picket-house, among a little crowd of generals and staff-officers, who were all levelling their glasses at the town, in anxious expectation of the spectacle. But already the smoke of the Russian batteries had so enveloped the whole place, that little was to be seen except the Round Tower, which stands somewhat in advance of the other works, and to the British right. Somehow or other, the appointed signal was not made to time; so the Seaman's Battery opened the ball. In a few seconds, another battery followed, and before half a minute, a long irregular line of jets of smoke had made the position of the British trenches no more a secret to any one. Amidst the general din—which, however, was not overpowering, as nobody had to raise his voice in talking—the rush of the shot from the Lancaster guns through the air was distinctly audible. Its resemblance to the panting sound of a railway engine in motion became at once the subject of remark. As some Paddy observed, 'it was the noise of an express-train that stopped at no intermediate stations!' The Round Tower was apparently the principal object of the new projectile. Indeed, most of the batteries seemed to have selected that unhappy edifice for their mark. To the spectators at the Picket-house, no arrangement could have been more agreeable, as the smoke prevented us from easily discerning any other target. For some time the shots fell a little short, but at length a 68-pounder from the Seaman's Battery hit it full, and made a gap that could

be seen with the naked eye. The tower was soon scarred all over, but the men inside it stood pluckily to their guns, despite the heavy odds against them, for about an hour, when it was silenced; and the bombardment thenceforward became all smoke and noise."

About eight o'clock it was evident that the French batteries could not contend against the overwhelming odds opposed to them. On the extreme of their right attack (nearest to the English) they were enfiladed by the Russian guns, and for half an hour the French fire rapidly sank in that direction, and slackened along their whole line, until it became obvious that the French must soon be completely beaten. It was not until the Russian batteries replied to the bombardment that the full extent of the earthworks of the defence, nor the tremendous weight of metal by which those works were surmounted, was perceived by the assailants. The British were prepared for this; heavy guns from the fleet opposed the ship-guns which the Russians had mounted upon their batteries; but the French did not remove from their fleet any very large cannon, and seemed to rely more on the practice than on the weight of metal. General Canrobert in his despatch states that the works of the city held out better than was expected; but how the general, or his engineer, or artillery staff, could have supposed that forty-six guns, the largest of which were only 24-pounders, could silence the huge earthworks which 25,000 men had been labouring three weeks to raise, is inconceivable. It might have been far more consistently said by the general, that the French attack held out better than could have been expected.

At half-past eight the fire became slow on both sides, as if by common consent. Some of the British and their opponents snatched a little refreshment during the pause, but the French had to toil with desperate perseverance in repairing their shattered works, or replacing their dismounted guns. The comparative quiet did not last long. At a quarter to nine the British sailors "powdered away" with renewed energy, and appeared to communicate that energy to friends and foes, for the flash and thunder were seen and heard again from every embrasure where a gun was still pointed. Scarcely had the fire been renewed when the French magazine on the extreme right battery of twelve guns exploded, killing and wounding, according to the French official report, fifty men, but in reality twice the number were placed *hors de combat*. The report was like a clap of thunder bursting immediately above the head, and causing the earth to vibrate. The British supposed that the explosion took place in the city, in some magazine immediately in the rear of the Rus-

sian trenches, and uttered a loud burst of cheering, the sailors leaping upon the parapets and waving their hats. It soon became obvious that there was no cause for exultation, and the tars set to work with increased energy to avenge the catastrophe which had befallen their allies. Within an hour of the explosion the French batteries were nearly exhausted, and after ten o'clock they only fired a gun now and then. It was observed that these occasional shots told with a precision from which the Russians always suffered, and sometimes most severely.

The battle, however, did not abate when victory declared itself so signally on the right of the defence; the British maintained the combat with great strength, indomitable courage, and a skill that did honour to the officers and men upon whom the terrible responsibility of the occasion devolved. Fiercer and fiercer still the battle raged, loud thunders seemed to leap from trench to trench, and the valley between the blazing heights seemed as if uttering groans of suffering beneath the struggle. The principal force of the Russians was now directed against the British; the men crowding from the batteries opposite to the French to relieve or assist those opposed to the English. In vain did the Russians put forth all their strength, skill, and courage; the English works were so solidly constructed that they resisted to an astonishing degree the weight of shot, and the expulsive force of shell, which fell upon them. The heavy English guns replied with terrible effect against those of Russia, scattering earthworks, smashing embrasures, dismantling cannon, and inflicting fearful slaughter. These enormous guns were worked with ease, especially by the sailors, whose perfect management of heavy cannon was the admiration of the military staff and soldiery. Shortly after the French were silenced a wind sprang up from the south, and driving the smoke beyond the contending lines over the city, the nature of the mighty conflict was revealed. With the exception of the 16-gun battery, the French trenches and works lay in piles of rubbish and hopeless ruin, here and there a gun or larger portion of a battery resting upon the wreck, and bravely attended by the gunners and those who served them. As the great curtain of smoke and mist went up, the English attack was clearly seen, little injured, and the men and officers displaying an energy that seemed superhuman. Still onward rolled the voluminous folds of smoke, disclosing the Russian defences, and bringing out every object into the clear light of the October sun. Entrenchment, redoubt, and battlement vomited fire in incessant flashes, the smoke rising and rolling away cityward and seaward, as fast as it gushed from the bellowing mouths

of the restless guns. The shot and shell of the English were telling fearfully; masses of earth would fly up like the gushing smoke, and then falling, show the deep rent in the works from which these masses were scattered; guns and carriages lay dispersed and broken, and the dead were many; but as fast as men fell, material yielded to the ponderous shock of the English artillery, other men took their places, and fresh guns were lifted with prodigious labour upon the broken embrasures.

As the wind swept over the Russian position it in some respects interfered with their command of the range, and relieved the English from the blinding collection of clouds of smoke over their own batteries, which in the morning impeded them so much, compelling them to fire by the line rather than by a distinct perception of the object at which they desired to aim. Glimpses could be caught also of the fleets hastening to the assistance of the land batteries,—aid which had been expected long before; but it was not until the French had almost ceased to discharge a gun, and the British were six hours engaged in the severest artillery battle upon record, that the fleet discharged a single shot. Had the ships begun the combat at the same time, it would have occupied the whole garrison, and caused such fatigue and loss as would have prevented the batteries opposed to the English from being so promptly fed and handled. This was not the first time in the war that the fleets disappointed every reasonable expectation: the fault was not with the brave men by which it was manned, but in the command.

Although the silencing of the French batteries enabled the Russians to concentrate their fire to a great extent upon those of the British they took care to pour a steady vertical fire upon the French, in order to cause as much destruction of life as possible in the trenches. The battle raged by sea and land after half past one; but only an occasional gun spoke from the French lines in reply to the constant shelling of the Russians. Before two o'clock it was the misfortune of our allies again to suffer from an explosion. One of the Russian shells fell into the reserve magazine of the principal battery, which instantly blew up, shaking the earth for a great distance around it, and filling the air with concussions which were felt over the whole camp. Twenty tons of powder were at once ignited; this battery, which had best resisted the shot of the enemy, was now completely demolished; the cannon, the heavies in the French trenches, were blown to a distance; the works scattered like the rubbish of a fallen building; and men and arms were cast up high into the air. Shells and rockets were blown in every direction, exploding amidst the troops; cannon balls were hurled to the rear

along the trenches, and over the ravine into the English left attack. The demolition was complete, and General Canrobert ordered the men to give up all attempts to replace the guns, or in any way answer the fire of the enemy. As the shock of the explosion reached the Russians, they paused a moment, and looked where the air, still lurid, showed the spot upon which the vast destruction had so suddenly taken place. A loud cheer burst from them, and ran again and again along their lines. The British, deprived of all support from their allies, began to suffer, not so much in loss of men, but their batteries were torn, and a number of their guns dismounted—one of the huge Lancasters was entirely disabled. Still there was no remission in the skill, obstinacy, or power of the English attack. The works about the Russian Round Tower (which had been silenced earlier in the day), although much battered, still maintained a galling fire, from which the British trenches experienced great injury; but every stroke from the English batteries smote heavily upon those of the enemy, and the scream of the remaining Lancaster gun could be heard above all the uproar, and the course of its terrible messengers traced by the peculiar sound until the ball struck, shattering everything which stood in its course—earth, stone, metal, all were swept away by this formidable engine of destruction. The aim of the Lancasters was very uncertain, and it was difficult to handle them, the men also conceived a prejudice against them; but where the oval ball from this weapon hit, everything went down before it with a destruction such as no other missile dealt forth. The enemy, finding it impossible to silence the English guns, which were worked with nearly the same energy as seven hours before, and as if the men who served them could never tire, prepared red-hot shot, in the hope of firing the English magazines. The subjugation of the French attack by exploding their magazines, encouraged the hope of a similar success against the English. At first there was reason to believe that their hopes would not be disappointed. A red-hot shot fell into a large ammunition waggon, heavily loaded with powder, which of course blew up instantly with a loud report. The powder having been uncovered and loosely loaded, exploded with comparatively little mischief; some men of the waggon train were killed, and a driver wounded, no other injury ensued. The Russians, supposing the loud report to proceed from a magazine, raised a loud shout, and expected to see a battery blown to pieces. Their disappointment was vexatious when they were unable to perceive any effect from the explosion; and their exultation was not merely followed by disappointment, but also by alarm and lamentation,

for scarcely had their cheer died away, and chagrin supervened, when a terrible explosion occurred in the largest magazine behind their lines. A shot from the Lancaster gun, it was supposed, lodged in it, and fired the vast store of ammunition it contained. This magazine was connected with a redoubt in front of the Redan wall, which the explosion rent, revealing a wide chasm, when the ruins of the redoubt, of guns, and other material, fell from the elevation to which they were cast. Beholders from the British lines represent this as the most terrible scene of the whole bombardment, the sound was as if all the cannon in Sebastopol had been discharged at once. The earth shook as if convulsed with an earthquake, and the shock seemed so tremendous to the allies, that it was supposed the chief part of Sebastopol had been blown up by the ignition of some great central depot. All uncertainty was soon removed by the obvious demolition of the redoubt, and of the greater part of the wall of the Redan. It could be seen clearly from the English lines that great numbers of dead, horribly mutilated, were dispersed among the *débris* of guns, gun-carriages, waggons, earth-work, and masonry. It was now the turn of the British to rejoice, and their cheers rang exultingly and defiantly over the whole theatre of conflict. The Russians seemed awestruck for a time—several minutes elapsed before they again fired a shot; but urged on by the artillery officers and chiefs of the navy, the men returned to their guns, and resumed their toil. As if to be revenged upon the Lancaster battery, they concentrated for awhile a heavy fire in its direction, but every shot fell short, and the dreaded battery, unharmed, sent its uncertain but sometimes destructive fire with impunity upon the defence. At last, all attempts to silence that battery were abandoned. For the remainder of the afternoon, the Russians answered the British siege batteries with much less spirit and success; and the latter, perceiving that they could inflict more damage by aiming at the men who manned the works than at the works themselves, the loss of life on the part of the Russian sailors and artillerymen was still more considerable than it had been. The contest, however, continued fiercely, until darkness shrouded the combatants, and during many hours after night fell, guns were discharged from both sides.

The effect upon the British was most encouraging, when at last the fleets opened against the sea defences, and drew off the attention of the enemy to a great extent in that direction. The booming of the cannon from the broadsides of the fleets and the land batteries, mingling together, seemed to startle the earth, and filled the air with concussions, producing the strangest sensations upon those

who, not actually engaged, could notice such phenomena. An amateur heard the first sounds of the naval bombardment while seated in his tent in the rear of the British lines, and he thus describes the impressions produced:—"The continuous muffled roar of their distant broadsides was very grand. Curiously enough, though it seemed far less loud than the cannonade from the trenches, it alone had the effect of making my tent poles vibrate. The two sounds together reminded me (my head must have been full that day of household images) of a gusty corridor in an old mansion; the naval broadsides were the long rattling of distant window-frames, and the shots from the trenches the sharp banging of doors. I again visited the Picket-house in the evening, and found that the French guns had ceased firing, in consequence of a powder-magazine exploding, so that the enemy were paying us their undivided attentions. The shells looked like revolving lights as it grew dark, and I was tempted to accompany a picket of the 19th regiment, then going to guard the left Lancaster battery. This was my first visit to the trenches. The night covered us effectually on our way, and when there, the compact nine-foot-high wall of bank and gabions and sand-bags, against which the officer in command and myself reclined, seemed a very fair security against round-shot to those who had nothing to do with the embrasures. Poor Captain Rowley was, indeed, killed by one that bounded down on him from the top of the parapet as he lay in the trench; but this must be a rare case. Shell, of course, are inconvenient in all situations of life, but at night they are less so than at other times, as one can see them coming, and scud out of the way. In fact, I had promised myself a very pleasant pyrotechnical evening in company with the officer who had invited me down; but the reports from the enemy's batteries gradually diminished in frequency; and at length there came an order to the gentleman in charge of the gun to cease firing for the night. So I retired, having not done much more than ascertain that the enemy's practice had been sufficiently good during the day to prove, that the perpetual pounding away that has been going on from the town for the last fortnight, has, at any rate, taught them the range of their metal. That night the Russians threw up earthworks which enfiladed the French guns, and swept many of them out of their embrasures; which, coupled with the explosion of the two powder magazines, kept our gallant allies silent all next day."

The British were in want of ammunition, which caused a pause in the morning, but more especially towards the close of the engagement this deficiency was experienced;

there had been no previous conception of the vast quantities required, and it was carried up with much labour, haste, and peril. The road or track by which it was conveyed to the lines was partly within the enemy's range who, watching the approach of the carts and men, directed shot and shell upon them. Nothing throughout the day so much tried and proved the courage of men and officers, as the way in which they discharged this dangerous duty. The trenches were occupied by troops acting as covering parties, and there were large stones, broken guns, and other fragmentary things, lying in the trenches, so that they could not be used by the soldiers passing from one battery to another; these brave fellows passed to and fro along the inner bank of the trench, while clouds of sand and dust were driven up into their faces by the falling shot from the enemy, and the bank of earth over which they passed seemed to sway under their feet, as the continuous peals of artillery caused the hard rock to vibrate upon which the way was raised. At the same time canister shot which the enemy used more freely than is usual on such occasions, swept the parapets of the trenches, and entered the embrasures. The dangerous task was however performed, not only bravely but gaily by the troops, the officer of the line assisting in the work, and setting the men an example of cool courage which was nobly followed.

The loss of the British was very inconsiderable; it seems scarcely to be credited, that among so many, exposed to such a furious cannonade, so few should be stricken. There were very many cuts and bruises never reported, although our soldiers are rather eager to show that they did not come off scatheless and to boast of their wounds. The English did not lose more than fifty men, while the loss inflicted upon the Russians could not have been less than 600, independent of that caused by the French fire. The comparatively little loss of the English, as compared with their allies and their enemies, arose thus: the French position was on the Russian practising ground and the range was familiar to every man who served the guns of the defence. The French works were beautifully executed, with a scientific perfection that met all the requirements of military art, but withal they were constructed as well as armed too lightly; the ponderous nature of the Muscovite works and armaments was not anticipated. The British works were characteristically strong. Marshal St. Arnaud and General Canrobert represented in their despatches the English infantry in the field as characterised by "*solidity*." So it was with their trenches and batteries, and they were armed with ordnance suited to such solid works. Powerful, therefore, as were the arma-

ments opposed to them, the resistance corresponded to their force. There was another circumstance in favour of the English: their batteries were placed on spurs of projecting rock, separated by gullies, as described in a previous chapter; the balls of the enemy, striking the rocky ridge, bounded high up into the air, and fell beyond the batteries; and the shells frequently exploded in the crevices and gullies, which confined their explosive power, and prevented their shattered particles from expanding upon the trenches above. The British companies of artillery, and the infantry regiments which lay in the trenches as covering parties, had often lost more men in a single day from dysentery or cholera, than they did under the fiery shower of the enemy's shells, round-shot, and canister. Several brave men fell however that day, whose loss was sorely felt. Among these was Dr. O'Leary, of the 68th regiment. He was sitting on the outer end of a traverse with another officer, and a servant in attendance, when he was swept off by a shot, which carried away the legs of the servant, and covered the other officer with the blood of both, and the fragments of shattered material which it dispersed.

The wounded were attended too close to the range of the enemy's fire, and some actually fell victims to this arrangement while under the doctor's hands.

By seven o'clock in the evening, the regiments serving in the trenches were relieved, and on their way to their tents, much in need of refreshment and rest, disappointed with the result, which, so far as it was a failure, was entirely due to the insufficient preparations of our allies, the tardy arrival of the fleets, and the imperfect way in which the ships were handled; but all were thankful that so dreadful a day was passed with so few casualties, and that the English artillery and marine force had placed themselves, in the opinion of friends and foes, in a position of so much glory. It was the most terrible day of artillery warfare which the world had ever witnessed; and the obstinate strength, endurance, courage, and persistence of the English had seldom, if ever, been more conspicuous. The whole army was loud in its encomiums of the English sailors; and the French, whose part in the day was without glory, acted without envy, and were magnanimous in their acknowledgment of the superiority of the English artillery, military and marine.

Before giving a description of the bombardment from the sea, we shall furnish some specimens of the letters written by spectators and combatants, which will at once illustrate our narrative, and place some incidents in a new point of view. An artillery officer thus conveys the impression which was produced

upon him by the extent and character of the defences when the combat was about to open.

We have seen no other account which presents so clear an idea of the vastness and power of the enemy's works:—"The enemy had opposed to our 6-gun battery on the right a tremendous entrenchment, thrown up on the top of the hills to the north of Sebastopol. It was, however, nearly 4000 yards distant, so its shot and shell all fell short, in such a manner that firing from it was soon discontinued. As we approach, this battery will prove a tough customer. Beneath this, and 1200 yards distant from our works, is a martello tower and entrenchment. The circular earthwork at its base has not only been completed, but two flanking parallels, each mounting fifteen large guns, thrown out at either side. In the creek, to the right of this tower, but so placed and covered as to command our Crown Battery on the centre, was the famous three-decker, the *Twelve Apostles*. More towards the town, and facing our Green Mound Battery, is the Redan wall, which shelters the south side of Sebastopol. It bristles with guns, and, to shelter it still further, the Russians have thrown up in its centre a regular three-sided redoubt, carrying about forty cannon. Passing over several intermediate 6, 8, and 10-gun batteries, the main strength of the Russians on the right is in some entrenchments called the Flagstaff Batteries. It is a huge hill, commanding the French lines perfectly, and entrenched for two tiers of guns, each about twenty-five in number. On the summit of the hill above the guns are banks for several large mortars. The existence of the upper tier of cannon appears to have been unknown until the moment it opened a deadly fire on the French works. On the enemy's extreme right of all was a 10-gun battery, most commandingly placed so as to enfilade the whole French line; and beyond this came the regular stone forts of the harbour, such as the Quarantine Battery and Fort Paul."

The *St. Petersburg Journal* contained a report from Prince Menschikoff, dated the 17th, in which he stated that the Russians had only a few guns injured by the fire from the trenches of the allies; that the French were entirely silenced; and the British had only two guns remaining in position, the Russian fire having dismounted all the rest! On the 18th, another report, from the same unreliable source, described the cannonade from the British lines as astonishing for its power and noise, but as being nearly innocuous! The following letter, from one of the gallant soldiers before the place, puts the effect of the British fire before us in a light very different to that in which Prince Menschikoff would have the readers of the *St. Petersburg Journal* to regard it. The writer was an infantry officer, and not on duty

in the trenches; he therefore could keep a journal of events as they proceeded as far as they fell under his review:—"Yesterday the Russians kept up a tremendous cannonade for half an hour, in the hope, I think, of finding out our line of fire; but as we were not ready, not a shot was returned. This morning we have let them know to their cost. We have at the present time about sixty siege-guns at work, and I think the French have about the same number. As the Russian batteries are very powerful, you may imagine the row that is going on. I was out with my company hard at work the whole of last night, and only got into camp in time to have a cup of chocolate and go on to the hill to see the opening of the ball, which was grand in the extreme. In about an hour and a quarter the smoke lifted, and we found we had silenced a white tower on the extreme left; but there is a great deal more to be done yet, and I shall not be at all surprised if we are obliged to carry it by assault after all. I cannot tell you how tired I am; and it is only the excitement that keeps me going. We have just got orders to be ready to turn out in a moment, as they may perhaps attempt a sortie—I only wish they would. Three, p.m.—Since I left off we have paraded, and every precaution has of course been taken. Loud cheers from our men; I must be off. I found the cheering was caused by our having set fire to a magazine near a redan, which has been pushing us hard; consequently their guns in that direction are silenced."

The same officer, resuming his journal late at night, adds—"The explosion was a Russian redoubt, which appeared to do some mischief, and, at all events, silenced their battery. Some astonishment has been felt at our cannonade not going on all night, as, up to this moment (about eleven, p.m.), since sunset we have had nearly a dead silence, which, at all events, shows that master Nick's subjects have had enough of it to-day, without troubling us with their usual shots. It has been a lovely day, and the sight this evening was certainly very beautiful. Ladies, if they could have got here, might have sat on the hills with us, and watched the operations. I certainly had a closer and better view of Sebastopol than I have had before, but I will wait until we are inside to give you a description. On looking over the town, through the smoke from our batteries and their own, you could just distinguish the fleets, and see the flashes from their guns in the volumes of smoke which constantly obscured them from our view. The landscape was most lovely. What the casualties have been during the day I have not been able to ascertain, reports vary so much, but at all events not great. An assistant-surgeon of the 20th regiment was killed; some other officers

were also reported to be killed; but I could not ascertain the fact."

The perusal of such letters gives the reader an insight into the feelings and impressions of the actors, as the more consecutive narrative does as to the events.

The bombardment by the fleets was arranged between the admirals and generals to take place contemporaneously with that on land. At ten o'clock on the night of the 16th, the ships were ordered by signal to "be ready for action at eight o'clock in the morning." As the land bombardment was to begin at half-past six o'clock, it is inconceivable why the admirals should order their captains to be ready at an hour so much later. Admiral Dundas represents, in his despatch, the value of the bombardment by sea, even if no forts were destroyed, and no batteries silenced, as consisting in the moral support afforded to the army, and in the relief extended to it by drawing away the enemy's gunners to the seaward defences. Both these forms of assistance could be given much better at half-past six than at eight; and better at eight had the appointment been kept than at half-past twelve, when the first guns from the ships opened upon the forts. The delay of six hours was a cause of great depression to the troops. When the French batteries became nearly useless, at ten o'clock in the morning, an attack from the fleets would even then have been most opportune in relieving the English from the concentrated fire of nearly the whole artillery of the garrison; but no support, moral or material, was rendered by the shipping until more than half the day was over.

Measures were taken by the ships' crews to be ready at the appointed hour, and it was no fault of the sailors or the captains if delay ensued. The dilatoriness and want of quick perception on the part of the commanders was the real cause of the untimely execution of everything attempted by sea.

On the night of the 16th, a boat went in with muffled oars to take soundings, and examine two shoals near Forts Constantine and Alexander, which were likely to impede an effective proximity of the ships. This dangerous duty was performed with skill and courage. The boat "rounded the shoals," and got quite under the forts, so that the crew could hear the conversation of the guard. There were two Russian steamers outside the sunken vessels, keeping watch like sentinels, but their vigilance was not wakeful, for the little craft maintained its noiseless course unseen, and actually entered the spaces between the sunken ships, and determined in the negative the question whether large ships could force an entrance. Having accomplished all that was committed to their enterprise, the brave crew returned

safe to the ship with the specific intelligence sought. The fineness of the night at once facilitated this achievement and incurred the danger of detection. The sea was smooth, without a ripple, and the smallest boat might venture safely anywhere; but the stillness of the evening made the least sound upon the water audible, and the bright starlight covered its surface with a chastened lustre, by which a vigilant watcher might have easily detected any dark object floating at a distance much further than the boat was, either from the sentries on the forts, or the gun-ships which were posted at the harbour's mouth.

The morning of the 17th, as has been already remarked in describing the land operations, was misty and calm. Both these circumstances retarded the movements of the fleets; but a want of arrangement and purpose was the chief impediment, by which any other might easily become formidable. The calm made it necessary that the sailing ships should be towed into position by the steamers. This was accomplished, not by the mode which is usually called "towing," but after the plan which was adopted at Petropaulovski, narrated in a previous chapter. The sailing ships were lashed to the steamers—the latter being at the off-side, and thereby protected from the fire of the enemy, so that they could not be disabled, and their important assistance lost. In this way they were to proceed as follows:—The French fleet was to be placed southward of the harbour, at the length of seven cables from the liff, and were to bombard and cannonade the Quarantine, Alexander, and Artillery Forts; the English were to take position opposite the northern forts; the Turks to take station midway between the allies. The ships were to be roadside on, across the harbour, in such a way as to bring the greatest possible amount of fire upon the batteries. From the Bay of Cherson the Wasp Battery is computed to be about two English miles, and upon a line of this extent the fleets were to display their force.

On the morning of the 17th they lay off the mouth of the Katcha, but two detached squadrons were at Balaklava and Kamiesch, assisting the British and French armies in those harbours. The first squadron was under the command of Sir Edmund Lyons, the second under that of Admiral Bruat. The fleets moved from the Katcha in such order as would bring the French in the rear, followed by the Turks and the British. The French not only performed their own task clumsily, but impeded their allies; the Turks were still more in disorder, increasing the difficulty of the English in taking up the positions assigned to them. The causes of the confusion appear to have been the want of skill on the part of all the admirals-in-chief, French, Turks, and English, in

handling such vast armaments, and maintaining close co-operation with independent commands. The smoke from the land bombardment was blowing out to sea, and obscured the fortifications, rendering it difficult for the officers to mark the objects against which they were to direct their fire, or take post in the precise position allotted to them. From this cause partly, the French lay too much to the north, displacing the Turks from their assigned position, who of course obstructed the British; so that the *Queen*, when coming to the spot where her fire was to open, found the Turkish admiral's ship already in occupation of it. So far as the smoke from the shore was an impediment it happened to be so because the admirals allowed half the day to elapse before they were at the post of duty. The early morning was so calm that the smoke hung in dense volumes over the contending gunners; and long before the wind sprung up, which blew it out to sea, the cannon of the fleet should have opened upon Sebastopol. Had Sir Edmund Lyons, instead of being with his detached squadron at Balaklava, and acting under orders, been entrusted with the command of the united fleets on the 16th, or earlier, the question of ships *versus* forts would at all events have had a more perfect solution, and the British troops would not have been left for hours to bear the violent cannonade which was concentrated upon them. In fact, the bombardment by sea was maintained only by the first French ships which arrived at their stations, and by the detached squadron of Admiral Lyons, which, passing through the line, engaged the forts of the enemy in close and desperate encounter. Admiral Dundas remained where he could neither do nor suffer much. Admiral Hamelin went in well, and had many and hair-breadth escapes. The following is the most exact representation we can impart of the positions and distances actually taken up. The reader will see how impossible it was at such ranges to effect the demolition of the forts, or even seriously to damage them. The shoals rendered it impracticable to go near enough for the former purpose, the plan of attack precluded the accomplishment of the other. Had Admiral Lyons been well seconded in his bold attempt to make up for all these deficiencies, history would have made a different record of the issue. A gentleman unconnected with either branch of the service, or with the press, thus describes the positions:—

"Place a good map of the coast before you, and describe a circle having its centre at Cape Constantine, with a radius of 1720 yards, and another having its centre at Cape Alexander, with a radius of 1990 yards, and the western point of intersection will give you the position of Admiral Dundas's ship. Alter the first radius to 770 yards, and the second to 1590,

and the same process will give you that of the *Agamemnon*. Substitute 1208 for 770, and 2280 for 1590, and the point of contact will show the position of the *Terrible*. The British ships were arranged in a form something like a pair of compasses, nearly closed, and *minus* half of one leg. Speaking more precisely, it was an acute angle, formed by two irregular lines, which, sloping towards the north-east from the *Britannia* and the *Agamemnon*, met at the *Terrible*. I will now write their names in the order which they would take in the imaginary figure I have described:—

British Line.	Towed by	Distance in yards from Cape Constantine.
<i>Britannia</i>	<i>Furious</i>	7120
<i>Trafalgar</i>	<i>Retribution</i>	1620
<i>Vengeance</i>	<i>Highflyer</i>	1580
<i>Rodney</i>	<i>Spiteful</i>	1300
<i>Bellerophon</i>	<i>Cyclops</i>	1160
<i>Queen</i>	<i>Vesuvius</i>	1140
<i>Lynx</i> (look-out ship)		1140
<i>Sphinx</i> (ditto)		1150
<i>Tribune</i> (ditto)		1340
<i>Sampson</i> (ditto)		1340
<i>Terrible</i> (ditto)		1410

Then, returning in a direction back towards the south-west, the—

<i>Albion</i>	<i>Firebrand</i>	1280
<i>Arethusa</i>	<i>Triton</i>	1140
<i>London</i>	<i>Niger</i>	1040
<i>Sanspareil</i>		880
<i>Agamemnon</i>		770

The *Spiteful* occupied a place inside the angle, between the *London* and the *Sphinx*. I have indicated all the ships by their distances from Cape Constantine, because it is necessary to have a common standard of comparisons; but you will, of course, remember, that the *Agamemnon*, and all the vessels north of her, were also exposed to the Telegraph and Wasp Forts, as well as to some recent earthworks, higher up the coast. Some of these ships were, indeed, much closer to the last-mentioned forts than to Fort Constantine. The French and Turkish men-of-war took up their positions in a line stretching in a south by south-westerly direction from the *Britannia*, to a point within 260 yards from the shore. They were placed in the following order:—

French and Turkish Line.	Towed by
<i>Napoléon</i>	—
<i>Henri IV.</i>	<i>Canada</i> .
<i>Mahmoudie</i>	<i>Turkish Admiral</i> .
<i>Valmy</i>	<i>Descartes</i> .
<i>Ville de Paris</i>	<i>Primoguet</i> .
<i>Jupiter</i>	<i>Christophero Colombo</i> .
<i>Turkish</i> (two-decker) ..	—
<i>Friedland</i>	<i>Vauban</i> .
<i>Marengo</i>	<i>Labrador</i> .
<i>Montebello</i>	—
<i>Suffren</i>	<i>Albatros</i> .
<i>Jean Bart</i>	—
<i>Charlemagne</i>	—

I should add that these lists represent the order and composition of the lines at half-past one, when they opened fire; but, by half-past

five, the following were almost the only ships engaged with the forts:—*Agamemnon*, *Sanspareil*, *Rodney* (on shore), *Bellerophon*, *Queen Sampson*, *Terrible*, *Spitfire*, and *Sphinx*. I have received another account, which puts the *Britannia* at 2500 yards, and the *Agamemnon* at 800 yards, from Fort Constantine; and which places the latter ship at 750 from the Telegraph Fort, and at 1200 from the Wasp Fort. As regards Fort Constantine, perhaps the apparent difference may be explained by the position of its batteries on the coast. The first scale is measured, not from the batteries but from the Cape. The sea round Sebastopol is so shallow, that even at the place occupied by the *Britannia* there are only fifteen fathoms water; while Admiral Lyons, who pushed his ship—no prophet was needed to predict it—as far as she could go (into five and a quarter fathoms), did not get closer than the point I have above indicated.”

The French were first in action; they were followed by the few Turkish ships, which were also engaged before the British formed line but at so great a distance that their fire was ineffectual. It was nine o'clock in the morning before those ships which were first to move from the Katcha received any orders to advance, and slowly and confusedly were these orders obeyed. All the steamers of our allies, except the *Pluton* and *Eumenide*, were lashed alongside the sailing ships, to push them towards the batteries. Immediately upon leaving the Katcha, our allies found the advantage of certain precautions which they had taken on the nights of the 15th and 16th, when the captain of the *Pluton* laid down buoys along the coast to guide the course of the fleet; on this account the *Pluton* took the lead. She was followed immediately by the *Charlemagne*, which was ordered to anchor close by the shoal, so that the succeeding vessels might occupy places to the north and north-east of her. The French line-of-battle ships were towed more slowly, or rather driven more slowly, into position than the admiral had calculated, in consequence of their great size and weight in proportion to the steam-power which propelled the vessels lashed to them. French writers represent the progress as about two knots an hour—half that rate of progression would be nearer the truth; these writers also state that at half-past twelve their ships opened fire, but it was many minutes later, and so slowly and imperfectly, that the bombardment by sea could hardly, with any propriety, be described as beginning until after one o'clock. It was half-past one before an English ship fired a shot. The *Vautour* had the honour of “leading fire.” Having worked her way into a little creek, her position seemed favourable, and at first her guns appeared to

tell upon the batteries of the enemy. The Russians fired too high. A French officer describes the effect as a "light whistling, like the noise made by certain birds of prey, audible at the masthead." When the battle began in earnest, the *Vautour* being obliged to go in nearer shore, to make way for the *Charlemagne*, found the shelter of a tongue of land, which, slight as it appeared, afforded comparative impunity. The *Vautour* soon discovered, what ought to have been understood by the admirals before, that the nearer the batteries the safer the ship. Not a man was lost on board this ship; her masts, from which all the yards had been taken down, escaped untouched. Three balls were lodged in the paddle-boxes, and as many in the hull, when she stood out at the greatest distance; not a shot from the batteries took effect when she went well in. This little steamer had been half an hour engaged before her efforts were seconded, so slowly were the operations of the French navy performed. The *Charlemagne*, at last, came to her assistance, but worked in so awkwardly, and opened fire with so little promptitude, that before a shot from her guns was directed upon the fortifications, considerable damage was sustained. Several shots told upon her hull; her masts were considerably cut up; and a shell, bursting in the engine-room, spread destruction there which it was not easy quickly to repair. She, however, avenged the mischief thus received; for a shell from one of the 80-pounders struck Fort Constantine, rending the space upon which it exploded, and throwing up a cloud of dust and broken wall.

The first French line dressed by the *Charlemagne* in the direction N.N.W., the *Napoléon* and *Henri Quatre* coming on first; the second line so formed as to fire through the interstices of the first. The two Turkish ships uselessly prolonged the French line; and further on to the N.N.E. of the second Turkish ship, a line of eight British was formed, the nearest portion of the English fleet. The *Montebello* and *Jean Bart* fired vigorously, and suffered considerably. The average distance of the French ships was about 1500 metres, a distance rendering their own fire almost innocuous, and placing them within a range at which the enemy had the greatest advantage. This arose partly from the shallowness of the water, but mainly from the bad seamanship of those in command. Ships in order to damage strong fortifications must fire their guns double-shotted; and this can only be done within 500 yards. The French, with the exception of the *Vautour* and *Charlemagne*, were placed at more than twice that distance, and some of their ships were 2000 yards off. The French admiral, as we have already shown, states in his despatch that the

Russian fire slackened at half-past two o'clock: this was true so far as Fort Constantine was concerned, and partially true of Fort Alexander; where, however, the cannonade was resumed again with the greatest fury.

Admiral Hamelin had a narrow escape. Leaning by the poop of his flagship, a shell fell within a yard of him, and, bursting instantly, killed one officer and a sailor, and mortally wounded an officer who was on duty near him. The coolness and self-possession of the brave admiral were the admiration of officers and men.

A French naval authority asserts that 25,000 shots were fired by Admiral Hamelin's fleet. This enormous discharge of heavy missiles upon the defences must have told very decidedly, even at a range of 1000 yards, had it been delivered rapidly and simultaneously from the broadsides of the fleet. But the ships of our allies came into action one by one, instead of advancing in line; and as each vessel came within range of the enemy it was smitten by shot and shell, and damaged before it could return a single stroke. The approach of the fleet of our ally was very imposing. The ships were beautifully constructed; and however unhandy their crews, as compared with those of the English fleet, they displayed all the heroism for which both the army and navy of France are so justly famed.

The reported loss of the French fleet was sixteen killed and 200 wounded; but we fear that this was much under the number, at all events of the slain. Many of those reported wounded were mortally so. We scarcely think that an equal loss was inflicted by the French upon the defenders of the batteries. The Turks were in a position to give or receive so little harm that it was a waste of ammunition to blaze away as they did, broadside after broadside, for so many hours.

When the English joined in the attack, they came on ship by ship, committing the same error as the French had committed. The scene around Sebastopol, when they had all taken up their positions, was one of the grandest ever presented. Some thousands of cannon emitting their flashes, the booming of their reports over the calm sea, and the echoes of the broadsides, and of the land batteries from the hills, encircling the flame-begirt city, formed a *tout ensemble* beyond all conception sublime. As the smoke ascended, a dark canopy was formed, beneath which the flashes from ships, forts, and trenches, were seen like lightnings warring with lightnings, as if the gods of mythic story had borrowed the shafts of Jove, and raged in mutual strife. Above the roar of battle in the trenches, the bellowing broadsides of the ships were heard; and notwithstanding the constant volleys which the fleets poured out, the crews could hear the rumbling thunder

which rolled through the trenches. The scene on board each ship which came seriously into action was startling. Officers and men were in the highest excitement; the latter stripped to their shirts, or naked to their waists, begrimed with powder, and stained with blood, working the guns with hot energy, and shouting defiance upon the foe. Shells were bursting upon the decks; cannon-balls piercing their hulls, or dashing the water up around the combatants; spars snapping; splinters flying; and above every noise, the voice of command was heard directing or cheering the men for a desperate struggle. None who witnessed it by land or sea, from trench or fort or ship, can ever fail to have a vivid memory of the first day of the bombardment of Sebastopol.

The English came into action as the French had done—the liners lashed to steamers: none of the British ships came under fire until the French had been a full hour engaged, thus giving the defenders of the forts the advantage of a defence in detail, and allowing them to keep their men fresh. Had Admiral Dundas really desired to make the attack ineffectual, he could scarcely have laid his plan for such an object more fitly. The *Queen*, *Britannia*, *Trafalgar*, *Vengeance*, *Rodney*, and *Bellerophon*, with the *Vesuvius*, *Furious*, *Retribution*, *High-flyer*, *Spitfire*, *Spiteful*, and *Cyclops*, alongside, formed the outer line, under the command of the admiral-in-chief, Dundas. The advance-line was under the command of the second admiral, Lyons, and consisted of the following steamers:—the flagship *Agamemnon*, the *Sanspareil*, *Sampson*, *Tribune*, *Terrible*, *Sphinx*, and *Lynx*, with that useful little appendage, the *Arrow* gun-boat, accompanied by the sailing ships *Albion*, *London*, *Arethusa* (these were lashed to the steamers *Firebrand*, *Niger*, and *Triton*).

A little steam-tug, the *Circassia*, commanded by Mr. Ball, led the way, carefully sounding as it went, and marking out the positions for the other vessels. This little vessel was exposed to great danger going in, but went in so completely under “the dip” of the enemy’s guns as to neutralise the peril. The mode in which she was commanded by Mr. Ball earned the admiration of the fleet.

Sir Edmund Lyons appeared to select the post of danger, but in reality it was the post of safety. He got farther in than any of his consorts; and as the guns of the forts could not be easily lowered to reach his ship, the fire passed over it, doing execution at a greater distance. Sir Edmund has been universally represented as breaking through the order of battle, and performing a most daring exploit, contrary to the intentions of his chief. This impression is unjust to Admiral Dundas. The arrangement belonged to the latter; but Ad-

miral Lyons asked and obtained permission to conduct the *Agamemnon* under Fort Constantine. The position he took up was one designed by Admiral Dundas to have been occupied by some other ship of the advanced line; but the request of his second in command was courteously complied with. The *Agamemnon* lost less men than any other British ship brought within range of the enemy’s guns. The first ships that went well in after the *Circassia* had felt the way, were the *Terrible* and *Sampson*, whose gallant commanders maintained the character for enterprise which they had won by their conduct throughout all the operations of the fleet. These two smart steamers, pushing rapidly through the fire from the fort, anchored opposite two small batteries, which, from their peculiar situation, could inflict great mischief upon the fleet, and frustrate the efforts of Admiral Lyons even to keep his position. One of these batteries was called the Telegraph, from its proximity to the signal-station; the other the *Wasp*, from its power to annoy in proportion to its size. The steamers opened briskly upon these batteries with shells, especially upon the *Wasp*. The *Agamemnon* was by this means allowed to come in to the edge of the shoal with comparative impunity, and take up a position admirably chosen, so as to do great damage, and receive little. From this circumstance she was enabled for four hours to pour her broadsides into Fort Constantine, until the towering fortress trembled beneath the blows. As she advanced, her hull received several round-shot, and more than one shell exploded upon her deck; but when fairly in, she chiefly suffered in her masts and rigging, being below the range of the casemates. The *Albion* and *London* followed the *Agamemnon*; but taking up their positions at a greater distance, they were precisely where the Russians could do them most injury. After a hopeless struggle, both vessels were driven out. Not so the *Sanspareil*, which followed closely in the wake of Sir Edmund. She seconded his fire upon the fortress with telling power; but being farther out than his ship, she came within the range from the casemates, and was terribly cut up, scarcely a part of her hull, masts, or rigging that was not impaired; and the loss of men on board was greater than in any other ship of either fleet. At last the *Sanspareil* was obliged to sheer off, and leave the *Agamemnon* to thunder alone against the fort, which seemed belching flame, and which sent its balls in showers upon the water, few of them falling near enough to hurt the sturdy *Agamemnon*. At last some of the guns were lowered in the casemates to get a nearer range, and the ship speedily felt this altered condition of affairs. Her masts and rigging were so cut up, that it was marvellous they did not go overboard.

Nor did all the shots strike her aloft; her hull and decks were stricken by several large shot. Sir Edmund expressed a wish that some of his officers would venture over to the *Bellerophon*, and bring her to his aid. A lieutenant undertook the perilous mission; and rowing off in an open boat, sought that ship. It seemed an undertaking prompted by despair; all expected to see the gallant little boat and her noble freight go down together, struck by some ponderous ball, or shattered to pieces by the bursting of a shell. All around, both descriptions of missile fell in a torrent of force and fire, yet onward sped the boat until the brave lieutenant reached his destination, and delivered his message. That message was a coarse one, unworthy of a great man upon a great occasion, when, whatever his dauntless bravery, it could not become him to use the language of low bravado, or profane recklessness. "Tell him to come in; these forts will sink me, and I'm d—d if I leave this." The captain of the *Bellerophon* promptly obeyed, and got in with little loss to the spot assigned to him, whence he threw a terrific broadside upon the fort. By this time the Wasp and Telegraph Batteries had sorely smitten the *Sampson* and *Terrible*, and were flinging their bolts upon the *Agamemnon*. The *Bellerophon*, after delivering the one crushing broadside upon the large fort, poured a shower of shells into the Wasp, scattering guns and men with rapid destruction. The brave ship did not come off scatheless in this encounter, a shell, bursting in her forepart, set fire to the lower deck, and the entire destruction of the vessel was apprehended. Ceasing to work the guns, all hands rushed forward to extinguish the flames: this was fearlessly and promptly done. It was well the Wasp had lost its sting before the ignition of the ship, or entire wreck would have been in all probability her fate. But while the attention of the crew was directed to the flames, the anchor dragged, and the vessel drifted towards the shoal, where she would have been an easy prey to the enemy. This critical juncture was observed by the captain of the *Spitfire*, who, dashing in, took the disabled *Bellerophon* in tow, and brought her out of action, the Russians cheering at her compulsory departure, the British because of her fortunate rescue. The *Agamemnon*, delivered from the tormenting Wasp, remained, confronting "the great fort," hurling the shot from her broadsides against it with incessant combat. The *Arethusa* frigate, and her little consort, the *Triton* steamer, suffered still more than the *Bellerophon*. The *Triton* towed the *Arethusa* under fire, and in doing so received a cannonade so heavy, that the Russian naval officers in the batteries were astonished that she was not shattered or sunk. The little steamer then

hauled round, bringing the broadside of the *Arethusa* to the foe. This put the *Triton* under shelter, as she was covered by the larger bulk of the sailing-ship. The men of the former then rushed on board the latter, to assist in working the guns; and seldom has a first-class frigate dealt forth a broadside so formidable as was poured upon the enemy. Broadside and battery uttered their defiance in quick and terrible response, the little steamer vibrating from stem to stern with the shock. Rigging, ropes, and yards, were cut by shot. Balls flew over the deck of the frigate, and hit the funnel and paddle-wheels of her consort. Shrouds, gaffs, stays, and all the furniture aloft which guides or garnishes a ship, hung in tangled tatters. Some of the most useful men among the crew of the *Triton* were wounded by splinters of shells. At last there was danger of both vessels sinking, and the frigate became nearly helpless. Her cockpit was smeared with the blood of wounded and slain; her rigging was shot away, or lay scattered about her decks, and it was evident she could no longer be useful. The *Triton* towed her out of line; but in doing so she was raked with shells, her decks were covered with wounded, and several were slain. When she got out of range, there were twenty-two holes in her funnel; yet in this condition she contrived to bring her charge to Constantinople, to be docked for repairs. When both vessels arrived there, they bore fearful evidence of what the sailors call "a severe mauling." The *Salvador* had a more narrow escape of wreck than either the *Bellerophon*, *Arethusa*, or *Triton*. A shell burst in the captain's cabin, and set fire to a coil of ropes. The powder-magazine adjoined, and there was imminent danger of its being exploded. A cry of fire, always so alarming on board ship, rang through the vessel; the pumps were worked, and the magazine deluged with water. The ship was saved, but the powder was spoiled, and her efforts rendered nugatory. The *Albion*, on coming out of action, was found to be so damaged that she followed the *Arethusa* to Constantinople to be docked. The *Rodney*, as Admiral Dundas's despatch relates, tailed upon a reef, and was exposed to a destructive fire, which shattered her masts. She must have soon been a wreck had not the active little steamer *Spiteful* got her off, but becoming in the effort a sharer in the damage.

The loss of the English was forty-four killed, and 266 wounded. It must be admitted that of the wounded many died; and none among the men were reported wounded who could still do duty. The *Britannia*, the flagship of Admiral Dundas, only contributed nine slightly wounded to the general loss; and although she was struck repeatedly, it was at such long range that, except for the honour of it, her

officers need not have said anything about it. Several of the officers and men sent home to the public papers such accounts of the engagement as would leave the impression that they had been active combatants and sharers in the general danger: no doubt every officer and man on board would have rejoiced if their ship had partaken with the "saucy *Arethusa*," or the gallant *Sanspareil*, or stubborn *Agamemnon*, the brunt of battle. One shell, however, fell upon the poop of the *Britannia*, exploding near Admiral Dundas, and placing him for a moment in as great danger as the leader of the French navy had been from a similar cause. If this ship was too far out of the way to receive many visitors of that description, she was also too remote to send many to the enemy; she, however, threw shell and shot all the afternoon, and fired many useless broadsides.

The loss of the Russians was very heavy; they admitted that the naval bombardment cost them five hundred men and several officers, two of whom were admirals. Several of the casemates were severely battered, Fort Constantine silenced; also the Telegraph Battery, and the Wasp destroyed. Still the effect produced did not answer general expectations. We cannot but think these expectations unreasonable: ships *versus* stone walls was not a case fairly decided by the issue of the day. Had gun-boats been attached to the fleet, and had it been possible for the ships to have got well in under the forts, which the shoal-water prevented, we are convinced that the victory for ships against forts would have been signal. But when to these disadvantages were added a timid and confused command, and the unskilful manner in which the ships came into action—already noticed—it ought to have been matter of congratulation that the results were no worse, and that the enemy suffered so severely. Admiral Nachimoff was killed by the fragments of a shell, and Admiral Korniloff was dangerously wounded, and ultimately died in consequence of his wounds. He was one of the officers who accompanied Prince Menschikoff to Constantinople on his famous mission concerning the keys of the Holy Places, and the protection of the Greek Church. The two admirals who had planned and executed the brutal and cowardly massacre of Sinope had now both fallen, and men could scarcely restrain the feeling that it was a providential retribution for the outrage against humanity perpetrated on that day.

The courage of the British sailors during the whole afternoon was worthy of the reputation of their class. As an instance of their intrepidity, on board the *Sanspareil*, eight men were swept away from a gun which they were working; the two who remained, coolly went

on loading with their sponge and rammer as if nothing had happened. Night at last closed around the combatants, and the ships withdrew; those who were spectators describe the contrast then presented to the scenes of the day as producing some of the strangest sensations they ever experienced. The heat, smoke, noise, danger, and shouts of conflict, were followed by a clear and serene night, bright with innumerable stars, reflected in long lines of light upon the tremulous sea. On board everything was quiet, the reaction consequent upon excitement giving to the stillness of discipline an intensity of which all were conscious.

Thus ended the opening day of the bombardment of Sebastopol, and all attempts on the part of the fleets to force an entrance or crush the batteries by which the harbour was commanded. Yet this day of toil, blood, and din of battle, was the terrible prelude of other days more bloody and terrible, ere the standards of covenanted France and England waved beside the crescent above vanquished Sebastopol. The *St. Petersburg Journal* gave certain accounts, evidently garbled and perverted, purporting to be extracts from the despatches of Prince Menschikoff, in which he was made to say, after referring to the land bombardment in terms of absurd triumph and falsehood, "At noon on the same day, fourteen vessels of the allied fleet attacked Sebastopol by sea, directing their fire against Fort Constantine and battery No. 10. The shortness of the time and the smoke rendered it impossible for Prince Menschikoff to furnish complete details of the loss on either side, but the Russian cause had sustained a severe loss in the death of Admiral Korniloff, whose leg had been carried off by a round-shot, and who died on the spot. The Alexander Battery, and battery No. 10, had not suffered much, but the Constantine Battery had been greatly injured. On the land side none of the Russian batteries had suffered, except No. 3, in which nearly all the pieces (thirty-three in all) had been dismounted. The Russian loss was estimated at 500 killed and wounded, among the latter Admiral Nachimoff, very slightly. The vessels which had taken part in the bombardment on the 17th, and which Prince Menschikoff believed to be all French, had gone away in the direction of Cape Chersonese. The smoke on the 17th, and a thick fog on the 18th, had rendered it impossible for Prince Menschikoff to state the enemy's loss, but he says it would seem that one ship of the line had been seriously damaged, and two steamers set on fire by red-hot shot."

It is remarkable that while in some positions on shore the roar of the artillery was deafening, and the sublimity of the whole conflict most impressive and even awe-inspiring,

yet in others the sound was represented as coming with a muffled and mumbling tone, and so subdued that conversation in a moderate voice could easily be maintained. An officer of British infantry thus described what he heard and saw:—"I must say it has not been quite so tremendous as I supposed. The noise is something like that which you may have heard in one of the large steam workshops in our dockyards at Woolwich, when the great hammers are at work; moreover, as the Royal Artillery and the Jack-tars from the men-of-war had the work pretty nearly to themselves,

there was but little excitement near us, the remainder of the army quietly sitting at the tops of the hills, in front of the line, spectators of the scene, in places where certainly, yesterday, they would have had unpleasant visitors, in the shape of shot and shell. But to-day the enemy's guns were fully employed on our batteries. What the effect of the day's work has been, I do not venture an opinion. The White Tower, which seemed their strongest work on this side of Sebastopol, and most frequent annoyance, was the first object, and was very soon silenced after the firing began."

CHAPTER XL.

ATTACKS UPON EUPATORIA.—CONTINUATION OF THE BOMBARDMENT OF SEBASTOPOL TO THE BATTLE OF BALAKLAVA.

"List his discourse of war, and you shall hear
A fearful battle rendered you."

SHAKSPEARE. *Henry V.*

WHILE the bombardment proceeded at Sebastopol, the Russians closely watched Eupatoria, and the gallant little garrison was obliged as closely to watch them. Some guns and rocket-tubes were landed from the fleet on the 19th, which increased the confidence of the garrison; but it was never tempted for a moment to imagine that it could rest in security. Every day skirmishes occurred. The Russian videttes were always lingering about; and the main body consisted of a brigade of cavalry of nearly 4000 men, besides some infantry and a strong force of horse-artillery. The British worked hard at the defences; a deep ditch was cut across the flat ground at either entrance to the town upon the north and south, and strong breastworks were raised behind the ditches; guns were planted upon earthworks raised to receive them. The fieldpieces and rocket-tubes landed on the 19th were placed in redoubts raised at the back of the town, barricades were raised across the streets which debouched upon the steppe, and Captain Brock at last assured himself that a cavalry attack, supported by even a large artillery force, could not be successful. Throughout October and November the Russian cavalry daily reconnoitred, advancing close up to the place, and were driven back by the artillery and musketry of the defence. Bodies of French sailors and marines were landed after the 19th, who were very eager for a brush with the enemy, whom they were disposed to hold too cheaply. It soon became evident, from the vigilance and enterprise of the Russian cavalry, and from the frequent notices of Eupatoria in the press of St. Petersburg, that the importance of the allied occupation began to be felt by the Russian armies and government. It was said

that the emperor felt keenly the impolicy of allowing the allies to take possession of it, and repeatedly sent angry and urgent orders to Prince Menschikoff to dislodge them. The prince might have replied in the quaint couplet which an old dramatist put into the mouth of Lord Sarsfield before the battle of Augrim, when Ginkle stormed Athlone, and when the French general St. Ruth gave an order similar to that of the Emperor Nicholas—

"Easily said—would they as soon obey,
We'd make the scellums for their entrance pay."

Prince Menschikoff gave stringent orders to attempt anything that was possible for cavalry and artillery to attempt, and promised upon the first opportunity to reinforce the troops before Eupatoria by an infantry corps and a sufficient number of heavy pieces of artillery. On the 20th of October the Russian cavalry were able to effect considerable mischief, mainly through the over-confidence and consequent carelessness of our allies. The accounts of this skirmish which reached London and Paris were very meagre, but the St. Petersburg papers wrote in a style of high triumph concerning it. The following went the round of those journals, and was copied into all the German papers:—"At Eupatoria the operations have been limited to skirmishes between our outposts of lancers and Cossacks with parties of the enemy who attempted to leave the town. On the 20th a detachment of volunteers, composed of Lieutenant Goriatchoff, Cornet Bogomalets, and twenty lancers of the regiment H.I.H. Mad. the Grand Duchess Catherine Mikhailowna, and some Cossacks, taking advantage of the thick fog, galloped up to the town itself, plunged into a crowd of Tartars who

were outside the wall, killed twelve on the spot, took two prisoners, wounded a great number, pushed into the town on the heels of the fugitives, killed the three French sentinels at the barrier, and while the town was in complete confusion, withdrew, driving before them cattle, sheep, and horses, to the number of 1000. In this skirmish Cornet Bogomalets was slightly wounded with a lance."

This was the most successful exploit of the Cossacks against the little fortress, which it now deserved to be called. In the winter a more determined assault was made, an account of which must be reserved for future pages of this narrative.

On the 18th of October the bombardment of Sebastopol was resumed. Before proceeding to recount its events, and those which followed, it is desirable to form some estimate of the forces of the assailants and assailed. On this subject an Austrian military paper of authority observed at the time:—"The fortresses of Sebastopol are said to command 800 pieces of artillery, while, with the army at Bagtché Serai, 100 field-guns can be brought into action by Prince Menschikoff. The numerical strength of the Russians within Sebastopol is estimated at 34,000 men, and at Bagtché Serai 30,000. It is, however, more than probable that the Russians are stronger than this estimate would imply; for Prince Menschikoff is said to have retreated from the heights of Alma in good order, with nearly all his guns, and more than 20,000 men. The Russian army which suddenly made its appearance and retreated before the English on their march from the battle of Alma to Balaklava, was represented as 15,000 strong, and considerable reinforcements are since known to have entered the Crimea and marched from Perekop to Bagtché Serai. The distance from Perekop to Simpheropol is about eighty miles, and Bagtché Serai lies at about half that distance between Simpheropol and Sebastopol, or twenty or twenty-five miles farther. This would make the distance from Perekop to Bagtché Serai a week or ten days' easy march for any large body of troops, but it is quite possible that reinforcements may have reached Prince Menschikoff much more rapidly. At any rate there are reasonable grounds for believing that the Russians under Prince Menschikoff will not be less than from 50,000 to 60,000 strong."

One of the Prussian journals thus noticed the probabilities:—"General Osten-Sacken is still at Perekop, awaiting the arrival of the reinforcements. It is very probable that he will take the separate command of the reserves, while Prince Menschikoff will confine his operations to the defence of his position near Sebastopol. These reinforcements that are so much talked of would, it was antici-

pated, in the first place, reach Simpheropol the 12th or 14th. We read now in a despatch from Odessa, that it is believed that the reinforcements will not arrive at their destination before the 25th of October, when it is presumed the garrison in Sebastopol (computing both the northern and southern sides) will number 25,000 men, and the army in the field at least 30,000, independent of the garrison of Bagtché Serai, Simpheropol, and Perekop which, taken together, will be at least 45,000 men, raising the Russian troops in the Crimea to the number of 100,000—a force greater than that of the allies, who cannot muster 80,000, and these are rapidly diminishing from hard work, insufficient hospital attendance, bad food, the diseases of the climate, and the guns of the Russians."

While putting these sheets through the press, a general officer, who took a distinguished part in the siege, has placed in the author's hands an estimate of the garrison of Sebastopol, at the time when the bombardment was opened, the correctness of which he then took great pains to ascertain, from the importance of such information to the position he occupied:—

GARRISON OF SEBASTOPOL.

Superior Troops—16 Naval Regiments, about	14,000
Garrison Artillery ..	4,000
Working men, drilled and organised....	3,200
Invalid Regiments	2,000
Dockyard Troops	2,000
Troops of the Line.....	5,000
	30,200

Independent of the Northern Forts and Lines, }
the garrison of which numbered about } 5,000

Accurate accounts of the allied forces have appeared in previous pages, and, notwithstanding the causes of diminution referred to in the Berlin paper just quoted, the reinforcements which arrived made up for all, and somewhat increased their number. The importance of a correct estimate of the relative strength of the contending hosts is necessary, in order to do justice to the strategy, of the generals, to explain the necessity for accepting or forcing battle, and to account for the character and issue of the contests. The entire Russian army, generally, in western Europe, so exaggerated as to its numbers, was thus estimated by an English gentleman resident in Vienna:—"The following *ordre de bataille* of the Russians has been received in Vienna, and we have reason to consider it entitled to credit:—Imperial Guards—41,000 infantry, and 12,000 cavalry, with 120 cannon; Grenadier corps—36,000 infantry, and 5000 cavalry, with 112 cannon; sixth infantry corps—288,000 infantry, and 30,000 cavalry, with 720 cannon; and two reserve corps, with 80,000 infantry. The

army of the Caucasus numbers 30,000 men, infantry; Orenberg, 25,000; Siberia, 20,000; Finland, 20,000. The total of the cavalry attached to these four armies is calculated at 20,000, with 530 cannon. The grand totals are 540,000 infantry, 67,000 cavalry, and 1482 guns."

If his account be precise, and, at the time, we believe its precision was not disputed, the amount and character of the Russian reinforcements might have been foreseen by our generals and their governments, and their military arrangements distributed accordingly. At the opening of the bombardment, and still more as the month of October advanced, the British felt the want of additional troops to carry on the stupendous work devolving upon them. It was not altogether the fault of the British government at home that reinforcements did not arrive. There were, at this very juncture, troops at Gibraltar, Malta, Corfu, and Scutari, which would have been ordered to the Crimea if Lord Raglan had demanded them; he, on the contrary, stopped the transmission of regiments and detachments from Constantinople at the very time the men were dropping in the trenches from overwork, cold, and sickness; it was his lordship's opinion that the forces operating before Sebastopol were quite sufficient. Had he been one of those generals identified in heart and hope with his own soldiery,—like Napoleon, Cromwell, Sir de Lacy Evans, and other military chiefs to whom their armies were attached,—he would have better known the wants and toils of his troops; and instead of forbidding the transmission of fresh bands, he would have urged their speedy arrival.

Before proceeding to narrate the events which followed the memorable 17th of October, we will give a few instances of the courage and condition of the troops up to that date. A private soldier of that noble regiment, the 42nd Highlanders, thus relates his experience in a letter from Balaklava, dated the day before the opening of the bombardment:—"It is a month since we landed in the Crimea, and we have not had off our shoes since, only to change our socks, or wash our feet in a burn, and that is very rarely done. We have had no vents since we came. We lie out in the open air night and day, the sky for our covering, and the fields for our bed. We sometimes come across some straw to make a bed to keep our bones off the stones, so you can picture to yourself how we live; but, thank God, we have had very good weather, very little rain, but very heavy dews at night, and it is getting very cold. I have to get up off the ground at night and run about to make my blood warm. We are quite benumbed this morning."

It is impossible to believe that, had either

the army or navy a *head*, that such sufferings would have continued unmitigated. Both the military and naval chiefs were without energy or acuteness; nothing requiring comprehensive conception was thought of, nothing requiring a comprehensive management was executed.

The following instances of individual prowess cannot fail to interest our readers:—A 55th man had gone into a garden some distance beyond our lines, when to his astonishment he was attacked by a Cossack, armed with a pistol and long lance. The son of the Don came down full tilt, but his weapon was kept off by means of a huge stake. The pistol was now called into action, but in vain—the soldier clinging tightly with both hands to the lance. Fear now attacked the Russian, and, thinking discretion the better part of valour, he left his weapon in our warrior's hands and fled. The soldier carried his trophy home in triumph to the general of his brigade, who gave him a sovereign for his noble conduct, and promised him immediate promotion.

A British naval officer writes thus to his friends in Yorkshire—"What unquenchable pluck those Frenchmen have—game to the backbone. Our purser, Bowley, when ashore next day, met a party carrying off a French officer badly wounded—one arm shot close off, and other wounds besides. He asked the poor fellow to drink a little brandy and water, and he immediately pulled out a flask of his own—drank to Bowley—sung out 'Long life to the Emperor and the English!' and then fell back exhausted. Their pluck never dies away."

To the Russians, the English appeared as singularly eccentric; and it is not to be wondered at, when the strange freaks they played are considered. A curious adventure happened one night to two of our sappers. Wandering about in the evening, they completely lost their way to the camp, and suddenly found themselves inside one of the Russian earthworks. A sentinel challenged them, whereupon the men, perhaps under the impression that it was good Russian, replied, 'Bono Johnny.' The consequence was that the alarm was given, and the men pursued. A volley was fired without effect at the two indiscreet sappers, but one of them soon received a bayonet in the body, and was thrown over the wall into the trenches as dead. The other, though slightly wounded, escaped. Towards morning, the man who had been thrown into the ditch concentrated all his energies, and dragged himself into the British camp, from whence he was conveyed to Balaklava. He reported that inside the earthwork he saw a battery of forty 56-lb. guns, probably taken out of the useless ships.

There is no exaggeration of the hardihood and recklessness of the common soldiery in the

following *morceau* from the correspondent of the *Morning Chronicle*:—"The men looked upon the whole firing as a spectacle got up for their especial amusement, and expressed their approbation or disapproval according to the merits of the case. If a shell burst within twenty yards of the group, it was hailed with a universal 'Bono Johnny,' but if, on the contrary, the projectile chanced to burst in the air (as often occurred), the men appeared even disappointed."

It must not be supposed that all the daring and enterprise was on the side of our own fearless soldiery, officers or men. The correspondent of the *Morning Post* gives the following specimen of the adventurous spirit of our neighbours and allies, the French:—"Our engineers have been daily engaged reconnoitring; but they go out, to my mind, far too *cock-haty*, and so at once attract attention. They should take a lesson from the French. Towards the evening, four Zouaves were seen walking, as it were, reeling drunk towards the walls of Sebastopol, just above the ship which had so long annoyed us. The Russians, thinking they were a sure catch, let them come quite close, and then sent out half-a-dozen armed men to bring them in; upon which the Frenchmen took to their heels at a railway pace, followed by the shots of the hopeful Russians, and reached their camp in safety, possessed of all the information they required as to the position and strength of the several forts and ships against which they are especially to act. These pretended friends of Bacchus were shrewd engineer-officers seeking important knowledge."

The correspondents of our London morning papers not only communicated intelligence which, but for them, had never reached the British public, but gave opinions in reference to military facts and probabilities, which would have done no discredit to our generals. The following is a specimen of the condition of things at the juncture of the bombardment. The expectations of Sir John Burgoyne were also those of the army generally, but we believe that several of the generals of division did not participate in them:—"Cholera at the camp is still very severe, and many cases are brought thence daily in the arabas to Balaklava. As yet, the greatest Russian ally has been the exceedingly beautiful clear moonlight nights, which would have rendered plainly visible to them the commencement of our engineering operations. I have taken another ramble across the dreary-looking country towards Sebastopol, and again looked down upon the enemy hard at work at the fortifications of their doomed city. While I was sitting in a friend's tent, the shot and shell frequently came whizzing over us, and during my stay a

shell unfortunately fell and exploded in a tent occupied by soldiers of the 68th, killing a sergeant and sentry, whose post was 200 yards off, and severely wounding three others. The day before had taken a rifleman pack from his back without injuring him. Sir John Burgoyne, it is said, speaks positively of a few days only being required to reduce the place. From deserters we hear that the Russians are determined to resist to the last; several Poles have come to the camp, who speak of the strong disaffection of their brethren in the town. There was some skirmishing at the outposts yesterday morning, when four Englishmen and six Cossacks were killed, and two guns have been captured from the enemy near Sebastopol. Yesterday, also, a body of Russian troops, consisting of 400 cavalry, and 3000 infantry, with Cossacks in advance, came from the eastward to about three miles from Balaklava. Cavalry and horse artillery were immediately sent against them, and the Guards and Highlanders immediately got under arms. They were fired into by the artillery, and immediately retreated. This appeared to be a reconnaissance, and there is report that a numerous army is in their rear. The marine camp on the heights now muster 1200 men, and they take the garrison duties of Balaklava. Three of the Greys were captured the night before last—they were upon outpost duty, and no doubt must have been very lax in their look-out. While I write there is heavy firing going on in the direction of Sebastopol, and most probably, before this reaches you, it will be crumbled to pieces. I should not be at all surprised if the enemy attacked this place shortly with a large force which we know is in the neighbourhood. They would naturally endeavour to cut off the retreat of the besieging army, and annihilate their base of operations. The French opened a fire upon Sebastopol two days ago. A three-decker (they say the *Twelve Apostles*) is careened over as much as possible, and is troublesome; and a gunboat with heavy guns is also disposed to be annoying. It is said that the first step will be to destroy these vessels at a long range. Seventeen howitzers have been landed from our fleet, and are to be posted on the heights, and the English pieces altogether will number on the land side about 150. The *Terrible* has landed four 68-pounders, and the *Beagle* (gunboat) yesterday sent her two heavy Lancaster guns on shore. The French are also landing ships' guns."

When the tidings of the 17th of October reached western Europe, the disappointment was extreme; and it required all the efforts of the governments and press of France and England to reconcile the people to the failure. They had been taught by the *Moniteur* and

other journals, to expect that even the rivalry and emulation of two great nations was a guarantee of success, and in consonance with the opinion attributed to Sir John Burgoyne, that the city could not hold out, except for a few days. The despatches of the chiefs, naval and military, dispelled that illusion, and there was a reaction, especially in France, of a very depressing character. The *Pays* endeavoured to soothe the mind of the French metropolis thus:—"The taking of an important town, defended by its position as much as by the soldiers within its walls, is always a great enterprise, surrounded with enormous difficulties. Men of light and superficial minds can alone feel surprise at the prudent slowness with which the operations of a besieging army, when it wishes to secure success, must be directed. Since public attention has been fixed on the Crimea, everybody knows the strong situation of Sebastopol. It is known that this town is protected by powerful fortifications; it is known that it will be defended with all the courage of despair. The Russians will not consent to lose this magnificent jewel of the czar's crown without a fierce struggle. We must neither dissimulate the difficulties nor the obstinate resistance which our brave soldiers will have to encounter. We do not belong to those who systematically depreciate their enemies. The Russians have certainly not the fiery dash of the French, nor the slow but continued and impassable march of the British: their reputation for strategy has rapidly sunk since the commencement of the campaign of the Danube, and they do not display the skill and boldness they put forth in the wars of the Empire; but their resources are still great, and not to be treated with disdain; nevertheless, they cannot long contend with the united arms of France and England."

During the night of the 17th, and early morning of the 18th of October, the Russians worked hard to repair the injuries suffered by their works, and by dawn on the 18th they were ready to resume the contest. The British, upon whom the toil and combat of the previous day mainly depended, continued their strenuous exertions, and were ready by daylight to renew the bombardment. The French were in no condition either to aid their allies or hurt their enemies. The admirals gave up all hope of reducing the sea defences, and left the bombardment altogether to the land forces. In a word, the English troops were alone prepared, on the 18th of October, to contest the victory. The Russian admiral gave a tolerably correct summary of the day's proceedings: according to the *St. Petersburg Journal*—"On the 18th, the English fire was less active than on the day before, and the French had hardly fired at

all. Prince Menschikoff attributes this to a diversion made without the walls by General Semiakine, who appeared in the enemy's rear, and thus diverted their attention from Sebastopol." The prince, however, overrated the effect of the diversion by General Semiakine; for although they were principally French troops who advanced to repel it, their doing so had no influence in slackening the fire of the French lines, which were almost silent because the previous day they were so thoroughly disabled.

At early dawn the British had the forethought to elevate their guns and gain the range before the enemy's cannonade covered the works with smoke, and rendered any accurate aim impossible. General Canrobert represented in his despatch that the English had got eight mortars into position by the time (on the 18th) that he wrote his despatch. Some mortars were brought up, but not half the number supposed by the general. Those brought into play did little good, for although they were well worked, the shells were old ordnance stores, and would not explode. The English magazines were found to be too small, and there was a continual deficiency, therefore, of ammunition, so that each gun was only fired once in every ten minutes. Some military critics aver that the execution thus accomplished was greater than by more rapid discharges. It did not appear at the close of the day that such an opinion was well founded. The British fire on the 18th was by no means so destructive as on the preceding day. The Russians had improved, and their fire was unremitting and terrible; their Flagstaff Battery enfiladed the British lines, and it required all the energy and heroism of the sailors and soldiers to stand to their guns. The Jack-tars emulated their own courage and usefulness of the day before, and they found in Captain Peel a commander to their taste. Perhaps it might in truth be said, that no man in any of the armies engaged on either day exposed his person so rashly as this dauntless man. His conduct, in this respect, would be deserving of censure, were it not that it powerfully stimulated the energy and daring of his crew. Lord Raglan, in his despatch, affirmed that the Russians responded to the British fire, although "*in a somewhat less degree.*" It seems presumptuous to correct the despatches of a commander-in-chief, but in this instance it is necessary to historical truth to do so. All witnesses, civilians and soldiers, amateurs and combatants, aver that the fire of the Russians on the 18th was heavier than that of the British, and also more powerful than their own fire of the preceding day. During the night of the 17th, six of the largest guns from the Russian ships were

placed on their works, and a number of their lighter guns removed for others of larger calibre. The aim of the Russians was excellent; their shot whistled through the embrasures of the British batteries continuously, and not always innocuously. Lord Raglan ordered red-hot shot to be fired, and carcasses to be thrown into the town, and good effect followed these measures; as the furnaces for heating the red-hot shot were brought up, the enemy directed a heavy but ineffectual fire upon the road which led from the camp. Lieutenant Peard, who was on duty twenty-four hours in the trenches, including the day and succeeding night of the 18th, and early morning of the 19th, describes what may be called life in the trenches upon that day, in the following terms:—"The full power of the sun's rays came upon us, and there was nothing to protect us from them but a few gabions and fascines, which we piled up in front of us; our men were all lying in the trench, using the embankment as their pillow, when a round-shot struck it, and sent almost a ton of soil and sand on the top of them. Some two or three were on their backs fast asleep, with their mouths open: these were completely covered up, and almost smothered. The sappers were now busily employed in making the magazines larger, and others were laying a platform for a mortar, which was opened that day, but without much effect. It was placed close to us, and we were nearly stunned when it was fired." The canister-shot used (about the size of a tennis-ball), did more execution on this day in the English trenches than either shell or cannon-ball, so far as the infliction of death or wounds was concerned.

The French made great attempts to assist the English by re-opening the batteries on their extreme right, but the light brass guns were borne down by the crashing balls of the Russian ship-artillery. Shells were also poured into the French trenches, and an explosion, as on the day before, paralysed all further efforts. The French right, however, was not silenced until the Flagstaff Battery was much disfigured. About ten o'clock, the Russian army in the field (referred to by Prince Menschikoff, in the despatch already quoted) approached, under cover of a fog, and were creeping up towards Balaklava, when they were fortunately descried. The Turks detected their approach, and opened fire upon them from a redoubt. Lord Raglan and staff galloped towards the firing, followed by strong detachments of French. The British cavalry also sounded to horse, but before they arrived, the Russians retreated. Several shot were plunged into their masses from the redoubt garrisoned by the Turks. At three o'clock, Mr. Russell, in his journal, recorded—"the

Russians are pressing us very sore, return three shots for our two." At this juncture Colonel Hood, of the Guards, was killed; was on duty in the trenches, and met death from the explosion of a shell. He was not the only gallant officer who fell that day in the trenches.

The British riflemen were destructive to the enemy's gunners; lying down in front of the batteries, at a considerable distance, wherever they could obtain cover, they watched the appearance of a Russian head or hand above the earthworks, and which, in a great majority of cases, was instantly hit by a Minié bullet. The Russians at last threw out skirmishers in opposition; the two parties met in the quarries, the British having the advantage until the ammunition ran short, when, taking up the loose stones which lay in heaps around the trenches, they "pelted" the Russians, who, for a few moments seemed struck with astonishment, whether as a point of honour, or from surprise, or because their ammunition also failed, then imitated the men of the British Rifle Brigade and threw stones in return. The scene was amusing, especially to observers on our side, as the Russians were but feeble opponents at stone-throwing, and soon fled, abandoning the quarry to their antagonists, who held it until more ammunition was obtained. Mr. Russell refers to this incident in his journal as occurring on the 19th; but Mr. Peard, who had better opportunities of knowing, having seen the transaction, relates it as having occurred on the second day of the bombardment. About half-past three o'clock an explosion near the Redoubt dismounted several Russian guns, and gave the British a seasonable advantage. When evening closed, the battle might be fairly considered a drawn one—the French were the chief sufferers; the British batteries maintained their character for great solidity, and in loss of men the disadvantage was on the side of the Russians. Night brought quietude; and the Russian sappers and artillerymen it brought to repose, for their places were taken by civilians and drilled dock-labourers in the works, who were fresh to carry on the necessary repairs while the sleeping sailors and gunners were re-invigorating for the toils of renewed combat. There was, however, but little rest for the British: those who fought by day had, in many cases, to watch and work by night, and inadequate were their numbers to their undertakings. Never did a few brave men bear up against such odds, and seem so strong of heart.

During the night of the 18th few shots were fired on either side; it was spent in repairing the damages incurred. On the afternoon of that day, British ships reconnoitred the sea defences, and perceived that whatever destruc-

tion of life the artillerymen and sailors of the garrison suffered, no great mischief was done to the forts. They bore evident traces of the struggle, and were much defaced; it was estimated, however, that an outlay of some twenty or thirty thousand pounds would restore the fortresses to their original beauty and completeness, while, for the purposes of defence, they were still as formidable as ever. All chance of making an impression upon them by the fleets was evidently lost. It would be necessary to have a new fleet of gun-boats, and to send in some larger vessels as sacrifices, in order to make any serious impression. The bold scheme of sinking the ships across the entrance to the harbour effectually thwarted the navies of the Western powers. It was resolved by the admirals to give up all attempts to force the harbour, or bombard its fortifications.

The morning of the nineteenth dawned softly and serenely upon the combatants, and the fire on both sides was renewed. The French were still inefficient; they made powerful efforts during the night to prepare new batteries near to the English lines, and they re-mounted a considerable number of brass guns, such as proved so inefficacious on the previous days. These were served with great skill when they were directed upon the enemy, but neither skill nor bravery availed—the pieces were too light, and went down with the works on which they rested beneath the ponderous metal of the foe. Not so the English, they returned the fire of the Russians as skillfully and bravely and energetically as their allies, but their cannon were of the right sort, and answered heavy stroke for heavy stroke against the battlements of their enemy. Very early on the 19th the English, however, suffered from want of ammunition. The skill of the officers in actual conflict was such as the nation might be proud of—it almost equalled their unsurpassed and unsurpassable heroism; but *out of battle* the imperfection of all the arrangements forced itself upon non-professional observers, and was the subject of keen and mortifying comment among the men. The almost superhuman exertions of the soldiers and sailors, and their officers, made up for recent deficiencies, but could not supply the want of either bread for themselves or powder for their guns. Yet, even in the latter respect, much of the bad arrangement was nullified by the prodigious labour and romantic carriage of the British. A young artillery officer, named Maxwell, was foremost amongst those who endured toil, surmounted difficulty, and incurred danger. “The valley of death,” as the road was called, by which *matériel* was conveyed to the trenches, was repeatedly traversed by him with the greatest coolness, to bring up

ammunition; a spell seemed around his life—as if Death levelled his dart in vain at the supremely brave. The road which he passed and re-passed with impunity was called “the valley of death,” because of the unremitting fire which the enemy kept up, to prevent the supply of what the sailors quaintly called “gun fodder.” Some very heavy artillery was added to the English attack in the early morning of this day, and other pieces were ordered, but the difficulty of getting them up was too great for the overtaken men. The energy of the sailors during the 19th, was in character with their exertions the two previous days, and it might be truly said of them they won “golden opinions from all sorts of men.”

The death of Lieutenant-colonel Alexander, of the Royal Engineers, caused regret throughout the whole army. Captain Gordon succeeded him, and his place on the left attack was taken by Major Tylden, one of the best officers in that department of her majesty's service. The engineer department was not filled by officers of the rank and experience which ought to be possessed by men holding these important positions; the abilities which many of them displayed prevented any injurious effects from this circumstance, but the Commander-in-chief at home was seriously responsible for the deficiency in number and seniority of the engineer officers employed at this juncture of the siege. There was but little wind throughout the day, and the smoke, in consequence, settled upon the bastions and earthworks, and filled the trenches, blinding the gunners and covering parties on both sides, and impeding the precision of their mutual fire. The calmness of the day was very serviceable to the besieged, for in the afternoon the town was on fire, the bombs from the British batteries having ignited some military stores, the conflagration spread to the neighbouring buildings. The garrison succeeded in extinguishing the flames.

A new weapon of destruction was now used by the British. No army is so famous for its rocket practice; this was well proved during the Peninsular and German campaigns of the last great war; and much hope was entertained from the play of these missiles upon Sebastopol. The hope was to a great extent disappointed, but still mischief was inflicted upon the enemy in a new form, and tending to disconcert their troops by its novelty, and the alarm excited among the inhabitants. To these rockets the firing of the town was in part attributable; it was expected that the dockyard buildings, and even the ships, would be ignited, but these expectations were not realised.

The Lancaster guns were very effective on this day; the most contrary accounts arrived

in England concerning their value as weapons of offence; the men began to like them better, and to work them more accurately; still their aim was erratic. Persons who seated on the Picket-hill looked down upon the combat, described the Russian civilians as moving about the town most audaciously until the rockets came into play, when the streets were emptied of all persons, except the soldiers passing to and from their posts. Sometimes these rockets would drop among a group of persons conversing, and, suddenly exploding, would fall in showers of fire, well calculated to spread alarm. Rifle conflicts, similar to those of the previous day, were renewed on this, and the victory was signally on the side of the British. They proved much better marksmen than the sharpshooters of the enemy; and many of the gunners fell upon the ramparts of the defence, pierced through the head by the Minié rifle ball. On the night of the 19th, the defenders worked with the most sedulous industry, so as by morning to have nearly finished new works to protect the ordnance stores and buildings, which the English had shown so much anxiety to demolish. When day dawned, these new works were not deserted by the workmen, who continued their labour, not only until the British batteries opened, but worked on under fire with intense energy, and a dogged pertinacity not interrupted by the balls, shells, and rockets of their assailants. During the 20th, the conflict raged as before: our allies did little to help us—our enemies much to resist us; and our brave men did everything that the brave could do under circumstances so adverse. The two 68-pounders brought up the night before did good service, and two others dragged up during the day proved of equal value. The heavy shot from these guns fell with crushing power upon the embrasures of the enemy's works, killing the artillerymen, smashing gun apparatus, and driving up the material of the earthworks as if they were scattered by shells. The precision with which these new guns played upon the defence was beautiful, at all events to the military eye.

On this day the artillerymen at last began to show signs of weariness and weakness; some of them fell down under the guns they were serving, their strength utterly exhausted; others slept while the roar of artillery filled the affrighted air, and missiles scattered the earth over them as they sank into profound and overpowering sleep. The horses of the artillery and baggage, engaged in bringing up ammunition and various other supplies to the trenches, were put upon short allowance; there was no hay for them, although plenty still existed at Balaklava, and a few pounds of barley furnished their rations. All around the shores of the Black Sea, fodder was

to be procured in abundance, and the idle fleets floated at the Katcha, in their safety and beauty, like swans in the evening seeking the reeds of the secluded margin of a lake, but no effort was made, by general or admiral, to feed the horses—a duty of the uttermost importance, but which no one seemed to feel, and which appeared to belong to no one's range of obligation.

The news of the sudden capture of Sebastopol, which had arrived in England, quickly following the tidings of the battle of the Alma, had reached the camp, and gradually circulated through the army; it was this day the subject of general conversation, even in the trenches and under fire, and produced a depressing influence upon the men, as leading them to feel that more was expected in England than it was possible to perform, and that the reinforcements and supplies so desperately needed would not be sent. The government and the commander-in-chief have been frequently excused in reference to the destitution of the army, and the starvation of the horses ultimately, on the plea that the severity of winter bid defiance to ministerial skill and official foresight; but now, so early as the 17th of October, the sea was open, the land unfrozen, the weather magnificently fine, but there was scarcely food for the horses; the men of the artillery had only five hours rest out of the twenty-four, and the infantry eight. Had the force actually in the Heracleian peninsula been well handled, and urgent requests made by the general-in-chief for supplies of men and material to his government, or for Turkish troops and food supplies to the British ambassador at Constantinople, all this misery might have been prevented, and the nation saved the lives of some of its bravest sons, and of millions sterling in property.

During the 20th, the Russians experienced considerable loss from the balls and shells of the English. The latter only lost three men, but between thirty and forty were wounded, some fatally. The French, although of no use to their allies, were good marks for their enemies, and they suffered more than the English, upon whom all the battle devolved. The state of the French batteries was much commented upon throughout the camp—all sympathising on account of the chagrin our allies must have experienced in not sharing in the honour of the fight, but many murmuring at the defective arrangements which led to such a state of things.

At this time a rumour circulated through the English camp, which increased the dissatisfaction. It was to the effect that General Canrobert had command of the French fleet, as well as of the French army, and that by his interference the arrangements of both admirals

were paralysed. A distinguished British general, who himself had high naval authority for what he wrote, gave to the author the following account, while these pages were passing through the press :—"The *on dit* amongst naval men in the Crimea, with regard to the bombardment of the 17th October, 1854, was, that an arrangement was unanimously made, at a meeting on the 16th, of the French and English admirals and captains, to the effect that the English fleet should attack the forts on the northern side of the harbour; the French fleet the same on the southern side. The English fleet to pass down from its anchorage off the Katcha by single ships, the flag-ship leading, and having delivered broadsides, to move on in a circular course, and be succeeded by another, and so on in succession, each ship coming into action again as often as the duration of daylight would admit. Everything was so arranged for this mode of attack on the following morning. But before daybreak on the 17th (the day of the action), French officers arrived on board the *Britannia*, the English flagship, with request that the arrangement, as above determined on, should be altered, in consequence of an order to that effect from the French military commander-in-chief,—for the French fleet was actually subject to the orders of the military chief. As the order of General Canrobert was peremptory, the French naval commander-in-chief had no option. And this, in fact, virtually imposed a necessity on the English naval chief to conform to it. But it hence became indispensable to acquaint the English captains of ships that the whole plan adopted on the previous day was to be altered. Delay, therefore, became inevitable, to enable the captains to be called together, and be made acquainted with the new plan of attack ordered by General Canrobert. It was, moreover, a bad calm, and a long time was occupied in ringing the heads of the line-of-battle ships to the intended direction. The whole of them were sailing vessels, with the exception of one—the *Agamemnon*—which is a screw steamer of the first class. The *Sanspareil* is so a steamer, but so defective as to her machines, that she was little to be depended on for self-propulsion. The sailing line-of-battle ships had each a steamer lashed along their sides. The distance of the Katcha anchorage from the entrance to the harbour of Sebastopol is four miles. The French (of which four were steamers) were already, and had been for some time, off and within Kamiesch Bay, at three miles distance from the harbour. And their headmost ships were enabled to get into action some time earlier than the English, but at a very long range. The arrangement proposed and agreed to by the commander-in-chief (it is said) of the English fleet was, that the

allied fleet should form a line across the harbour mouth. Accordingly, as the ships got to their stations, they were to anchor. When the line was completed, the *Britannia* was on the right of the British fleet. The French steamer, the *Napoléon*, was on the left of the French fleet. These two ships were within pistol-shot of each other, in front of the mouth of the harbour; and, though 1500 yards distant, exposed to a destructive cross-fire from the north and south forts, and being armed with 32-pounders our fire was effective. The line from before Fort Constantine was so short, that the ships were almost touching each other. The guns of the forts were of equal or greater calibre. The fire from the whole allied line commenced at half-past one, and continued till after dark, when objects were no longer distinguishable. All the English fleet, except the *Agamemnon*, had sent one-third of their crews on shore, to form the naval artillery brigade. These men detached were the *élite* of the crews. The consequence was, that after the action a good deal of difficulty took place in weighing anchors: and this was a serious objection to the plan ordered by the French military chief."

About nine o'clock on the night of the 20th, a general alarm was spread through the lines: the Turkish infantry in the redoubts, in the plains of the Tchernaya, or, as some call it, the valley of Balaklava, fired several discharges of musketry, and it was presumed that the Russians were advancing in force in that direction. Bombs and cannon speedily emitted their fiery contents, and the hill-side flashed with the repeated discharges. Mr. Russell thus describes the cause of the disturbance :—"The Turkish musketry was directed upon some Cossacks, and the batteries had mistaken the preparations for chibouque lighting of a Turkish advanced picket for flashes of musketry, and blazed away—fortunately in the thick darkness of the night, having given their guns sufficient elevation for the shells to pass harmlessly over the heads of our astonished allies, and burst far beyond."

The Garden Battery tormented both British and French, and the shells produced much havoc in the French trenches.

During the night of the 20th, about 2000 French were employed in preparing a heavy twelve-gun battery; the Russians came to know what was going forward, and made a very bold and skilful sortie, and by calling out "*Ingles! Ingles! ne tirez pas, nous sommes Ingles!*" they deceived the French, and leaping into the trenches, spiked two mortars. The French, with their characteristic presence of mind and quickness, soon recovered from their surprise, and bayoneted several of the Russians upon the mortars they had spiked, and drove the

rest from the trenches, directing a volley upon them as they fled; several prisoners remained in the hands of our allies, of whom nearly all were wounded. The battery was completed, and opened successfully upon the enemy, but was silenced as the day advanced by the heavy fire of the Russians, who fired slowly but with good aim; indeed, they appeared to be deficient in ammunition the greater part of the day. The French sappers worked with indefatigable toil and courage the whole of the 20th and the following night, and the morning of the 21st.

During the 21st the French perseveringly pushed on their zigzag approaches, in spite of the enemy's fire, and made desperate efforts to prepare new batteries closer to the hostile lines, and in more advantageous positions. The British sustained, as on the previous days, the weight of the attack, and received the chief fire of the defence. The two Lancaster guns were removed, being no longer serviceable. The shells, rockets, and red-hot shot of the English did much damage during the afternoon, and set fire to the town in the direction behind the Redan. In about three quarters of an hour the town was again in flames near the same place; very little damage seemed to be done by these fires as viewed from the British positions; but it was afterwards ascertained that the first of them did great mischief, setting fire to the hospital, and causing the loss of many lives among the sick and wounded. An officer of General Cathcart's division, recording the events of this day, says, "We all became wearied with the sameness of our work as well as with its fatigue, and with the monotonous roar of the cannon. Often have I sat upon the Picket-hill and watched the cannonade until my head ached, and longed for any more vigorous course of action which promised a speedy termination to the existing state of things."

The Russians had now completed a new work behind the Redan, to protect the Arsenal and government stores. The second division suffered a good deal of annoyance from a very heavy gun got up by the enemy towards Inkerman. To meet this a battery was erected, on the night of the 21st, for two 18-pounders on the British heights above Inkerman. The construction of this battery did no credit to our engineers or sappers; it was imperfect for the object intended, too slightly built, without any breastwork; it was thirty feet long and eight feet high; no *banquette* for the troops to fire from with musketry was formed, an omission fatal in its consequences; it was called the Sand-bag Battery.

On this night several of our sappers went astray, and also some men of the artillery; for, although the night was beautifully fine, a mist fell like a veil, after sunset, over the opposing

lines. There appeared to be a great want of intelligent precaution in the engineer and staff arrangements, for, even in the daylight, officers and men were continually missing the positions assigned to them. The correspondent of the *Morning Herald*, noticing this fact, accounts for its frequent recurrence during the whole siege in the following terms:—"The necessary working parties in command of a field-officer were told off for trench duty, and proceeded at dusk to the slopes overlooking the town. Here, after wandering about for some time, the whole party returned to camp as they went. The engineers were unable to find in the dark the lines they had traced for the batteries during the day; thus twenty-four hours were lost. As, during the course of the siege, many ridiculous accidents of an almost similar nature occurred—accidents by which both men and officers lost their lives and were taken prisoners, it will not, perhaps, be amiss to contrast our mode of operations in this respect with those of our gallant allies. Three or four days before the nature of the attack had been decided upon, their engineer officers set to work and took a perfect survey of the ground round the south of Sebastopol. In this plan the conspicuous heights received arbitrary names, by which they were immediately known through the French camp; and the bearings of the heights from the principal buildings in the town of Sebastopol were correctly laid down. The French took their plans with theodolites; the English had no theodolites with them. The French plans were immediately copied on a large scale, and given to the officers in command of working parties. With such clear charts before them they knew instantly the nature of the ground they would have to defend, and by having the names and bearings of the hills, it was impossible for them to lose their way. To avoid the latter absurd mistake, which was constantly happening to our own troops, the French adopted the very simple expedient of marking the paths to the batteries with a row of white stones on each side. These were not so large as to attract the enemy's attention, yet sufficiently so to prevent even strangers on dark nights from getting out of the route to the trenches. Even at the English engineers' office there was no general plan of the English and French attacks with the Russian defences. The plans that were in the office could hardly be called easily accessible to the officers in command of working parties. They, therefore, went to their posts almost in entire ignorance of the points most likely to be assailed, and those which it was most important to defend. To this hour ninety-nine out of a hundred of our officers in the Crimea have seen no detailed plan of our own trenches, and certainly none of

the French. They were always in ignorance of how far the works of their allies could be successfully attacked, and consequently how far such a success would jeopardise their own batteries. It is quite true that any English officer who applied to the French authorities could always receive a pass by means of which he was permitted to inspect the French works during the day for which the order was issued. But it was hardly to be expected that officers who passed two-thirds of their time in our own trenches, would devote the short period they had for rest in acquiring a knowledge of the French works at the risk of their lives. The result of their ignorance was, that for the first month or six weeks of the siege, it was a matter of common occurrence for our men to miss their way, and either lose the night before they found it, or get shot or taken prisoners by the enemy. The officers of the different trench guards, who had to post the out-sentries in front of the parallels, suffered so severely from want of knowledge of the ground, that the duty was at last considered as the most dangerous that could fall to their lot."

His Royal Highness Prince Edward of Saxe-Weimar was wounded in the trenches while assisting in the Sailors' Battery. He had displayed great courage, and won the hearts of the rough sailors who cheerfully obeyed his commands, declaring that he could fight like a Briton.

Before the fire of the 21st ceased, a deserter made his way by some means into the English lines, and stated that their red-hot shot had destroyed a small steamer. His testimony was afterwards found to be true. The English fire told severely this day upon the Redan, which had only three guns "alive" in the evening. The fire of the Russians evidently slackened, and had the English batteries been well supplied with ammunition, the Redan would probably have been silenced, and some serious impression made upon the batteries of the Garden and Round Tower. Our sailors complained of the smallness of the embrasures in the new 68-pounder battery; and both sailors and artillerymen complained much of the smallness of the chambers in the trenches used as magazines. Our sappers seemed to feel some discouragement from these complaints. Notwithstanding the effect produced upon the Redan, a general misgiving as to the scientific fitness of the plan of attack prevailed throughout both armies. The French laid the blame of the plan adopted upon General Burgoyne, the English upon the chief of the French engineer staff; but there were many in both armies who placed it to the account of Lord Raglan, to whom, it was alleged, General Canrobert was too deferential; while others said

that Lord Raglan allowed his own superior judgment to be overborne by his more forward and less experienced colleague. Mr. Wood presents the following remarks on this subject:—"The nature of Sir John Burgoyne's plan, which was rejected *nem con.* at the council of the 7th, has, I believe, never transpired; but it was impossible that it could have been framed upon more erroneous grounds than the one adopted on the 8th. Rightfully or not, the blame due to the latter was always bestowed upon General Bizou, the French *chef-de-génie*. According to his view (if it really was his view), the Flagstaff Battery was the vulnerable point of Sebastopol—the key of the whole position. Upon that and the surrounding works the real attack was to be pressed by the French on the left; the Malakoff and the Redan were works of no moment as regarded the event of the siege. The English batteries were to engage them at long range, but more to divert the enemy's attention and keep down the fire. This fatal error in the plan of attack was one which lasted throughout the winter, and until the arrival of the English engineer general, General Jones. By it the Russian positions in the Redan and Malakoff were left comparatively uninjured, and as the enemy never fell into the mistake of believing that the Flagstaff was the key of their position, but knew, on the contrary, that the fate of the whole place hung on the Malakoff, they were enabled at leisure to strengthen the latter to an extent which almost surpasses belief, and which has certainly never been witnessed before in the annals of warfare."

During the night of the 21st, the 68-pounders were taken down from the Five-gun Battery to the right attack, except one, which fell over, rolling down the hill and killing several of the horses. Almost the last thing which happened this night was the capture of Lord Dunkellin, who was going to the trenches with a working party, but lost his way, and was taken prisoner, further exemplifying the mischief which arose from the imperfect information concerning the general plans of the siege possessed by the officers of the army generally. Lord Dunkellin is son of the Marquis of Clanricarde, and heir-apparent of the title. His lordship was treated kindly by the Russians, and was soon after exchanged. Being near-sighted, as well as very imperfectly acquainted with the positions of the batteries, he almost wandered into the enemy's lines.

The interest of this day was not confined to the trenches. Early in the afternoon a large force of the enemy suddenly appeared in front of Balaklava, and manœuvred there in such a way as to keep its garrison in great suspense. The Tunisians, from their advanced position, exchanged shots with the Russians. The cavalry

division was sounded to horse, and the 93rd Highlanders in the valley, and the Turks and marines on the heights, were under arms the remainder of the day. In the evening the assailants retired slowly, and in a confident manner, as if relying upon a strong support. They fell back in the direction of Traktar, and halted on the slopes ascending from the Baidar valley. On this spot they bivouaced for the night, to the number of about 5000 men and three troops of horse-artillery. Sir Colin Campbell, suspecting that this was in reality the advance-guard of a numerous body designed for a night attack, caused the troops to remain under arms, or to lie down in their ranks in their great coats, without bivouac fires. The cavalry also remained booted and spurred, with horses saddled, ready to turn out at a moment's notice. The correspondent of the *Morning Herald*, who has obtained so justly a celebrity for his accurate information, remarks upon these necessary precautions—"Though the latter step (remaining without bivouac fires) was adopted to prevent the enemy ascertaining the weakness of the numbers that held the position, the necessity for contracting the line seems not to have entered the heads of the English chiefs. Perhaps this is to be accounted for by the great importance General Airey attached to the possession of the Woronzoff Road, and which he still persisted in believing was one of the only two routes which communicated with the town. But this which, if true, would have been a sufficient reason for holding the road, would also have justified its being held in strength. Still no attempt was made to reinforce the 250 Turks who garrisoned the redoubts, or to advance supports nearer than a mile and a half, to what all saw must of necessity be the first point attacked."

As the work published by the writer of the above extract has obtained such extensive circulation, it is necessary to make some strictures upon this quotation. However dull Lord Raglan and General Airey may have been, it was scarcely possible for them to reinforce the redoubts, or send supports nearer to them than the positions occupied by the cavalry brigades, from the paucity of men in the British army. The troops were drooping from fatigue and over-work, and could not have any additional labour imposed upon them. Neither could detachments be spared by General Canrobert. The dilatoriness of the commanders in ordering up reinforcements was the true cause of these shortcomings, and this arose from the want of information as to the number and resources of the enemy, and the want of any organised system by which it might be obtained. General Airey and his chief, upon whom the responsibility ultimately

rests, were wrong in attempting to hold so extended a position with such an inferior force, notwithstanding the importance of commanding the Woronzoff Road. The battle of Balaklava, unhappily, too soon demonstrated this. The animadversions upon General Airey's obstinacy in believing that the Russians had no other roads to Sebastopol, arose from the hallucination under which the correspondent laboured, that there was a road from Inkerman along the southern shore of the harbour. He does not seem to be aware that General Airey came at last to agree with that opinion. It was utterly groundless. No officer had so good an opportunity of forming a tolerably clear conjecture on this matter as Lieutenant-general Sir de Lacy Evans, whose division being placed on the extreme right of the English lines, and nearest to Inkerman, would, both by what they saw and heard, have some suspicion of the existence of such a mode of ingress to the city. The general has, in conversation with the writer of these pages, positively declared that no such road ever existed. William Upton, Esq., assistant engineer to his father, Colonel Upton, who constructed the Docks, must have known if such a road existed previously to the siege: he has assured the author that there did not, and is of opinion that the obstacles to its construction were such as to render it improbable in the extreme, if not impossible, that such a work had been afterwards accomplished. On the 486th page of this History, other evidence is afforded against the opinion entertained by the *Herald's* correspondent, and which General Airey, after so long and so sensibly resisting, at last adopted.

After General Evans discovered and cut the pipes by which water was conducted to Sebastopol, the great aqueduct was made a mode of entrance and exit to the city—at least so deserters alleged. The pipes were discovered only a few inches beneath the surface of the ground, close to the house where Lord Raglan held his quarters; but this did not cut off a supply of water from the garrison, who drew it from seven wells at the head of the harbour, and which the British commander-in-chief permitted to be done without any effort to prevent it, although perfectly within range of his fire, had he chosen to plant a long gun in a position to command them. The cutting off the water-course, by leaving the aqueduct dry, left a good passage for troops destined to attack, and perhaps surprise, General Evans' position. So circumstantial was the correspondent of the *Herald* on the subject of this road, that in his volumes containing a revised edition of his letters, he thus wrote:—"The momentous question was long in doubt. No one believed but that the Russians had a road along the

south shore, or would soon make one. General Airey, who was bound by the duties of his position to know the roads, was consulted. He said that decidedly no road existed along the south shore. He afterwards went further, and said that from the natural obstacles, such as ravines, rocks, &c., it was impossible to make one. The truth was, that the road had been making for some considerable time, and was publicly opened and used for traffic nearly four months before the allies invested the south side of the town." Wheresoever this generally careful writer obtained this information, it was, in all its circumstances and details, untrue.

As questions connected with the docks, canals, and aqueducts, and in relation to the other topics referred to in the foregoing extracts, will frequently arise in the history of the siege, it will facilitate their discussion, and enable our readers to approach them more familiarly, if we here refer to the aqueducts and docks more particularly than in the general description of Sebastopol, already given, it was possible to do. The following is taken from the *Moniteur de la Flotte*:—"The canal or grand aqueduct of Sebastopol was about twelve versts in length. Its width was six feet, and its mean depth seven feet and a half. It commenced above the bridge of Traktar, skirted in a straight line that celebrated plain, and passed at the foot of the hills occupied by our army. It traversed part of Careening Bay, on a succession of small stone arches, which gave it the appearance of a Roman aqueduct. At its entrance into Sebastopol were several extensive works. The latter only were blown up, the destruction of the remainder being perfectly useless. The aqueduct of Sebastopol was intended to convey the water of the Tchernaya to the docks. The port of Sebastopol properly speaking, also called the Southern Port, or Bay of the Arsenal, is situate at the distance of 1550 yards from the entrance of the roads, and on the southern bank. It is upwards of 2000 yards in length. On the eastern side of the port, about 2000 yards from its entrance, opens the bay, at the extremity of which were six wet docks for ships of the line, constructed with stone or granite, on the plan of those of the military ports of England and France. They communicated with the sea by means of two magnificent sluice gates, which were opened to admit war vessels requiring repairs. The ship being once placed on the graving dock, the gates were closed, the basin was drained by means of an engine, and the carpenters and others could then set at work. This operation was effected in the most regular manner. The canal of the Tchernaya afterwards served to fill the dock and float the ships when the repairs were completed. The six wet docks were placed on one line, two by

two, parallel with each other. The last two, situate nearest the wall separating the town from the suburb of Karabelnaia, were, according to a plan proposed by Admiral Istomine, who was killed during the siege, to be lengthened, and appropriated to screw ships. Those basins and the Tchernaya canal had been constructed by a French engineer, M. de Riancourt. There was another hydraulic work which was destroyed during the siege, namely, the subterranean aqueduct, supplying the great reservoir and the fountains of Sebastopol with water, issuing from a spring about five versts from the city. This aqueduct was constructed by an English engineer, Mr. Upton, to whom it does great honour, and whose family still inhabit the Crimea."

A gentleman alluded to by the *Moniteur de la Flotte*, has drawn up for the author the following account of these stupendous works, which have conferred upon their author a world-wide renown:—

"The Sebastopol dry docks were approved for construction by the emperor in the year 1831 (the necessity for them having been pointed out by the then commander-in-chief of the Black Sea fleet and ports, Admiral Greig, a Scotchman of great scientific attainments, both as an engineer and astronomer), at which time a committee was appointed under the presidency of a Major-general Berg, with two other members; one for conducting the accounts, called the scientific member; and the other for providing materials, making contracts, &c., called the economical member; besides which there was a secretary, with assistants, treasurer, numerous clerks, &c. The entire superintendence and responsibility for the construction of the works, the demanding, certifying, and issuing of the necessary materials, formed the exclusive duty of the builder, Mr. Upton; who was also the projector, to whom was attached an assistant, and an efficient staff of engineer officers.

"The formation of the canal from the village of Chovguna to the docks, was commenced in the year 1832. But for the first two years little was done at the docks themselves. However, in the year 1837, when the emperor visited them for the first time, the docks were in such a state of forwardness that he saw the superiority of their construction over those at Cronstadt, and exclaimed, 'Ah, I see the mistake we have made, we have no inverted arch.' He complimented the builder at each fresh surprise, seizing him by the hand, and calling to his attendants, '*C'est magnifique!*' He afterwards expressed a wish to the commander-in-chief, Admiral Lazarev, that Mr. Upton should enter the corps of hydraulic engineers, which he consented to do, as a field-officer. Consequently he became a lieutenant-colonel, and was

afterwards promoted to the rank of colonel, and decorated with the orders of Stanislaus and St. Anne, of the second class.

"The docks were constructed at such an elevation above the level of the sea, that the water could be filled in them and the basin to thirty feet above that level; the walls being elevated four feet six inches above the height of the water. The absence of tide in the Black Sea caused this to be the most advantageous system that could have been adopted; as after a ship had been taken into dock, there was no leakage to pump out, or interfere with the repair of vessels. Three locks were necessary to raise the vessel to the height required, with a rise of ten feet to each. The openings at the gates of the locks, and two docks for ships of 120 guns, were sixty-four feet. For one eighty-four-gun ship dock, fifty-four feet; and for two frigate docks, forty-five feet. These dimensions were given by the authorities at the commencement, and were afterwards found too small for the class of vessels required; but as two docks for ships of 120 guns were made instead of one, as originally intended, this evil was in some measure obviated. The arrangement of the docks was thus:—a frigate dock on each side of the upper lock; then the basin; and the three remaining docks on the opposite side of it. The gates, nine pair in number, were undertaken by Messrs. George and Sir John Rennie, at their establishment in London. The builder's assistant, Mr. William Upton, having been sent over by the Russian government in the years 1843-1845, with the necessary drawings and instructions for their construction. The ribs were of cast iron, with wrought iron plating. The lock gates weighed upwards of 200 tons each pair. The nine pair cost more than £30,000, although the price was very low. They were erected by means of traversing cranes, without any accident. The heaviest heel-posts weighed eleven tons.

"The canal to supply the docks has an elevation of about sixty-six feet at the commencement. There is a fall of two feet three inches in a mile, with nine feet reserve at a reservoir near Inkerman. It runs over six stone aqueducts; the largest of which is a handsome construction of sixteen arches across the valley of Hooshakov, a pleasant resort in the summer time, as there is a capacious pavilion, surrounded by forest trees, well adapted for a dancing saloon. The canal also runs through two tunnels; the largest at Inkerman, 938 feet long, is through a limestone rock so compact, that not a single fissure was encountered, and the water was passed through it without any artificial precaution; the whole forming a solid stone trough.

"During the excavation of this tunnel, considerable doubt existed in the minds of the

inhabitants, as to the practicability of accomplishing it. Even the member of the scientific department of the committee—a colonel of engineers—gave it as his opinion that it would take ten years to accomplish it; and that it would be impossible to make the two ends meet. At each end, for the excavation, three men were employed in relays, day and night, others carrying away the refuse; and it was finished in fifteen months, long before the different prophecies concerning it had ceased. No shafts were required, as the height of the rock above was considerable, in proportion to the length of the tunnel. One of the stone aqueducts, of eleven arches, meets the tunnel, and conveys the water to it, across a valley having a perpendicular rock on each side, from which the freestone, employed in the construction of the docks and public buildings at Sebastopol was taken. This stone (if not exposed to a damp saline atmosphere, or not previously absorbed in salt water, as frequently occurs in the delivery) has the property of hardening by exposure to the air, particularly all horizontal surfaces on which the rain falls, or when completely immersed in sea-water. The outer shell of the rock, from long exposure, is as hard as flint; and it was this probably that induced those who had not given the subject due consideration, to suppose the undertaking one of greater difficulty than it really was. The other tunnel is near the powder magazine, between Inkerman and the Careening Bay. It is 105 feet long, through a perpendicular rock, rising abruptly out of the water.

"The scientific members of the dock committee were frequently changed, from their continual interference with the builder, particularly before he became an officer in the Russian service. They could not understand why they had no authority over him. One of them, a major in the corps of Civil Engineers, gave in a written denunciation of the whole project, founded on what he considered philosophical reasoning. He attempted to demonstrate that the continually accumulating friction of the water against the sides of the canal, at a given distance from its commencement, would cause the water to come to a stand-still. He also discovered that the builder, from want of scientific attainments, had omitted to take into consideration the effect that capillary attraction would have in obstructing the passage of the water. In fact, he considered that you might as well attempt to carry water in a sieve, as to convey it by that canal. These insulting remarks were replied to by the builder, and forwarded to the commander-in-chief, and by him to the emperor; and the philosopher was given a new appointment somewhere in Siberia. The canal from the vicinity of the Careening Bay to the

Docks has been lately lined with stone, and a part of it tunnelled, to avoid a large mass of earth which began to slide towards the Bay. The water of this canal, before arriving at the docks, supplies the fleet. It was filtered by passing downwards through a mass of coarse sand in one division of an apparatus, and then upwards in another, containing finer sand, until it reached an outlet leading to a cistern, from whence it was conveyed by pipes to five taps at the quay. As the river Tchernaya Raitchka does not afford a sufficient supply during the heat of summer, an engine-house was erected, with two engines by Maudsley and Field, of 30-horse power each, with three pumps, to which the sea-water was admitted by a culvert; so that a vessel could be taken into dock by this means, when there was a deficiency of water in the canal. It was twelve miles long, four feet deep, twelve feet wide at the top, and four feet at the bottom. The docks were built principally of the freestone from Inkerman, backed up with rubble from the neighbourhood. For the upper course and vertical bearings of the gates, granite from the Bug was used. The first ship was taken into dock in the year 1849, but the docks were still in an unfinished state. In 1850, the largest vessel in the fleet was docked. In 1851, the builder, Colonel Upton, died, when his duties were conducted by his son and assistant, Mr. William Upton, until July, 1852, when the dock-committee was annulled; and what remained was entrusted to the Russian engineers. In the year 1853, in consequence of the vessels being increased by the adaptation of the screw, it was decided to make an alteration in the locks, to increase their length. On which occasion the Russian government availed itself of the superior judgment of Mr. Walker, the English engineer. The expense of the docks exceeded, it is thought, £1,500,000, but this sum was much increased by the delay in assigning money, in consequence of which, the pumping water, salaries of the numerous officers and artisans, &c., were incurred for a longer time than was necessary."

Before dawn of the 22nd, a transport arrived with shot and shell, which gave confidence to the men, who saw with uneasiness the failure of the ammunition—the supplies of which were, in common with all other arrangements, regulated by the presumption that Sebastopol would fall in a few days, or at farthest, in a few weeks. The mis-calculations of Menshikoff as to keeping the heights of Alma were not more presumptuous than those of the allies as to the capture of Sebastopol.

The morning of the 22nd opened with some encouragement to the English; their allies had brought about twenty guns into action; the fire of the enemy was slack, it was believed

from want of ammunition. Their batteries, however, seemed thoroughly repaired, while the British retained the gaps and derangements caused by the heavy fire they had sustained. The men were too few and too fatigued to repair the damage. The French not only drew upon themselves some portion of the enemy's fire, but the practice of their artillery was good, and not a few Russians fell by their guns. The British and French rifles harassed the Russian sailors and artillerymen, by firing at them through their embrasures from the broken ground in front. Many men fell in the Malakoff and Redan from this cause. As the day advanced, this rifle practice became sharper; and so close did our men advance, and so well was their aim directed into the embrasures of the Malakoff especially, that the garrison sent out skirmishers to dislodge them. This drew away the attention of our sharp-shooters from the embrasures to the Russian riflemen, and a severe combat occurred, in which our men greatly overmatched their opponents in aim, rapidity of movement, and individual courage. The Russian sharp-shooters, powerfully reinforced by troops of the line, pushed on to the covers from which our men fired, who used their rifles with deadly skill as the enemy's infantry advanced, and then received their charge with the bayonet; countless hand-to-hand contests occurred in this way, sometimes in hollows and behind rocks, where the spaces were too small to allow of regular charges in line, and there fierce and confused combats with the but-ends of rifles and muskets took place. When the Russians retired, the batteries played upon them, and they were pursued into their works by a piercing fire from the British Rifle Brigade and the Chasseurs de Vincennes; about thirty of them lay near the contested hollows, and a still greater number before their own works. Our men complained, and with reason, of the wretched state of the ammunition, especially of the shells, the fuses of which, in many cases, would not burn.

The British lines suffered from the Russian steamer *Vladimir*, whose captain had repeatedly shown talent and enterprise throughout the war. She came up to the head of the harbour, and opened fire on the right attack, and put more than twenty men *hors de combat* before a shot could be given in reply. A large traverse was erected to oppose her, and when she found she could no longer shell the English with impunity, she hauled off. Major Tylden, whose energy and ability deserve the highest praise, placed twenty guns in position on this attack, which he directed. This did not by so many increase the fire of the preceding day, for more than half that number had been silenced before the night of the 21st. No adequate preparations had been made to silence

or injure the Russian ships; this had been unaccountably neglected since the siege commenced. During the 22nd, attempts were made to atone for this oversight; and Captain Chapman not only succeeded in repairing old traverses and platforms, but also in commencing a new battery for 32-pounders, which, being within 550 yards, was expected to do considerable execution among the shipping.

Before evening our allies, notwithstanding the hopes of vigorous co-operation with them in the morning, were again silenced, and their works cut up in every direction. A number of deserters came over in the dusk of the evening, and their report was such as to encourage the besiegers. According to them, the besieged were greatly daunted; instead of volunteering to serve in the batteries, they had to be forced thither in their turn of duty. Three thousand had been killed and wounded since the 17th. The shops were all closed, the trading community had deserted the town, having placed their goods in strong stone cellars. The deserters represented the conical balls and shells—those of the Lancasters—as doing the chief mischief. These balls, falling in the centre of the town, killed many women and children. The supplies of food were stated to be good, fresh, and abundant.

The English suffered mainly from fatigue; so complete and solid were their works, that very few lives were lost, and very few were even wounded. The principal achievement of the day was the silencing of the Barrack Battery. It annoyed our French friends, causing them great loss; and they sent a request that, if possible, the British should draw off a portion of its fire: this they did with a vengeance, for the whole battery—works, guns, and men—was dispersed before nightfall. The British were not a little pleased at rendering this service to their allies, who were always so prompt to render any assistance to them. The Garden Battery, by which the French also had suffered, received a considerable share of attention from the English artillerymen, and was much battered, and nearly silenced before darkness came to its relief. A few hours after nightfall a loud explosion occurred in the town, near the head of the great harbour. It was expected in the besieging lines that some magazine had taken fire; it was, however, occasioned by the accidental ignition of the contents of a powder waggon, while driving through the streets; some damage was done to the neighbouring buildings, and several civilians wounded; two horses were killed.

* An officer of the 20th regiment gives the following interesting account of his experience on this day. It will be seen from his narrative how badly armed his regiment was. The value of the Minié musket was never fully

appreciated until (as it may be justly said) it decided the battle of Inkerman. There was time enough to have armed the 20th, and every other regiment of the line with this weapon, instead of the old musket. Lord Hardinge, the Commander-in-chief at home, was urgent for the supply of these rifles; but he met with dissuasives and opposition on every hand, and his endeavours were to a great extent frustrated by the indomitable adherents of the old way in everything, who infest the official ranks at the Horse Guards. "I went out with Captain B——, 20th, K——, and 250 men, to a picket-house in the ravine on the left, and in advance of Chapman's Battery. It was a very pretty spot, and appeared to have been used as a tea-garden by the inhabitants of Sebastopol, as it is at a convenient distance from the town, and had gardens well laid out. There was also a beautiful spring shaded by fine trees, and a great many caves in the rock, which showed marks of fires having been lighted in them. The house was well built, with substantial walls, and large, lofty rooms; the ceilings were positively black with flies. Two poor dogs were the only remaining tenants of the house; these the soldiers treated with great kindness. How changed the quiet hamlet must have seemed to them! They must have wondered where the gentle hand that had so often fed them was gone. They still, however, occupied the door-step undisturbed, and did not seem inclined to follow us. The sappers were busily employed in taking up the floors from the rooms, for platforms of a new two-gun battery which was being made on the left of the ravine above this picket-house, about 550 yards from the inner arm of the harbour. This was intended to play upon the shipping below. From this battery we expected great things, as it was such a good distance for red-hot shot. The picket-house was full of shattered furniture, sofas, tables, and glass bookcases, which were all broken and cut to pieces. No shot, however, came near it, which was a comfort, and we sat in one of the rooms and ate our breakfast. The flies here were so numerous that we began to imagine that we were to be visited with one of the plagues of Egypt. A short distance in advance, in the valley, was a wall, which, running across, formed a protection for an advanced party, and I was sent hither with thirty men, with orders to defend it to the last. I sent out and posted my sentries some distance in front, at the turn of the ravine, just to the right of the French works; and on the return of my sergeant, he reported to have seen two Russian soldiers sitting under a tree, and to have beckoned to them to come to him, but they sat still and took no notice of his invitation. I ordered my sentries not to fire at

single men, as it would only disturb our picket; and as our men were only armed with the old "Brown Bess," and not the Minié rifle, the shot would probably have been in vain. After some little time the report of a rifle was heard, and then another, which was quickly responded to by my sentries; a brisk fire then ensued between the two parties; and finding that we should have a great disadvantage, K—— asked me to allow him to go and drive them in; and my men, hearing what was going on, came up and volunteered for this service almost to a man. I selected fourteen, with a sergeant, and gave orders that they were not to go too far. The sentries during this time were blazing away, and the French sentries had now crept up, and were beckoning to us not to advance. As soon as our men turned the corner I heard some file firing, and bullets came whizzing over our heads. Shortly after, some fieldpieces were heard, and our fellows came doubling back, quite blown, and in the greatest excitement, each with his little anecdote of what he had done. K—— told me they had driven in the Russians' picket past their picket-house, and had killed three men; but some small battery opening on them, after a great deal of difficulty he managed to make our men retire. One or two of the enemy's picket had remained in the house, and peppered them from the windows as they returned. They did not touch our men, though the grape-shot came very near them. The sentries were not again annoyed that day, but a poor fellow was brought to the house from the trenches mortally wounded, who died shortly afterwards, and was buried under a tree in the garden. At night the sentries of the 50th regiment fired into our reliefs, but did no harm."

When the troops retired at night, fires were seen in various parts of the town, and remained burning for some time; but whether caused by our rockets and redhot shot, or by accident, could not be ascertained. Sir John Burgoyne had mentioned the substantial character of the stone buildings, resisting shells and rockets, and, if ignited, burning so slowly as to give ample time to the inhabitants to extinguish the fire, as one of the difficulties of the siege. Certainly on this, as on former occasions, the garrison and inhabitants succeeded in quenching the conflagrations in a short time.

Captain Childers was killed while watching the effect of a gun which he had ordered to be discharged.

The morning of the 23rd presented the enemy's batteries and works in a state of thorough repair; it seemed as if labour and material were exhaustless within the town. Our men were rapidly reducing in number, not from the blows of the foe, for not more

than an average of fifty per day were killed and wounded; but from fatigue, salt provisions, and want of every sanitary requisite for a camp. About 700 men had been sent from the lines to Balaklava, unable to attend to duty; and of the fine army which landed in the Crimea, and the reinforcements which followed them, Mr. Russell estimated that not more than 16,000 men were fit for duty. This startling statement, published through the world by the *Times* newspaper, astonished and appalled friends and foes. The truth of this statement was officially denied in both Houses of Parliament. Lord Aberdeen, Mr. Gladstone, and Mr. Sidney Herbert, exhausted all the ingenuities of verbal artifice and subtle evasion which they could command, to convince the members and the country that the statement could not be true. Subsequent events showed that Mr. Russell was a moderate and faithful man, and by no means placed matters in their worst light. It was painful to find that the official authorities in the Crimea, conniving with those at home, wrote express denials of these statements, denouncing them as gross exaggerations, when they must have known them to have been even less than the truth. Lieutenant Peard represented the number available for good service, at the end of the 23rd of October, as less than half the number given by Mr. Russell. In fact, there were few men in the British infantry, artillery, engineers, or sappers and miners, that were not knocked up. Hardship and disease depressed them, although still their dauntless courage sustained them against every stroke of fortune. The hope of battering down the earthworks of the enemy began to give way; the men were ready to remain and die in the trenches, but they began to despair of conquering a place which every night was revived as if by magic, and was found every day stronger than on that which preceded it, notwithstanding the laborious and scientific cannonade to which it was subjected. In vain were guns dismounted, batteries broken up, or the gunners shot down through the embrasures, a single night sufficed to repair every disaster.

An impression began to prevail in England that the Russians had adopted a new system of defence—earthworks instead of masonry; and that this new system was invincible. Lieutenant-general Sir John Burgoyne, the British general of engineers, endeavoured to dispel the impressions thus popularly taken up, and his remarks will throw much light upon many incidents of the siege which were yet to follow.

"Some erroneous conceptions have gained currency of late in England (for abroad they have no idea of the kind) that the prolonged

defence of Sebastopol has been greatly due to the superiority of earthworks over those of masonry,* and the ability with which the Russian engineers have availed themselves of that discovery, as it is assumed to be. A few years ago this point was strongly advocated and warmly discussed; and now that a brilliant defence has been made at Sebastopol, and that earthworks were employed there, a deduction is endeavoured to be drawn that it is a triumphant proof of the soundness of the arguments of the supporters of that system, with which it has, however, no connexion whatever. The Russians had to raise their works of defence on a sudden emergency, and with rapidity, and they adopted, in this respect, the means employed time out of mind—namely, earthworks; and not from choice, but for the best of all possible reasons, that they were the only ones open to them; and, in fact, the great credit which is undoubtedly due to the Russians, is not for their ingenuity in employing earthworks, but for their energetic defence, notwithstanding the weakness and imperfection of such works.

“The leading arguments against masonry are, that besides its great expense, it can be battered down from a distance, and that the splinters from it are more injurious to the defenders than the shot and shells; but it must be recollected that these evils are not a necessary part of masonry works, but where they exist are usually unavoidable, either from occurring in fortifications of very old date, or in confined situations, where there is not sufficient space for the regulated course to be pursued—namely, of sinking the wall below the level of the ground, leaving the parapet of earth alone exposed to view.

“If the system of earthworks is to be taken as a modern improvement, it must be as compared with that previously established in modern times by military engineers, which implies always, as the rule, parapets of earth, and escarp walls well covered from exterior view, till only the breadth of the ditch intervenes. This at once and entirely removes the two evils above adverted to.

“One of the principal ingredients in defensive works is an obstacle to the approach of the assailants, and the best obstacle is a wall or vertical face to be surmounted. If this exceeds thirty feet in height, it becomes very formidable indeed; an escalade (which, while the wall is entire, is the only resource) is the most desperate of military undertakings, and never succeeds but by absolute surprise, or from very great weakness on the side of the

defenders. The consequence is, that it is necessary to have recourse to a breach, but, in such well-covered works, the breach can only be formed by batteries established at the edge of the ditch, and it is well known the vast increase of difficulty that the besieger finds in proportion as his approaches and batteries get nearer to the place; and, after all, the breach or breaches being made, he has only the limited extent of those openings as an ingress, whereas the earthworks present one universal breach throughout the whole extent of the place. The entrance into the place is, in fact, reduced at the breaches to what the earthen escarpments were from the commencement everywhere.

“Apply this reasoning to Sebastopol. The French, by immense efforts and sacrifices, gained lodgments at thirty yards from the ditch of the enemy's works. It is stated that the difficulties so multiplied upon them, that it would have been almost impossible for them to establish themselves nearer; and yet, had the place been fortified by the ordinary description of permanent works, it would have been necessary to place and maintain breaching batteries on the very edge of the ditch, by which openings of only a definite extent could have been made, which never could have afforded space for the heavy assaulting columns, by which alone the place was taken. The retrenchments also within the outer line would have been of the same character, and their escarpments would have been entire.

“I have not adverted to the question of opening such a place by mining from any distance. In the first place, offensive mining may be checked and impeded by an underground contest with great facility; secondly, it is extremely difficult to open a practical breach by mine; it is only to be effected by an enormous chamber and mass of powder, which would greatly increase the difficulties. Then the opening would be even more limited in extent than if effected by cannon; and if the assault is to be made from a distance, it has still all the unknown intermediate impediments to be overcome to arrive at the breach.

“The energy displayed in the defence of Sebastopol does great honour to the Russian arms; but it may be well to reduce that merit to its proper limits, and not suppose that either in skill, labour, or bravery, they surpassed the allies. Warfare is a difficult game, and, as with players at chess or whist, that general is the best who commits fewest errors.

“The siege of Sebastopol exhibited, no doubt, errors on both sides; but whilst those of French and Russians were tacitly submitted to, as of unavoidable occurrence, and amply compensated for by general merit, attention has been loudly called to innumerable lapses on the part of the British—some well-founded,

* By “works of masonry” are meant those in which the rampart of earth is supported by a wall of masonry, as in modern systems of fortification, in contra-distinction to works of earth only, where the rampart is continued at the natural slope of earth to the bottom of the ditch.

but very many emanating from the minds of critics who had no knowledge of the business of which they constituted themselves supreme judges, nor made any allowance for the circumstances of the case. For the defence of Sebastopol the enemy possessed immense advantages:—1. The positions all around it were exceedingly strong in features, and in many parts presented a very rocky soil to the attacks. It is true that it was not regularly fortified; but there were along the front substantial towers, old earthwork walls, and strong buildings that could be turned to good account against any attempt at a *coup de main*. 2. It had within it, not what could be called a garrison, but an army of not less, probably, than 25,000 men; it was, in fact, not a fortress, but an army intrenched on a very strong position, along a line of moderate extent, with its flanks perfectly secure. 3. It contained the resources of a very large naval and military arsenal—probably the largest ever collected in any one place—with those of a fully manned and equipped fleet of fifteen or sixteen sail-of-the-line, besides other vessels, which furnished, in addition to the material, not less than 10,000 good seamen gunners, quite competent to every service of batteries. 4. Over the flank, on which was decidedly the front for attack, they held the commanding ground on the opposite side of the harbour, greatly in advance of their line of defence of the south side; so that the attacking party in their approaches were taken in flank and rear for a distance of not less than 2000 yards from the place. Although the range from that side was considerable, and much cover was afforded by the undulations of the ground, still, from the circumstance, and the very great command possessed by the enemy of artillery of the heaviest nature, this advantage caused great annoyance to the allies, restricted them from availing themselves of many otherwise favourable sites for batteries and works, and acted as a powerful support to the defence. 5. The force of the allies was too small to make it possible to invest the place on both north and south sides (and there cannot be a doubt about the propriety of choosing the south); the consequence was, that the communication between the place and the country, in which they had a manœuvring army, was free and unobstructed for the whole period of the siege; the garrison could be augmented, reduced, or relieved at pleasure; every supply could be sent into it, and sick, wounded, and encumbrances removed from it at will. Nor should it be omitted, among the advantages, that the town and buildings in general, many of which were very substantial, though not absolutely incombustible, were of such a nature that no great efforts were required to prevent fires from spreading.

“The criticisms passed on the British officers and on the military proceedings in the Crimea by some individuals have been far too severe; they show a disposition, whether intended or not, utterly to disparage everything connected with the military service; in fact, the facility and brilliancy of pointing out supposititious errors, instead of the dull matter-of-fact assumption that duties may have been well performed, is very tempting.

“One mode of detraction is to advert in flaming language to the superior manner in which the Russians carry on their operations, and what superior ability and labours they have exhibited in their defence of Sebastopol. We are far from wishing to retaliate by language of disparagement on their merits; their officers and men have exerted energy, skill, and bravery, and deserve well of their country; but they also have committed their errors, and we cannot allow them to be considered as our masters in skill any more than in courage.

“We have before adverted to the credit given them for the adoption of earthworks, and shown that they had no other resource; and it would almost seem to have been a species of compulsion with them; for it is somewhat remarkable that the Russians appear to make use of exposed masonry in fortification more than the engineers of any other country. Their sea defences are almost exclusively of that description, not always on the absolute necessity of circumstances, but frequently where the shores present commanding sites, well adapted to powerful earthen batteries. But there is a still more striking proof in the very position that has given rise to the discussion. The great tower of Malakoff, of only ten years’ standing, was most injudiciously devised. It certainly would have acted as a great support against an early assault of the position, although it might have been greatly improved for that object, but against approaches and batteries it was worse than useless. It was immediately silenced, and very soon extensively breached; its ruins must have been very embarrassing, and it must have cost much labour to put the lower remnant of it in a shape to have been in any degree useful. Had the same expense and labour been applied towards the construction of a good fort or redoubt on that hill, on the modern principle, of about 700 yards interior periphery of parapet (which appears to be about the size of the work actually constructed during the siege), escarps and counterscarps revetted, earthen parapets, and *caponnières* flanking defences, and the interior with sufficient traverses and full of casemates, most certainly the attack of it would have been attended with far greater difficulties than as it actually existed; and we all know the efforts that, even

in its actual state, were required from our gallant allies to obtain possession of it. It will hardly be considered an excuse that this tower was given to the empire by the munificence of an individual whose name it bore, because, though the funds were provided by him, it was designed and constructed by the Russian military engineers.

"Then we hear a great deal of the 'gigantic' works raised by the Russians. No doubt they were gigantic, but how could they be otherwise by the labour of 25,000 men for a twelve-month? And what were the works of the allies but gigantic? If the number of miles of trenches, the batteries, and guns mounted, and the defensive works, were enumerated, the aggregate amount would appear enormous. Then the works of the Russians were of comparatively limited extent. They had a few leading points on which their greatest efforts would be concentrated, such as the Bastion Central, Bastion du Mât, the Redan, and Malakoff, &c.; each of these would naturally present a formidable aspect. The Russians, moreover, were but a short distance from, and with good roads to, their resources, which were in perfect order, and included abundance of timber; while the allies were seven, eight, and ten miles from theirs, with a great height and terrific roads intervening.

"There is some confusion in the ideas formed of the character of the Russian works. We hear of the wonderful labyrinth within them to obtain bombproof cover, and adding, as commonly supposed, to their defensive power; but this, it is apprehended, is not the case. These improvised casemates must have been very necessary and judicious, but they must have been rather an encumbrance to the defence, and quite inferior in that respect to the arrangement of the regular permanent work, as above suggested. Altogether, although we would give to the enemy every credit for their manly defence of Sebastopol, we must claim for the allies, and for every branch of their services connected with the attacks, the merit eminently due to them for their energetic exertions."

The foregoing is a very remarkable paper, containing a fair and clear vindication of the principles of the attack, and the courage and skill of the allies; and no man can do justice to either the defence or the siege without keeping in view the general principles there laid down; yet we cannot but concur in the opinion now prevalent in Europe, that the allied commander-in-chief was deficient in skill, energy, foresight, vigilance, and care, at the period of which we write, and that the magnitude of the undertaking was neither comprehended nor adequately provided for by the Western governments.

On the 23rd, the Russian general sent to Lord Raglan a flag of truce, requesting an armistice of some hours for the purpose of burying the dead. Lord Raglan, knowing that this was to gain time, either to complete or repair batteries, or bring up ammunition, and not having any dead to bury in his own army, refused the request, assigning that fact as his reason for so doing. The Russian chief resorted to a most barbarous revenge—the dead within his lines were brought beyond them, and left to decay upon the surface, so that the allied skirmishers could scarcely endure the stench; and this circumstance was undoubtedly the cause of sickness in both armies. The French had many in hospital, but did not suffer so much as the English from sickness, because their rations and medical care were so much superior; nor did they lose so many men from fatigue, because their numbers enabled them to change the working parties more frequently; but by the night of the 23rd, they had lost twenty officers and nearly 600 men in killed and wounded, according to their own admission; it is probable, however, that the number was much greater.

In England, at this juncture, great eagerness was evinced for news from St. Petersburg, from which city the first detailed intelligence of events in the Crimea was generally received. On this date Prince Menschikoff directed a despatch to his master, which the *Invalide Russe* professed to publish for the benefit of the Russian public. It presents the incidents which we have recorded, from a Russian point of view, suppressing Russian reverses, and exaggerating every real or apparent success. "A report received from Prince Menschikoff, dated October 23 (n. s.), gives the following further details in continuation of his former report on the operations before Sebastopol:—On the 20th of October General Sémiakine renewed his offensive movement from the village of Tchorgoum on the right bank of the Tchernaya, advancing for that purpose two columns on Komarz, and on a small fortification which the enemy had constructed a little behind that village. Our detachment having found that these two points had been abandoned, returned to its former position, which it regained at nightfall. In consequence of this movement the English troops advanced anew upon Komarz, and opened a fire of musketry and artillery against the heights which we had quitted, but beyond this attempted nothing. In the night of October 20, several detachments of volunteers were sent against the enemy's batteries. One of these detachments, composed of five officers and twenty-seven men, suddenly entered the French trenches, spiked eight mortars and eleven guns, and as speedily returned to the place,

after having thus made the enemy's battery useless for the work of the morrow. This fortunate sortie, which spread alarm in the enemy's camp, cost us two officers killed—Lieutenant Troitsky and Prince Pontiatine, of the marine guards—and a sailor. The other detachments found the enemy everywhere vigilant and active, and returned to the place with a loss of twelve men wounded. During the bombardment of the 20th, we lost in all fifty killed, including three officers, and 197 wounded, of whom five were officers. On the 21st and 22nd of October the siege batteries of the enemy continued to bombard Sebastopol, but the damage caused to our fortifications was, as on preceding days, of small extent and easily repaired, so that in none of our bastions has the firing been interrupted. Our loss on the 21st was thirty killed, including one officer, and 160 wounded, of whom three were officers. Our loss on the 22nd is not exactly known. On the night of the 21st and 22nd one of our pickets, composed of eight men, seeing an English patrol of forty men approaching, boldly threw itself on the enemy and dispersed the patrol, and made its commanding officer, Lord Dunkellin, a captain of the Guards, and son of Lord Clanricarde, prisoner. From the seaward the enemy has attempted nothing."

In the above account of the successful and ingenious sortie of the 20th, the number of mortars spiked is exaggerated, and the cannon alleged to have been also rendered unserviceable is a fiction; perhaps it was so reported to the prince by the leaders of the enterprise. In the following despatch of General Canrobert there is as little candour as in the Russian document there was moderation. Canrobert conceals from his government the fact (or his government mutilated his despatch) that, not only were his works entered, but a number of his mortars spiked.

Before Sebastopol, Oct. 22.

MONSIEUR LE MARÉCHAL,—Our works of approach continue according to the plan indicated in my preceding despatch of the 18th. I have not time to write to you at length, but I have the honour to send to you the journal of the siege, which will make you acquainted with all the details of our operations. The difficulties with which we meet are of two kinds—those which result from the nature of the soil, the solid stratum of which, already insufficient, diminishes in proportion as we approach the place, and those resulting from the number and calibre of the pieces of artillery which the enemy plants against us almost in a right and very extended line. In this respect, the resources which he draws from his vessels stationed in the port—men as well as materials—are almost inexhaustible; while ours, although augmented by the loans which we make from the two fleets, are necessarily limited. The 63-pounders, the 80 howitzers, and the 12-inch mortars are, in short, almost the only artillery upon which we can rely. This position renders the siege of Sebastopol one of the most laborious operations which have been met with for a long time, and the efforts which we are compelled to make to carry them into effect will explain the delays which have arisen. In the night of the 20th the enemy made an attempt to spike our guns, which failed. A few men, who, by a surprise,

entered our batteries, were killed there by the officer in command. The losses which we have experienced from the fire of the enemy are by no means so considerable as might have been expected, considering the difficulties of our position, which I have explained to you. I send successively, and by all the means which the fleet places at my disposal, my wounded to Constantinople, where our hospital resources have assumed a more satisfactory character. The state of health of the army is satisfactory. The maladies which have arisen have been produced by the excessive fatigue which our brave soldiers have had to undergo. The naval gunners who have landed have also been attacked with illness. They evince a courage and devotion which are remarked by the whole army. Accept, Monsieur le Maréchal, the assurance of my respectful devotion.

The General Commander-in-chief,

CANROBERT.

To the Minister of War, &c.

The despatch of Lord Raglan, written a day after, affords a little more information. It informs the English war-minister, however, that the French batteries opened on the 19th, and had "continued ever since." If, by continuing, his lordship meant that they were not entirely blown away, he is correct; but if he meant to convey the idea that they continued to fire upon the enemy without interruption, the statement is at variance with the facts, as they were repeatedly silenced.

Before Sebastopol, Oct. 23.

MR LORD DUKE,—The operations of the siege have been carried on unremittingly since I addressed your grace on the 18th instant. On that afternoon, the French batteries not having been able to re-open, the enemy directed their guns almost exclusively on the British intrenchments, and maintained a very heavy fire upon them till the day closed, with less damage, I am happy to say, to the works, and with fewer casualties than might have been anticipated. On the following morning, shortly after daylight, General Canrobert not only resumed his fire from the batteries which had been injured, but materially added to the weight of his attack by the fire of batteries which he had caused to be constructed the previous day; and these have continued ever since; and he has had it in his power to push his approaches forward, and, like the English, materially to injure the defences of the place; but these are as yet far from being subdued, neither is a serious diminution of their fire perceivable. Our fire has also been constant and effective; but the enemy, having at their disposal large bodies of men, and the resources of the fleet and arsenal at their command, have been enabled by unceasing exertion to repair their redoubts to a certain extent, and to replace many of the guns that have been destroyed, in a very short space of time; and to resume their fire from works which we had succeeded in silencing. This facility of repairing and re-arming the defences naturally renders the progress of the assailants slower than could be wished; and I have it not in my power to inform your grace, with anything like certainty, when it may be expected that ulterior measures may be undertaken.

I have the honour to transmit to your grace the return of killed and wounded between the 18th and 20th instant inclusive. In my last I announced to your grace the death, which had just been reported to me, of the deplored officer the Hon. Colonel Hood, of the Grenadier Guards. No other military officer has since fallen; but Major Prince Edward of Saxe-Weimar was slightly wounded on the 19th. His Serene Highness insisted, however, upon remaining in the trenches until the detachment to which he was attached was relieved at the usual hour, and he has now resumed his duty. Captain Lord Dunkellin, of the Coldstream Guards, was unfortunately taken prisoner yesterday morning before daylight, in front of the trenches.

The naval batteries have continued their exertions without intermission, and I regret I have to report the death of two gallant officers of the royal navy—the Hon. Lieutenant Ruthven, who has died of his wounds, and Lieutenant Greathed, of her majesty's ship *Britannia*. Both are universally regretted. The latter received a mortal wound while laying a gun, after having, to use the language of Brigadier-general Eyre, who was then in charge of the trenches, “performed his duty in the batteries in a manner that excited the admiration of all.”

A considerable body of Russians appeared two days ago in the vicinity of Balaklava, but they have since withdrawn, and are no longer to be seen in our front. I have reason to believe that Prince Menschikoff is not in Sebastopol. He is stated to have placed himself with the main body of the army in the field, which is represented to be stationed in the plains south of Bagtché Serai. Admiral Korniloff, the chief of the staff, and temporarily in command of Sebastopol, is reported to have died of his wounds the day before yesterday.—I have, &c.,

RAGLAN.

His Grace the Duke of Newcastle, &c.

On the same day 10,000 Russians crossed the Tchernaya, and reconnoitred. On the 24th, 500 recovered invalids from Scutari were landed at Balaklava, but as they marched out to the camp many of them fell down on the way, unable to proceed. It was in mournful keeping with the treatment of our poor sick soldiers, to send them on to the severe climate of the Crimea, and the labour for which the strongest were scarcely equal. The English mortars had nearly ceased fire, the shells were useless; it was hoped that the worst had been consumed, but the last sent up were inferior to the former. The complaints of want of material were very general in the army at this time. Gun-carriages, wheels, timber, tools, ropes, horses, powder, balls, and shells, were

required in far larger quantities than they were supplied, while the enemy seemed strong in all these sinews of war. The arrival of commissariat officers, and officers of the Irish constabulary, was an encouraging omen that the government at home were beginning to think more of their army in the Crimea.

The Russians commenced firing on the morning of the 24th from a new battery. The number of their guns now amounted to 230, and fresh works were in progress. The French sappers and miners were indefatigable, but their artillery still failed to bring a sufficient number of heavy guns into play.

During the 24th, the enemy in the valley of the Tchernaya continued to reconnoitre the British right and rear, and they repeatedly approached the redoubts held by the Tunisians. It was obvious that they considered the weakness of these works, the distance from all support, the small number of troops under the command of Sir Colin Campbell, the scanty corps of observation under Bosquet, and the defenceless condition of Sir de Lacy Evans' flank, as constituting a combined plan to tempt them forward. They were kept back by the conviction that such apparent weakness concealed some trap, into which the allies would, by the display of that weakness, allure them. On the next day, Liprandi, who commanded the Russian forces on the Tchernaya, received from his spies a full and clear account of the forces opposed to him, and made those attacks which issued in the battle of Balaklava.

CHAPTER XLI.

THE BATTLE OF BALAKLAVA.

“I see you stand like greyhounds in the slips,
Straining upon the start! The game's afoot,
Follow your spirit, and upon this charge,
Cry, ‘Heaven for Harry, England, and St. George!’”—SHAKSPEARE. *Henry V.*

THE night of the 24th of October was passed in the trenches as other nights during the bombardment had been; fewer shots were, however, fired by the enemy. The morning of the 25th dawned obscurely; the mists of the Crimean October hung over the heights, and rested upon the beleaguered city; and the bombardment was resumed as on other days, and, as usual, responded to by the garrison. The mists which hid from view the city and its defences extended over all the valley of the Tchernaya, from the head of the harbour of Sebastopol to the gorge of Balaklava, and far east across the plain, enveloping the heights opposite to those upon which the allies were encamped. Under cover of this veil the Russians, who had been lingering in the Tchernaya valley, were enabled to push their Cossacks forward to examine the

positions of the Earl of Lucan, Sir Colin Campbell, and General Bosquet.

Although this task was very imperfectly performed, from the dimness through which everything was seen—if seen at all—yet they were enabled to ascertain the “ostentatious weakness” of the positions, and to make such report to the Russian general as would decide him in the course he had already meditated. This was no less than a grand attack upon the allied flank and rear, so as, if possible, to capture Balaklava, destroy its stores and shipping—perhaps hold the place, and compel the allies, eventually, to lay down their arms, or embark under circumstances of despair and ruin. Reinforcements had been repeatedly received by the enemy in large numbers, as well as supplies of all kinds; while both men and muni-

tions arrived in driblets to the allies, utterly disproportionate to their labours, the task assigned them, and the new dangers which had gradually gathered around. A powerful army corps, under the Russian general, Liprandi, who had distinguished himself in forcing the Danube, occupied the valley of the Tchernaya in positions which secured them against any sudden attack from the allies, had they been able to attempt the like, and which facilitated a surprise on their side against Balaklava. Favoured by the character of the morning, Liprandi put his corps in motion before dawn, and at daylight commenced the series of operations which are generally known under the title of the battle of Balaklava.

The first tidings received of the event in England were from Russia. The *Journal de St. Petersburg* contained the following, which is represented as announcing a glorious victory over the English:—

“His majesty the emperor has just received a report from Aide-de-camp General Prince Menschikoff, dated the 25th of October:—

“Our offensive operations against the besiegers began to-day, and were crowned with success. Lieutenant-general Liprandi had orders to attack, with the division under his charge, the private entrenched camp of the enemy, which defends the route from Sebastopol to Balaklava. This operation was executed by him this morning in a brilliant manner. Four redoubts, in which we captured eleven pieces of artillery, are now in our possession. The principal redoubt of the enemy, which was defended by the Turks, was carried by assault by the Azoff regiment of infantry, under the command of Major-general Sémiakine, commander of the brigade, and the commander of the regiment, Colonel de Krudener, who distinguished himself in this affair.

“The English cavalry also opposed our detachment. Under the command of Lord Cardigan, it charged with extraordinary impetuosity the brigade of Hussars of the 6th division of cavalry, but, taken in flank by four squadrons of the combined regiment of Lancers in reserve, and forced upon the cross-fire of shot of the artillery of the 12th and 16th divisions of infantry, and upon that of the men armed with carbines of the first brigade of the latter, it suffered considerable loss.

“The 1st brigade of the 16th division, under the command of Major-general Jabokritsky in person, was pushed forward in advance to prevent the enemy from turning the detachment of General Liprandi. At the same time that it attacked our Hussars, the English cavalry rushed at a gallop upon the battery of position, No. 3 of the Don, where some of the gunners were put to the sword.

“The loss of our infantry in this affair does not exceed, as it appears to me, 300 men both in killed and wounded. As to that of the cavalry and artillery, it is not yet known even by conjecture. Major-general Khaletsky, commander of a regiment of Hussars of his Imperial Highness Nicholas Maximilianovitch, was wounded by a sword on the ear and arm. It is difficult to calculate with certainty the loss of the enemy, but it was very heavy.”

The following pages will show how little truth this despatch contained. It describes General Liprandi as having under his command only a “division,” whereas a strong army corps was placed at his disposal, variously estimated at from 30,000 to 50,000 men, but most generally set down at 35,000. The estimate formed by Mr. Woods, who witnessed the battle, was 25,000 infantry, 4000 cavalry, and thirty or forty cannon. Distinguished officers of experience have assured the author that this estimate is probably correct. The despatch of Prince Menschikoff, or rather the account of it given in the *Journal de St. Petersburg*, is useful as putting us in possession of the names of the officers commanding the different detachments.

Liprandi's force advanced from Tchernougoum upon the Woronzoff Road. He halted at the mouth of the Baidar Valley, on the north of this road, and rested his right wing upon the hills near to Tchernougoum. From the main body four battalions of infantry were detached upon the left; these crossed to the south of the road, and advanced upon Kamara, a little village which was near the right front of the English position, and only 4000 yards beyond their lines. Before giving any further description of the Russian advance, it is necessary to describe with some minuteness the ground to the east of the plateau on which the allies formed their encampments, and to the north and east of Balaklava, the depot of the British munitions and resources.

The country presents the appearance of a great plain, partly divided into two valleys by a ridge of hills called the Fedukine heights; these valleys, meeting again beyond the range of heights, form one plain of several miles in extent from the plateau on which the allies stood, stretching away to a range of hills beyond. Through this plain the Tchernaya river finds its way to the harbour of Sebastopol. From the disembovement of the Tchernaya to the ruins of Inkerman is about a mile, and there the average width of the valley is only three-quarters of a mile, being narrowest opposite to the ruins; from Inkerman the hills separate more, until, at the Traktar Bridge, it has a width of four miles. A range of low hills traverses this plain, upon which redoubts were erected, each garrisoned by 250 Tun-

sians, auxiliaries of the sultan's army. This range was north of Balaklava.

The nearest of these elevations to the plateau was above the village of Kadikoi. The most eastern was called Canrobert's Hill; not for the absurd reason assigned by Mr. Woods—that General Canrobert declared it to be untenable, but because there Lord Raglan and the French general met when, after the celebrated flank march, the latter descended into the valley of the Tchernaya. The number of the hillocks occupied by the redoubts, and garrisoned by the Tunisians, was four. On the most remote of these (Canrobert's Hill), some good intrenchments were made, and earthworks thrown up; but the other three were surmounted by carelessly constructed redoubts, which it would be difficult to defend under any circumstances; and which, although the most exposed positions of the allies, were garrisoned by their worst troops—men who scarcely knew the use of arms, and were without any of the moral characteristics so necessary to form a good soldier. These redoubts were occupied for the purpose of commanding the Woronzoff Road, and of defending Balaklava from any sudden attack, such as Liprandi now attempted.

The first of these defensive works, called No. 1, was a mile and a half from Balaklava, and very nearly a mile from No. 2, which was higher up the Woronzoff Road. Nos. 2 and 3 redoubts were each a mile from their supports. No. 4 was close under the plateau where General Bosquet was posted with a *corps d'observation*, consisting of French and Turkish troops. General Bosquet's position also dominated the Woronzoff Road, and part of the plain of Balaklava; his lines could only be approached by a surprise. The works erected along that position (the eastern ridge of the plateau) were as strong as French military engineering could, under the circumstances, make them.

The Woronzoff Road lay from Baidar and Traktar Bridge, and crossed the plain of Balaklava on the low ridge of hills already described as dividing the plain into two parts. Winding up the heights in rear of the light and first divisions, it was continued through the camp into Sebastopol, entering by the cemetery, on the right of the Redan. There was another road, the situation of which must be kept in view in the various operations which were conducted in the valley of the Tchernaya from the 25th of October—the Simpheropol Road—which, winding down the northern heights of Inkerman, crossed the Inkerman vale, and the bridge there over the Tchernaya, came up the opposite Inkerman heights, and passed through the camps of the second, first, and light divisions, and joined the first-mentioned road near

the windmill, which served as an English powder-store.

If the reader will keep in view the general outline of the country as here presented, with its roads and leading military features, the series of actions comprised in the battle of Balaklava, and their general bearing upon the immediate and more remote results, will be more easily comprehended. Liprandi having advanced towards Kamara, formed line at right angles with the redoubts held by the African auxiliaries. It was half-past six o'clock before the Russians began their attack. When they came in sight of the Turkish redoubts they halted, and remained some time in observation, instead of dashing on at once to gain possession. In each of the Tunisian redoubts there was a British artilleryman to assist in directing the guns; upon the appearance of the Russians some of these men sent intelligence to Lord Lucan, who at once sent off an orderly to Sir Colin Campbell, by whom the dragoon was ordered forward to head-quarters with a despatch to Lord Raglan. His lordship on receiving the tidings, sent across the ravine to General Canrobert, requesting his assistance, and set about his own arrangements for meeting the impending danger. Lord Lucan, upon receiving the intelligence from the redoubts, ordered the bugles to sound to saddle; it was fortunate for the dispatch of this order that the men were at the moment leading their horses forth to water. In a very few minutes the heavy brigade was ready for action. This fine brigade consisted of five regiments, two of Dragoon Guards, namely, the 4th Royal Irish, and the 5th,* commonly called the "Green Horse." The former, although nominally an Irish regiment, was nearly altogether composed of Englishmen; while the latter, nominally an English regiment, was composed principally of Irish. The other three regiments were the same that at Waterloo, under Sir William Ponsonby, was known by the designation of the "Union Brigade," because consisting of an English, a Scotch, and an Irish regiment. The 1st Royal Dragoons, the 2nd Royal North British Dragoons or Scots' Greys, and the 6th or Enniskillen Dragoons.† These five regiments had, when sent out, consisted of about 250 men each, but were now reduced in the aggregate to about 720. The 5th had suffered horribly in Bulgaria from cholera; the Enniskillens had lost men by fire on shipboard, and horses by other disasters at sea; and all the

* In various accounts this regiment is called the 5th Dragoons, there is no 5th Dragoons, that regiment having been disbanded many years ago.

† The origin or meaning of this designation may be unknown to many of our readers. Enniskillen, or Inniskillen is the county town of Fermanagh, in the province of Ulster, in Ireland, where the regiment was raised.

regiments were reduced by cholera, diarrhoea, and dysentery, in the Crimea. The want of proper fittings in the transports had been the chief cause of the loss of the horses.

The light brigade had their horses saddled soon after, and stood like "greyhounds in the slip," ready for action. This brigade consisted also of five regiments, the 4th (Dragoons), the 8th (Royal Irish Hussars), the 11th (Prince Albert's Hussars), 13th (Dragoons), 17th (Lancers). It mustered about 680 men. The commander of the heavy brigade (as will be seen elsewhere) was Brigadier-general Scarlett. The light was commanded by Major-general the Earl of Cardigan.

While the cavalry brigades were getting ready for action, Sir Colin Campbell made the best preparations, circumstances and time allowed, for the more immediate defence of Balaklava. The 93rd (Highlanders) were posted to the right of the cavalry, in front of a steep conical hill; to the right of the Highlanders there were placed two regiments of Tunisians, and a few companies of newly-arrived Turkish conscripts. On the heights, a detachment of sailors and marines, with a few hundred invalids, were drawn up, and heavy ships' guns were placed in battery. While Sir Colin was effecting these arrangements, the Russians, who had unaccountably halted when they approached the Tunisian redoubt, which was nearest, again resumed their advance, and presented the heads of their columns south of the Woronzoff Road, below the hills near Kamara. To check their progress, two batteries of artillery, commanded by Captains Barker and Maude, were detached with the Scots Greys; and the light cavalry moved across the plain towards the redoubts 2, 3, and 4. Barker's field-battery opened fire upon the enemy, and was instantly joined by Maude's horse-artillery. The fire of these 6 and 9-pounders was very spirited, but the Russian guns were more numerous, and, as usual, of heavier metal than ours. Twelve-pounders, similar to those which, in the autumn of 1853, and the spring of 1854, were so effective in Asia Minor, were employed by the Russians on this occasion, with similar tokens of their usefulness. These guns were moved with as much celerity as our 6-pounders, and handled with as much ease. The Duke of Wellington relied greatly upon the facility with which the British 6-pounders could be used in action, and on more than one occasion considered the rapidity with which they could be employed as counterbalancing heavier weight. Waterloo seemed to afford some ground for such an opinion; but at Balaklava the Russians moved and worked their 12-pounders as rapidly and easily as the British managed their lighter guns: if the latter produced a greater proportionate effect, that was due to the skill

of the officers in command, and the precision of our gunners. Seldom have British guns been worked in the field with equal gallantry and address; and by their instrumentality the Russians were kept at bay so long, that the time thus lost seriously impaired the execution of their plans. The British artillery was at last obliged to withdraw from *want of ammunition*. Their loss was very severe, and especially in the case of Captain Maude, who was dangerously wounded by the bursting of a shell on his horse. This gallant officer had rendered the most valuable services to his country, and his misfortune excited the regret of the whole army. The Greys retired with the artillery, falling back upon the position where General Scarlett's brigade was drawn up. The Russian infantry then moved forward in five distinct columns, flanked by cavalry, who threw out clouds of skirmishers in advance. A powerful force of artillery moved on before these dark, dense columns of infantry.

As seen from the plateau on which the allies were posted, the progress of the Russian troops was extremely impressive, for by this time the mists had disappeared, as if swept away by the rising sun. The field of action seemed formed for a great military display. The opposite hills, composed of limestone rock, glistened in the morning light, and everywhere scarped and indented in forms the most grotesque, wild, and varied, contrasted powerfully with the dark-brown landscape below, covered with parched and often stunted herbage, or dark moss. The whole country seemed, with its wild sweep of plain, encircled by rude upland, rock, and mountain, as if intended for a theatre of war.

As the main body directed their course towards the Turkish redoubts, loose bodies of Russian horsemen scattered over the plain. Upon these a French mortar battery, situated on the edge of the plateau, and connected with the corps of observation commanded by General Bosquet, opened with effect, throwing shells into various groups, and dispersing men and horses with prompt and terrible destruction. The Russians made no attempt to return this fire, but kept steadily in view their object—to enter the gorge of Balaklava. To accomplish this, it was necessary to expel the Tureo-Tunisians from the eminences on which they had been posted; and, therefore, advancing to the principal redoubt on Canrobert's Hill, their artillery opened fire. The redoubt mounted six iron guns, 12-pounders. The Tunisians, unaccustomed to war, perceiving before them a powerful army, no supports near them, and no Europeans, except a gunner, to assist or direct them in the works, lost all self-possession, and ran about the redoubt uttering cries of despair. They fired their guns in an aimless volley,

which did no mischief, and then fled like a disorderly rabble dispersed by mounted police.

The mode in which the Russians captured this redoubt was timorous, and utterly deficient in military spirit. Instead of boldly advancing, when it was obvious no resistance could be offered to them, they opened a cannonade at some distance with two troops of horse-artillery, and for little less than ten minutes sustained this useless fire. The cavalry were then thrown out in skirmishing order, and as cautiously as if an army corps had been drawn up behind the hill. The officer in command of the Tunisians soon thought it time to provide for his own safety, and, leaving his troops to take care of themselves, mounted his horse and galloped away. Many of the men seemed to think it their duty to follow their leader, and rushed out of the redoubt; the enemy's cavalry closing around them, shot some as they clambered over the earthwork, and sabred others on the plain. Some of the Cossacks scrambled into the redoubt, their wiry little horses literally climbing the frail ramparts; there the scene presented was truly pitiable; many of the Tunisians, too much frightened to escape, were slaughtered by the spears of the Cossacks; the cries and helplessness of the Africans brought no pity—it was a military Sinope on a small scale. The unfortunate wretches did not know how to ask for quarter, and the conquerors were alike without mercy or magnanimity. Far over the plain, even to Balaklava, might be heard the piercing cries of the Africans, as they fell by the weapons of their sanguinary victors, or fled in frantic despair towards the next redoubt garrisoned by their countrymen.

The Russian infantry took possession of the redoubt, and found the guns ready loaded. The British artilleryman who had been in redoubt No. 1, had not been able to spike any of the guns from the whirl of confusion in which he was involved by the terrified Tunisians; the Russian artillerymen, therefore, soon turned all the pieces against the second redoubt, and upon the advanced position occupied by the 93rd Highlanders. Sir Colin Campbell prudently withdrew the regiment, from a useless exposure, under the shelter of a gentle elevation in the plain. Ammunition had now arrived for the British artillery, and a field-battery was placed on the more exposed flank of the 93rd, and returned the enemy's cannonade.

Meanwhile the right wing of Liprandi's force advanced against No. 2 redoubt. No. 1, which had already been captured, was the strongest of the four; No. 2 was badly constructed, badly armed, and badly garrisoned. No defence was made, unless the firing of two guns at an elevation which rendered them

harmless, and a straggling volley of musketry by which no one could be hit, might be called so. The scenes which were presented in No. 1, were now to be witnessed in No. 2; the same helplessness, confusion, and flight; the officers creating much of the disorder, and setting the example of cowardice. In this case, however, they were sooner out of the work than their comrades at No. 1, for every man had cleared the defences before the Russians entered. The unfortunate fugitives did not gain much by their promptitude; for the Cossacks, anticipating it, met them with spear and pistol as they fled, strewing the plain with their dead. Most of the runaways cast their arms and accoutrements from them, and sped with great rapidity, some towards the third redoubt, and others towards the position of the Highlanders. The Cossacks were too fleet, and a great number fell beneath their lances: some, however, turned in their flight, and, with cries of mingled despair and rage, rushing ferociously upon their pursuers, in the suddenness of the unexpected attack, unhorsed or disabled them; those who had the courage, or fury as it seemed, to do so, generally escaped.

At this period, Lord Raglan arrived upon the scene of action, partly preceded and partly followed by the first and fourth divisions, the 1st French division, and a squadron of Chasseurs d'Afrique. The British commander-in-chief descended the ridge of the plateau where General Bosquet was posted, and then with his staff and a numerous body of officers, French and English, whose corps were not engaged, he ascended an elevation from which he could command a view of the whole theatre of conflict. At the moment of his arrival the Tunisians ran out of redoubt No. 3, which, although the nearest to the lines, they abandoned with most alacrity, not even firing a musket as they fled. The Cossacks, as in the other cases, speared and shot down many of the fugitives. Their early flight, however, enabled the majority to reach the Highlanders' position, where they drew up in an irregular way upon the right flank of their countrymen, already posted in line with the British regiment. The Russians immediately entered the redoubt, and secured the guns, which had been spiked by the British artilleryman. Their advance was then slackened; for redoubt No. 4, although not so near the lines as No. 3, opened a galling fire upon them. The fire of the British fieldpieces was delivered with a rapidity and precision which also kept at bay the advancing columns, and compelled the cavalry to gather up their skirmishers.

The general position of the British at this juncture was as follows:—The Highlanders now occupied the slope of the undulation

beneath which they had taken shelter from the superior artillery of the enemy. To their right lay the two Tunisian regiments; further to the right what was left of the fugitive Tunisians from the redoubts. On the extreme right, but some distance in front, Barker's field-battery was rendering excellent service by replying to the captured guns in redoubt No. 1, and checking the advance of the enemy's infantry from Kamara. To the left the cavalry divisions were in separate lines of brigade, the heavy considerably in advance of the light. In the rear, upon the heights commanding the entrance to the harbour, the marines, invalids, a few sailors, and the heavy ship-guns were posted.

There can be no doubt that the position of the English was critical; but we cannot concur with some writers, that had Liprandi boldly advanced, he might easily have captured and held Balaklava. Mr. Woods says—"Had Liprandi pushed forward his whole force, he must have forced the entrance of Balaklava; and once in, half an hour would have sufficed to destroy all our stores and shipping. But the Russian general appeared either to doubt the extent of his own success, or else to be feeling his way, ere he trusted his troops in a pitched battle with the soldiers who had forced the heights of Alma."

Upon these remarks it may be observed that, had Liprandi captured Balaklava, and occupied it, the allies would not have been compelled to raise the siege; they could still have used the neighbourhood of Cape Cherson, Kamiesch, and Arrow Bay, where their allies had their depots. It is true that Liprandi might have penetrated the gorge, but a couple of good war-steamers, and a resolute fire from the heights, would have caused him severe loss; while the movement of the two British divisions, and the French division already named, upon his flank and rear, with the cavalry, and these troops instantly reinforced, would have probably caused the Russian general the loss of his army. The opinion of Mr. Woods is well supported, however, by military authorities; but Liprandi himself seems to have regarded it in the light we put it—for the appearance of the British and French divisions descending from the plateau was sufficient to cause the astute commander to draw in his force, and content himself with the capture of the redoubts. With so large a force as that which he had at his disposal, it is impossible to conjecture what would have been the result had he adopted a bolder policy. It is certain that, although he would have suffered much from the British frigates at the head of the harbour, and from the small force on the heights, he could, with such a body of troops as appeared at his disposal, have taken possession of the high

ground above the harbour, and, in that case, everything in it would have been destroyed by his guns. Perhaps the true solution of Liprandi's conduct may be, that his forces were considerably less than observers from the plateau supposed. Large bodies of men in the distance are generally exaggerated by beholders; and if such was the case, as is probable in this instance, Liprandi, remembering how these divisions fought at Alma, would, as he saw them descending from the plateau, wisely hesitate before he risked his army in the encounter. The Russian officers all felt that the defeat at the Alma had greatly disheartened their troops, and it discouraged, on their part, all hazardous enterprise. The Russian accounts state Liprandi's army to have been under 20,000 men.

It appears, however, that Lord Raglan was filled with apprehension that the event supposed possible by Mr. Woods would actually take place, for his quartermaster-general, Airey, was instructed to order Captain Tatham of the *Simoom*, who commanded the harbour, to act upon the probability of such a contingency. That officer gave his directions accordingly; all vessels were directed to leave the harbour, and the drums beat to quarters on board the *Wasp* and *Diamond* frigates. Men were sent on board these ships to work the guns, their own men being on duty in the trenches. The ships were soon in readiness, and took up a position to defend the head of the harbour until the transports had got out to sea. From a careful examination of all the evidence accessible in connexion with these transactions, it appears to us that the order of Lord Raglan was hastily given, and was another instance of "the timid counsels" which so frequently appeared to prevail at head-quarters. It must be allowed that at the moment when Lord Raglan sent the order, the Russians were making bold movements, and appeared as if resolved to carry out a great enterprise. They pushed forward a strong cavalry division, exceeding 3000 men, between the redoubts, but their infantry still remained behind the ridge on the Tchernaya side.

The Grand Duke Millinovitch, who commanded the cavalry, divided it into three bodies; one of these he held in reserve, the other two were thus handled:—One body, about 1200 strong, moved gradually down the ridge which had been occupied by the Russian cavalry division into the plain where the British heavy cavalry brigade was posted; the other, about half that number, directed its course towards the hillock, on the slope of which the 93rd Highlanders and the Turks were placed. Very different accounts are given of what then occurred, some of which are altogether incorrect. The generally received

version is, that the Russian cavalry made a dashing charge upon the Tunisians and Highlanders, which the latter, left alone by the defection of their allies, repelled by deadly volleys of musketry. The truth is, the Russian cavalry never charged; they would undoubtedly have done so, had there been, on the part of the gallant Highlanders, the least wavering. At first, there did not seem to be the slightest intention of charging on the part of the Russians, as their force was utterly disproportionate to the line of infantry drawn up by Sir Colin Campbell, which consisted of about 700 Highlanders, and more than twice that number of Tunisians. The Russians, accordingly, approached rather as cavalry in a reconnaissance, than as about to perform a charge. They cantered down the hill at some speed, until they came within 800 yards of the infantry, when the latter fired; but it is an "open question" whether the cavalry had not halted *before* the volley—at all events, they had halted when the smoke of the musketry drifted away. Scarcely had the Tunisians discharged their pieces, when they turned and fled *en masse*; their officers, as in the flight from the redoubts, setting the example of *saute qui peut*. We are not disposed to be severe upon these undisciplined and inexperienced troops for their conduct in the redoubts; if the same number of British troops had been placed there, "the only difference would have been, that we had lost both men and redoubts." But in the instance under notice, the conduct of these Africans was execrable; they fled before a force so inferior, and instantly upon the delivery of their fire. The flight was that of perfect rabble, without an attempt to rally, and stopped only when they found a temptation to plunder in the light cavalry camp, which they completely stripped. They not only abandoned their fellow-soldiers, allies in their own cause, but they plundered those soldiers who for that cause were on the instant receiving wounds and death. Seldom, in the history of war, has cowardice and rascality been so combined. These men would have rivalled the worst Bashi-bazouks that ever murdered and plundered friends, and fled before enemies.

The Russians had not a man hit from the distant volley of Sir Colin Campbell's infantry; and it is inconceivable that the gallant chief should have ordered a volley at such a distance—if he supposed the enemy were on the charge, he would have reserved his fire for a surer range. The cavalry, observing the shameful flight of the Tunisians, took heart again, and moved to the right of the Highlanders, where their allies had forsaken them. They did not spur their horses to the charge, but moved slowly, and afterwards put their chargers on a trot. The Highlanders brought their Grenadier

company to protect the menaced flank; perceiving which, the cavalry halted with evident indecision. At this juncture, the Highlanders delivered another volley—the distance was about half that at which they fired before—but very little effect was produced by it. The Russian commander, perceiving the unshaken front of the gallant Gaels, turned his men back to the base of the hill on which No. 1 redoubt was situated. There was, strictly speaking, no cavalry charge upon the Highlanders at Balaklava. Two volleys, very harmless, were fired by them upon a small body of Russian cavalry while reconnoitring their position, no doubt with the hope of finding an opportunity for a charge. Mr. Russell's account of the numbers of the cavalry, the rapidity of their onset, and the destructive force of the volley which especially checked it, is erroneous; and had that able and eloquent writer personally revised his letters, he would have seen the necessity for correcting such statements. These remarks are no disparagement to the brave Scots, or to their heroic chief—both leader and men would have stood their ground against any number, however resolute their charge; but such enduring courage was not called for upon the occasion in question.

In every narrative of the battle of Balaklava which we have met with, Sir Colin is represented as receiving *in line* a charge of cavalry; and this unusual feat is set to his account as an achievement of the greatest glory. It is alleged that the noble-hearted veteran declared that "he scorned to form his men even *four deep*." Upon this Mr. Woods remarks—"Sir Colin is far too good and experienced a soldier ever to think of exposing 700 men in a line two deep, to receive the shock of a charge of cavalry 600 strong and four deep.* Had the Russians shown any sign of closing with the regiment, it would have instantly formed square."

This piece of criticism has lately received extensive credence; but it is not founded upon correct views of military usage. Infantry will not receive cavalry in line upon the open plain; or, if retreating and harassed by cavalry under circumstances favourable to the action of the latter, they will form square to repel them; but infantry will always, when they can, take up a position affording them the opportunity of an extended line of fire when attacked by cavalry. Sir Colin did so in this instance. He placed his infantry along the slope of an eminence, up which the cavalry must have charged at a disadvantage, while exposed to the extended line of fire which the infantry, so posted, could direct upon them. It may have been judicious to form square even in the advantageous position chosen by Sir Colin, but that

* Sir Colin estimated them at 400, which was beneath the reality.

entirely depended upon the number and quality of the cavalry. In this case they were slightly inferior to the Highlanders in number, and greatly inferior in courage and discipline; it was natural for the general to form the resolve of braving, with "the thin red line," the assault of such a force. This is not simply the view of the author of these pages, but that of some of the most experienced generals in the service; and who deem it very doubtful whether a man of Sir Colin Campbell's habits and character would utter the vaunting language which is attributed to him.

The following is Sir Colin's report to the Adjutant-general:—

Camp Battery, No. 4, Balaklava, Oct. 27.

SIR,—I have the honour to inform you that on the morning of the 25th inst., about 7 o'clock, the Russian force which has been, as I already reported, for some time among the hills on our right front, debouched into the open ground in front of the redoubts Nos. 1, 2, and 3, which were occupied by Turkish infantry and artillery, and were armed with seven 12-pounders (iron). The enemy's force consisted of eighteen or nineteen battalions of infantry, from thirty to forty guns, and a large body of cavalry. The attack was made against No. 1 redoubt by a cloud of skirmishers, supported by eight battalions of infantry and sixteen guns. The Turkish troops in No. 1 persisted as long as they could, and then retired, and they suffered considerable loss in their retreat. This attack was followed by the successive abandonment of Nos. 2, 3, and 4 redoubts by the Turks, as well as of the other posts held by them in our front. The guns, however, in Nos. 2, 3, and 4, were spiked. The garrisons of these redoubts retired, and some of them formed on the right, and some on the left flank of the 93rd Highlanders, which was posted in front of No. 4 battery and the village of Kadikoi. When the enemy had taken possession of these redoubts, their artillery advanced with a large mass of cavalry, and their guns ranged to the 93rd Highlanders, which, with 100 invalids under Lieutenant-colonel Daveny in support, occupied very insufficiently, from the smallness of their numbers, the slightly rising ground in front of No. 4 battery. As I found that round-shot and shell began to cause some casualties upon the 93rd Highlanders and the Turkish battalions on their right and left flank, I made them retire a few paces behind the crest of the hill. During this period our batteries on the hills, manned by the Royal Marine Artillery and the Royal Marines, made most excellent practice on the enemy's cavalry, which came over the hill ground in front. One body of them, amounting to about 400 men, turned to their left, separating themselves from those who attacked Lord Lucan's division, and charged the 93rd Highlanders, who immediately advanced to the crest of the hill and opened their fire, which forced the Russian cavalry to give way and turn to their left—after which they made an attempt to turn the right flank of the 93rd, having observed the flight of the Turks who were placed there, upon which the Grenadiers of the 93rd, under Captain Ross, were wheeled up to their right and fired on the enemy, which manœuvre completely discomfited them.

During the rest of the day the troops under my command received no further molestation from the Russians. I beg to call Lord Raglan's attention to the gallantry and eagerness of the 93rd Highlanders under Lieutenant-colonel Ainslie, of which probably his lordship was an eye-witness; as well as the admirable conduct of Captain Barker and the officers of the field-battery under his orders, who made most excellent practice against the Russian cavalry and artillery while within range.

I have, &c.,

COLIN CAMPBELL, *Major-general.*

Brigadier-general Estcourt, Adjutant-general.

In the despatch of Sir Colin Campbell, the word "charge" is applied to the advance of the enemy's cavalry towards the position of the Highlanders. The gallant general must have used the expression in a popular, and not in a military sense, for there was really no charge. Mr. Woods justly observes, "Every officer who was present at the battle of Balaklava knows perfectly well that, apparently, the enemy's cavalry had no more intention of charging the Highlanders than they had of charging the marines on the heights."

As the Cossacks fell back from before the infantry under the command of Sir Colin Campbell, the other body of Russian horse, consisting of two regiments of Hussars, made their way in the direction of the heavy cavalry camp. They descended the ridge in two lines, each line four deep; their march was as deliberate as if on a review. The sight was imposing; their light blue uniforms and graceful steeds (for they were excellently mounted) showed to great advantage, and their weapons and accoutrements glistened in the morning sun. As they approached near to the plain where the British heavy cavalry were preparing for an attack, they closed up, and advanced steadily in one compact body; the sun at this moment shone out more clear and brilliant than before upon the gay Hussar uniforms, and the swords of the proud horsemen, flashing in its light, appeared at a distance like swords of flame. Already two hours and a half had been consumed by the enemy in capturing the redoubts, cannonading the artillery, and reconnoitring the infantry. It was about nine o'clock when the Hussars wheeled round the high ground which kept them out of view of the British horse, and met them in the shock of one of the grandest cavalry charges on record. When the Russian troopers came down the hill, General Scarlett's brigade was still among the tents of their camp, in a position of great disadvantage: not only was time lost in extricating themselves from the tents, but some confusion was created by the cordage and other camp impediments. There was not room for the advanced line to make good their charge when the enemy came suddenly upon them. It is difficult to say upon whom the blame of this state of things should rest. The heavy cavalry were immediately under the command of Brigadier-general Scarlett, but the cavalry head-quarters was in their camp, and therefore it is alleged Lord Lucan should have personally seen to everything, and assured himself of the proximity of the enemy's Cossacks and Hussars. No such precautions, however, were taken as were necessary to enable the brigade to take any advantage of position, or even to charge on equal terms. Brigadier Scarlett is near-

sighted, and although a good regimental officer and a gallant man, was not experienced in a large command. Lord Lucan understood the cavalry service of Russia, and ought to have known the troops with whom he had to deal, and have had opportune cognisance of the proximity of the enemy to his own head-quarters. The British were formed into two lines, the first of which consisted of the Scots Greys and Enniskillen Dragoons; the second consisted of the 1st Royal Dragoons, and the 4th Royal Irish Dragoon Guards. The 5th Dragoon Guards, General Scarlett's own regiment, constituted the reserve.

Spectators of the scene have described the moment of onset as exceedingly exciting. Just as the opposing lines came clearly into view, the Russian tramp ceased with a sudden rattle of accoutrements; and then, advancing their squadrons on the extreme right and left of their line, it assumed the form of a semi-circle, and again moved on, in double line, as before. All was stillness over the whole plain, where so recently the cannon boomed, and the sharp rattle of musketry startled the ear of the listener with the angry sound so peculiar to it. The neigh of the Russian horse could be heard on the height where Lord Raglan took post to observe the battle, and the noise of their arms, scabbards, and accoutrements, came thither in a continued jingle—so still were the groups of officers by whom the allied chiefs were surrounded. The British, during this brief time, seemed as if men and horses were statues. At a distance they appeared perfectly motionless. On came the Russians, their speed increasing. The British officers might now be seen moving along their lines, and as they passed, a slight motion showed that the men were closing up.

The excitement amongst the staff of the two generals-in-chief, the numerous groups of officers, English and French, amateurs, and men of letters, who crowded the height in front of the plateau, was so intense, that it seemed as if every man held his breath in suspense and awe. At last, the note of a cavalry trumpet rose clear and shrill over the valley—it was the *British bugle sounding the charge!* From line to line, from squadron to squadron, it was caught up—the hills repeating in wild echoes the martial summons. It was promptly answered by the living hearts to which it was addressed—the first line dashed onward to the charge, clearing the picket ropes and tent equipage as they could, their scarlet uniform and brazen helmets contrasting to the light-blue jackets, and the dark Busby's of the Hussars. There appeared an eagerness in our men to reach the enemy, as, with their raised sabres, they leaned forward in their saddles, and the line swept onward with a rushing sound like a torrent,

and like it gleaming in the sunshine. It is no exaggeration to say that the earth trembled beneath their horses' hoofs. The enemy had the advantage of the ground, and were more than thrice the number of the British—they swept down upon them like an avalanche. At last, the moment came when the opposing lines smote each other with sudden shock—a muffled and heavy sound, such as a large and ponderous body makes when falling upon grass or soft earth, was heard in the distance; the flashing of sabres could be seen, and then men and horses, whether friends or foes, none could say, rolling upon the field.

After the shock of the charge there was a slight recoil. It was momentary—the opposing lines instantly mingle—cheers and cries ring out from the heaving and contorted mass; the red jackets seem as nothing, in point of number, to the dark uniforms, in the midst of which they appear to struggle with vehement strength and resolution. After the lapse of a minute the red coats are through, and dashing onward, broken but impetuous, against the second line of the enemy. To the distant beholders this also was an exciting moment. As Scot and Irish burst through the first line, a cheer rang from the heights, which the brave fellows must have heard, for it seemed to inspire them with renewed determination to conquer; but when the beholders observed the thin and broken line dashing on against the second plateau of the foe, the deepest concern for their safety filled every mind. The second line of the enemy is speedily reached, and as speedily penetrated; but the overwhelming numbers of the foe seem to prevail. The red coats are surrounded and hidden; and the feeling, "they are lost," pervades the heart of every beholder of their desperate situation. But the suspense is short—for, as if a shell had burst among the Hussars, they are dispersed, and the little band of Enniskillens and Scots emerge. Both lines of the Russians now outflank them, and they are again enclosed in a dark circle, from which no valour can extricate them. At this moment the second line of the British is precipitated upon the enemy. The moment chosen is opportune, as the juncture was critical. The 1st Royal Dragoons and the 4th Royal Irish Dragoon Guards penetrate like a sharp wedge into the Russian flank, supported by the 5th Dragoon Guards. The 4th Royal Irish are represented by some of the spectators as piercing the dense mass of Russians like a sharp instrument suddenly plunged into a soft body. The effect was instant, decisive, and terrible—the Russians were broken and discomfited. They did not attempt to rally; the dispersion was complete. The 5th Dragoon Guards, the regiment held in reserve, pursued them, dealing death by their sabres among the

fugitives. That was the moment for a light cavalry charge upon their flank. Had such been executed, the whole Russian brigade would have been destroyed.

The Russians re-ascended the ridge in great disorder, and fled in a tumultuous mass across the high road. Our Dragoon Guards followed, until the Russian cavalry drew up under protection of their artillery, which, playing upon the British, compelled them to retire from the heights, and the vicinity of the high road, to the shelter of a friendly declivity. Had the English light cavalry attacked the flank of the dispersed Russians, the latter would never have been able to obtain the shelter of their own cannon. Why this was not accomplished, is one of the mysteries of the campaign which the authorities and public at home have been ever since unriddling without success. Several of Lord Cardigan's officers urged upon his lordship the propriety of making such a charge, which he peremptorily refused, alleging as his reason what, if his impressions were correct, must have been satisfactory—that his lordship was bound to remain in his position until he received fresh orders.

The following is represented to have been the conversation which occurred between Lord Cardigan and one of his officers upon the dispersion of the Russian Dragoons:—

Captain Morris.—"My lord, are you not going to charge the flying enemy?"

Lord Cardigan.—"No; we have orders to remain here."

Captain Morris.—"But, my lord, it is our positive duty to follow up this advantage."

Lord Cardigan.—"We must remain here."

Captain Morris.—"Do, my lord, allow me to charge them with the Lancers. See, my lord, they are in disorder!"

Lord Cardigan.—"We must not stir from here."

Captain Morris (to several officers).—"Gentlemen, you are witnesses of my request!"

A happy disregard of orders has sometimes saved an army; and during this battle of Balaklava, Sir Colin Campbell and one of his officers rendered great service to the country by disobeying the orders of Lord Raglan himself. But the officer who so acts undertakes a most serious responsibility, and, in case of failure, he is sure to receive censure, perhaps dishonour. In this instance, the officer immediately above the Earl of Cardigan in authority was the Earl of Lucan; and when it is recollected that between the noble brothers-in-law there exists a rancorous family and personal feud, Lord Cardigan may well be excused from incurring the risk of his lieutenant-general placing upon his conduct an unfavourable construction. Lord Cardigan had received precise orders to remain where he was, and watch a certain line

of ground over which the Russians might have attacked. If Lord Lucan deemed it necessary for his major-general to deviate from these orders, he might have sent an aide-de-camp with new and special instructions adapted to the case. This might have been done, in the foresight which a lieutenant-general is expected to exercise, before the heavy cavalry charged. Lord Lucan pleads that the general character of Lord Cardigan's instructions was sufficient to have secured his co-operation in the emergency. It is upon that point that the whole question turns as to the culpability of Lord Cardigan neglecting to charge, and that of Lord Lucan in omitting to give his brigadier more positive directions.

The general of division accuses his junior of neglecting to exercise a sound discretion, and requisite military promptitude. In the *Times* newspaper of the 7th of April, 1855, the following letter from Lord Cardigan appeared:—

TO THE EDITOR OF THE TIMES.

"SIR,—A pamphlet having recently been published containing the speech of the Earl of Lucan, and an appendix having been added to it, in which reflections have been cast upon my conduct in the following terms, viz:—

"So disappointed was Lord Lucan at not having the support of the light cavalry brigade, that he sent by the first staff officer that became disposable, to desire that Lord Cardigan would always remember that when he (Lord Lucan) was attacking in front, it was his (Lord Cardigan's) duty to support him by a flank attack, and that Lord Cardigan might always depend upon receiving from him similar support."

"I beg to state in the most positive terms that no such message was ever delivered to me on the occasion referred to, nor one word said on the subject when I met the lieutenant-general commanding the division immediately afterwards, or at any subsequent time. Further, I have to add that just before the period alluded to, when the Russian cavalry attacked the heavy brigade, I had been personally placed by the lieutenant-general in a particular position, at some distance off, with positive orders to remain there, and to watch a certain line of ground over which the Russians might have attacked (and they had plenty of additional troops for the purpose); and in the event of such being the case, I had permission from the lieutenant-general to attack anything that might approach except close columns of infantry. The heavy brigade had at this time two fresh regiments to pursue the Russians if necessary.

"With regard to the second note, viz:—

"The communication received by Lord

Lucan from Captain Maxse, A.D.C., was, that Lord Cardigan objected to his brigade being placed where it was, as there were batteries of the enemy on the left, which would open upon it. Lord Lucan, who was at this time riding up to the right flank of the light cavalry brigade, replied, "Tell Lord Cardigan that he is placed there by Lord Raglan's orders, but that I will take care of him." To show that Lord Cardigan had not mistaken his position, although no batteries did open then, the light cavalry brigade had not advanced more than 100 yards when they were fired upon, and Captain Nolan, who had placed himself in front of a squadron of the 13th Light Dragoons, was killed.

"I beg to state that the whole of this statement is incorrect. I have only to repeat what I have stated in my place in Parliament, that the only message I ever sent was, that the hills on each flank were covered with Russian riflemen and artillery leading to the Russian force stationed in the valley below, and the answer was, 'We were about to attack immediately.' A map has been appended to this pamphlet, containing a most unfair and untrue representation of the formation of the troops opposed to each other on that occasion. The enemy's battery is placed at the bottom of the valley in an oblique position, whereas it is notorious that the front of the battery was quite parallel to the front of the brigade attacking, the only point to lead upon being the centre guns of the battery. The map alluded to would induce it to be supposed that the brigade attacked without an enemy in front, and only received an oblique fire from the battery, as it is placed in the map. In addition to this large battery of about from twelve to twenty guns, which was square to our front, there were Russian batteries and riflemen on each flank. The attack having been ordered and executed by the light cavalry brigade—and in which attack no one man surpassed another in gallantry—I cannot permit the peril of that undertaking to be detracted from by any misrepresentation.

"I am, Sir,
"Your most obedient servant,
"CARDIGAN."

36, Portman Square, April 6th.

Lord Lucan thus replies:—

TO THE EDITOR OF THE TIMES.

"SIR,—In the *Times* of the 7th instant there appears a letter from Lord Cardigan, in which his lordship, after many days' deliberation, denies—and, as he says, in the most positive terms—having received the message I stated I had sent to him, conveying, perhaps, too mild a reproach for not having made use of his light cavalry in a flank attack, and a pursuit

of the enemy when they had been repulsed and routed by the heavy brigade, at the battle of Balaklava, on the 25th of October last. It is, sir, not the less true that it was sent to him through my aide-de-camp, Lord Bingham, who, I have every reason to believe, delivered it. I quite admit that I did not speak to his lordship on the subject—never having on any one occasion, to my recollection, allowed myself, directly or personally, to remark upon any act of Lord Cardigan's; so to avoid, as I succeeded in doing during the time that he was under my command, all altercation with his lordship—the prudence of which the major-general's letters to his divisional commander would, I think, establish.

"It is an error to suppose that two regiments of the heavy brigade were unengaged; there was but one, and this, from its position, could not be brought up in time. Lord Cardigan denies—perhaps, not so positively—having sent a message by Captain Maxse, objecting to the position of his brigade, in consequence of the enemy's batteries on his left. It is, again, not the less true that a message to this effect was delivered to me; my recollection is quite clear, and I cannot doubt it can be easily proved. I regret that the plan attached to the pamphlet should not please Lord Cardigan; it was done from memory, to meet different points in Lord Raglan's letter, and does not pretend to give every gun and man of the enemy, or to do more than show their positions. I believe it to be generally correct—certainly not less so than the description given in his lordship's present letter, and in the speeches in which his lordship has, at such length and on different occasions, brought his services before the public.

"I am, Sir,
"Your very obedient servant,
"LUCAN."

Castlebar, April 9.

On the retreat of the Hussars before the heavy brigade, or rather before the 5th Dragoon Guards, the only portion of the brigade which had not been in action, and was therefore fresh enough to pursue, General Liprandi placed himself upon the defensive. He had already received three important checks:—the first from the field-batteries which were on the right front of Sir Colin Campbell's infantry, by the fire of which the advance of the Russian infantry in that direction was prevented; the second was given to the Cossacks who reconnoitred the Highlanders, and who, intimidated by their bold front, retired without attempting a charge; the third check was that by Scarlett's brigade—and this was so thoroughly felt by the divisions in that direction of the field, that Liprandi expected a general attack. It is, indeed, surprising that the two divisions of infantry—those of the Duke of Cambridge and

Sir George Cathcart, together with the French division which had descended the plateau, and the whole force of the cavalry and artillery, did not advance, re-capture the redoubts, and chastise the enemy. A general officer of great distinction, well acquainted with the whole field of action, and the character of the troops on both sides, has repeatedly assured the author that such a course would have deprived the enemy of a victory which he undoubtedly obtained, averted the injurious moral effect of leaving any of the redoubts in his hands, and of allowing him to carry off the guns. If the position were too extended to maintain, as Lord Raglan asserted in a subsequent dispatch, it should have been abandoned, not as the result of a success by the enemy, but because of the deliberate judgment of the allied chiefs, after that enemy had been repulsed from the ground he had conquered. If, at the juncture when the Russian Hussars fled to their guns from the pursuing British Dragoons, a general advance had been ordered upon a consistent and well-conceived plan, our light cavalry would not have been sacrificed, nor would the shame of a defeat have sullied our arms. No advance of cavalry, light or heavy—no exertions of Lord Lucan, could have prevented the enemy from carrying off the captured guns. A general advance of the whole of the French and British then on the plain, would alone have sufficed to retake the guns and the redoubts. It has been alleged that it did not suit Lord Raglan's purpose to bring on a general action—why not, if by it defeat could be averted and victory secured? It is argued that our army was weak, and a general action would have reduced it; but it would have reduced the enemy in still greater proportion. As it was, our sacrifice was as heavy as in all probability it would have been had a general advance secured redoubts, guns, and honour, and at the same time chastised the foe. The whole battle was one of blunders; and it is unjust and uncandid to shift the blame upon particular officers, as it is the fashion to do, when it is so obvious that the planless and incapable direction of affairs from head-quarters was the sole cause of disaster and defeat.

Scarlett's heavy cavalry had scarcely reformed and retired, when the Russian infantry drew back into the plain of the Tchernaya, abandoning redoubt No. 3, but retaining Nos. 1 and 2 in great force. Each side seemed now uncertain what to do; and, as if to keep themselves occupied, they engaged in a distant cannonade. After some time spent in this desultory fire, the Russians made an advance from Kamara upon the English right. A general officer, who served during a portion of the Crimean campaigns, told the author of these pages that he had, on entering Balaklava from

the celebrated flank march, formed apprehensions as to the facility with which the Russians could offer mischief from this quarter. By a vertical fire they could have thrown shells from 13-inch mortars over the hill, causing certain injury, perhaps much destruction. Fortunately they never thought of this, or, at all events, never put it into practice. On this occasion their advance upon the British right was repulsed by the precision and activity with which the field-battery, posted near the 93rd regiment, was worked. The same zeal and skill which made this battery so effective in the early part of the day, in resisting a similar advance, was put forth by officers and men; but while most carefully discharging this duty, and when grave results depended upon its prompt and sustained performance, an order arrived from the quartermaster-general to retire with the guns, and place them on the heights to the extreme left. Had they been all suddenly deprived of reason at head-quarters, such a command might be accounted for, but on no other supposition. The officers in command were astounded. The enemy was steadily and gradually gaining ground, but the fire of these guns at once thwarted his design, and punished his hardihood. Had they been withdrawn, the flank of the Highlanders would have been uncovered, and assailed by the artillery of the enemy. The British artillery officers hesitated to obey so absurd an order, in the presence of so great a danger; but as the command to retire and take up entirely new ground was precise and clear, they were about to yield compliance, when Sir Colin Campbell, observing their movement, and wondering what could be its import, rode up and inquired. The officer in command boldly offered to obey the orders of Sir Colin, and to disregard that from head-quarters, if the general would venture to countermand the directions which obliged him to go to the rear. Sir Colin instantly assumed the responsibility, and the ridiculous order of the quartermaster-general remained unheeded for the remainder of the action, while the guns continued to render the most important aid to the safety of the position. Dreadful as were the consequences of the foolish order given soon after to Lucan, this order, had it been obeyed, would have involved consequences still more disastrous. Instead of repeating the order for retiring the guns, to take ground where they could be of no use, the Duke of Cambridge was directed to place the remainder of his division, under the command of the governor of Balaklava, near the spot where the guns were so important, thus securing the entrance to Balaklava from any attack by way of Kamara. The fourth division, under Sir George Cathcart's command, advanced to the slope over the Woronzoff Road; this was supported by the

first French division, under General Canrobert in person.

An officer who served in the fourth British division thus describes the general position immediately before the light cavalry charge, which will be presently related:—"Lord Raglan, who was on the hill above, and saw the whole gallant affair (of the heavy cavalry), dispatched an aide-de-camp immediately to Brigadier-general Scarlett to say, 'Well done!' who replied, with a countenance beaming with delight, 'I beg to thank his lordship.' The greatest enthusiasm now prevailed, and hearts and hands proclaimed their delight, and many a cheer rent the air. The loss of our heavy cavalry was but trifling, but they did not pursue their flying enemy very far. Lieutenant-colonel Griffiths, Major Clarke, and Cornet Pendergast, were wounded, but there were not more than half-a-dozen men killed. At half-past ten, A.M., the fourth division took up their position in the centre of the plain, in front of Balaklava, and the light companies in front on the left flank, with the heavy cavalry in reserve. The guns were on the right, and the 3rd Dragoons and Enniskillens on the right of the brigade, and the Greys and 4th and 5th Dragoon Guards on the left. A body of French cavalry, the Chasseurs d'Afrique, also came down to the valley, taking up their position some distance to our left." In describing the 3rd Dragoons as having a part in these arrangements, the gallant officer makes a mistake, or his publisher a misprint. The 3rd Dragoons is a light cavalry regiment, and was not in the Crimea; the 3rd Dragoon Guards is a heavy cavalry regiment, but neither was it serving in the Crimea. The 1st Dragoons was probably meant.

Before the above arrangement was completed, Lord Raglan sent the first of his two celebrated orders to Lord Lucan, which the former noble lord represented thus:—"The cavalry to advance, and take any opportunity to recover the heights; they will be supported by infantry, which has been ordered to advance on two fronts." Lord Raglan afterwards complained that no attempt was made to execute this command. Lord Lucan declares that the order presented to him was not what the commander-in-chief alleged, and no doubt intended, but ran thus:—"The cavalry to advance, and take any opportunity to recover the heights; they will be supported by infantry, which has been ordered. To advance on two fronts." Lord Lucan considered the order he actually received as impracticable, and scarcely intelligible. No advance of infantry, however, was made of the nature indicated; and had Lord Lucan attempted to recover "the heights" with his cavalry, the entire destruction of that force must have been the result. The

order was in keeping with the directions given to the harbour-master at Balaklava, to "get steam up—the Russians will be down upon us in half an hour." And with the order so bravely set at nought by Sir Colin Campbell, for the removal of Captain Barker's field-battery. The execution of such an order as that given to Lord Lucan, if its meaning be that the positions captured by the enemy should be stormed, could only have been accomplished by a movement of the whole of the allied army which had descended from the plateau—by the whole allied force, in fact, then occupying the plain. Had Lord Raglan pressed on a general action, which he admitted he desired to decline, then only would there have been any hope of dispossessing the Russians of the redoubts, and of the positions they had taken up.

Liprandi, also, had now made new dispositions. He retired with his forces towards the Baidar Valley, into a narrow gorge, with a steep acclivity on either side. On his left were the hills upon which stood the redoubts which he had taken in the morning—Nos. 1 and 2; and on the slope beneath them there were planted six pieces of cannon. On the opposite side, to his right, six more guns were planted on a slope somewhat corresponding. Their guns crossed fire, so as "to rake" an attacking body of troops. Across the front of the gorge twelve pieces were posted, which could sweep the whole valley; behind these the main force of Liprandi rested. With the guns on his right, two regiments of cavalry were placed at right angles with his front; on the left, also at right angles with his front, a body of rifles, equal in number to two ordinary battalions of British infantry, were dispersed. Immediately behind the guns which fronted the gorge the remainder of his cavalry were in line, and the infantry behind all. This was the exact position of Liprandi's army, the numerical force of which, and the number of guns posted in front and flanks, have been greatly exaggerated.

The British commander-in-chief supposed that the Russians *were about to abandon this strong position*, because there appeared some movements in the redoubts indicating that they were taking the captured guns out of them. His lordship instantly ordered, through his quartermaster-general, that Lord Lucan should advance, and prevent the accomplishment of the enemy's object. All the force at Lord Lucan's disposal could not have had the smallest effect in hindering the enemy from removing these guns; nor is there any conceivable light in which the order given to him can be regarded which makes it practicable. It was as follows:—

"Lord Raglan wishes the cavalry to advance rapidly to the front, to follow the enemy, and

try to prevent the enemy carrying away the guns. Troop of horse-artillery may accompany; French cavalry is on your right.—*Immediate.*

“RICHARD AIREY.”

After the above description of the position occupied by Liprandi, it reads very like mockery to send some 1500 cavalry, half of which had been desperately engaged with the enemy already, against a fortified position—for such it actually was—to prevent the enemy from removing guns planted on eminences which were occupied by powerful detachments, and supported by a whole army! The assistance of a troop of horse-artillery against such a force of guns is sufficient to excite a smile, if the results were not so awful. The information that French cavalry was on his left was little less amusing, as the force of Chasseurs d'Afrique did not reach 300 men, and he knew not what orders they had received. Lord Lucan obeyed this command, and incurred the great disaster of the day. The commander-in-chief subsequently charged him with a misconception of the directions which he received, because he was desired to advance and try to prevent the enemy from carrying away the guns, *not to attack at all hazards*. When Lord Lucan received this order, he could not conceive to what guns the commander-in-chief referred, whether to the captured guns in the redoubts, or the enemy's own guns in position. The order gave him no information, nor did the bearer of the order throw any certain light upon the subject. Lord Lucan had no evidence of the intended retreat of the Russians; there was no notion of a retreat anywhere, but in the mind of Lord Raglan and his incompetent staff. It was impossible for Lord Lucan to carry out this command without precipitating his men upon destruction. Let the reader take the order item by item. It directed a *rapid advance*—whither? Not upon a retiring enemy, as the bewildered framers of the order intended, but upon an army in a very strong position. The cavalry could not advance at all without moving under the heavy fire of a powerful artillery. Well might Lord Lucan inquire, as he is said to have done, “Where are we to advance to?” “What guns?” The order was for a *rapid advance*; this, in the face of an enemy holding fast his position, could only mean a charge; there was no other construction to be placed upon it, why else gallop under the fire of such a range of cannon? “Follow the enemy,” says the written despatch; where to, if not into the mouth of the gorge whither they had retired, and taken up their position? There they were followed; there was no other place into which to “follow” them.

The commander-in-chief not only repre-

hended the lieutenant-general for commanding a charge, but also for not supporting that charge when he did command it to be made. What support could he render to it? He moved his heavy cavalry as near as the destructive fire of the enemy's artillery at all permitted; he could give no other support to the light brigade, which executed the charge, except by following it to destruction with his heavy cavalry. No combination of force at the disposal of the cavalry commander could have done anything more than add to the useless slaughter to which Lord Raglan's order consigned so many. “The troop of horse-artillery was neglected,” according to the commander-in-chief's statements inculcating his lieutenant. To move a box of toys into the arena would be nearly as rational as to order thither a troop of horse-artillery under such circumstances. Lord Lucan had no excuse for disobedience. He certainly did not comprehend the incomprehensible—he did not fathom head-quarters intellect in giving him such directions; but the order was precise, and the aide-de-camp who brought it understood it to be a direction to charge. No sane man could suppose it to be anything else—nor could any sane man suppose it to be that, if he did not consider it as only a single feature of some more general combination. The paper bore the endorsement “*immediate*,” the aide-de-camp rebuked the hesitation of the general; there was nothing left for him but to obey. Never was an officer more unjustly blamed than Lord Lucan in this transaction. He was ordered to act in a manner only applicable in the presence of a retiring enemy; he was ordered to do so immediately; the enemy had not contemplated a retreat, and showed no symptoms of such an intention. If Lord Lucan erred, it was in not precipitating his whole division and himself into the gulf of destruction before him.

This enigmatical order was carried by Captain Nolan, who was virtually Lord Raglan's, although nominally General Airey's, aide-de-camp. He received personal instructions to give it to Lord Lucan instantly. When Captain Nolan delivered the written order, the whole of the Russian force, except a few straggling Cossacks, was out of sight, under the ridge of the hills at the other side of the Woronzoff Road. As Lord Lucan read the paper handed to him by the aide-de-camp, he was, as well he might be, profoundly astonished, and, after at first hesitating, remonstrated, urging the uselessness of such an attack, and the destruction to his men which it would probably entail. Captain Nolan had not seen the position; he had galloped across the field at full speed with the order, supposing that Lord Raglan was cognisant of the duty to be performed, and had fully appreciated its dangers and its importance. He,

therefore, listened with a haughty coldness to Lord Lucan's remonstrances; he was, in fact, prejudiced against the whole cavalry command, believing conscientiously that the lieutenant-general was not fit for the responsibility with which he was entrusted. At head-quarters the feeling against Lord Lucan was strong, and on this account also Captain Nolan's mind was biassed. Had it not been so, he would have listened to the well-grounded objections of the lieutenant-general, have himself seen their force, and have carried to the general-in-chief the expression of Lord Lucan's opinion. The urgency of the order no doubt stimulated the gallant captain to receive with impatience any symptoms of hesitation. Besides all this, his own opinions as to the capabilities of cavalry, especially the British cavalry, were enthusiastic even to fanaticism; so that he could scarcely tolerate any doubt on the part of a cavalry commander as to whether his men could not ride down infantry, artillery, and whatever else might obstruct their charge. The conduct of Captain Nolan on this occasion has been the subject of very extensive discussion, but the real state of his feelings is that which is above disclosed. A truer soldier, a better horseman, or a more accomplished swordsman seldom trod the field of battle; but he was a man of a warm and enthusiastic temperament, and of dauntless courage, so that he could but ill brook any appearance of timidity. While the aide-de-camp chafed under the general's remonstrances, the latter said, with a doubtful and puzzled expression of countenance, something about mistaken orders, which Nolan did not distinctly hear, who instantly retorted—"They are *Lord Raglan's orders*; the cavalry must attack immediately." This was undoubtedly the intention at head-quarters, however it may have been afterwards disguised; and Captain Nolan only expressed what he knew to be the meaning, at all events, of the quartermaster-general. To the stern tone of the aide-de-camp, as well as his words, Lord Lucan replied in a querulous and deprecatory voice, "Where are we to go? What guns are we to take?" Captain Nolan, turning his horse's head, with an indignant gesture pointed over the ridge towards the valley, and said, in a manner full of contemptuous meaning, "There, my lord, is your enemy, and there are *our guns*." Lord Lucan made no reply, but was goaded by the manner of Captain Nolan, all the more in consequence of that officer's great reputation. The noble earl summoned his major-general instantly to the spot, and told him the order that he had received. Lord Lucan remonstrated in very energetic terms, but Lord Lucan replied that he concurred in the objections, but must obey orders.

Lord Cardigan, having definitively received

his instructions, boldly set about their execution. The light cavalry advanced to the front of the ridge, in two lines of four squadrons each. The first line was formed by the 13th Light Dragoons and 17th Lancers; the second by the 4th Light Dragoons and the 11th Hussars; the 8th Hussars formed the support. They then moved slowly over the Woronzoff Road, when the trumpets sounded, and the pace was quickened to a trot. The scene was a sublime one. Never in the history of war was so small a host marshalled against an enemy so numerous, and that enemy placed in such a position of strength. The achievement of Xenophon before the hosts of the Persians did not appear so desperate, nor was it so glorious. Yet at that moment the little brigade (if in any sense its numbers entitle it to be called so) appeared to glory in their perilous duty. The men, whether from their rougher natures, or being incapable of appreciating the full honour and danger of the deed, were less excited than the officers. In the 8th Royal Irish Hussars a number of the men lit their pipes, as if conscious that soldierly etiquette was no longer of any account, and that they might as well take with composure the desperate task before them. The officers, on the other hand, shouted, and waved their swords; and, as the headlong fury of the charge began, they galloped out far in advance of their men. The Earl of Cardigan showed great presence of mind and coolness in the emergency, endeavouring to restrain their ardour, and to prevent the disaster it might occasion. The author of these pages has good authority for saying that the noble lord was obliged to place his sword before some of those gallant men to keep them in their proper places, so eager were they for the formidable encounter.

Before, however, the grand crash of the charge was felt, or filled the spectators with astonishment and awe, poor Nolan paid the penalty of his own urgency with his life. Many various accounts have been given of the way he fell. He has been generally represented as leading the brigade when he received his death-blow. Lord Cardigan has denied this, and stated that Nolan was not leading the brigade, but a considerable distance on the general's right, and in advance. In this case both accounts are true. There is no doubt that the intrepid horseman was far in advance, and determined to keep the lead until his sword met the enemy, but he fell before the actual charge commenced, and while (just as Lord Cardigan represented) his horse was prancing about. At the moment of his fall he had just waved his sword, and given a cheer, when the fatal blow performed its mission. In several of the published accounts, Lord Cardigan is repre-

sented as detracting from Captain Nolan's merit in the statements he gave of the position of that officer when he fell. We are in a condition to positively refute that calumny. So far from Lord Cardigan wishing to depreciate Captain Nolan, he has vindicated his memory; and, when living, showed his confidence and respect by offering to place him upon his own staff. The writer of this narrative has these facts from the lips of the noble earl himself, who could have no motive, unless it were a personal courtesy, in deviating from the sternest matter of truth in the case. The fall of this fine officer has been described as caused by a shell, which killed him on the spot. The true occasion of his untimely end was a fragment of a shell, which entered his breast. The shell had fallen midway between the spot where Lord Cardigan rode and that where the uneasy steed of Captain Nolan, sympathising with its rider, seemed with joy to anticipate the charge. When Captain Nolan was struck his sword dropped, and the reins fell from his hand. The horse, following the instincts generally shown on such occasions, turned from the battle. The brigade now coming up fast, opened to let him pass. He immediately threw up his arms with an expressive cry, as if dissuading them from their course. This he repeated as the second line opened to make way for him, and then fell from his horse. It was universally supposed by those of the brigade who survived, that in riding so far to the front his quick eye perceived the impregnable position of the enemy, and his imploring gestures were intended to stop the cavalry from their self-immolating career. It is probable that the proud soldier dropped dead from his horse; for the general by whom that handful of men was so bravely led into the unequal struggle told the writer that, immediately on retiring from the charge, he saw the captain lying dead in a hollow, where he had fallen.

When the sad episode was past, the brigade increased their pace to the gallop, and then to a furious speed—so furious, that to it is to be attributed the fact that so many reached the guns alive. On dashed the heroic band, and first their gallant chief; nearest to him was Captain Jennings. These two men had the honour of being foremost in the most glorious charge of cavalry ever made. As the brigade rushed forward, like the wild horse of Mazeppa, the fire of the enemy's artillery was awfully destructive. In the first volley the advanced line was broken, and horses and men strewn along the field. The second line closed up; and on they dashed together, the earth reeling beneath their tread. The enemy now used case-shot, and a dreadful *mitraille* fell in rapid and destructive showers upon them.

Lord Cardigan led the brigade upon the centre gun. Like a thunderclap the charge was made—down went the greater number of the artillerymen; for although they sought shelter under the guns, and wherever they could find it, so rapid was the sword-flight upon them, that they were swept off before its edge.

Before reaching the guns, the intrepid as-sailants were exposed not only to their fire, but also to that of those situated at right angles with them. As the cannon on the Russian front were silenced by the brigade dashing among them, the enemy's infantry opened a continuous roll of musketry, and a double line of cavalry were ready to receive and to return the charge. Amongst these infantry a number of our gallant Dragoons madly spurred, cutting down with furious energy those who resisted their progress; some actually penetrated the lines of cavalry, and charging again through cavalry and infantry, rushed back between the guns into the plain over which they had advanced. Officers and men, however, having cut down as many of the gunners as they could, and perceiving the hopelessness of charging the host beyond them, wisely felt that they had accomplished all that duty required, and returned. All order, however, was broken, and "the men came back by twos and threes," as a gallant officer who was present expressed it to the writer. The 8th Royal Irish Hussars, commanded by Colonel Sewel, was the only regiment which retained any order, which it was enabled to do being the supporting regiment. It was fortunate that they succeeded in maintaining a compact form, and that they were handled by such an officer as Colonel Sewel, for the retreat of the brigade was still more perilous than its advance. The infantry pouring down the ridge from the slopes beneath the captured redoubt, obstructed the retreat—some opening a well-directed rifle fire, others throwing themselves in the path of the fugitives. This latter body of foot soldiers was sabred and dispersed. The cannon on either flank re-opened its destructive cross-fire, and the cavalry on the enemy's right rushed forward, and fell upon the wearied and wounded heroes, as scattered groups appeared likely to escape from the showers of case-shot, musket bullets, and conical rifle balls, through which they rode. This force of the enemy's cavalry would have effectually prevented all retreat had not the regiment which had suffered least up to this point—the 8th Hussars—charged them, and with such vehemence as to break the line of the Lancers, and sabre numbers of them. The Irish Hussars, however, lost half their men in the performance of the gallant and well-timed feat. At this juncture occurred the most bloody and savage atrocity ever recorded of war. Sinope, with its cool-blooded butchery,

fades away in tragic horror before the sanguinary act which "Holy Russia" now perpetrated. While the Irish Hussars and the Russian Lancers were mingled in close and desperate fray, the Russians, perceiving that the Hussars, few although they were, were the victors, creating furious havoc among the Lancers, determined upon a course which even to savages would be repugnant. The Russian gunners again opened fire with case-shot upon the whole struggling mass of cavalry, mowing down friends and foes in one remorseless sacrifice to their unsated vengeance. The cruel and relentless calculation, that as the Hussars were successful it would on the whole be an advantage to sweep away victors and vanquished together, as the only way of conquering the former, was however baffled, for, surrounded as the poor Irish Hussars were by sevenfold, or even tenfold, their number, they were in part protected by the bodies of their assailants from the missiles of the artillery, and for one Hussar put *hors de combat* an overwhelming disproportion of the enemy's own cavalry fell by this murderous scheme. What must be the moral state of the Russian army and of Russia, of men and officers, when the fact is verified that not a Russian who subsequently fell into our hands, of any rank, ever blamed this assassin mode of warfare, but seemed highly to approve of the deed from admiration of the motive—the destruction of the greatest possible number of their enemies even by the deliberate murder of their own troops! At this critical moment, the Chasseurs d'Afrique charged the line of guns on the Russian right, which they performed with a gallantry almost rivalling that of their British *confrères*. Their number, considerably beneath 300 men, was too small to do more than give the British horsemen a chance of escape; for when they had got among the guns, and were cutting down the artillerymen, the infantry opened a musketry fire upon them, as they had when the British charged the guns in front; and the Chasseurs d'Afrique, after slaying a number of the Lancers, who were grappling in deadly combat with the Irish Hussars, retired with a loss of two officers and fifty-three men. The British were now seen returning—a wretched wreck of the fine lines of cavaliers that had so lately, full of lusty life and military pride, charged an unworthy enemy. Some came back horse and man wounded. A sergeant of the 8th Hussars was killed going into action, but his horse carried him into the combat, and returned with him still in the saddle. Many came back on foot, wounded or unscathed, and some, resting on the manes of their horses, lived to reach the camp, and then dropped dead.

As soon as the charge was over, the Cossacks

scoured the plain, overtaking and killing the fugitives; and wherever they saw a sign of life in a wounded officer or man, they gathered around, and with savage exultation continued to pierce him with their spears until signs of life remained no longer. The wounded Russians seemed to forget their wounds in their eagerness to murder their wounded enemies.

Lord Lucan ordered forward the heavy cavalry brigade to cover this retreat, and save as many as possible of the wounded; in this service they suffered very severely, the peril of their own magnificent charge was nothing to the danger of the artillery fire to which they were now exposed. Various stories are in circulation of the feats performed by the leader of the light brigade. In the printshops he is represented as leaping over a piece of Russian ordnance, and other such-like achievements. All these acts of horsemanship and swordsmanship are simply inventions, or ridiculous misapprehensions of real occurrences, as the author of this book learned from the gallant earl himself, whose modest recital of the part borne by him in this charge has since been proved to be as true as it was unassuming, simple, and earnest. We have necessarily read much, and have had opportunities of conversing with many concerning this charge, and the part borne in it by the major-general who commanded, but by far the most unpretending and clear narrative we have anywhere received has been in conversation with the noble earl himself. It is scarcely necessary to say that all idea of command and discipline were soon lost, in spite of almost superhuman efforts to maintain them—the case of Colonel Sewel and the Royal Irish Hussars being an exception, for the reasons already given. When the charge upon the guns sent its shock through friends and foes, Lord Cardigan found himself in front of a large gun, which, instead of flying over as if he were one of the Seven Champions of Christendom, or the knight of a fairy tale, he rode round, and was confronted by a dense mass of Cossacks at a little distance. Two who were immediately near charged him, the lance of one passing through his clothes, that of the other also passing through his apparel and grazing his hip. The suddenness of the onset nearly unhorsed him: to the strength and docility of his fine charger he was indebted for his life. Having firmly regained his seat, he rid himself of his assailants, who showed no desire for renewing the struggle. The Cossacks always shunned encounter with our troopers and especially with the officers, except when they could take them at a great disadvantage. The Earl of Cardigan had now no alternative but to charge, single-handed, the body of Cos-

sacks before him, with the same prospect of success that Don Quixote had with the wind-mill, or to retire. As he fell back—the only thing left for him to do—he performed in our opinion a far more gallant exploit than even his chivalrous leading into action. He deliberately walked his horse out of the range of guns, in a fruitless effort to collect and head in their retreat any groups of men then returning to the camp; but the only body of men which were able to keep together (the 8th Royal Irish Hussars) were on the extreme right of the gorge, coming out. Lord Cardigan emerged from the vortex of slaughter and disaster on the opposite side, and providentially regained, through a deluge of rifle balls and musketry fire, the cavalry head-quarters, where they were doing their best to save all who, like him, could escape beyond the limits of that vale of death. The first group of men—some unscathed, some wounded, others dismounted, or riding horses with dreadful and gaping wounds—who had been collected together, on perceiving their commander riding out in safety, loudly cheered him, manifesting exuberant joy at a sight they had no hope of witnessing.

When the remnant of the broken band was drawn up, Mr. Woods informs us that Lord Cardigan exclaimed, "Well, Nolan has died like a soldier; but if he had not, I would have tried him by court-martial for this!" And Mr. Woods very properly adds, "In the heat of the moment Lord Cardigan seemed to forget that Captain Nolan was merely the bearer of a written order." It is doubtful whether his lordship ever uttered the language here attributed to him. He knew that the order was in writing; but he also knew that Captain Nolan was urgent for its performance, in obedience to the command which he personally received at head-quarters. This question has already been discussed; but lest it should appear that we have placed anything in an *ex parte* light, we would call the attention of our readers to an article in the *United Service Magazine* for April, 1856. We do so at the suggestion of a gallant officer, whose breast wears many a decoration, and to whom all the officers named in this narrative are and were then intimately known. The article is an elaborate effort on the part of some military man to vindicate Sir Richard Airey from the implications and statements in the report of Sir John McNeil and Colonel Tulloch. It is as follows:—"The harbour of Balaklava was connected with the camp by two roads—one a circuitous route through the heights, the other more direct, facing the position taken up by the enemy on the Tchernaya. This latter route was protected by four little eminences, running across the low ground from ridge to ridge, and forming a sort of screen, guarded by redoubts, and held

by Turkish troops. On the 25th of October, the Russians, having mustered a strong force on the Tchernaya, hurled a body of cavalry against these redoubts, which the Turks instantly abandoned, flying towards the English lines, pursued by the enemy. The brigade of Guards was ordered by Lord Raglan to advance to the redoubts, and Lord Lucan, who was near the spot, was directed to hold the ground with the cavalry till they came up; but, by some unaccountable wilfulness, he disregarded the order, and the cavalry never moved. Lord Raglan, posted on a commanding height, was now the witness of a singular scene. As he was anxiously awaiting the appearance of the British cavalry, he saw the light squadrons of the enemy scouring over the ground, and peering into the English position, while a number of artillery horses, collected at different points, trooped out from the enemy's lines towards the redoubts, trailing up the turf with the hooks of their harness as they came along. These hooks were manifestly designed to be fastened to the guns abandoned by the Turks, and left unspiked in the redoubts; and Lord Raglan, seeing what was intended, and amazed at the inaction of the British cavalry, now called out for an officer to gallop off directly to Lord Lucan, and order the cavalry to advance without delay, so as to prevent the guns being carried off. The ill-fated Captain Nolan, who was aide-de-camp to Sir Richard Airey, rode forward, when Sir Richard suggested that the order should be put in writing, to which Lord Raglan assented, and it was accordingly written down as follows:—"Lord Raglan wishes the cavalry to advance rapidly in front, follow the enemy, and try to prevent their carrying away the guns. Troops of artillery may follow. French cavalry on the left.—*Immediate.*" It has been said that this order is ambiguous, and Sir Richard Airey has been blamed for not expressing himself in plainer terms; but anything more distinct, particularly after Lord Raglan's previous directions to Lord Lucan, it would be difficult to conceive. Lord Lucan is commanded 'to follow the enemy, and *try to prevent* their carrying off the guns.' But when he received this order the enemy had actually carried off the guns, had re-entered his lines, and restored his batteries; so that, in fact, the time for action had gone by, the guns could not be recovered, and to advance a body of cavalry in face of the enemy's batteries, and an overwhelming force of artillery, cavalry, and infantry, was only to expose it to destruction. This was the course, however, that Lord Lucan adopted, and he then throws the blame on Captain Nolan, and indirectly on Sir Richard Airey, whose order, be it remembered, was for an operation wholly different from that really executed, and pointed to a combination with

the French cavalry, which was never even attempted."

So far as the combination with the French cavalry, referred to in the closing sentence of this extract, is concerned, we have already observed upon the subject, so as to require here only the remark that it was scarcely possible for Lord Lucan to effect any combination at that moment; and, from the words of the order, it was rational for him to suppose that Lord Raglan had seen to the execution of that part of the matter. The order did not call upon him to communicate with the Chasseurs d'Afrique, but to advance immediately, and to expect the support of the French, in virtue of a general arrangement, a part of the detail of which it was for him to execute on the instant. The reference to the support ordered, by advancing the brigade of Guards, is met by the fact that they were sent to Sir Colin Campbell's right, to defend the gorge of Balaklava against the advance of Russian infantry from the direction of Kamara. Instead of the Duke of Cambridge being ordered to sustain any movement consigned to Lord Lucan, he was directed to place himself under the temporary charge of Sir Colin Campbell, whose task, as has been already seen, was of another description. It is not correct that all the guns were left unspiked in the redoubts. They were in No. 1, and partly in No. 2; but feeble as the defence was of No. 3, the British artilleryman there on duty succeeded in spiking probably all. The description given in this extract of the artillery-horses trooping out, and trailing along the ground tearing up the turf, the hooks they had affixed by ropes to their harness for dragging away the captured guns, is obviously an invention, for the purpose of saving the reputation of Sir Richard Airey. It would be impossible, either from the position occupied by the French *corps d'observation*, or from the acclivity upon which Lord Raglan and Sir Richard Airey stood, to have seen objects so minute as the ropes and hooks with any glasses which the staff possessed. We do not trust to our own judgment in this assertion, but have submitted it to an officer well acquainted both with the ground and the events of the day, much more so than the writer of the article in the *United Service Magazine* could be, and he confirms our opinion on this point.

The historian has no interest in throwing blame on officers, any more than in the preservation of any officer's reputation in these transactions; his duty to his readers and conscience requires truth. And when so many of the bravest of the brave were sacrificed, it is right that no sophisms, such as those of the article quoted, should be permitted to mislead the public mind. With the writer or dictator of

the fatal order, or both, the responsibility must rest, and not with Lords Lucan or Cardigan, or Captain Nolan.

When the relics of the brigade were drawn up, the loss was appalling; but so unbroken was the spirit of these illustrious braves, that they gave three hearty cheers—conscious that the unparalleled achievement which they had performed, would be accepted by their country and brethren-in-arms as one of the noblest ever attempted by soldiers. The loss appeared still greater than it was; for by degrees men came in, and some were heard of as alive in the hands of the enemy. The terrible affair did not last more than half an hour. The number who went into action was scarcely 680, and, according to the adjutant-general's returns, subsequently made, the loss was twenty-one officers, twenty-three sergeants, eight trumpeters, 229 privates, and 495 horses, killed, wounded, and missing. Amongst them every man and officer did his duty—none was bravest, all were greatly brave. No story of heroic antiquity can eclipse that of the British light cavalry charge at Balaklava. The 17th Lancers, being in the front line, suffered severely in men and officers. Among the latter, Sir William Gordon (wounded severely), Captain Winter (killed), Captain Morris (wounded severely), Captain White (wounded severely), Lieutenant J. H. Thompson (wounded, and taken prisoner), Adjutant Chadwick (wounded, and taken prisoner). The 13th, being also in the front line, suffered heavily. Captains Oldham and Good were killed; Cornet Montgomery was wounded, and taken prisoner; Cornet Wombwell was taken prisoner, but escaped. Both Lord Cardigan's aides-de-camp, Captain G. Lockwood and Lieutenant H. F. Maxse, were killed. The second line did not suffer quite so much, but it had a sorrowful catalogue of the wounded and slain.

The following is Lord Lucan's report from Balaklava to his excellency the commander of the forces:—

"MY LORD,—I have the honour to report that the cavalry division under my command was seriously engaged with the enemy on the 25th instant, during the greater part of which day it was under a heavy fire; that it made a most triumphant charge against a very superior number of the enemy's cavalry, and an attack upon batteries which, for daring and gallantry, could not be exceeded. The loss, however, in officers, men, and horses, has been most severe.

"From half-past six in the morning, when the horse-artillery first opened fire, till the enemy had possessed itself of all the different forts, the cavalry, constantly changing their positions, continued giving all the support they could to the Turkish troops, though much ex-

posed to the fire of heavy guns and riflemen, when they took post on the left of the second line of redoubts by an order from your lordship. The heavy brigade had soon to return to the support of the troops defending Balaklava, and was fortunate enough in being at hand when a large force of Russian cavalry was descending the hill. I immediately ordered Brigadier-general Scarlett to attack with the Scots Greys and Enniskillen Dragoons, and had his attack supported in second line by the 5th Dragoon Guards, and by a flank attack of the 4th Dragoon Guards. Under every disadvantage of ground, these eight small squadrons succeeded in defeating and dispersing a body of cavalry estimated at three times their number and more.

"The heavy brigade having now joined the light brigade, the division took up a position with a view of supporting an attack upon the heights, when, being instructed to make a rapid advance to our front, to prevent the enemy carrying the guns lost by the Turkish troops in the morning, I ordered the light brigade to advance in two lines, and supported them with the heavy brigade. This attack of the light cavalry was very brilliant and daring; exposed to a fire from heavy batteries on their front and two flanks, they advanced unchecked until they reached the batteries of the enemy, and cleared them of their gunners, and only retired when they found themselves engaged with a very superior force of cavalry in the rear. Major-general the Earl of Cardigan led this attack in the most gallant and intrepid manner; and his lordship has expressed himself to me as admiring in the highest degree the courage and zeal of every officer, non-commissioned officer, and man who assisted. The heavy brigade advanced to the support of the attack under a very galling fire from the batteries and infantry in a redoubt, and acted with most perfect steadiness, and in a manner to deserve all praise.

"The losses, my lord, it grieves me to state, have been very great indeed, and, I fear, will be much felt by your lordship.

"I cannot too strongly recommend to your lordship the two general-officers commanding the brigades, all the officers in command of regiments, as also the divisional and brigade staffs; indeed, the conduct of every individual, of every rank, I feel to be deserving of my entire praise, and, I hope, of your lordship's approbation. The conduct of the Royal Horse Artillery troop, first under the command of Captain Maude, and, after that officer was severely wounded, of Captain Shakespear, was most meritorious and praiseworthy. I received from those officers every possible assistance during the time they respectively commanded.

"I have, &c.,

LUCAN."

The account given by the gallant leader of the light brigade is as follows:—"I received the order to attack, and although I should not have thought of making such an attack without orders, and although I differed in opinion as to the propriety of the order, I promptly obeyed it. I placed myself at the head of my brigade, and gave the word of command. We advanced, but before we had gone twenty yards, a shell burst between me and the staff officer who had brought the order, and was riding *within thirty yards of my side*, killing him, and leaving me untouched. From that moment there was nothing to be done but to obey the order, and attack the battery in the valley. We proceeded—we advanced down and along a gradual descent of more than three-quarters of a mile, with one of the batteries opposed to us vomiting forth shells, round-shot, and grape—with a battery on the right flank, a battery on the left, and a distant battery which had been lost by the Turks, and all the intermediate ground covered with Russian riflemen—so that when we came down within a distance of thirty yards to their artillery, which had been firing at us, we were, in fact, surrounded and encircled by a blaze of fire, and raked by the riflemen who fired upon us in flank. As we passed, the oblique fire of the artillery was brought upon our rear. Thus we had a strong fire on the front, in the rear, and on both our flanks. We entered the battery—we went through the battery—the two leading regiments cutting down a great number of the Russian gunners. In the two regiments which I had the honour to lead, every officer was either killed or wounded, or had his horse shot under him, except one. Those regiments having proceeded on, were followed by the second line, consisting of two more cavalry regiments, which continued to cut down the Russian gunners. Then came the third line, consisting of two other regiments, who also nobly performed their duty. The result was, this body of about 600 cavalry succeeded in passing through a body of, as we have since learnt, 5600 Russian cavalry. I know the number of the Russian regiments, and the name of the general officer who commanded the brigade. We did as much execution as we could, and suffered an immense loss of life ourselves. After riding through the Russian cavalry we came upon the Tchernaya river. There we were stopped, and we had to retire by the same route by which we came, destroying as many of the enemy as we could. I believe we succeeded in destroying the greater part of the Russian gunners, and in doing great execution among the Russian cavalry. The scene, on retiring, was lamentable in the extreme; still nothing could be accomplished more regularly, or with greater order; there

was no confusion, no hurry, no galloping about, no desire to retire too hastily, but the whole thing was conducted as coolly and systematically as upon parade. As we returned up the hill we had descended, we had to run the same gauntlet, and incur the same risk from the flank fire of the Russian riflemen. Numbers of men and horses were shot down, and many soldiers who had lost their chargers were killed whilst endeavouring to escape on foot. The consequence was, that when we reached the top of the hill, there was about one-third of the whole brigade left. I think when I went round, to count them, 195 only remained. The rest were gone—destroyed in that charge! Now I am not going into this case any further; I am not going to say whether this thing should have been done, or, indeed, to say anything more upon the subject. You have all of you had an opportunity of reading Lord Raglan's despatches describing how it occurred. I will only say further with regard to that charge, that, highly as you approve of it—and I will not conceal my pride and gratification at receiving your approbation and high opinion of the gallantry then displayed—I feel that, whatever gallantry you may attribute to me was equalled by every man in that brigade. I led, they followed—there was no hesitation; I never saw so ready, so cheerful a body of men in my life. I never witnessed anything done with more spirit or with lighter hearts; and to such an extent was this evidenced, that when the remnant of the brigade returned to position, the men were so elated at what they deemed so creditable to themselves and to the British arms, that they gave three cheers of rejoicing at having attacked the Russian batteries, and at having ridden through and through so large a body of Russian cavalry."

The above account, given by the Earl of Cardigan in public, contains several errors, such as are inseparable from the hurry of a public address, and the slips of a rapid report. Thus, his lordship errs in representing the brigade as riding through the whole of the Russian cavalry. It would be impossible for any officer to see all the *general*, not to say particular, occurrences of that complicated affair; and his lordship had enough to do to defend his own life during the brief interval after the guns were reached, without observing what was done by others. It is also an error to speak of the supporting line as consisting of two regiments; this must have originated in the report. Our own narrative is an accurate representation of the action, and in general accordance with what we know to be Lord Cardigan's own views of it. The conduct of Lord Paget, Colonel Sewel, and all the other leaders, merits the eulogy which Lord Cardigan gives them, who with great pro-

priety, however, refrained from pointing out any by name.

The acts of individual courage during this short, but memorable charge, were innumerable; nor were they confined to the officers—"groom fought like noble;" and this was especially exemplified in the instance of private John Penn, of the 17th Lancers, whose likeness will appear as one of the illustrations in this work. Seldom has heroic courage equalled his; had he been a soldier of any other army in the world than that of England—humbly born although he is—he would have been promoted to rank, and have other honours conferred upon him than the medals and clasps which cover his breast. He bears eleven honours, in the form of such decorations. Besides detailing his gallant conduct in the battle of Balaklava, we shall give a general outline of his military career:—"He was born in the 14th regiment of Light Dragoons, and was left an orphan before he was eight years of age, by the death of his father, Farrier-major Penn. At fourteen he was taken into the service of Lady John Bethell; but, not content with that situation, and his whole wish being for a dragoon's life, he entered the cavalry as soon as he had attained the standard height. This excellent soldier has seen eighteen years' service. He was through the Afghanistan campaign, under General Pollock, for which he received the Cabul medal. He was also through the Sutlej campaign, under Lord Gough. He was in the memorable action of Moodkee—was then severely wounded, and received a contusion on the head from the blow of a sponge-staff from a Sikh artilleryman. In the capturing of the guns he was unhorsed, and was found in the field next morning by a reconnoitring party, the poor fellow having lain there all night in great suffering. His wounds were dressed, and within two days of the battle of Sobraon he rejoined his regiment, and took part in that action, for which he received a clasp. He was with the army at Lahore, and until the close of the war; he was again in the field at Ramnuggur; he was also at the forcing of the passage of the Chenab. He was next at the brilliant attack of Soodoolapore, where the Sikhs were driven from their position on the Chenab. He was also in the action of Chillianwallah, 1849. He fought at Goojerat, when the Sikhs were again defeated, which was the last battle fought with that race of Indians. The 3rd Light Dragoons were then ordered to England, which they reached in July, 1853. Penn had not been many days at home when, hearing that the 17th Lancers were ordered for Turkey, he volunteered into that corps; and on the 23rd of June, 1854, he embarked at Portsmouth with a detachment of 6th Enniskillens, 13th Light Dragoons, 17th

Portrait of General G. G. G.

Lancers, and fifty-seven horses, under Captain the Hon. Hercules Rowley, the present Lord Langford. They arrived at Varna in July following. On the 1st September, Penn proceeded to the Crimea. He was in the action of the Alma; he was with his troop at Mackenzie's Farm when the Russian baggage and stores were captured; and in the Light Cavalry charge of Balaklava, for which he received the medal for distinguished conduct in the field. He speaks very highly of the lance—a weapon of which the Russians are very much in dread. Unfortunately for many of the brave fellows of his regiment, they had their poles shattered by the enemy's showers of grape-shot. On their coming up to the Russian guns, they were ordered to charge, when he made a point at a gunner, which took effect—the lance going through his body. He could not extricate it, as he was at a gallop. Passing through the enemy's guns, the 13th Light Dragoons and 17th Lancers were obliged to open out, when our hero came in contact with a Russian officer (a Hussar); he made for him, and the officer wheeled his horse about, for the purpose of making a bolt; he, therefore, took a favourable distance on the officer's left (both at the time being at a gallop), when he delivered cut six, which instantly dismounted the officer, whose head was nearly severed from his body. At the same time his horse halted, and on dismounting, to his grief, he found that his horse had received a ball in his near shoulder. He then took a view of the Russian officer; he must have died in an instant, as his body never moved after falling to the ground; he cut his pouch belt off, and took his sword, and a clasp-knife, which he wore in a belt round his waist. This gallant affair was witnessed by several of Penn's comrades. He returned with the second line, composed of the 4th Light Dragoons, 8th Hussars, and 11th Hussars, keeping a sharp look-out on their front, flanks, and rear, until they had forced a passage through the Russians, who had closed upon them. By perseverance they forced a passage, after a few guards with the Russians, Penn using his trophy—the Russian officer's sword. The seventh guard he took with a Russian, the point of the sword broke about ten inches off. He luckily returned with the remnant of his regiment. The ball was speedily extracted from his horse, which recovered, and the animal stood the winter, and was doing duty when he left the Crimea. Penn was at the battle of Inkerman, for which he received a clasp. He was never ill during the whole of the season, although much exposed. He was always employed on general duty. On account of the heat of the sun in July, when he was on outpost duty at Baidar, his head became affected, which caused him to be invalided

home. This arose from his having his right collar-bone fractured, and the lower jaw broken, by a horse falling on him when he was at field-drill in India, in 1852."

We dismiss our account of this part of the battle of Balaklava by quoting the words of a civilian, who saw something of the engagement, and conversed much about it on the spot:—"Of course, in the cavalry camp, the charges of the heavy and light brigades at the battle of Balaklava are very fertile topics of conversation. As far as I could judge, the opinion of by far the majority of cavalry officers was, that Lord Lucan was an injured and hardly-used man. The order which he received was so worded as to place him in a very cruel dilemma. Had he refused to charge, his enemies at headquarters—and he had many, and bitter ones—might have accused him of a disobedience of orders, and of having thrown away a chance of brilliant success; and in carrying out the orders of his commanding officer, evidently against his convictions, he is accused of having sacrificed his light brigade. The disastrous result of that charge has proved that it was madness; but had Lord Lucan refused to obey the order, would the madness of it have been so evident? We know it was madness now; but should we have known it then? It enhances the glory of some of the actors in that chivalrous display of courage, to lay great stress on the knowledge they possessed of the frightful carnage they would be exposed to, and of their self-devotion in having galloped almost into the jaws of death. But suppose the charge had not taken place, and they were not the heroes they now are, would not some have been found who would have been too glad to visit the want of success on their commander, and have passed over in silence the knowledge they possessed, or fancied they possessed, of the risks that should have forbidden the attempt? It is a question, like many others connected with this winter campaign in the Crimea, that will never be settled to the satisfaction of all parties. Viewed in its worst light, it was an error of judgment, and, in that case, surely the blame must be shared by those who originally gave the order; the attempts lately made to tack on to it worse motives are far more likely to injure the accusers than the accused. . . . As far as I could gather from officers engaged in the charge of the heavy brigade, the Russian cavalry was not a very formidable foe, and, but for their officers, would have retired expeditiously, even much sooner than they did. In this, as in every other point connected with the Russian military service, 'we had 'got hold of the wrong end of the stick,' as the saying is. We dreaded their cavalry as being the best in Europe, and despised their infantry as being the worst. The very

first campaign has established the opposite results."

It was not generally known at the time, nor until long after, that General Scarlett received a sword-wound in the charge, and was struck on the back of the hand by a spent musket-ball, when covering the retreat of the light cavalry.

The battle of Balaklava has been generally represented as terminating with the disastrous charge of the light cavalry. The remaining incidents of the day were, however, interesting and important. As soon as the heavy cavalry had covered the retreat of the light, they moved slowly back in columns of squadrons, all the while exposed to the incessant fire of the enemy. Our infantry then moved towards the redoubts, and the enemy's infantry retired as they advanced. The French cavalry threw out skirmishers, and the enemy gradually withdrew their guns from the right of the entrance to the gorge. Had the French Chasseurs been in sufficient force at this instant, they could, in conjunction with the heavy cavalry, as the allied infantry came on, have pressed the enemy closely, who momentarily increased his caution, and showed a disposition to retire. As our infantry advanced, the Russians played upon them with shot and shell from the captured redoubts. The first division, which, with the exception of the 93rd regiment, still retained its old position, had now well advanced, and began to suffer from the well-plied guns of the enemy, when the Duke of Cambridge ordered them to lie down in double line, and in such a manner as to screen them from the effects of the showering shot. Sir George Cathcart's division, supported by two regiments of the French division, under the command of General Canrobert, attended by a powerful artillery, advanced to the enemy's right, where the French Chasseurs had played, and were still playing, so distinguished a part. The Russians, perceiving the determined approach of so formidable an allied force, showed symptoms of apprehension, and even of trepidation, and abandoned No. 1 redoubt, that which they had at first conquered, into which the left wing of the 20th regiment of British infantry entered. One gun was found by them in the ditch, which they dragged into the battery. Thus, almost without a shot, by a prudent and general-like combination of force, this redoubt was re-taken, which, by such means, might have been far more happily accomplished, without the confused and random orders given in the early part of the day to Lord Lucan, and which might well have bewildered a steadier head than his. The approaching infantry were covered by the ridge in their steady advance, so that, with the exception of the injury sustained by the first

division before it lay down, the balls of the enemy did little mischief. In fifteen minutes after No. 1 redoubt was abandoned, the Russians blew up the magazine of No. 2, and left it with precipitation. In half an hour more, as the allied infantry, cavalry, and artillery skilfully and gradually made good their advance, the Russians exploded the magazine of the No. 3 redoubt, and fled precipitately from it also. So well prepared were they, however, for an advance of the allied infantry, that they succeeded in carrying off seven of the guns from these earthworks. Had the advance of the allied divisions been as spirited and enterprising as it was skilful and cautious, not a gun need have been lost. The Russians did not retire until they had covered the removal of the guns. They afterwards occupied a strong position in the rear of No. 1 redoubt, of which they were allowed to re-possession themselves. About mid-day the whole of the Russian infantry had retired within the gorge, and on the heights which flanked it; and in this very strong position, with their cavalry still thrown out in front upon the plain, appeared willing to offer the allies battle.

In the various accounts given by correspondents of periodicals, officers and men to their private friends, and amateurs who kept journals, considerable confusion and contradiction exists as to the successive occupation and re-occupation of the redoubts. We shall present the accounts given of the close of the action by a few of the most trustworthy, where they illustrate and assist one another in their descriptions. Mr. Russell thus describes it:—"At twenty-eight minutes after twelve, the whole of the allies again got into motion towards the enemy, with the exception of the first division, which moved *en echelon* towards the opposite hills, keeping their right wing well before Balaklava. At forty minutes after twelve, Captain Calthorpe was sent by Lord Raglan with orders to the troops, which seemed to have the effect of altering the disposition of our front, for the French, at one, P.M., showed still further up on our left. When we got to the ridges, they took possession of redoubts Nos. 1, 2, and 3. But the Russians evidently intended to keep No. 4, and to draw us after them, if possible, into the gorge, where they had retired their guns. As our object was solely to keep Balaklava, this was not our game; and as the Russians would not advance, but kept their cavalry in front of the approach to the mountain passes, it became evident there would be no further engagement to-day. The cannonade, which began again at a quarter past twelve, and was continued with little effect, ceased altogether at a quarter past one, and the two armies retained their respective positions. Our men and horses were alike

tired and hungry, and the French were no better. Lord Raglan continued on the hill-side all day, watching the enemy. It was dark ere he returned to his quarters. With the last gleam of day we could see the sheen of the enemy's lances in their old position in the valley; and their infantry gradually crowned the heights on their left, and occupied the road to the village which is beyond Balaklava to the southward. Our Guards were moving back, as I passed them, and the tired troops, French and English, were being replaced by a strong French division, which was marched down to the valley at five o'clock."

Lieutenant Peard was with the wing of the 20th regiment, which entered the recaptured redoubt, and he relates that its occupation was an affair of very considerable danger, while the Russians continued in possession of No. 2—from which shot and shell were cast furiously upon the British infantry in the redoubt, and the artillery of the fourth division, which was posted on the slope outside. One fragment of a shell struck the staff of the queen's colours, which this gallant officer carried. From the position there taken up by the detachment of the 20th, those who composed it could see the whole field of battle lying between the redoubt and the Russian cavalry, who were manœuvring along their own front. The enemy's infantry lay concealed among the brushwood on the heights, which Liprandi seemed prepared to defend. Lieutenant Peard describes what he witnessed on the battle-field:—

"From our elevated situation I witnessed many heart-rending scenes through my glasses. Poor troopers were standing about all over the plain, wounded; others were to be seen galloping into camp at an earlier part of the day, by twos and threes, in regular order, as if in the ranks. One poor animal came cantering along with his hind-leg broken, and swinging round and round at every stride. Others would be seen with both hind-legs broken, endeavouring to rise from the place where they fell. I shall never forget one scene, so dreadful, and yet one which would have made a splendid study for an artist. It was a wounded Scots Grey, who passed us, his horse led by a companion. All looked so sad: even the poor horse, though not wounded, bowed his head, and appeared to sympathise in his master's sufferings. The poor fellow seemed to be in a dying state, and as he leant on the pommel of his saddle, his pale and agonised face could just be observed under his bear-skin; the horse's shoulder was covered with blood, and yet the poor creature seemed to know with what care he ought to carry his wounded master.

"We could plainly see the Cossacks on the field of battle, amongst the dead and wounded, and now and then their gory lances would be

thrust through the body of some wretched sufferers, who had in vain lifted up their hands, expecting aid instead of destruction from these savages. The servant of an officer who was ill at Balaklava, walked up from the field of battle, where he had picked up a Cossack's sword, and shortly afterwards took a poor wounded officer on his back to Balaklava. On the way they were fired at by a wounded Russian. Upon this he deposited his load on the ground, and, walking up to the villain, lopped his head off, and proceeded on his way with his burden.

"We watched with the greatest interest a wounded dragoon, who was creeping on his belly from the battle-field, near the Russian horse, to us. Every now and then he would halt and hold up his sword. He was presently spied by the Russian sharpshooters in the redoubt near us, and they opened a sharp fire on the poor fellow. He still persevered, and was shortly seen by a sailor, who had a brass helmet on his head, and was walking about picking up trophies, with a friend, quite heedless of their rifles. They immediately went to his rescue, and carried him on their shoulders some little distance, when he was put on a horse, with great difficulty, and brought into our lines. I do not know when my heart felt more relieved. A brother officer, M——, was busy in shooting wounded horses which were near our redoubt; and Captain B—— and W—— were rendering all the assistance in their power to a wounded Russian officer, by sewing up and washing his wounds, but he died that night, chiefly from the intense cold. Some swords belonging to the Scots Greys were picked up; one I saw was broken off within six inches of the hilt, and another was complete, only the handle was covered with blood and brains, and a piece of a skull had adhered to it. Just before dark we were agreeably surprised to hear that we were to evacuate this place and return to our camp before Sebastopol, about eight miles distant, as soon as the clouds of night had sufficiently gathered around us. A strong French division was marched into the valley for our relief.

"Thus ended this melancholy day, in which our light cavalry had been annihilated; the killed, wounded, and missing amounting to 385, and horses 520, 130 of whom were wounded. We heard that there were several men in camp who had not turned out, being ill or otherwise engaged, amounting to about 200 men. The two guns out of nine which the Russians left of ours were taken from the Turks into our own better keeping. At nine, p.m., the Russians fired a tremendous volley of artillery on our works, in honour of the complete victory they were supposed to have gained, and on the arrival of our guns in the town of Sebastopol; but it did us no injury."

CHAPTER XLII.

DESPATCHES OF THE COMMANDERS-IN-CHIEF.—LETTERS CONCERNING THE BATTLE.—NOTICES OF THE PROMINENT ACTORS, AND STRIKING INCIDENTS OF THE CONFLICT.

"In the field of proud honour, our swords in our hands,
Our king and our country to save;
While victory shines on life's last ebbing sands,
O! who would not die with the brave?" BURNS.

HAVING completed the narrative of the ever-famous battle of Balaklava, we present to our readers, in a separate chapter, the despatches of the chiefs to their respective governments, and such incidents as will further illustrate the glories of the hard-fought field.

Before Sebastopol, Oct. 28th.

MY LORD DUKE,—I have the honour to acquaint your grace that the enemy attacked the position in the front of Balaklava at an early hour on the morning of the 25th instant.

The low range of heights that runs across the plain at the bottom of which the town is placed, was protected by four small redoubts hastily constructed. Three of these had guns in them; and on a higher hill, in front of the village of Kamara, in advance of our right flank, was established a work of somewhat more importance. These several redoubts were garrisoned by Turkish troops—no other force being at my disposal for their occupation.

The 93rd Highlanders was the only British regiment in the plain, with the exception of a part of a battalion of detachments composed of weakly men, and a battery of artillery belonging to the third division; and on the heights behind our right were placed the marines, obligingly landed from the fleet by Vice-admiral Dundas. All these, including the Turkish troops, were under the immediate orders of Major-general Sir Colin Campbell, whom I had taken from the first division with the 93rd.

As soon as I was apprised of this movement of the enemy, I felt compelled to withdraw from before Sebastopol the first and fourth divisions, commanded by Lieutenant-generals his Royal Highness the Duke of Cambridge and the Hon. Sir George Cathcart, and bring them down into the plain; and General Canrobert subsequently reinforced these troops with the first division of French infantry, and the Chasseurs d'Afrique.

The enemy commenced their operations by attacking the work on our side of the village of Kamara, and after very little resistance, carried it. They likewise got possession of the three others in contiguity to it, being opposed only in one, and that but for a very short space of time. The furthest of the three they did not retain, but the immediate abandonment of the others enabled them to take possession of the guns in them, amounting in the whole to seven. Those in the three lesser forts were spiked by the one English artilleryman who was in each.

The Russian cavalry at once advanced, supported by artillery, in very great strength. One portion of them assailed the front and right flank of the 93rd, and were instantly driven back by the vigorous and steady fire of that distinguished regiment, under Lieutenant-colonel Ainslie. The other and larger mass turned towards her majesty's heavy cavalry, and afforded Brigadier-general Scarlett, under the guidance of Lieutenant-general the Earl of Lucan, the opportunity of inflicting upon them the most signal defeat. The ground was very unfavourable for the attack of our dragoons, but no obstacle was sufficient to check their advance, and they charged into the Russian column, which soon sought safety in flight, although far superior in numbers. The charge of this brigade was one of the most successful I ever witnessed, was never for a moment doubtful, and is in the highest degree creditable to Brigadier-general Scarlett, and the officers and men engaged in it.

As the enemy withdrew from the ground which they had momentarily occupied, I directed the cavalry, sup-

ported by the fourth division, under Lieutenant-general Sir George Cathcart, to move forward, and take advantage of any opportunity to regain the heights; and not having been able to accomplish this immediately, and it appearing that an attempt was making to remove the captured guns, the Earl of Lucan was desired to advance rapidly, follow the enemy in their retreat, and try to prevent them from effecting their object. In the meanwhile the Russians had time to re-form on their own ground, with artillery in front and upon their flanks. From some misconception of the instruction to advance, the lieutenant-general considered that he was bound to attack at all hazards, and he accordingly ordered Major-general the Earl of Cardigan to move forward with the light brigade. This order was obeyed in the most spirited and gallant manner. Lord Cardigan charged with the utmost vigour, attacked a battery which was firing upon the advancing squadrons, and having passed beyond it, engaged the Russian cavalry in its rear; but there his troops were assailed by artillery and infantry, as well as cavalry, and necessarily retired, after having committed much havoc upon the enemy. They effected this movement without haste or confusion; but the loss they have sustained has, I deeply lament, been very severe in officers, men, and horses, only counterbalanced by the brilliancy of the attack, and the gallantry, order, and discipline which distinguished it—forming a striking contrast to the conduct of the enemy's cavalry which had previously been engaged with the heavy brigade.

The Chasseurs d'Afrique advanced on our left, and gallantly charged a Russian battery, which checked its fire for a time, and thus rendered the British cavalry an essential service.

I have the honour to inclose copies of Sir Colin Campbell's and the Earl of Lucan's reports.

I beg to draw your grace's attention to the terms in which Sir Colin Campbell speaks of Lieutenant-colonel Ainslie, of the 93rd, and Captain Barker, of the Royal Artillery; and also to the praise bestowed by the Earl of Lucan on Major-general the Earl of Cardigan, and Brigadier-general Scarlett, which they most fully deserve. The Earl of Lucan not having sent me the names of the other officers who distinguished themselves, I propose to forward them by the next opportunity.

The enemy made no further movement in advance, and at the close of the day the brigade of Guards of the first division and the fourth division returned to their original encampment, as did the French troops, with the exception of one brigade of the first division, which General Canrobert was so good as to leave in support of Sir Colin Campbell. The remaining regiments of the Highland brigade also remained in the valley. The fourth division had advanced close to the heights, and Sir George Cathcart caused one of the redoubts to be re-occupied by the Turks, affording them his support, and he availed himself of the opportunity to assist with his riflemen in silencing two of the enemy's guns.

The means of defending the extensive position which had been occupied by the Turkish troops in the morning having proved wholly inadequate, I deemed it necessary, in concurrence with General Canrobert, to withdraw from the lower range of heights, and to concentrate our force, which will be increased by a considerable body of seamen, to be landed from the ships under the authority of Admiral Dundas, immediately in front of the narrow valley leading into Balaklava, and upon the precipitous heights on our right, thus affording a narrower line of defence.

I have, &c.,

His Grace the Duke of Newcastle, &c.

RAGLAN.

The following despatch from General Canrobert not only informs his government of the battle of Balaklava from a French point of view, but discloses the general's view of the progress of the siege, which, in spite of every interruption, was continued. The French general, writing on the 27th, naturally notices the battle of the 26th as well as that of the 25th, of which we shall give a correct relation in its proper place:—

Camp before Sebastopol, Oct. 27th.

M. LE MARÉCHAL,—We are continuing the construction of fresh batteries, destined to batter the eastern front of the bastion which we are attacking. They are placed on the bare rock, and it is only by the explosion of petards and by means of sand-bags and other laborious expedients that we make our way. Still we shall in a short time be able to multiply our fire against the defences, in repairing which, as fast as they are destroyed, the enemy labours with remarkable obstinacy. This siege will evidently form an epoch among the most laborious operations of the kind.

The town has suffered much from our fire, and we know that the loss of the defenders has been enormous. The English protect Balaklava, where they disembark their munitions, with a body of marines, a battalion of infantry, and some Turks.

On the morning of the 25th, at break of day, some hills, 2500 metres distant from the port, defended by some very imperfect redoubts, each manned by about 150 Turks, were carried by a very superior Russian force, which occupied them, having driven out the Turks. As soon as information of this affair reached Lord Raglan and myself, we proceeded to the heights which border the valley of Balaklava, and form the limits of our position. The enemy then occupied the hills I have mentioned, covering in masses the woody heights which bound the valley towards the Tchernaya, and displaying a force estimated at 20,000 men, besides those which were hidden from our view by the ravines and thickets. It was evidently his intention to entice us into deserting our excellent position, and to make us descend towards him into the plain. I contented myself with uniting, at the request of Lord Raglan, my cavalry to the English horse, which occupied a position on the plain before Balaklava, and which had already executed a most brilliant charge against the enemy's cavalry. Besides this, and while Lord Raglan established two divisions of infantry before the port, I caused all the men that I could spare from my first division to descend to the foot of the front slopes of our position.

Things were in this state, and the day already far spent, when the English light cavalry, 700 strong, led away by too much ardour, charged vigorously the whole mass of the Russian army. This impetuous charge, executed under a cross-fire of musketry and artillery, produced at first great confusion among the enemy's ranks; but this troop, hurried away too far from us, suffered considerable loss. After having sabred the gunners of two batteries it was forced to return, weakened by the loss of 150 men. During this time my brigade of Chasseurs d'Afrique, which was in the plain on the left of the English cavalry, was eager to get to its assistance, and did so by a bold manoeuvre, which was much spoken of, and which consisted in attacking on the left a battery of guns and some battalions of infantry, which it forced to retreat, and thus stopped a murderous fire which had been kept up on the English. In this affair we lost about twenty men killed and wounded, two of whom were officers. The loss on the enemy's side was considerable, and he suffered our chasseurs to effect their retreat in good order and without molestation. The night supervened to put an end to the combat. The day after the Russians made a sortie from the place, and towards Inkerman, attacked the division of Sir de Lacy Evans, which covered the siege works. Received by a crushing fire, and with that solidity which is peculiar to our allies, the Russians left on the ground more than 300

dead, and found themselves chased to the outskirts of the town, losing in their flight about 100 prisoners. This short and smart affair was most brilliant, and has certainly compensated for the painful incidents of the day before.

Having given a full account of the battle, as known in the allied camps, it will interest our readers to peruse the Russian account—the report of Lieutenant-general Liprandi, chief of the 12th division of infantry, to Aide-de-camp General Prince Menschikoff, dated October 26th:—

According to the orders of your highness, the troops of the division intrusted to my command, and those attached to it, executed on the 25th of October a general movement in advance from the village of Tchorgoum, and attacked the fortifications of the heights forming the valley of Kadikoi. Conformably with the arrangement which I had made on the evening of that day, all the troops of the detachment left, at five o'clock in the morning, the village of Tchorgoum by two defiles. A regiment of Chasseurs of the Ukraine, under the command of Major-general Lévousky, marched by the principal defile leading from Tchorgoum to Kadikoi, with four guns of the battery of position No. 4, and six guns of the light battery No. 7. These troops advanced with precision, and, on approaching the heights of Kadikoi, opened their fire upon the redoubts Nos. 1 and 2. After them the Azoff infantry regiment, the 4th battalion of the regiment of the Dnieper, with four guns of the battery of position No. 4, and six guns of the light battery No. 6, moved on under the command of Major-general Sémiakine. By the second defile, leading to the valley of Baidar, an advance was made under the command of Major-general Gribbe, of the first three battalions of the infantry regiment of the Dnieper, with six guns of the light battery No. 6, four pieces of the battery of position No. 4, a detachment of the regiment No. 53 of the Cossacks of the Don, and a squadron of the combined regiment of the lancers. Major-general Gribbe, who had marched in advance, occupied the village of Kamara, after having dispatched the detachment of Cossacks in the direction of the valley of Baidar. Simultaneously with this movement, Major-general Sémiakine in taking up his position to the left of the regiment of the Ukraine, covered by the fire of the artillery and a chain of riflemen, formed by the second company of the battalion of riflemen with the carabineers of the infantry regiment of Azoff, advanced rapidly with the latter regiment in two lines by columns of companies, there not being a space of more than 100 paces between the two lines; and in third line the first battalion of the regiment of Azoff, and the 4th battalion of the regiment of the Dnieper, by columns of attack. After having approached in this order to the distance of not more than 100 paces from the fortified height of the enemy, Major-general Sémiakine gave orders for the assault. The companies made a rapid movement in advance, and at half-past seven o'clock the regiment of Azoff had hoisted its flags upon the fortifications. The trophies gained upon this point were three rampart guns and a camp. In this redoubt the loss of the enemy in dead only was more than 170 men. At the same time the enemy, from the rapidity with which the principal height had been occupied, and in consequence of his seeing the advance of the regiment of chasseurs of the Ukraine, abandoned the redoubts Nos. 2 and 3 (the former armed with two guns and the latter with three), which were immediately occupied by our troops. The regiment of Chasseurs of Odessa, with the light battery No. 7, under the command of Colonel de Scudari, advanced to the redoubt No. 4; but the enemy, terrified upon this point also, did not wait for our attack, and abandoned the redoubt, in which there were three guns. Besides this, in each of the redoubts the enemy had left his tents, and his powder magazines, and engineering tools.

Immediately after the occupation of the redoubts, I ordered the troops to establish themselves there. I immediately ordered the redoubt No. 4 to be razed, as it

was too much advanced, and I ordered its guns to be spiked, and their wheels and carriages to be broken, and the fragments to be thrown down the mountain. When these orders had been executed, the troops who had occupied the redoubt joined the general line of the other corps.

The brigade of hussars of the sixth division of light cavalry, under the command of Lieutenant-general Ryjoff, who accompanied the detachment, was posted at the right wing of our general line of battle, with the light horse battery No. 12, and the Cossack battery of position No. 3. During the movement of the troops in advance, the artillery of the Don moved rapidly forwards, and having placed itself in position, contributed by its well-directed fire to the success of the general attack.

When all the redoubts had been occupied, I ordered the advance of the cavalry, with the regiment No. 1 of the Cossacks of the Oural, and three detachments of the regiment No. 53 of Cossacks of the Don, upon the enemy's camp, situated upon the other side of the mountains. Our cavalry advanced rapidly, even to the camp; but, attacked in flank by the fire of the enemy's riflemen, and in front by the English cavalry, it was compelled to halt, and afterwards resumed its first position at the right wing of the general order of battle, being so placed that its front did not present a right line, the direction of one of its wings forming an angle with that of the centre.

At this time Major-general Jabrokritsky, with a detachment of the infantry regiment of Vladimir (three battalions) and that of Souzdal, ten guns of the battery of position No. 1, four guns of the light battery No. 2 of the 16th brigade of artillery, two companies of the battalion of riflemen No. 6, two squadrons of the regiment of hussars of the Grand Duke of Saxe-Weimar, and two detachments of the regiment No. 60 of Cossacks (of Popoff), advanced upon the heights to the left of our cavalry, and occupied them. Our cavalry hardly had time to form in order of battle beyond the right flank of our infantry, when, from the other side of the mountain, where the redoubt No. 4 was raised, the English cavalry appeared, more than 2000 strong. Its impetuous attack induced Lieutenant-general Ryjoff to turn back upon the route to Tchorgoum to draw the enemy. At the same time I ordered to advance towards my right wing the combined regiment of lancers, under the command of Colonel Yeropkine, which came from Baidar to join the detachment of Major-general Gribbe, and I ordered that regiment to post itself behind the infantry in a concealed position. The enemy made a most obstinate charge, and, notwithstanding the well-directed fire of grape from six guns of the light battery No. 7, and that of the men armed with carbines of the regiment of Chasseurs of Odessa, and of a company of the 4th battalion of riflemen at the right wing, as well as the fire of a part of the artillery of the detachment of Major-general Jabrokritsky, he rushed upon our cavalry; but at this moment three squadrons of the combined regiment of lancers attacked him in flank. This unexpected charge, executed with precision and vigour, was attended with brilliant success. The whole of the enemy's cavalry in disorder precipitated itself in retreat, pursued by our lancers, and by the fire from our batteries. In this attack the enemy had more than 400 men killed, and sixty wounded, who were picked up on the field of battle, and we made twenty-two prisoners, one of whom was a superior officer.

A French squadron of African horse chasseurs rushed upon the detachment of Major-general Jabrokritsky. Having turned the left flank of the battery of position, it reached the chain of riflemen, and began to put the artillery to the sword. Two other squadrons followed. Upon this two battalions of the regiment of Vladimir, under the command of Major-general Jabrokritsky in person, precipitated themselves in advance at the point of the bayonet, and induced the enemy's cavalry to retreat, and it was pursued as far as the foot of the mountain by the well-directed fire of the foot Cossacks of the Black Sea, armed with carbines, and that of the riflemen. More than ten bodies and several horses remained upon the spot; three prisoners were taken, and the officer who commanded the attack made by the enemy was killed.

Remarking that the enemy again brought up fresh troops to his left wing, I reinforced my right wing, and disposed all the troops of the detachment in the following

order:—A battalion of the regiment of the Dnieper occupied the village of Kamara; the regiment of infantry of Azoff and the 1st battalion of that of the Dnieper were ordered to defend the redoubt No. 1; a battalion of the regiment of the Chasseurs of the Ukraine was left in the redoubt No. 2; and another battalion of the same regiment in redoubt No. 3, near which were also placed the whole regiment of Chasseurs of Odessa, two battalions of a regiment of the Dnieper, and a battalion of that of the Chasseurs of the Ukraine. All the artillery was ranged on advantageous positions; the cavalry, as before, remained on the right flank of the infantry. However, the enemy did not make any fresh attack, and ceased his fire at four o'clock in the afternoon.

In the taking by assault of such a strong position, I consider our loss in infantry as very insignificant. That of the cavalry was more important. Subjoined is a list, rapidly drawn up, in reference to this point (this list includes six superior and subaltern officers and 232 men killed; one general, nineteen superior and subaltern officers, and 292 wounded). I owe the success of the day to the zeal and excellent arrangements of the respective chiefs, and the courage and ardour of all the troops; more particularly Major-general Sémiakine, chief of the first brigade of the division intrusted to my command; and, under his orders, Colonel de Krudener, in command of the regiment of infantry of Azoff, who were ordered to attack the strongest redoubt, No. 1, situated upon a very steep height, personally exhibited an example of courage and judicious arrangements. The attack of the regiment of infantry of Azoff was executed with boldness, celerity, and decision. The second company of the 4th battalion of riflemen, under the command of Second-captain Kalakoutsky, six guns of the light battery No. 6, under the command of Lieutenant-colonel Afanassieff, and four guns of the battery of position No. 4, commanded by Lieutenant Posnikoff, who accompanied that column, acted with precision and celerity, and thus facilitated the capture of the height.

When the enemy's cavalry charged, and while it was being repulsed, eight guns of the light battery No. 7, which were stationed near the regiment of Chasseurs of Odessa, directed by Captain Bojanoff, did the most injury to the enemy's cavalry by the precision of their fire of grape-shot.

All the operations of the artillery of the twelfth brigade of that arm, directed by Colonel Nemoff, commandant of that brigade, were crowned with brilliant success. Staff-major Guersivanoff, and the aide-de-camp of your highness, captain of corvette Baron Willebrandt, whom your highness sent to me, and who was at my side during the whole of the combat, rendered me very useful assistance, transmitting, with the most strict exactness, all my orders to the troops in the first line.

With the present report I have the honour to present to your highness the flag and the Turkish standard taken in the redoubt No. 1.

Knowing, as our readers do, the numbers actually engaged on the part of the allies, the falsehood of the above despatch, which rated our cavalry at 2000 men, will be obvious. The whole spirit of the despatch is as ungenerous to a brave enemy, as it is boastful of the performances of the general himself, and of his troops. The repulse of the cavalry by our infantry is the least incorrect; the charge by our heavy cavalry is slurred over and evaded; and while some honour is given to the courage of our light cavalry, their chivalry is still glossed over without that acknowledgment which a noble enemy would have made.

A field-officer, who witnessed from the elevation on which Lord Raglan stood the events of this sad day, and whose military *status* enabled him to know with certainty the events

which followed, gave to the author of this History the following relation of what occurred after the battle:—

“Eventually, the Russians retained possession of two of the entrenched posts (Nos. 1 and 2) held by the Turks in the morning, and nine 12-pounder English guns. Their columns also remained in the plain, about 1500 yards from our front, drawn up as if to offer battle. Much murmuring was heard that they should be allowed thus to defy us, and to keep possession of the hills on our right front. The Turks were loaded with abuse for running away from the outposts, and losing the guns; but the amount of obloquy seems undue. Others, besides Turks, would have left such very slight field-works if attacked by an army, and having no support within cannon range. These so-called redoubts were but a semblance of cover for the defenders, but no obstacle to the assailants. Any sportsman would have considered it no great feat to have ridden his horse over both ditch and parapet. Subsequently, the Russians rather concentrated their force on the village of Kamara and No. 1 redoubt, the nearest to Kamara and the nearest to Balaklava. This redoubt was, as the crow flies, but 3700 yards, and Kamara but 4200 yards from the northern part of Balaklava Bay. And though a high ridge intervened, this could not interfere with vertical fire. It was obvious that had two or three heavy mortars been brought round from Sebastopol, a distance of some fourteen miles (for which two or three days would have sufficed), and placed in redoubt No. 1, Balaklava Bay would in all probability have been quickly abandoned, and vast stores belonging to our army lost.

“On that night (the 25th), the orders to prepare to quit Balaklava were reiterated, and the necessary instructions were given to the commissariat, ordnance, and medical departments to withdraw all their stores. At the same time, Captain Tatham sent round the *Caradoc*, to inform Sir Edmund Lyons of the proposed abandonment of the harbour. The night following the battle of Balaklava was an anxious one inside the little harbour: all night long the vessels were shipping their cables, and the tugs towed them out as fast as they cast off. The commissariat shipped all their money, and much of the stores were re-embarked from the ordnance and quartermaster-general's departments. At each trifling alarm the Russians were looked for, as it was thought certain they would take advantage of the night to re-commence their attack. Had they done so, their success would have been almost certain; but, fortunately for the English, Liprandi commanded against us.

“On the evening of the 25th, Sir De Lacy

Evans, it is said, received orders as usual to send 800 men from his weak division into the trenches. During the usual midnight relief, a working party of 800 would necessarily occasion for about four hours a diminution of the force in position of 1600 men; add these to outlying pickets, and it will be seen how few must have remained disposable for holding a vital point. Not unfrequently a still greater number were required for the trenches; but the gallant general was so thoroughly impressed with the danger which threatened the English from the valley and heights of Inkerman, that he was led, it is stated, on this as on previous occasions, to utter a strong remonstrance against the impolicy of weakening his force. His reasons were probably unappreciated, and consequently his warnings practically disregarded.”

The tidings of the battle of Balaklava brought mingled tears and joy to every home in England. Wherever virtue and valour were prized, there was sorrow over the fallen brave; yet all felt prouder of a country which could produce such dauntless men. After the arrival of the public accounts, and the newspaper notices, there was an eager desire to peruse the letters of survivors, or of those who witnessed the deeds of their glory. When a family, in any rank of life, was known to possess such a treasure as a letter from the seat of war, all their acquaintances came with earnest heart and countenance to hear of the sanguinary tragedy, and deathless glory of Balaklava. To have joined in those glorious charges, to have led them, seemed to have been the acme of military honour, and it only remained for fame to crown the surviving heroes with her choicest wreaths.

A few of the letters which arrived at home, after this and the other battles, will give variety to our pages, and no doubt deeply interest our readers. Minor features of the conflict came out in such correspondence, which can never be presented otherwise by the historian. In these letters, too, we see the hearts of the combatants or spectators, and are enabled to enter into the feelings those great events stirred up as they were occurring, or left behind when they had passed away. Actors and spectators seemed to look back upon them with emotions of self-surprise, and mingled triumph and pathos, as they surveyed the wreck which attested the fury of the whirlwind of war. One of the most interesting letters from the pen of a spectator, was written by a gentleman of fortune, an amateur in campaigning, who dwelt in the camp; and who, if he did not go out to battle, lost no opportunity of observing its ebb and flow, and of soothing the wounded and weary who were borne from its dangers and its toils:—

Camp, October 29th.

"Well! I have seen a battle, or rather part—the bloodiest part—of a battle; and am amazed to find how little I have seen! If I had been told beforehand that the spectacle of two armies, arrayed front to front in a spacious valley, and assailing each other with the deadliest instruments of modern warfare, differs little, to the mere eye, from a review—that even to the *mind* of one 'who hath no friend or brother there' the event of the day is so absorbing, that at the moment he hardly heeds the human wrecks, dwarfed by distance into pigmies, which mark the course of every manœuvre—that a single combat is more stirring than a general engagement, and the anguish of one poor wounded wretch, whose groans are in your ears, more shocking than the most wholesale slaughter—I should have doubted. Yet such is the lesson of my own experience, and I believe that those who have witnessed similar scenes would, if true to themselves, bear me out in the avowal. I am glad, at any rate, that you do not depend upon me, exclusively, for an account of the battle of Balaklava. How any one, who has not somebody in the secrets of the generals by his side to explain the movements, can understand an affair of the kind is to me a mystery. If a man is in the *melée* he sees only that; if, on the other hand, he is at a sufficient distance to take in the whole field, he sees an array of dark sparkling masses—now moving, now stationary—covered with smoke, or emerging from it. Finally, he sees a certain portion of the whole marching away, perhaps in very good order. We will suppose that at such a juncture, by good luck, he really does know that the fight is decided, and which party it is that is retreating, and that he rejoices or laments appropriately. Nevertheless, as regards all the sudden emergencies, the daring movements and sagacious plans—all, in fact, that give the battle its historical interest—our spectator comprehends no more of them, believe me, than you comprehend of the manœuvres of a review.

"And now, having reduced your anticipations to the proper level, let me fairly own that I was on the wrong side of the ridge for observing the most interesting portions of the engagement of the 25th. The reason was that when, on that morning, repeated discharges of musketry and artillery in our rear proclaimed the long expected arrival of Osten-Sacken's force, I, in common with my neighbours, believed that it would very soon be beaten back again. The enemy were advancing at the time towards the ridge to which I have alluded, and which traversed the valley at a point between them and Balaklava. Now this ridge, though a great deal lower than the hills

which it connects, is yet high enough to conceal from persons on one side of it, the movements of troops for some distance behind the other. Assuming, therefore, that the enemy would be routed and pursued, I determined not to let the ridge intervene between me and the sport, and took up my position on what may be called the Russian, as opposed to the allied side of the hill, close to the French mortar battery, under the telegraph. The battery is situated just under the crest of the western hill-side of the valley in the rear of our camp, and commands a view of Balaklava to the right, broken only by the unlucky ridge.

"On arriving at the battery about half-past eight, I could see the Russians (computed at 20,000 strong) defiling from behind some rising ground to our left, on the opposite, or eastern side of the valley. Numerous loose horsemen preceded them. Detached portions of the force were scattered over the whole breadth of the plain, and the mortars near which I stood played upon some of the nearest of them with evident effect. We watched the shells bursting over and among them, and producing large gaps in their masses; but it was too far to see individuals being killed. The fire was not returned. After half an hour or so had been thus spent, a body of Russian horse charged over the nearest end of the ridge, and to the great mirth and delight of our party (I was standing among some French officers) we soon saw them galloping back again. Then they joined the main body on the eastern side of the valley, and the whole advanced up the farthest end of the ridge, where there were three Turkish redoubts, giving a cheer as they reached the summit. To our intense chagrin they stopped there; we saw nothing like resistance. After a time, the troops of the British first division (who had been ordered down from the camp) began to cross the ridge about its centre, and bodies of our cavalry took up their position between them and the western hills. The larger portion of the Russian force then retired half-a-mile. Our troopers shortly afterwards were seen galloping towards the enemy. There was a mass of smoke; and when it cleared away, we saw many corpses strewing the ground; and some horses galloping riderless, and some lying on the field. Whether they were British soldiers who had been slaughtered, or Russians, or both, we could not tell; but after the smoke had cleared away the *melée* was at an end. Excepting some sharp firing behind the Balaklava side of the ridge, in the direction of the redoubts, we could discover or hear nothing more; till at two, becoming impatient, I went down to the ridge to an earthwork manned by a French regiment

(the 27th). Here I perceived the whole arrangement of the British force. They were formed in three rows, extending across the valley; the first composed of regiments of the line, the second of troopers standing by their horses, the third of the Guards and Highlanders. Ambulances were posted here and there, and everything seemed ready for a general action; but after waiting till four, and seeing no new symptoms of a move on either side, I returned to camp—there to learn what I had really been looking at!

"I soon ascertained that all the most effective portion of the battle had taken place on that side of the ridge which I had visited too late. The Russians whom we saw galloping back over it in the morning were no doubt the relics of those whom the 'Heavies,' as you will have learnt, had drubbed so heartily, and against such fearful odds—one of the few spectacles in modern warfare, by the bye, which, from its having been a purely cavalry affair, had none of its effect marred by smoke. The splendid reception given by the 93rd Highlanders to the Russian cavalry, was shut out from us by the same unlucky screen. The troopers whom we had watched dashing into the fire of musketry and artillery on the further side of the valley, were, it is true, then and there making their terrible charge under Lord Cardigan; but so dense was the pall in which they were at once wrapped by the musketry and artillery of the enemy, so complete, too, our ignorance of the nature and object of the movement, that even now I can hardly believe myself to have witnessed that sublime display of military devotion. I had so far provided against this annoyance by arranging with — that I was to accompany him in the event of any engagement taking place, when I should have been pretty sure of seeing the best of everything, and with the best lights. But he, poor fellow, was, and is, sick on board the —; and even had it been otherwise, I suppose his duty would have compelled him to remain behind in camp with his chief, to look after the front. And—but that is enough in all conscience! Why I should have told you so long a story, with so little to tell, I'm sure I don't know, unless to convince you that seeing a battle is not always comprehending it, and to make you of a grateful and contented mind with your newspaper in the Temple.

"Next day I again went to the rear, and rode pretty close to the two redoubts, which were taken by the enemy, and which still remain in their hands. Cavalry pickets were posted near the other earthwork; but I learnt that no attempt would be made on the part of the allies to offer battle. Certainly, unless some great advantage was to be gained by a

general engagement, one thing is enough at a time—when that thing is the siege of Sebastopol; while there could be no point of honour with the Western powers in driving the enemy from posts which were wrested only from Turks. I saw eight or ten Russians and three or four horses lying dead on the slope, as I rode over the spot where the affair with the heavy cavalry took place. The rest, I suppose, had been buried in the twenty-four hours that had elapsed in the interval. The corpses bore the number '12' on their buttons, wore fur-trimmed pelisses, and belonged, I believe, to a crack regiment that goes by the name of the 'Weimar Hussars.' Their feet had already been stripped by our men of boots and stockings—a practice invariably resorted to, partly on account of the value of the articles themselves, and partly from a belief that money is to be found concealed in them. I noticed that the features of these men had become so coarse from exposure, that they expressed little beyond a stern, sad endurance. Still, the 'last enemy' had lent their faces a dignity which I have not seen in the countenances of their living countrymen; and the stark, white feet told eloquently of death. It felt strange to find and leave them there alone, scattered among the stones and thistles—and not a living soul to watch!"

A military correspondent of the *Morning Chronicle* thus describes the scene, and judges of its cause and consequences:—

"The disaster, of which the mere shadow darkened so many a household among us, is not much less than the annihilation of the light cavalry brigade. Had there been the smallest use in the movement that cost us so much—had it been the necessity of a retreat, or part of any plan whatever, we should endeavour to bear this sad loss as we do the heaps of human life lavished in an assault. Even accident would have made it more tolerable. But it was a mere mistake—evidently a mistake, and perceived to be such when it was too late to correct it. The affair then assumed the terrible form of a splendid self-sacrifice. Two great armies, composed of four nations, saw from the slopes of a vast amphitheatre seven hundred British cavalry proceed at a rapid pace, and in perfect order, to certain destruction. Such a spectacle was never seen before, and we trust will never be repeated. There are two consolations—the first that, owing to the very incomplete state of our regiments, there were not more to exhibit in this fearful death-parade; and, secondly, that even in that awful progress, when officer and soldier felt themselves hurried to their doom by some inextricable error, they still kept their ranks, went fiercely on, rode

up hills, stormed batteries, and sold their lives as dearly as the manifest odds against them would allow.

"The error was one of unusual simplicity, and requires no science to understand it. There was no surprise, not even too short a notice. There was no misconception of the enemy's strength. There was no inevitable train of consequences, in which disaster was the slow result of successive operations. This grand military holocaust was a wholly distinct affair. The Russians, masters of the four redoubts taken from the Turks, and of a few cannon found in them, had been effectually checked by the firmness of the 93rd Highlanders and a splendid charge of the heavy cavalry brigade. They had paid for their temerity by a considerable loss, and had been compelled to surrender a good part of the ground they had won. It was about noon, when they had rested for some time, and were apparently preparing to retire with the guns they had captured, that the fatal movement took place. The cavalry then received an order to advance rapidly to the front, to follow the enemy, and attempt to prevent them carrying off the guns; and, as the circumstances under which the order was received were not a little formidable, they were told that the French cavalry were on their left. How far the order was itself the result of a misconception, or was intended to be executed at discretion, does not appear, and will probably afford the subject of painful but vain recrimination. It was interpreted as leaving no discretion at all; and the whole brigade advanced at a trot for more than a mile, down a valley, with a murderous flank fire of Minié muskets and shells from hills on both sides. It charged batteries, took guns, sabred the gunners, and charged the Russian cavalry beyond; but not being supported—and, under the circumstances, perhaps it is fortunate it was not—and being attacked by cavalry in front and rear, it had to cut its way through them, and return through the same cavalry and the same fire. The brigade was simply pounded by the shot, shell, and Minié bullets from the hills. Not more than a dozen were killed by the Russian cavalry, who, if they had been good for anything, would have taken care that not a single British soldier should return to tell the tale. Causeless as the sacrifice was, it was most glorious. A French general who saw the advance, and apprehended at once its fatal issue, exclaimed, 'This is indeed magnificent, but it is not war!' The enthusiasm of the moment, and the fellow-feeling of the two armies, almost led the Chasseurs d'Afrique to follow the British brigade to its doom, but they were wisely restrained, and did much better service by

charging a Russian battery on the flank, and for a time checking its fire.

"It is difficult not to regard such a disaster in a light of its own, and to separate it from the general sequence of affairs. Causeless and fruitless, it stands by itself, as a grand heroic deed, surpassing even that spectacle of a shipwrecked regiment, settling down into the waves, each man still in his rank. The British soldier will do his duty, even to certain death, and is not paralysed by feeling that he is the victim of some hideous blunder. Whatever the case of the common soldier, and however little he might know the full horrors of his position till death had done its work all around him, the officers who led him on, with a conspicuous gallantry that extorted the admiration of the foe, knew well what they were about. Nor were those officers mere soldiers of fortune, with nothing to lose but themselves, and no inducements out of their profession. They were men who risked on that day all the enjoyments that rank, wealth, good social position, and many fortunate circumstances can offer to those who are content to stay at home. Splendid as the event was on the Alma, yet that rugged ascent in the face of heights blazing with destruction was scarcely so glorious as the progress of the cavalry through and through that valley of death, with a murderous fire not only in front, but on both sides, above, and even in the rear."

The following letter was written by a gentleman on board the *Himalaya* troop-ship, giving a description of incidents after the battle, and an account of what he saw upon the field:—

"Since my last we have brought up from Constantinople 550 troops of different regiments convalescent; arriving here on the morning of the 24th, also a quantity of charcoal for the troops. As we approached the land we could see and hear heavy firing about Sebastopol. Among the officers who came up with us were Captain Dickson of the 30th, and Captain Warden of the 19th. Both these gentlemen had been wounded at Alma, and sent to Scutari Hospital, with leave to proceed home; but they thought themselves sufficiently recovered to be again of service to her majesty's arms, and, with more zeal than I think discretion, have marched up and rejoined their respective corps. When we see cases such as these of devotion to the service, one cannot wonder at the general success of the British forces. I shall now give you an account of what I have either witnessed myself, or heard from those actually engaged in it.

"October 25th.—At daylight heard very sharp and heavy firing towards Sebastopol, and also near Balaklava, increasing towards nine o'clock, and from that time incessant. Could

see occasionally shells bursting over the high hills by which the bay is surrounded; so as soon as possible I went on shore, and found that a very heavy cavalry action, with artillery, was going on. . . . Colonel Griffith got shot in the head; Brevet-major Clarke a sabre-cut at the back of his neck; Cornet Prendergast shot right through the foot; Cornet Handley stabbed in the side and arm, being at one time surrounded by four Cossacks, three of whom he shot with his revolver, and the fourth was cut down by his sergeant. I saw this young gallant fellow a few hours after, and he was then getting ready to rejoin his regiment from the temporary hospital, not finding his two wounds of sufficient consequence to keep him from his post. The colonel did the same, after getting his head dressed. Major Clarke did not, I believe, leave the field. I also saw Lieutenant Elliot, 5th Dragoon Guards, riding into Balaklava, his face so covered with blood, and his head bound up, that we could not recognise him. The gallant Captain White, too, of the 17th Lancers, was lying on his back when we came up to him, with a round-shot right through his leg, with Sir W. Gordon dreadfully cut about the head, both receiving, however, every attention and care from Surgeon Kendall, who was formerly at Southampton with Mr. Ward, surgeon of that town. In this garden and temporary hospital could be seen men with every description of wound—from the sabre-cut to the grape and canister-shot. One poor fellow's leg was taken off while we were there; nor can one easily forget the shocking scenes, the result of such a day's fighting. The surgeons (Brush and his assistant Chapple) of the Greys were working away with their sleeves turned up, arms bloody, faces the same, looking more like butchers than surgeons, so hard had they worked all day."

The same writer, after dwelling on various details, adds:—

"This afternoon, the two armies, the Russians being enormously strong, were waiting for one or the other to advance, throwing an occasional shell by way of invitation or challenge. But for several hours there they stood, as if content with what had already taken place, and we so near the two, that with the aid of my glass, a good Dollond, I could distinctly see the colour of their uniform (grey), and their standard, with an eagle on the top of it; I could also plainly see the dead, both men and horses, on the scene of the late encounter. I observed one horse stand fully an hour by the side of his dead rider, while others were wildly galloping about, not knowing which way to turn their riderless course. One of the most wonderful things, I think, is to see the way in which our riflemen go about in small detached

parties, crawling along on the ground up the side of a hill, till they appear to be within 300 yards of the enemy, and thus they lie on their bellies till a chance offers, when crack goes a Minié, and down falls a Russian. I was informed most credibly that one of these brave fellows a few days since thought he would go and do a little business on his own account, got away from his company, and crawled up close to a battery under shelter of a hill, lay on his back and loaded, and turned over and fired, when, after killing eleven men, a party rushed out, and he took to his heels, but, sad to say, a volley, fired after him by this party, levelled him with the earth, and he was subsequently picked up with thirty-two balls in his body. A party of Russian sharpshooters made a sort of attempt to come up to the battery manned by the marines; but a few well-directed shot from that gallant little body sent them back again, having taken nothing by their motion. Lieutenant Maxse, aide-de-camp to Lord Cardigan, was severely shot in the foot and ankle, and was carried on board his lordship's yacht, the *Dryad*. He was close to the unfortunate Captain Nolan of the 15th Hussars, who was shot in the breast while cheering and gallantly charging the enemy, and who, after getting off his horse, made two or three staggers forward, and fell dead.

"Whenever, during the day, you saw any of the Turkish soldiers, you saw the people hooting them, and calling them cowards and runaways. I witnessed two Irishwomen actually driving four of these chivalrous gentry before them, making them carry some things for them, probably to their own wounded husbands, and saying, 'Eh! ye cowardly divils, this is all you're fit for, to be our servants—sure, you are afraid to fight!' And on our return I saw a young middy drawn up before some fifty of them, abusing them most heartily for having run away. One of them made a sign as if he was going to draw his sword, when master midy sang out. 'Oh!' said he, 'I'm not afraid of you, such a set of cowards as you are,' set his arms a-kimbo, and then stood, the picture of a young lion, and, I should say, about as brave."

The following is from a light cavalry officer of rank:—

"We all knew that the thing was desperate before we started, and it was even worse than we thought. However, there was no hesitation; down our fellows went at the gallop, through a fire in front and on both flanks, which emptied our saddles, and knocked over our horses by scores. I do not think that one man flinched in the whole brigade, though every one allows that so hot a fire was hardly ever seen. We went right on, cut down the gunners at their guns (the Russians worked

the guns till we were within ten yards of them); went on still, broke a line of cavalry in rear of the guns, and drove it back on the third line. But here our bolt was shot; the Russians formed four deep, and our thin and broken ranks and blown horses could not attempt to break through them, particularly as the Russian cavalry had got round our flanks, and were prepared to charge our rear (with fresh men). We broke back through them, however, and then had to run the gauntlet through the cross-fire of artillery and Minié rifles back to our own lines, with their cavalry hanging on our flank. The heavy brigade, which had made a good charge of its own in the morning, covered our coming out of action, and lost some men from the artillery.

"There is no concealing the thing—the light brigade was greatly damaged, and for nothing; for, though we killed the gunners and horses of nine 12-pounders, we could not bring them away. . . . Nolan (who brought the order) is dead. The first shell that burst hit him in the breast. He gave a loud cry, his horse turned, trotted back (with him still in the saddle) between the first and second squadrons of the 13th, and carried him so for some way, when he fell dead. He was hit in the heart.

"In the two leading regiments, including Lord Cardigan (who led in person) and his staff, we had nineteen officers. Only three came out of action untouched both man and horse; all the others were killed, wounded, or prisoners, or had their horses hurt. . . . It was a bitter moment after we broke through the line of cavalry in rear of their guns when I looked round and saw there was no support beyond our own brigade, which, leading, in the smoke had diverged, and scarcely filled the ground. We went on, however, and hoped that their own men flying would break the enemy's line, and drive them into the river. When I saw them form four deep instead, I knew it was 'all up,' and called out to the men to rally. At this moment a solitary squadron of the 8th came up in good order. This saved the remnant of us; for we rallied to them, and they, wheeling about, charged a line which the Russians had formed in our rear. You never saw men behave so well as our men did. As we could not hold our ground, all our dead and badly wounded were left behind, and we know not who are dead or who are prisoners. All this makes me miserable, even to write; but it is the naked truth. Our loss in men is not so great as that in horses; for men whose horses were shot in the advance got back on foot. I hear from a man who dined with Lord Raglan to-day that they do us justice at head-quarters, and say that our attack was an unheard-of feat at arms,

and that Lord Raglan says that the moral effect has been wonderful. The Russian prisoners, since taken at Sebastopol, say that the Russians were petrified at the audacity of the attack, and the energy that could, after such a fire, break through their lines. These prisoners were taken in a very successful affair by Sir de Lacy Evans, who is a first-rate division leader."

"P.S.—Whatever might have been the error of judgment committed by Captain Nolan—if the mistake really originated with him, which we must not rashly assume—he paid a full penalty. He volunteered to accompany the charge, and had ridden but a few paces when a shot struck him, and his horse bore back his body, fixed rigidly in his saddle, as if even in death he vindicated his reputation as one of the finest horsemen of the age."

The last letter with which we shall illustrate the feelings and impressions of the actors and observers of this terrible tournament, was written by a captain in that distinguished regiment, the Enniskillen Dragoons. The letter is one of the most remarkable ever written by an officer concerning the personal encounters in which he was engaged:—

"I am, you see, alive at this date, but God knows how long after. You have, I presume, devoured all the accounts which have been sent home as to our glorious charge. Oh! such a charge! Never think of the gallop and trot which you have often witnessed in the Phoenix Park when you desire to form a notion of a genuine bloodhot, all-mad charge, such as that I have come out of, with a few lance-prods, minus some gold lace, a helmet chain, and Brown Bill's (the charger's) right ear. From the moment we dashed at the enemy (whose position, &c., you doubtless know as much about as I can tell you) I knew nothing, but that I was impelled by some irresistible force onward, and by some invisible and imperceptible influence to crush every obstacle which stumbled before my good sword and brave old charger. I never in my life experienced such a sublime sensation as in the moment of the charge. Some fellows speak of it as being 'demoniac.' I know this, that it was such as made me a match for any two ordinary men, and gave me such an amount of glorious indifference as to life as I thought it impossible to be master of. It would do your Celtic heart good to hear the most magnificent cheer with which we dashed into what P—— W—— calls 'the gully scrimmage.' Forward—dash—bang—clank, and there we were in the midst of such smoke, cheer, and clatter, as never before stunned a mortal's ear. It was glorious! Down, one by one, aye, two by two, fell the thick-skulled and over numerous Cosacks and other lads the tribe of old Nick.

Down too, alas! fell many a hero with a warm Celtic heart, and more than one fell screaming loud for victory. I could not pause. It was all push, wheel, frenzy, strike, and down, down, down, they went. Twice I was unhorsed, and more than once I had to grip my sword tighter, the blood of foes streaming down over the hilt and running up my very sleeve. Our old Waterloo comrades, the Greys, and ourselves, were the only fellows who flung headlong first into the very heart of the Muscovites. Now we were lost in their ranks—now in little bands battling—now in good order together—now in and out, until the whole ‘Heavies’ on the spot plunged into a forming body of the enemy and helped us to end the fight by compelling the foe to fly. Never did men run so vehemently—but all this you have read in the papers. . . .

“I cannot depict my feelings when we returned. I sat down completely exhausted and unable to eat, though deadly hungry. All my uniform, my hands, my very face were bespattered with blood. It was that of the enemy! Grand idea! But my feelings—they were full of that exultation which is impossible to describe. At least, twelve Russians were sent wholly out of the ‘way of the war’ by my good steel alone, and at least as many more put on the passage to that peaceful *exit* by the same excellent weapon. So also can others say. What a thing to reflect on! I have almost grown a soldier-philosopher, and most probably will one of these days, if the bullets which are flying about so abundantly give me time to brush up.

“My dear fellow, our countrymen have not tarnished their fame in the Crimea. Gallantry and glory will never abandon the march of Celtic bands—never! Oh that I could have patience to write you of such deeds of individual heroism as have come within my notice! Fictionists are shabby judges of true bravery. No novel ever had a sham hero who comes up to the realities I have witnessed. One of my troop, for instance, had his horse shot under him in the *mélée*. ‘Bloody wars,’ he roared, ‘this won’t do!’ and right at a Russian he ran, pulled him from his horse by the sword-hand in the most extraordinary manner—then deliberately cutting off his head as he came down, vaulted into the saddle, and turning the Russian charger against its late friends, fought his way. This took less time to do than I to tell it. I saw another of our fellows unhorsed, and wounded, creep under a Russian charger, and ran the sword up his belly. The animal plunged and fell on his slayer, crushing him to pieces. . . . We must take this doomed place, even, as O’Grady says, if we be doomed who take it. Any one of our fellows is a match for three Russians.”

The gallantry evinced by individuals in the great charges at Balaklava, and the hairbreadth escapes which these brave men experienced, would fill many pages of history with stories as exciting as those which lend so much interest to the perusal of the novel or romance. Captain Toosey Williams, son of R. B. Williams, Esq., of Westbourne Terrace, Hyde Park Gardens, London, and Buscot Park, Farringdon, Berks, led the second squadron of “the Greys.” It was his first action, he had spent his previous service chiefly as aide-de-camp to successive lord-lieutenants, at Dublin Castle; but, like many other courtly men, he hurried off to the war when queen and country required. Captain Williams was ill of fever when the memorable morning of Balaklava peeped through the mists which, along the banks of the Tchernaya, so generally hang over an October dawn. At the first note of danger he insisted on getting to horse, and sharing with his comrades the perils of the day. He fought with marked valour. Four times he was separated from his men in fierce encounters; twice with two horsemen, once with three, and once with even four. He in every instance got clear of his assailants, inflicting with his sword and revolver fatal penalties upon their temerity. After the battle, he was obliged to take to his bed with renewed fever, but refused to leave the camp, or be invalided. On the 20th of November, his case appeared dangerous, and he was borne on a litter through the tents of his brigade to Balaklava, where, being put on board ship, he was brought to Constantinople, and, after lingering some time, died at Scutari, regretted to a degree accorded to few officers even among those who were and deserved to be most regretted. It was Captain Williams who captured the Russian general at M’Kenzie’s farm.

Captain Winter, of the 17th Lancers, was another of the heroes who signalled themselves in that dark gorge among the Baidar Hills. He was the eldest son of Samuel Winter, Esq., of Agher, county of Meath, in Ireland—of an old Gloucestershire family, long settled in that country. He had previously known no service abroad, and was among the favoured officers who were placed on the personal staff of the Irish viceroys. He accompanied the reconnaissance in the Dobrudscha, so unfortunate for the horses of his brigade, under Lord Cardigan. At the battle of the Alma, he shared with his regiment the task of watching the Russian cavalry, who threatened the British left. At M’Kenzie’s farm, during the celebrated flank march, the captain distinguished himself by the promptitude and alacrity with which he took advantage of the Russian surprise. Perhaps no officer in his brigade performed so much out-

post and night patrol duty in the Tchernaya Valley. In the fierce charge of the 25th of October, he led the second squadron of his regiment, and was last seen among the enemy's guns, furiously cutting down the gunners. The first horse that galloped back to the cover of the British lines was Captain Winter's, wounded in several places by grape-shot.

Cornet Hugh Montgomery, a very young officer, merits notice in connection with the forlorn charge of the light cavalry. He was the eldest son of Hugh Montgomery, Esq., of Ballydrain, county of Antrim, and was a young man of superior education and refined mind. As a pupil at Harrow, and afterwards matriculating at Cambridge, he was noticed for his classical proficiency. At the age of twenty-four, he fell in the ranks of the 13th Light Dragoons, in the first line of Lord Cardigan's brigade. He was observed in desperate combat with six Russian Hussars, four of them fell by his revolvers, and his sword put the other two to flight. He retreated with the last straggling groups that came back from the enemy's guns, but seeing two of his men hard pressed by numbers, he returned to assist in their rescue, and was shot with a horse-pistol in the neck: thus falling a victim to loyalty, generosity, and valour.

By far the most noted person who fell on this day, where such rare valour made all worthy of note, was Captain Nolan, of the 15th Hussars, aide-de-camp to the quarter-master-general, Airey.

Lewis Edward Nolan was the only surviving son of Major Nolan, a gentleman of very limited means, in the county of Carlow, in Ireland. There were two branches of the family; the elder residing in Mayo, in the remote province of Connaught; the younger in Carlow, about forty Irish miles from the metropolis. Both of these produced many gifted and accomplished men, and not a few who won gloriously a soldier's honour and a soldier's death in foreign services—when denied, by a policy now happily obsolete, the opportunities and privileges of distinction in their own. When Major Nolan (father of our hero) retired from the military service, he resided in Milan, where he served the British government as vice-consul. Young Lewis Edward was then a schoolboy; the family taste was so decidedly military, that he and both his brothers were placed in the military school. Before he was fourteen years of age Lewis Edward had won an extraordinary renown for horsemanship, being regarded as at once the most fearless and elegant rider in Milan. His reputation as a horseman and a swordsman, and for his military talents generally, spread through Lombardy, became the subject of conversation in the Austrian army, and a

topic of admiring remark in the highest military coteries in Vienna. When attending the riding-school, at the military college, he was able to subdue a wild or vicious horse, when veteran riding-masters had failed to tame its temper, and render it fit for service. Some of the feats of wild enterprise and daring courage, which he performed in his equestrian exercises at Milan, are still talked of in that city and in the Austrian army. He was of a hasty and sanguine temper, high-spirited and haughty to superiors in rank, but kind and respectful to the poor; the pride of his tutors, and an idol with the common people and the soldiery, with whom the union of so much tenderness, gentleness, enthusiasm, and bravery, constituted the *beau idéal* of an officer and a gentleman. It was not generally understood, that with all his passion for enterprise, pleasure, amusement, and exploit of any kind, he was a student and a scholar. He was no stranger to the love of elegant studies, and he utterly despised professional ignorance. He studied profoundly all departments of military science, but most especially cavalry tactics—in which he became the greatest proficient of his age.

While yet a youth at Milan, Austrian officers of eminence in the emperor's service visited his father frequently. Among them was an imperial grand-duke, who presented him with a commission in an Austrian regiment of cavalry. He was scarcely entered upon the roll of his regiment when it was ordered from Lombardy to Hungary, and thence to Austrian Poland. While quartered there, many British gentlemen, travelling, sought his acquaintance—especially natives of his own country, who were naturally proud of his great reputation, which began to penetrate the military circles of England. Yielding to the importunities of these gentlemen, he entered the British service on the 15th of March, 1839; he was gazetted to an ensigncy in the 4th infantry, as a preliminary to an exchange into the cavalry, where his services would be most prized. In a month he became a cornet in the 15th Hussars. He soon joined his regiment in India, where his fame had preceded him; and great curiosity existed in the regiment, and in the Company's service, to make acquaintance with the redoubtable cavalier. His countryman, Sir Henry Pottinger, then governor of the presidency of Madras, was desirous to give the young hussar some opportunity of distinguishing himself. His excellency was so delighted with the evolutions through which Cornet Nolan put the Hussars, that he attached him as an extra aide-de-camp to his own staff. Here his love of study enabled him to attain the Sanscrit, Hindostanee, and Persian languages, while he

appeared to mingle in all the gaieties of his companions. He pursued also his military studies, and suggested various improvements in the management of our oriental cavalry, which Sir Henry Pottinger was too good a soldier, and too intellectual a man, not to appreciate. Mr. Nolan was soon appointed riding-master to the regiment; and he greatly improved the men in the sword exercise.

Still, notwithstanding his merits, he soon found that being tempted into the British service was a bar to his military distinction—vacancies occurred, and fools were appointed over his head. He obtained a lieutenantancy, not because he deserved it, nor because he could serve his country better in that capacity—but his widowed mother, proud of her son, out of her small resources *purchased* it for him. Had he remained a hussar of Austria, the widow might have retained her little property, and the noble soldier would have been promoted for the same reason that he at first obtained a commission in that service—admiration of his qualities. He remained in India until 1852, without any promotion, but not without bringing the 15th Hussars to a state of great perfection as a corps of light cavalry. At last he obtained a troop, *without purchase*, through the influence of Sir Henry Pottinger and other officers, who urged upon the government the duty and propriety of conferring upon him that step. Soon after, the regiment returned to England; but Captain Nolan immediately went abroad (it was generally believed in the service of the government), and travelled through Russia and Prussia, to make himself perfectly acquainted with the cavalry system in the armies of those two nations. On his return to England, he published his book upon the *Organization, Drill, and Manœuvres of Cavalry Corps*. This book excited universal attention. His assertion that cavalry could break squares was a doctrine regarded by the infantry as heterodox. A discussion of the novel opinions of this publication was opened in the London and provincial press, and our French neighbours were engaged also with deep interest in the subject. The Horse Guards adopted several of the improvements suggested by Captain Nolan, and his fame attained a great elevation. It was a source of pride to his relatives and friends; to know that his book was in the hands of every cavalry officer in the kingdom who intended to study his profession; and many of the intelli-

gent non-commissioned officers and men were its students.

On the breaking out of war, he was ordered by Lord Hardinge to purchase horses in Tunis, Syria, and Constantinople, as remounts for the army; which task he performed with promptitude and skill—to little purpose, for many of these animals were allowed to die of cold and hunger by the incompetent staff. He was ultimately appointed aide-de-camp to General Airey; but in effect he served Lord Raglan in that capacity—being the only officer about the person of his lordship upon whom, as a staff-officer, he could place reliance for intelligence and extensive military knowledge. To the skill of Captain Nolan, the efficient state of our cavalry at the battle of Balaklava is mainly to be attributed. After his death the cavalry became of no service, the horses being allowed to die of hunger and for want of shelter. At the battle of Alma, he was much engaged in conveying orders through the hottest of the fire. At Balaklava we have already seen how he fell.

Captain Nolan had one fault, which, both as a man and an officer was injurious to him—his great excess of enthusiasm. It was sometimes amusing to listen to his bold assertions of the possibility of a cavalry general, at the head of British horsemen, riding down anything. An intelligent but determined advocate of the invincibility of the British infantry square, an acquaintance of the author's, would sometimes maintain this point in argument with the late captain, and it was a matter of no small entertainment to their circle, to mark the vehemence and dogmatism of their respective pretensions to the superiority of cavalry and infantry. This enthusiasm had some part in bringing about Captain Nolan's destruction. His age was only thirty-five years when he fell: he was unmarried. His widowed mother lost in him the third son who had fallen in the British service. Are there no honours which Britain bestows upon the bereft mothers of the fallen brave, who have rendered their country signal services while living, and at last laid down life for her glory?

We now bid farewell to the records of this tremendous struggle, and shall be happy if our humble narrative contribute ever so little to the feeling which will make the word Balaklava one of honourable and glorious association to British citizens and soldiers of our own, or, it may be, of other days.

CHAPTER XLIII.

BOMBARDMENT CONTINUED.—BLOWING UP OF A FRENCH BATTERY BY POWERFUL RUSSIAN BOMBS.—THE FIRST ACTION OF INKERMAN.

"They closed in clouds of smoke and dust,
With sword-sway and with lance's thrust;
And such a yell was there—
As if men fought upon the earth,
And fiends in upper air.
Oh! life and death was in that shout—
Recoil and rally—charge and rout,
And triumph and despair!"—SIR WALTER SCOTT.

EARLY on the morning of the 26th, the batteries commenced as usual, and the Russians varied the monotony of the proceedings by bringing a sixteen-inch mortar into play from some of the vessels in the harbour. Before eleven o'clock, these tremendous bombs blew up the magazine of the principal French battery, silenced it for the remainder of the day, and dismounted nine guns in our right attack.

FIRST ACTION OF INKERMAN.

This action was commonly styled among those engaged in it, as the "Little Inkerman." In this war, independent of siege affairs, the English were engaged in four general actions,—the great battles of the Alma and Inkerman, and the minor actions of the 25th and 26th October. That of the 25th, or Balaklava, in which were some incidents of painful import, we have just narrated. We now proceed to that of the 26th. About noon on that day, a strong Russian force of infantry, supported by cavalry and artillery, were descried from the naval battery, sallying from the works near the Malakoff; other movements of troops were observed on the north of the head of the bay. These threatening appearances having been also discerned by those on the look out of the second division, the generals and staff of this division immediately took post on commanding points, and the pickets were pushed a little forward over the edge of Shell Hill. The Russian columns appeared to move slowly. Their destination seemed yet uncertain. The troops were soon on the alert along our whole line.

On a detailed map of the Crimea, a road is shown which, branching to the right from the Worronzoff Road in its course towards Sebastopol, descends the heights to the valley of the Tchernaya, close to the head of the great harbour or bay. Across this, on the inner slope of an eminence, the second division were encamped. The road, passing over the ridge, turns to the right, and winds down a deep ravine to the valley and head of the bay. To the left of this road, the ground rises to a second eminence called Shell Hill, about 1100 yards in front of the position of our troops.

Most of the space on and between both ridges was covered with low coppice. This was also exactly the scene of the subsequently great conflict of the 5th November.

From the first, the Russians showed great jealousy of any one advancing above the crest of Shell Hill. No sooner was the hat or cap of a single English officer or vidette discovered above this line, than he was saluted with sundry round-shot and shell, of no small dimensions, from the works or shipping of the enemy. As the ridge in front was rather higher than that behind which this division was posted, and as the road, as well as the slopes from the valley on the left of it, afforded facilities to the advance of an enemy not found at any other point of the plateau, this was notoriously the weak point of the allied positions. But this, it would seem, the head-quarter authorities could not be brought to understand.

Gradually the enemy stole up the heights, but the artillery of several other of the divisions, as specified in General Evans' report, came to the assistance of that under his command. Meanwhile, the pickets were so well directed by the officers in charge of them—especially by Lieutenant Conolly, afterwards promoted to a company for his services on this occasion, with the assistance of Sergeant Sullivan—that the enemy were kept at bay a sufficient time for both brigades of the division to take favourable ground, and meet the ascending foe. The contests between the pickets and the masses of the Russian infantry were exceedingly fierce: perhaps during the whole war, no bodies of troops, so few in number, fought against such desperate odds—it was a conflict between a few hundred men, and nearly twenty times their number. The Russians pressed up the acclivities, eager to reach the summit, carrying with them trenching tools, by which they hoped to form a position, which, reinforcements speedily following, would have enabled them to hold. Against this vast column, the brave men who were on picket duty held their ground with the most desperate tenacity. The courage and solidity of Sir De Lacy Evans' division and the Guards, at

the greater Inkerman, did not surpass that here displayed. Lieutenant Conolly's men fell fast around him, but he rallied the survivors, and still fought, refusing to give way an inch. Again and again the enemy, in vastly superior numbers, rushed upon him and his little band with the bayonet. They were met as they advanced with deathful volleys of Minié musketry, delivered within a few yards; scarcely a shot that did not put two, and many three men *hors de combat*—the Minié balls, piercing the bodies of the nearer soldiers, entered those in their rear, and thus destruction was caused similar to that which, on a larger scale, was inflicted at the second battle of Inkerman. When the advancing parties of the enemy closed with the gallant little bands, they sustained the bayonet charges, repelling the assailants repeatedly with heavy slaughter. Gradually and steadily these brave men fell back upon their supports, fighting every step—Conolly and Sullivan performing prodigies of valour even where all were superbly valiant.

Military men admire the arrangement by which General Sir de Lacy Evans met the enemy: it is universally admitted to have been the only perfect affair during the war. The great experience of that lion-hearted man, and the military genius with which he is naturally endowed, secured the only perfectly skilful feat of arms in the records of this war. The battle was General Evans' own; for although the Guards, under General Bentinck and the Duke of Cambridge, protected his right, and several regiments of General Cathcart's division supported him, he might have told the officers who brought him this aid, as he did the officer who conveyed to him the offer of assistance from Bosquet—"I thank the general, but the enemy is already defeated." After the pickets fell back, it became for some time a battle of artillery—the result of which was that the Russian cannon were literally swept off the field. Sir de Lacy Evans assured the author of these pages that he was under great obligations to the artillery on this occasion, whose courage and skill entitled them to his highest admiration. When the Russian guns were thus silenced, the British cannon opened upon the columns of infantry, and tore through them with round and case-shot, while the volleys of the British infantry rolled with incessant power and steadiness upon them. At last they gave way, chased by the infantry of General Evans' division down the slopes, and across the valley. In this retreat the Russians especially suffered from a Lancaster gun, worked by sailors, under the charge of Mr. Hewett of the navy. This gun rendered good service during the Russian onset, as well as retreat. Mr. Hewett was acting mate of the *Beagle*, and was placed by Captain Lushington, who com-

manded the sailors' division, in direction of this gun. In the early part of the action, the Russian skirmishers approached within 300 yards, and picked off some of the gunners with their rifles. Mr. Hewett received at this juncture an order from some quarter to spike the gun, and retreat. This order did not come from Sir de Lacy Evans, or Generals Pennefather or Adams; but it was very much of a piece with the order to Lord Lucan, that to Captain Barker to remove his battery at Balaklava, and the repeated directions to abandon the harbour. Mr. Hewett determined, like Captain Barker and Sir Colin Campbell, to give no heed to the cowardly and foolish command. He replied, "Such an order does not come from Captain Lushington, and I will not obey it until it does." He then blew away with powder part of the earthen parapet, and the right cheek of the embrasure, so as to obtain a sufficient lateral sweep for the gun, and fired a dozen rounds into the Russian column with devastating effect. As the brave men of the second division, directed by Sir de Lacy himself, pressed hard upon the enemy at this juncture, the latter gave way—Mr. Hewett discharging 68-pound shot upon them in their retreat, until beyond the range of his gun. The play of the British field-artillery was at the same time magnificent, and would have been more destructive, but most of the men of General Evans' division wore their great-coats—rendering them scarcely distinguishable from the enemy, especially as both were half hid in the coppice, through which the Russians skirmished with some audacity, as they got away from the British heights. Whenever our artillery officers could see a gleam of red through the grey great-coats, they took care to avert their fire, or cast it beyond upon the retreating foe.

During this short action, which did not last much more than an hour, the enemy continued to get up some long range guns upon Shell Hill—the position from which, in the greater Inkerman, they so fearfully galled our divisions. The advantage in this instance was but small, in consequence of the tenacity with which Captain Conolly, and the other officers of the pickets, held their ground; for already powerful batteries were prepared to open against Shell Hill, which soon silenced the guns there. Conolly and the other officers, trained in their duty by that great master of the art of war, Sir de Lacy Evans, and his glorious second in command, General Pennefather, knew too well the value of the positions to yield a foot until the supports were ready to offer the enemy an effectual resistance. The Russians left dead upon the field within our lines two officers and 181 men; 100 wounded prisoners, men and officers; and forty-eight men, and several

officers, unwounded; but the trail of their dead was left behind them all the way into Sebastopol. Sir de Lacy Evans, with the modesty which is so generally characteristic of the brave and wise, estimated the total loss of the enemy at 600 men. Other officers since that have computed it at 1000 men. Sir De Lacy Evans himself admitted to the author of this work, that his original conjecture was far beneath the truth, as facts proved to himself after his despatch was written. If we state the Russian loss to be 1200 men killed, wounded, and prisoners, it will be much nearer the real amount. This terrible chastisement of the enemy was effected with so little injury to the British as to make the contrast almost incredible. Only thirteen were killed, and seventy-three wounded; the Russians carried away no prisoners. The officer who had so lately captured Lord Dunkellin (heir of the Marquis of Clanricarde) was among the prisoners. The force of the assailants has been variously estimated. Lord Raglan made it 6000 men, which was far below the truth. The gallant general upon whom all the honour of the victory rested, informed the writer that he believed the number was from eight to ten thousand; and that the strength of his division in the action did not exceed 1800 men.

This splendid feat of arms was, as to its importance, acknowledged coldly in Lord Raglan's despatch, but the merits of the general were referred to in the most handsome terms. This does Lord Raglan great honour, for never did a man maintain more sternly his political and religious prejudices and antipathies than Lord Raglan—and the liberal opinions of General Evans were not likely to gain his favour, nor commend their possessor to his partiality. The manner in which his lordship, in this and other despatches, subjects his strong political bias to the justice and honour of the soldier deserves honourable mention. His lordship, however, allowed, in his despatch concerning this battle, his high aristocratic prepossessions to prevail in reference to Sergeant Sullivan. General Evans placed the names of the non-commissioned officers beside those of the commissioned officers who deserved well of their country; but Lord Raglan named the officers in his despatch, and left out the no less intrepid man who, if of inferior birth, was of as noble nature. This afterwards attracted the attention of the House of Commons, and the denunciations of the press; and General Evans succeeded, after some difficulty, in obtaining for the brave man a commission. He certainly need entertain no gratitude for the justice or favour of the commander-in-chief for obtaining what his proud valour won from the reluctant concession of those who are so slow to confer military honour on the humbly born.

A writer in *Blackwood's Magazine*, who was present at this action, thus describes the evidences he saw of the punishment inflicted upon the foe:—"All that afternoon waggons were bringing in wounded Russians. Passing the hospital tent of the first division, on the way to my own that evening, I saw a neat boot stretching out of the door-way, the wearer's leg being supported by an orderly. I looked in, but quickly withdrew. A very young Russian officer, extended on a table, whose thigh-bone had been splintered by a ball, was undergoing amputation of the hip-joint. As I turned away, the booted limb was detached from the bleeding mass, and laid upon the ground. He died in an hour. Outside the same tent next day, I saw a guardsman making soups in a large camp-kettle, while within a stride of his fire lay the bodies of five Russians, in different postures, who had died of their wounds, and had been laid there for burial. The young officer's body was laid apart, covered with a blanket, and near it, covered also, but not hidden, was a heap of amputated arms and legs."

Such were the appalling scenes which followed this short but decisive battle, which has been generally called a sortie, because the attacking force was not detached from the army of Liprandi in the field, but came out from Sebastopol, and was supposed to have been commanded by the junior Gortschakoff.

Much discussion took place in the English camp as to what could have been the precise motive of the enemy in thus forcing an action, on that particular point, with numbers which were inadequate to drive the allies from their position. The motives of the enemy were, however, clear enough to the indomitable man by whom they were repelled. The mere fact of carrying with them so large a supply of trenching tools, showed that they hoped, if possible, to make a lodgment. It may be urged, that if they had driven back the second division there were still the large bodies of British troops belonging to the other divisions, and the French division of Bosquet all hurrying up to the support of Sir De Lacy Evans: but Liprandi was on the alert, and had any lodgment been effected by Gortschakoff, he would have pressed forward, and ascended the heights in rear of Gortschakoff's columns, or perhaps have stormed Bosquet's position, weakened by the support sent to Sir De Lacy Evans. A sortie at the same time upon the British left might be effected by the garrison; this was, in fact, the plan upon which the second Russian attack on Inkerman was, with certain modifications, based. By this assault upon the position of General Evans, the Russians also gained a complete knowledge of the weakness of the English

position, and were encouraged to renew on a vast scale their attack upon the unprotected post of Sir De Lacy Evans. That general had not fought in fifty pitched battles, nor served on the quartermaster-general's staff in various campaigns, in vain. He knew well, that unless the position was strengthened, there was danger the most imminent; but his remonstrances to Lord Raglan and General Airey were, for the most part, treated with silent indifference. It is true, Lord Raglan wished to place a couple of guns in position there, to which General Evans objected—his sagacity foreseeing that so feeble a defence would only direct the attention of the Russians to the weakness of his position, and invite attack. After the action just now related, the general renewed his importunities to have the position strengthened. His arguments were met by the same cold and haughty silence as before, and nothing was done. Lord Raglan, in his despatch, did not seem to have any idea of the great importance of the position, the peril which menaced it, or the likelihood that the battle of the 26th was only preliminary to larger combinations for a more determined assault. He begins his despatch by some trifling notices of the continued siege operations, which amount to a statement that very little was done, and *then* he incidentally brings in the action of the 26th, as a sortie which was repelled with much address and energy by Sir De Lacy Evans.

If, however, Lord Raglan and his quartermaster-general, and the rest of his immediate staff, could not appreciate the events of the 26th, his lieutenant was not so dull, neither was the enemy. Sir De Lacy Evans could not sleep at night from the state of anxiety in which he was kept by the defenceless state of his position, and the uselessness of his remonstrances; and there is no doubt that the ill-health which deprived the army, in its hour of peril, of the loss of his services, was as much caused by this anxiety as by the accident which some days after befell him.

The excuse made by Lord Raglan for not sufficiently fortifying the extreme right of his line—that he had too few men, was absurd; for although his men were too few for the purposes to which he often uselessly put them, he could spare them for an extended line of defence before Balaklava, from which, on the 25th, he was driven, while he neglected the proper support of a position upon which the safety of his army depended. After the greater Inkerman, when he was still more pressed for men, he was obliged to strengthen this part by a large body of Turks—far greater in number than would have been requisite for erecting and manning formidable batteries

upon the heights occupied by the second division.

The action of “little Inkerman” might have opened the eyes of any commander not too haughty to consult those whose experience was much superior to his own, and whose military capacity and general attainments so much qualified them to be his counsellors.

The enemy profited largely by the knowledge this action gave them of the state of the British positions, and the mental calibre of the British chief; for on the arrival of Danenberg's reinforcements, every means were put into requisition to follow up the attack on Sir de Lacy Evans, upon a scale of magnitude, and with forethought and forces, almost ensuring success. While Raglan went on in his dreamy command, and while the versatile and undecided Canrobert paraded about among his men, and at the British head-quarters, as gay as he was brave, and, apart from a supreme command, also talented—Menschikoff, Gortschakoff, Danenberg, and Liprandi, with persevering industry, vigilance, and a deep and remorseless hatred, laid their schemes for the destruction of the allies, to be in ten short days carried into execution—or at all events, attempted with all the energy of mingled hope and despair, and national and religious rancour. Such was the action of the lesser Inkerman, and such its consequences.

The 25th and 26th of October were indeed eventful days to the allies, and left the traces of their influence long after the roar of their cannon died away.

The battle of Balaklava deprived us of a good and short road from Balaklava to the camp, and caused the dreadful sufferings incurred throughout the winter in bringing up to the lines provisions and munitions of war, especially as neither Lord Raglan nor his *alter ego*, General Airey, would make another road when prudence and reason dictated its urgency. That battle led to the insane orders to the ships to anchor outside the harbour of Balaklava, and thereby caused the ruinous loss of our stores during the storm which so soon after swept with irresistible fury the shores and waters of the Black Sea. The 26th taught the Russians that there was a way of assault open for them upon the British lines; and as no efforts to fortify the position were made after the action of that day, they learned to despise the command-in-chief of the allied armies, and to lay their schemes accordingly. The success of the 25th inspired the attack of the 26th, and that attack, although resulting in defeat, inspired the conception which was afterwards put into execution upon the 5th of November. The Russians felt that the allies had commanders that would not be taught by an enemy; and the British and French generals

commanding infantry divisions had bitter experience that their chiefs would receive no counsels from their friends, although grey in wisdom and scarred by war.

We shall close the detail of this action, and the discussion of its consequences, by the despatches, and by some specimens of the correspondence of those who wrote from the contested heights, in the anxious camp.

Second Division, Heights of the Tchernaya, Oct. 27.

MY LORD,—Yesterday the enemy attacked this division with several columns of infantry, supported by artillery. Their cavalry did not come to the front. Their masses, covered by large bodies of skirmishers, advanced with much apparent confidence. The division immediately formed line in advance of our camp, the left under Major-general Pennefather, the right under Brigadier-general Adams. Lieutenant-colonel Fitzmayer and the captains of batteries (Turner and Yates) promptly posted their guns and opened fire upon the enemy. Immediately on the cannonade being heard, the Duke of Cambridge brought up to our support the brigade of Guards under Major-general Bentinck, with a battery under Lieutenant-colonel Dacres. His royal highness took post in advance of our right to secure that flank, and rendered me throughout the most effective and important assistance. General Bosquet, with similar promptitude, and from a great distance, approached our position with five French battalions. Sir G. Cathcart hastened to us with a regiment of rifles, and Sir G. Brown pushed forward two guns in co-operation by our left. The enemy came on at first rapidly, assisted by their guns on the Mound Hill. Our pickets, then chiefly of the 49th and 30th regiments, resisted them with very remarkable determination and firmness. Lieutenant Conolly, of the 49th, greatly distinguished himself, as did Captain Bayly of the 30th, and Captain Atcherly; all of whom, I regret to say, were very severely wounded. Sergeant Sullivan also displayed at this point great bravery.

In the meantime our eighteen guns in position, including those of the first division, were served with the utmost energy. In half-an-hour they forced the enemy's artillery to abandon the field. Our batteries were then directed with equal accuracy and vigour upon the enemy's columns, which (exposed also to the close fire of our advanced infantry) soon fell into complete disorder and flight. They were then literally chased by the 30th and 95th regiments over the ridges, and down towards the head of the bay. So eager was the pursuit that it was with difficulty Major-general Pennefather eventually effected the recall of our men. These regiments and the pickets were led gallantly by Major Mauleverer, Major Champion, Major Eman, and Major Hume. The Russians were similarly pursued further towards our right by four companies of the 41st, led gallantly by Lieutenant-colonel the Hon. P. Herbert, A.Q.M.G. The 47th also contributed. The 55th were held in reserve. Above eighty prisoners fell into our hands, and about 130 of the enemy's dead were left within or near our position. It is computed that their total loss could scarcely be less than 600. Our loss, I am sorry to say, has been above eighty, of whom twelve officers are killed, and five wounded. I am happy to say hopes are entertained that Lieutenant Conolly will recover, but his wound is dangerous.

I shall have the honour of transmitting to your lordship a list of officers, non-commissioned officers, and privates whose conduct attracted special notice. That of the pickets excited general admiration. To Major-general Pennefather and Brigadier-general Adams I was, as usual, greatly indebted. To Lieutenant-colonel Dacres, Lieutenant-colonel Fitzmayer, Captains Turner, Yates, Woodham, and Hemlin, and the whole of the Royal Artillery, we are under the greatest obligation. Lieutenant-colonel Herbert, A.Q.M.G., rendered the division, as he always does, highly distinguished and energetic services. Lieutenant-colonel Wilbraham, A.A.G., while serving most actively, I regret to say, had a very severe

fall from his horse. I beg leave also to recommend to your lordship's favourable consideration the excellent services of Captains Glazbrook and Thompson, of the quartermaster-general's department, the brigade-major Captains Armstrong and Thackwell, and my personal staff, Captains Allix, Gubbins, and the Hon. W. Boyle.

I have, &c.,

DE LACY EVANS, *Lieutenant-general*.

The Right Hon. Lord Raglan, G.C.B., &c.

Before Sebastopol, Oct. 28.

MY LORD DUKE,—I have nothing particular to report to your grace respecting the operations of the siege since I wrote to you on the 23rd instant. The fire has been somewhat less constant, and our casualties have been fewer, though I regret to say that Captain Childers, a very promising officer of the Royal Artillery, was killed on the evening of the 23rd, and I have just heard that Major Dalton, of the 49th, of whom Lieutenant-general Sir de Lacy Evans entertained a very high opinion, was killed in the trenches last night. The enemy moved out of Sebastopol on the 26th, with a large force of infantry, cavalry, and artillery—amounting, it is said, to 6000 or 7000 men—and attacked the left of the second division, commanded by Lieutenant-general Sir de Lacy Evans, who speedily and energetically repulsed them, assisted by one of the batteries of the first division and some guns of the light division, and supported by the brigade of Guards and by several regiments of the fourth division, and in rear by the French division commanded by General Bosquet, who was most eager in his desire to give him every aid.

I have the honour to transmit a copy of Sir de Lacy Evans' report, which I am sure your grace will read with the highest satisfaction, and I beg to recommend the officers whom he particularly mentions to your protection. Captain Bayly of the 30th, Captain Atcherley of the same regiment, and Lieutenant Conolly of the 49th, all of whom are severely wounded, appear to have greatly distinguished themselves. I cannot speak in too high terms of the manner in which Lieutenant-general Sir de Lacy Evans met this very serious attack. I had not the good fortune to witness it myself, being in front of Balaklava at the time it commenced, and having only reached his position as the affair ceased, but I am certain I speak the sentiments of all who witnessed the operation in saying that nothing could have been better managed, and that the greatest credit is due to the Lieutenant-general, whose services and conduct I have before had to bring under your grace's notice.

I enclose the return of the losses the army has sustained since the 22nd.

I have, &c.,

RAGLAN.

His Grace the Duke of Newcastle, &c.

In connection with the foregoing despatches it is very honourable to the British arms, and to the wise and intrepid general (Sir de Lacy Evans) by whom the battle of the lesser Inkerman was fought and won, that General Canrobert requested a copy of the report made by General Evans to the British commander-in-chief, in order to transmit it to his own government. So much did the gallant commander of the French admire that report, for its simplicity, modesty, and succinctness, and the mode in which the action was fought which it recorded, that he preferred sending home the British general's own narrative with his despatch, to the usual mode of only describing in his own language the achievements of his ally.

The report of General Bosquet to his chief was also very complimentary to Sir de Lacy

Evans. Bosquet, in his own *brusque* and generous mode, informed Canrobert that he could only find one fault in Sir de Lacy Evans' dispositions and performance on that day, which was, that the gallant British chief had left him (Bosquet) nothing to do—having gained a complete victory with his own small division, without the aid of allies, or of other divisions of his own army. General Bosquet was much impressed with the tact and generalship of the British chief, who rode over to the place, a mile and a half distant, where Bosquet had halted his battalions on the intimation from Sir de Lacy that their aid was not required, and from that spot the two generals rode back to the field of battle. The men of the second division, seeing the two popular officers together, welcomed them as they rode up the hill, after going over the contested ground, with the most enthusiastic cheers. This gratified the gallant Bosquet, not merely on account of the compliment paid to himself, but because of the devotion which it evinced on the part of the soldiery of Sir de Lacy's division to their chief.

It was a matter deeply to be regretted, that the numerical strength of the British did not allow of their following up, on the instant, the victory of the 26th. Throughout the whole siege there never again occurred so glorious an opportunity for storming the place. Had General Evans' division been 8000 men, as it ought to have been, instead of 1800, he could have entered Sebastopol with the retreating foe. The men of this division would have gone anywhere with him; and in the retreat of the Russians, the British were so mingled with them, that they might have penetrated the place with their flying battalions. It was well Sir de Lacy did not attempt it, as from the impotency and incompetency of the command-in-chief, he would have been left to perish with the few soldiers of his division. The total want of resolute counsels at headquarters would have made it a madly rash act for General Evans to have gone in with the fugitive enemy; although there can be no doubt that had he done so, and had he been, at the same time, bravely seconded by Lord Raglan and General Canrobert, the place must have fallen. In consequence of the various motives attributed by different writers to the Russians in directing this attack upon the position of General Evans, the author of this work communicated with the gallant chief himself, requesting his opinion, which will be found substantially as follows:—

Different reasons have been assigned as to the object of the Russians in this attack. Some have considered it a reconnaissance, preparatory to the greater offensive operation of the 5th of November. We believe, however, that it occurred in the following manner:—Great

rejoicings were known to have taken place in Sebastopol on the night of the 25th, in consequence of the capture of the artillery and part of the allied position at Balaklava. It was a first success after their overthrow at the Alma, and tended to restore the confidence of the Russian troops. A *Te Deum* was celebrated in Sebastopol on the morning of the 26th. The whole of the garrison were assembled. They were addressed, it was stated, by the general-in-chief, in glowing terms, on the victory of the preceding day. An extra spirit ration was issued, and it was resolved to take advantage of the supposed discouragement, and probable dislocation of the forces of the allies, by a sudden attack on the weakest part of our line. But though not a reconnaissance, the knowledge thus obtained of the ground, and of the numerical deficiency of its defenders, very probably led to the decision of repeating the attack, with at least quadruple means, on the 5th of November. In both instances, intrenching tools were brought up by the assailants, but in neither case were they used, in consequence, perhaps, of the resistance encountered having been greater than anticipated.

We now proceed to give a few letters, descriptive of the varied features of this combat, according to the course we adopt on occasion of all the leading and important incidents of the siege and its attendant conflicts.

An officer of the 49th thus writes:—"Since my last from here our division has been engaged. Yesterday I and two others were on a hill overlooking Sebastopol and the French lines, amusing ourselves with our spy-glasses, when all at once we perceived two strong lines of Russian skirmishers leaving the town and advancing towards our camp, which is on the right of the English line, to the northward of the half of Sebastopol we are investing. We immediately bolted back, in time to put on our shakos and coats; the firing, just as we fell in, was getting louder and quicker. On reaching the end of the slight rise, at the foot of which our camp is pitched, we were ordered to lie down and allow the artillery to pass us, and take up the crest of the hill. They immediately began playing on the advancing columns of the Russians, who were coming on as steady as a rock, driving our skirmishers, consisting of only three companies, before them. These latter, however, fought right well, disputing every bush and stone behind which they could lie down and fire, the artillery of the Russians sending grape and canister among them, and our own firing rockets and round-shot over their heads. This went on for about a quarter of an hour, or perhaps not quite so long, when the Russians could stand it no longer: they broke into skirmishing order, and retired as fast as they

could; nevertheless, they occasionally fired a shot from their guns, their men keeping up pretty sharp fire at the same time. Our artillery practice was beautiful; wherever a body of Russians was seen, there came a shell or a rocket sweeping everything before it. We followed them up for some time, and had the army, instead of one division, about 1500 men only, been engaged, we might have gone with them into the town. It was my luck to be left for about two hours with my company on picket, so that I had full opportunity of visiting the ground of my first battle-field. I shall never forget the horrible sights I saw; in one spot eight or nine men, dead and dying, their bodies ripped open, arms, legs, and heads blown off—all Russians. I did not see one of our men; at the moment they fell they were carried by the bandsmen of the division to the hospital tents. . . . We (49th) had two officers wounded, one very badly, shot through the shoulder—Conolly; he was shot heading a few men of his company, fighting hand to hand with the Russians, who wanted to take him alive, but he defended himself with his sword, wounded one, and was immediately shot by another who was a yard from him. Lord Raglan, who saw the whole thing, sent to know who the officer was who was fighting so bravely against such odds. When he heard that he had been wounded, he sent at once to know how he was getting on. I am happy to say that our surgeon says there are good hopes of him, as the ball just missed his lungs. . . . We hear that 15,000 more French troops are expected every day; good news, if true; as, although the men we have are in every way 'good men and true,' still our army is not what it was; sickness has greatly thinned our ranks. Cholera has almost entirely disappeared."

It will be perceived that the impressions of the officer who wrote the foregoing letter, were in accordance with our opinion that Sebastopol might have been entered with the fugitives, had the division of General Evans been suitably reinforced. The following is an admirable sketch of the affair; the quotation made from the words of a French general (who was no doubt Bosquet) shows the good generalship and resolution which the Russians had to encounter this time:—"On the 26th, it appears that Gortschakoff, one of the Russian generals, entered Sebastopol, and spread it about the town that the Russians had gained a splendid victory, and had taken no end of cannon, that the English had fled in disorder, and that a sortie from the town would quite finish them. This account inspired them with a little extra courage, for about 8000 of them made a sortie on the English trenches. We were, however, quite prepared for them; all

our heavy guns were loaded with grape, and our field-pieces crammed with bullets, &c. besides the guard of the trenches ready with their rifles and muskets. On they came, and when within a short distance of our trenches the signal was given, and all our pieces belched forth at once. The Russian column was changed in five seconds to a heap of dead and flying, the latter of whom our men then chased into the town. It was the work of three minutes. A French general, in describing the affair to me, said, 'I saw dense masses of grey coats marching on towards the English trenches, and was surprised to find all was still there—not a head appearing. Being afraid of the result, I ordered three battalions to go to their support. I turned to give the order, when I heard a roar like hell broke loose, and on the smoke clearing away, I saw a heap of struggling animals where the former column was, and the English red-coats quickening their motions.' It was the debt we owed them for the work of the day before paid with interest, cent. per cent., and something over."

The following account is also a graphic one—"I happened to be with the second division on the 26th when the order was given for them to turn out and stand to their arms. On our side, it was a sudden and unexpected attack until a few minutes beforehand. A lot of officers were standing on an eminence, looking down upon the skirmishers on both sides, having no idea that a powerful sortie was about to be made, when they saw some guns on an opposite ridge, to the right, about 1000 yards distant. No one had the least suspicion as to what they were, when some one looking through a glass, said 'Green guns, by Jove!' and all bolted. (The Russian gun-carriages are painted pea-green.) In two minutes more the round-shot began to sing overhead, and the sharp sound of musketry from the pickets showed that some sharp fighting was going on. The pickets were under the command of Major Champion, of the 95th. They behaved admirably, and, although compelled to retire, did so in excellent order, and kept the Russians in check until our artillery got to work. I saw three immense Russian columns cross the ridge I have just spoken of. As soon as our gunners got the range they sent a storm of rockets shot, and shell into them, and the column literally melted away. Our infantry then advanced, firing; and the Russians retreated and were followed by some of our skirmishers nearly down to the walls of Sebastopol. The second division, under Sir de Laey Evans, was the only one engaged. The Duke of Cambridge, with the Guards, was in reserve. Other divisions were coming up, and had the action lasted longer, would have come in full

it. Two officers were taken prisoners. From what they said, it appears that in the morning Menschikoff assembled the troops in Sebastopol, told them of the great victory obtained over the English the day before at Balaklava, that the English cavalry was destroyed, and that the infantry only required finishing; whereupon they demanded to be led against the English. As I was on the ground from first to last, and had nothing to do except to look about me, you may depend upon my account being correct. It is very much the fashion to say that the Russians must have lost so many, and I am afraid, in general, rather to overrate their losses; so I will give the losses on both sides, as far as can be correctly ascertained. Our loss was twelve killed, and seventy-one, including five officers, wounded, all of the second division. We took 100 prisoners; 112 bodies were buried by us, and we know of many more lying beyond our position, so far away that the burying parties would be under the fire of the guns of Sebastopol."

The following is an extract of a letter to the author, by an officer who took part in the en-

gagement:—"By some it has been conjectured that the close of this affair offered, perhaps, a peculiar opportunity for penetrating the enemy's works in the direction of the Malakoff by a *coup de main*. It is true, that on no other occasion was a large body of the enemy put so completely to flight. The 30th and 95th regiments were mingled completely with the Russians in pursuit of their columns, and probably, therefore, might have entered with them into their lines of defence, followed, if such had been decided on, by the remainder of the second division and the brigade of Guards. But this amount of force must have been wholly inadequate to maintain its position within the enemy's defences, unless rapidly supported by an advance of the whole of the allied army. But this, even if advisable, could only have been carried into effect by means of prompt and comprehensive dispositions, by both the commanders-in-chief. But this was out of the question, as neither of those authorities were present, or aware of what was taking place, till some time after the opportunity—if opportunity it was—had passed away."

CHAPTER XLIV.

SIEGE OF SEBASTOPOL—FROM THE ACTION OF THE "LITTLE INKERMEN," OCTOBER 26TH, TO THE EVE OF THE GREAT BATTLE OF INKERMEN, NOVEMBER 5TH.

"The Soldier,
Full of strange oaths and bearded like the pard,
Jealous in honour, sudden and quick in quarrel,
Seeking the bubble reputation even in the cannon's mouth."—SHAKESPEARE.

AFTER the action of Inkerman, on the 26th, a curious incident occurred in the camp. When all was silent, the sentinels were alarmed, and many of the sleepers aroused, by the tramping of a large body of horse, who thundered along at a furious rate from the direction of the enemy near the Woronzoff Road. Before there was time to form a conjecture as to what it could mean, or to remember how improbable it was that the Russian cavalry would charge along there in that fashion, at that hour, 250 horses, without riders, saddled and equipped for hussars, galloped into the lines. Some were killed, some killed or maimed themselves, and the rest were captured; about 185 of them were unhurt, and the whole were serviceable. This restored the balance as to loss of horses incurred on the 25th. Many of them being greys, were handed over to the Scots Greys. This flight of steeds was occasioned probably by some French rockets fired at the enemy's pickets. As horses were very valuable on both sides, the incident was a matter of gratulation with the allies, and of chagrin to the Russians.

On the 27th, Admiral Lyons arrived off Balaklava in the *Sanspareil*, and at once adopted vigorous measures to prevent the abandonment of the harbour. It was alleged that he had much difficulty in prevailing with Lord Raglan to dismiss the idea; but at last his influence, which was very considerable with the British commander-in-chief, prevailed so far, that the latter consented not to give up the place unless the enemy made some fresh attempt upon it in great force. Lieutenant-general Sir de Lacy Evans, Sir Colin Campbell, Colonel Hamley, Captains Powell and Christie of the royal navy, and, in fact, all who ventured to give any opinion, were energetic in their disapprobation of the policy of withdrawing our stores and shipping from the town and harbour. Captain Christie wrote to Quartermaster-general Airey, reminding that officer that the anchorage outside the harbour was most unsafe, and requesting measures to be taken for selecting another place of debarkation of ammunition and stores, if the ships were not to re-enter the harbour. To this letter General Airey replied, stating that it was in accordance with Lord Raglan's views that all

the transports not then required in the harbour should be got out; but he at the same time treats the measure as only precautionary, and adds, "perhaps we may not change the place of our landing at all." This indecision bore bad fruits from the first, in a few weeks it entailed wide-spread disaster. Among the minor incidents of mischief resulting from the indecision at head-quarters, was the perpetual damage to ships "lying on and off the harbour, from the variable winds and strong currents which set in round capes Ayia and St. George." In this way, the *Pride of the Ocean* was nearly wrecked on a fine October evening. On the 2nd of November, she again came off the harbour with a cargo of live bullocks. Her captain signalled that he was out of water for the cattle, but still he was not permitted to enter, and had to stand out to sea for five days. Arrangements were then made to take the cattle from her, *but upwards of ninety had perished for want of water, and all the rest were in a dying state!*

Captain Dacres of the *Sanspareil* became senior officer, and took charge of the defence of the harbour. He seems to have executed his task either with singular caprice, or understanding General Airey's orders for keeping ships out to be most stringent, he obeyed with a stern fidelity which no expediency could relax. As a specimen of the consequences, an occurrence may be related, which took place on the 3rd of November. Dr. Tice was the medical officer in charge of Balaklava, and as 200 invalids had arrived in camp that morning, the doctor applied to Captain Dacres for a ship to take them to Scutari. The captain peremptorily refused to allow any ship in for the purpose; there were no adequate means at Dr. Tice's disposal for the proper care of these invalids in the town, and the result was an amount of appalling suffering, and some loss of life.

Considerable apprehensions existed after the battle of Balaklava for the fate of the brave men who were left wounded upon the field, or fell as prisoners into the hands of the enemy; accordingly, it was deemed expedient to send a flag of truce to make inquiries concerning them. On the 27th, Captain Fellowes, attended by a trumpeter, was sent to the enemy's camp on the Tchernaya. The mode in which this flag of truce was received, was neither courteous nor generous. As Captain Fellowes approached the Russian lines, two officers, attended by two Cossacks, rode off to meet them, and demanded in French their business, which was politely and speedily communicated; one of the officers then remarked, "You must turn round, you cannot be permitted to approach our camp so near. This is an affair for the general to deal with, and I shall commu-

nicate with him." The English aide-de-camp and his attendant were compelled to remain with their backs towards the Russian lines for some time, when an aged officer appeared, followed by a small staff, and said in a fierce and vindictive tone, "*Je suis le général-en-chef ici; que voulez-vous de moi, Messieurs?*" The object of the British officer's message was again explained, to which the Russian listened with a cold and hard expression of countenance; when, however, Captain Fellowes requested permission to bury the British dead, the general replied with an air of indignation, which events proved afterwards to be assumed, "*We have buried the dead. Tell my Lord Raglan that we are Christians, and though we make war, we perform all the duties of Christians. The dead are buried. The wounded are taken care of.*" The British officer delivered some letters from Russian officers in the hands of the English, which seemed to mollify the hard-featured general a little, for he then said more softly, that he did not know the names of the British prisoners, but would inquire; and if Captain Fellowes returned another day, he would afford him particulars. As the English messenger departed, the stern-looking old man turned to him and remarked, "*Vous m'excuserez si je vous dise que votre attaque du 25me était une attaque bâte, partant selon la loi militaire.*" On the return of the British captain, he learned that there were only two officers alive in the enemy's camp—Lieutenant Clowes of the 8th Royal Irish Hussars, and Cornet Chadwick of the 17th Lancers; that there were fifty-eight non-commissioned officers and privates prisoners, of whom only fifteen were without wounds. The Russians brought letters from the two British officers, testifying to the good treatment which they had received, but expressing a wish to have clothes and money sent to them. The cavalry charge of the 25th was of course the topic of conversation in the Russian lines, and the Russian officer who this time held communication with Captain Fellowes, imitating his chief in the former interview, remarked that it was a "*charge des fous.*" This officer also assured Captain Fellowes that the murder of the wounded arose from the barbarity of the Cossacks, and excited the horror of the Russian officers. He held up in his hand a piece of gold lace, and assured the British deputation that Cossacks would go anywhere or commit any crime for so dazzling a temptation. All this was, however, assumed, for shortly afterwards, at Inkerman, as previously at Alma, some of the most barbarous and ungrateful murders were perpetrated by the officers; and the officers made prisoners by us showed little gratitude for any kindness they received, and often betrayed the basest vindictiveness to those

who succoured and saved them. An instance of this is stated by the author of *A Month in the Camp before Sebastopol*, in the following terms:—"They brought in a Russian officer the other day, shot through both jaws with a Minié ball; it had also cut the root of his tongue so deeply as to make the end protrude from his mouth; and there was the greatest danger of his dying either from suffocation, or from the impossibility of swallowing food. He was placed in a little ruin used as a storehouse, and I lately went with —, of Brigadier-general —'s staff, to ascertain if we could be of use to him. He never looked up as we came in. It was night, and it was piteous to see him by the glimmering candle-light in that desolate place, sitting in his shirt on an old box, before being put to bed; his face tied up, and his swollen tongue being laved by the soldier who attended him. But my reason for describing to you such misery is to come. By the skill of Dr. Alexander, of the light division, this man recovered sufficiently to be sent on board ship; and he left the poor soldier who had helped to clothe him out of his own scanty wardrobe, and who had nursed him like a woman, night and day, without a single look, sign, or token of acknowledgment."

The state of things at Balaklava harbour was aggravated by the general inaction of the fleet, which it was supposed, both at home and in the camp, ought to have been able to effect something more than it did. Of course, the admirals attacking Sebastopol again was out of the question. A gentleman, then in the Crimea as an amateur, commenting upon the inability of the ships to come close enough in during the bombardment, and the good luck notwithstanding of the *Agamemnon*, and some others, in getting so close to some of the forts that the Russian fire went over them, observes:—"Whatever conclusion facts may suggest as to the part played by the fleets on the 17th, it appears that, in one respect, so favourable an opportunity as they then enjoyed cannot recur. The Russians, taught by experience, are said to have deepened their embrasures in Fort Constantine, so as to admit of the guns being hereafter depressed to the requisite level."

From information of the most trustworthy kind—and from quarters of the very highest authority—which has reached the author during the progress of these pages through the press, he is convinced that Admiral Dundas put forth every effort which circumstances and his means allowed; but a large portion of his best men, about 1500, were on shore, and he had no gun-boats, or small craft, of a description to enable him to effect anything against forts built on shores washed by shallow

waters. On this date, the 27th, the admiral wrote to the Admiralty, and his letter gives us a fair insight to the occupation of the fleets, and the feelings of the gallant officer himself. It will show why nothing was doing in the Sea of Azoff, and why Kertch was not attacked. The admiral writes in answer to a letter of the secretary of the Admiralty, already published in our pages:—

Britannia—off the Katcha, Oct. 27, 1854.

SIR,—With reference to your letter of the 13th instant, I beg you will acquaint the lords commissioners of the Admiralty that the *Sidon* and *Inflexible*, together with two French steamers of war, have been most active in preventing any force from entering the Crimea from Odessa by the Bay of Cherson. I have always been fully aware of the value of the Sea of Azoff to the enemy, and that could only be attained by the possession of Kertch. Some weeks ago I urged that 2000 men should be embarked for that place; but their lordships are aware that, from disease and the action at Alma, our troops have suffered great loss, and the French admiral, when he applied to his general for assistance to attack Kertch, was told of the impossibility of sending a man. The last report, by a neutral, that we have is, that the navigation through the straits at Kertch is entirely prevented by the enemy sinking ships and stones; and, under existing circumstances, all I can do is, when I have steamers to spare from the duty here, to send them off the port, to damage the enemy as much as possible.

It is necessary to observe that no troops have ever passed by sea to or from Anapa, all go by land through Kertch; and that the *Wasp*, which vessel recently arrived from off Anapa and Soujak, reports that the garrisons of those places are 8000 or 10,000 strong, so that without a military force it is impossible for me to act.

J. W. D. DUNDAS.

To the Secretary of the Admiralty.

Britannia—off the Katcha, Nov. 8, 1854.

SIR,—I beg you will acquaint the lords commissioners of the Admiralty that on the arrival of the *Sphinx*, *Gladiator*, and *Stromboli*, I prepared a squadron for the purpose of bombarding Odessa, and have obtained the consent of Vice-admiral Hamelin for the co-operation of the French steam-frigate *Cacique*, already employed off Odessa with Captain Goldsmith, of the *Sidon*. Yesterday I received from Admiral Hamelin a letter, of which I enclose a copy, and I have consequently postponed the bombardment for the present.

I have, &c.,

J. W. D. DUNDAS.

To the Secretary of the Admiralty.

INCLOSURE.

VICE-ADMIRAL HAMELIN TO VICE-ADMIRAL DUNDAS.

Ville de Paris, Nov. 7, 1854.

MY DEAR ADMIRAL,—I receive this instant a letter from General Canrobert, informing me that he agrees with Lord Raglan, that an attack on Odessa by steam-boats throwing only a few shells, would be, in the present circumstances, rather unserviceable than useful. Consequently, the generals have ordered that it is not to be made.

Yours, &c.,

HAMELIN.

The jealousy existing among the naval commanders was calculated to cripple the exertions of the fleet. It must be mentioned, in justice to Admiral Dundas, that although severely animadverted upon in letters from the fleet, and in the newspapers of the British Isles, so great is his antipathy to controversy that he pre-

ferred injury to debate of any kind. It is certainly true that his second in command obtained the credit of every active measure. Yielding to the general opinion in this respect, supported by so many appearances, we fear that we have done Admiral Deans Dundas some injustice in a former page. It is one advantage of the publication of this history at intervals, that it gives opportunity of correcting data, and reviewing facts and allegations. Hitherto it has not been necessary to correct any statement we have made—writing, as we always do, from authority which is of the most reliable kind; and the press generally has acknowledged our accuracy, and the originality of our sources of information. No authority, however, is infallible, and it is a pleasure to give to Admiral Deans Dundas the benefit of any new light which may be thrown upon his command by the testimony of intelligent and competent witnesses. We are now convinced that whatever may have been the vigour of Admiral Lyons *while second in command*, Admiral Dundas has neither, in this history nor elsewhere, received his meed of praise. It is unnecessary to trouble our readers with lengthy documents on the merits of the rival admirals, as we must call them; for although we are sure Admiral Dundas felt no rivalry, events forced him into a position in which he and Admiral Lyons were competitors as much as co-operators. We give in a note below all that our pages can afford of space to this controversy.*

* An officer who knew well the state of the fleet, and the spirit of the commanders, and who was as competent as any man to offer an opinion, addressed to the author the following letter. As our encomiums upon Admiral Lyons' activity, and our censure of Admiral Dundas's supposed supineness justifies the call, *Audi alteram partem*, we print the letter *in extenso* :—

April, 1856.

"MY DEAR SIR,—In page 491, you say, 'Had Admiral Dundas shown activity and tenderness worthy of his high station,' &c. I know him well, and in my humble opinion this is a reproach utterly undeserved.

"Again—'but almost every duty devolved upon his second in command, Sir Edmund Lyons, whose authority was but limited.' Sir Edmund Lyons, I have no hesitation in saying, is entitled to the credit of being a diplomatist and special pleader of the first water. His first exploit in diplomacy was that of ingratiating himself into the friendship and confidence of that eminent specimen of royalty, King Otho, while conveying him in his frigate from Trieste to the throne of Athens. The consequence, it is alleged, was, that Otho soon caused it to be made known to the British government that it would be agreeable to his majesty were Captain Lyons accredited as British minister to his court. This was a berth far better than the command of a frigate. He is a man of address and fluent conversation. On arriving with the Black Sea fleet as second in command, there can be no doubt but that he zealously endeavoured to disparage his superior, and supplant him in the estimation of Lord Raglan. He soon got complete possession of the confidence of Lord Raglan, and the result was an actual hostility of feeling on the part of the unsuspecting and good-hearted Lord Raglan towards Admiral Dundas. To an apparent similar purpose, conversations were reported to have been usual on board the *Agamemnon*, derogatory to

The severe labour of maintaining the siege, and guarding the position, began now to tell severely on the English. Sir John Burgoyne made representations to the French general of engineers as to the necessity of strengthening the positions on General Evans' right, but no assistance was rendered. The English were bearing an undue proportion of the labour. The harassing nature of their duties is thus described by Mr. Woods:—"These night attacks, alarms, or surprises, are now matters of course. They have long failed to be surprises; we should be more surprised if they did not occur. In fact, they have ceased to be anything except a fertile source of blasphemies against enemies in general, and Russians in particular. They are, beyond all doubt, the most disagreeable and harassing incidents of the siege. For instance, after a laborious and exciting day—a day of such fatigue as renders rest, even in a tent, acceptable, you retire in all the great-coats you possess, to lie upon the ground. An hour or so gets you over the feeling of extreme numbness, which at first leads you to suppose you have lain down in a brook by mistake, and then you gradually drop off, not to sleep, but into a hazy state of existence, conscious of cold and conscious of wanting slumber; in fact, in that peculiar condition of vitality which in England justifies the immediate intervention of the Royal Humane Society. In this ambiguous state four or five hours pass away; I mean in literal time, for, if you estimated the period by your feelings, you would expect to wake grey and decrepid. It is past two o'clock—"the witching time of night" in the Crimea—when suddenly you feel a slight concussion in the earth, followed a few seconds after by the deep boom of a gun, and then comes the roar of a shell, screaming through the air, nearer, nearer, nearer, until it falls with a heavy dump outside the line of tents. Here it fortunately remains, and, after hissing for a moment like a locomotive blowing

the admiral-in-chief, and therefore not quite conformable with discipline. Letters to a similar tendency appeared, and one in particular was published in a great journal, dated from the maintop of the *Agamemnon*. This letter was afterwards discovered and avowed to be written by a friend of Sir Edmund Lyons, then staying on a visit to him. This letter, written by the friend of the latter, was considered to impugn grievously, not only the professional, but personal character of Admiral Dundas. It was easy, perhaps, to create ill-feeling towards Admiral Dundas at the military head-quarters, because he bluntly and repeatedly declared that the expedition was taken too late, and with insufficient means. Admiral Dundas, finding that Lyons was so great a favourite at the military head-quarters, thought it was more convenient for the service to place him permanently in communication with Lord Raglan; and I am not inclined to think that Admiral Dundas 'limited' unduly Sir Edmund Lyons' 'authority.'

"As for his qualities and great proficiency as a special pleader, only look at a leading article in this day's *Times*, on the gallant naval diplomatist's evidence of yesterday at Chelsea."

off, explodes with a loud bang, and the pieces go humming through the air. With a prophetic sigh, you guess what is to follow. Eight or ten more shells drop about the same place, too far off to hit you, but much too near to leave you perfectly unconcerned, and then five or six guns begin to go off at once, and make a roar. Still the camp is quiet, and the guardsman says, 'All's well,' as if he was at Kensington. The cannonade continues, and, after one or two temporary lulls, breaks out into a regular storm. Shells pour over the hill, and fall with a 'dab' into the wet soil, and you begin to see dimly the flashes of their explosions through the canvas of your dwelling, which at that moment you would so willingly exchange for lodgings, even in Islington. Still the allies make no sign of turning out, though the cannonade gets hotter every moment. In another minute you can plainly hear the sharp quick report of a musket, followed by another and another. Then the cannonade ceases, and the crack of Miniés spreads along our line of outposts. Still the allies are unaccountably quiet, and you begin to wonder whether Lord Raglan intends them to be massacred in their tents; and are just getting peevish and public-spirited about it, when the roll of drums in the distance tells you that the French are beating to arms. At the same time the signal, 'Guard, turn out' is passed along our lines, all the bugles begin to blow the 'assembly;' there is a moment of confusion, in which oaths prevail most distinctly, and then comes a rattle and hoarse murmur, and you know that 30,000 men are under arms and getting into their ranks. All this while your special correspondent has not moved, but, feeling for his revolver in his tent, is emphatically 'blessing' both Turks and Russians, and hoping against hope that there will be no occasion for him to turn out. During this time the fire of musketry has been increasing and coming nearer. Our pickets are evidently retiring, and you begin to think it is really a sortie after all. In the darkness you hear the 'Forward!' roared out to the different brigades, and a peculiar jingle and clatter show that the artillery are saddling and preparing for action. With a sigh you feel that you must go, and issue forth into the raw damp air and thick wet grass, which wets you as effectually as if you forded a river. The crackling of musketry and little flashes on the hills over Sebastopol soon tell which route to take; without such guides you would assuredly lose your way. You pass the batteries of artillery, at which an officer is cursing vaguely about loss of time, and, cutting across the camp, ascend the hills just as you hear the guns begin to rumble after. Our brigades are marching forward fast up the hill, in line, with supports in open

column. No one is very urbane, though all yawn and shiver amazingly. These, you feel, are the appropriate compliments of the season, about the many returns of which, if things go on in that style, you have serious doubts. Arrived upon the hill, the state of affairs is guessed at a glance. The sparkles of musketry are light and incessant in the valley beneath—one minute they swell into a continued rattle, for the next few seconds there is quiet and darkness, which is again broken by musketry, until the great blinding explosions and stunning report of the big guns run along the enemy's works, and your flesh creeps as you hear the iron volley tearing through the air. Half-an-hour of this work and the musketry gradually dies away: as it does so, the cannonade increases, and it is only an *alerte* after all. In the course of another half hour or so the enemy cease firing. Then the troops (by this time thoroughly numbed with cold, and wet with dew) return within cantonments, having been out about an hour. Within a minute after, they have piled arms; the men are stowed away in tents, and the camp as quiet as if no enemy were in existence. What I have now said may give your readers a general idea of the manner in which nearly every night is passed here. Of the discomforts attendant upon such sleep-walking heroism they can form no notion."

It is not surprising that the health of the men should give way under such circumstances as these, and accordingly the ranks of every battalion were diminished at a fearful rate. A gentleman of fortune, an amateur, says:—"The doctors have enough to do just now. Cholera is gone, but diarrhoea remains, and lying o' nights in the trenches is not good for the complaint. Still, though I often talk to the men out on picket, I never hear them grumbling; they only seem anxious to know when they are to storm 'Sebastopol,' and, faith, they are not singular in their curiosity. I have just been thoroughly sickened by seeing poor —, and —, go off in one of those white hearses, called ambulances. Fancy a live man being put on a stretcher and slid into a kind of pigeon-hole, under the seats, in the body of such a vehicle! I was glad that — determined to sit out the journey, as he best might, on the bench."

The condition of our allies, although better than ours, was still bad. There were no newspaper correspondents in the French camp to report the true state of affairs, nor did the public reports of the French government, nor the accounts of the Parisian press, present very faithful pictures. The French army suffered fearfully from ill-health and the climate, but in several respects they had advantages over the British. Their superior commissariat and

hospital management have been already noticed, and by these means the men were kept healthy, and restored when sick. Their numbers, in proportion to the labour required by their position, were much greater than on the part of the English. The position itself was in several particulars more favourable. It was remarked in narrating the events of the first day of the bombardment, that the French position was more exposed to the fire of the enemy, and the Russian artillerymen also knew it better, having previously made it their practice-ground. It was, however, less rocky, and therefore more favourable to the work of the engineers, sappers, and miners. The distance, also, between the French landing-places and their camp was considerably less than that between Balaklava and the English camp. This circumstance determined the French taking the left before Sebastopol; for, since the landing at Old Fort, the British had occupied the left. On the way from Old Fort to the Alma the left flank was the place of danger, and at the battle of the Alma, the left of the allied line had the more onerous task. But, in terminating the flank march, the English took possession of Balaklava, which necessitated their occupation of the right before Sebastopol. It was remarkable that the French had hitherto continued, from the landing at Old Fort, and indeed from the landing in Turkey, to keep the best positions, and secure the best quarters. The British staff seems to have been singularly *mal-adroit* in this particular, from the landing at Gallipoli to the formation of the lines before Sebastopol. We have conversed with officers as experienced as any in the British army, and several of these accustomed to large and responsible commands, and they have concurred in the opinion that the position of the English was less advantageous than that of their ally, for the reasons here stated. To this unhappy choice of a post, and of the position which it necessitated—exposing the British flank and rear to ceaseless and harassing attacks from the enemy—much of the overwork of the soldiers, and their consequent suffering and sickness, are to be attributed.

The enemy also suffered most severely. The bombardment caused great havoc; the sorties and attacks were conducted at a great sacrifice of men; and although reinforcements arrived, they were not composed of a proportionate number of engineers, sappers, miners, military artificers, and artillery. The seamen of the Russian fleet were thinned by the fire of the bombardment, especially from the English guns, and those could not be replaced. They were the most efficient defenders of the Russian works. A civilian, unconnected with the press, thus writes:—"Deserters bring very

cheering accounts of the distress in Sebastopol, and these appear to be confirmed by the circumstance that there is not more than one man seen working every three or four guns."

Indeed, by the end of October the allied guns had nearly ceased to fire, except in reply to the Russians, which the latter perceiving, greatly slackened their fire. This might partly account for what is written in the above extract; yet, making every allowance for this circumstance, it was obvious that great slaughter had been inflicted upon the gunners, and the accounts given by deserters, or which reached London by way of Berlin and Vienna from St. Petersburg, confirmed the impressions which appearances conveyed.

In the despatch of Lord Raglan, written on the 28th, allusion is made to the death of Captain Childers, of the artillery, who merited the eulogy the commander-in-chief conferred upon him. This young officer was son of Captain William Childers, late of the 42nd Highlanders, and grandson of Colonel Childers, one of the aides-de-camp of the Duke of York in the unfortunate expedition to Walcheren. The way in which he fell, and the circumstances attending his death and burial, are feelingly related by the superior officer of his company in the letter which follows; it is addressed to his father:—

Camp near Sebastopol, Oct. 25.

"MY DEAR SIR,—It has fallen to my duty to be obliged to communicate to you the melancholy tidings of the death of your son, Captain Childers, of the Royal Artillery, and second captain in my company, who fell in his country's cause in the trenches before Sebastopol, on or about four o'clock in the afternoon of the 23rd of October. He was standing by me, and left me to see the effect on the enemy's works; he put his head above the top of the earthen parapet, and a large round-shot struck him on the head, and his death was instantaneous—he could not possibly have suffered at all. Being myself a parent, I can feel for you and with you, and to me his death is irreparable. He had only joined me a short time, but in that time I had been able to appreciate his good qualities, both in a private as well as in a public capacity, and had he been spared, he would have been ere long an ornament to his profession. Willingly would I give way to my feelings and weep for him as for a brother, but stern necessity forbids it. I have a large family myself, and while I am writing these lines in haste, have to go into the trenches again, and God only knows who may be the next. The Lord gave and the Lord may take away, and we must all be prepared for our great change, whenever we may be called on. His remains I brought with me to the camp, and

yesterday they were interred in a secluded valley close to the camp, where they will not be disturbed when we quit the country. They were followed to the grave by numerous officers and men. I had a quiet coffin made to put him in, which I did with my own hands, assisted by his servant, and fastened him down myself, taking, alas! a sorrowful long farewell of one whom I much loved and respected. I have also made arrangements for his grave being banked up, to preserve it. I cut off some of his hair, which I now inclose. His effects, rings, &c., will be forwarded to England by the first opportunity. I have allowed nothing to be disposed of, as his family, I dare say, will like to keep all his things as tokens of the memory of one who, I am sure, must have been a good son. Trusting that I may meet him in a better world,

"Believe me, my dear Sir, very truly yours,
"JOHN NOBLE A. FREESE."

The state of the English cannon began now to cause uneasiness, the wear and tear of firing was rapidly rendering them unfit for use. Great anxiety, also, for reinforcements began to be openly evinced by men and officers; but the unflinching spirit of both bore them up through sickness, toil, and combat, with immortal honour. The British sailors were conspicuous for hardihood and endurance beyond all. On the night of the 27th they completed a very formidable battery on the heights before the French positions; this was executed with great perseverance and great recklessness of danger.

During the early morning of the 28th, before daylight, the Russians fired very heavily, and there appeared some intention of a sortie against the French, which was repulsed by the musketry fire of the covering parties in the trenches. By daylight the allies threw out strong skirmishing detachments, and during any lull in the cannonading, the Rifles, especially the British, kept up sharp-shooting upon the Russian embrasures. The usual error was practised on this occasion, of increasing the rifle fire when the artillery discharges of the enemy became less frequent: as we have elsewhere shown, the period when the cannonade is going on is the most suitable time for the occupation of the sharp-shooters. Of course, the chance of hitting their gunners is greatest when they are most exposed, which is when keeping up a quick fire, and not when they have partially or altogether retired from before the embrasures. These rifle parties were thrown out, not only to aid in silencing the cannon, but also to chastise and check the disposition of the enemy to assail the trenches. On the 28th, also, the cavalry abandoned their old camp, and took new ground on the heights,

in the direct route to Balaklava from the camp, very close to the rear of the French centre. The lower road, which had been hitherto so useful to the British, was now altogether resigned to the enemy. This was one of the results of the unfortunate battle of Balaklava. The position taken by the cavalry division, in spite of some pains employed in the selection, was miserably bleak and raw—cutting wind searched it by night and day, which was injurious to the men and destructive to the horses. The arrival of 1000 Turks, to aid in trench work, was a relief to the over-tasked British infantry divisions. The Chasseurs d'Afrique, who so bravely assisted our light cavalry at the fatal charge in the battle of Balaklava, were now also generous allies in supplying wood, prepared coffee, and other little comforts to their rivals and friends quartered beside them on the bleak steppe of the plateau on which the lines and encampments were formed.

Tidings were now heard in the camp from Lord Dunkellin, who was sent as a prisoner to Moscow, but most kindly treated.

On the 29th, the Russians, although their fire slackened, worked hard at new lines of defence, and in throwing up works in various directions. The results of their renewed efforts to erect fresh obstructions to the progress of the allies, as they appeared on this day, have been better described by Mr. Russell than by any other pen, military or civilian:—"At present we are all waiting for the French. I am not sure but that the French think they are waiting for us to '*écraser*' some of the obnoxious batteries which play upon their works from ugly enfilading positions. They certainly are exposed, in their advance towards their portion of the town, to very heavy fire. It is opposite to them that the assault must be made, and the first lodgment effected. The Quarantine Fort is opposed to them on their extreme left. Then comes a long, high, loop-holed wall or curtain extending in front of the town from the back of the Quarantine Fort to the Flagstaff Battery. The Russians have thrown up a very deep and broad ditch in front of this wall, and the French artillery have as yet made no impression on the stonework at the back. The Flagstaff Battery, however, and all the houses near it, are in ruins; but the earthworks in front of it, armed with at least twenty-six heavy guns, are untouched, and keep up a harassing fire on the French working parties, particularly at certain periods of the day, and at the interval between nine and eleven o'clock at night, when they think the men are being relieved in the trenches. Inside the Road Battery we can see the Russians throwing up a new work, armed with six heavy ships' guns. They have also erected new batteries behind the Redan

and behind the Round Tower. The latter is now a mass of crumbled stone, but two guns keep obstinately blazing away at our 21-gun battery from the angle of the earthwork around it, and the Redan has not yet been silenced, though the embrasures and angles of the work are much damaged. The heavy frigate which has been 'dodging' our batteries so cleverly gave us a taste of her quality in the right attack again to-day. She escaped from the position in which she lay before, where we had laid two 24-pounders for her, and came out again to-day in a great passion, firing regular broadsides at our battery, and sweeping the hill up to it completely. Occasionally she varied this amusement with a round or two from 13-inch mortars. These shells have done our works and guns much damage; but the sailors, who are principally treated to these agreeable missiles, have got quite accustomed to them. 'Bill,' cries one fellow to another, 'look out, here comes "Whistling Dick!"' The 13-inch shell has thus been baptised by them in consequence of the loudness and shrillness of the noise it makes in the air. They all look up, and their keen, quick eyes discern the globe of iron as it describes its curve aloft. Long ere 'Whistling Dick' has reached the ground, the blue jackets are snug in their various hiding-places; but all the power of man cannot keep them from peeping out now and then to see if the fusee is still burning. One of them the other day approached a shell which he thought had 'gone out;' it burst just as he got close to it, and the concussion dashed him to the ground. He got up, and in his rage, shaking his fist at the spot where the shell had been, he exclaimed, 'You — deceitful beggar, there's a trick to play me!' Our losses continue to be remarkably slight.—Five r.m. I have just heard that Major Powell, of the 49th, a most active and intelligent officer, has been killed in the trenches. Captain Maxwell, 50th regiment, M.P., had a miraculous escape lately. He was in a trench behind an embrasure, and happened to stoop for a moment. As he did so a 32-lb. shot came in through the embrasure, knocked off his cap, and carried away a piece of skin from the top of his head about the size of a crownpiece."

News arrived from England on the 28th and 29th which gladdened the hearts of the sick and suffering soldiery. The Duke of Newcastle's despatch, expressing the queen's approbation of her army, and the reception which the accounts of the battle of the Alma met with in England, arrived both in the newspapers and by private letters, and sent a thrill of joy through the camp. Groups of officers were gathered in one place, and of soldiers in another, discussing the newspaper articles and

the letters of "own correspondents." Lord Raglan's despatch concerning the battle of the Alma was deemed very inaccurate; and the *Times'* correspondent was put often and severely on his defence in reference to his account, which he felt himself obliged to correct in his next letter. The effect on the whole was greatly to stimulate the love of glory in the soldiery; the events of the great victory recurred again to the heroes who performed them, and they burned with impatience to add to their honour by the conquest of the grim city whose dark earthworks were so formidable. French papers arrived also on these days, and their encomiums stimulated the heroism of our allies. It was well that the British soldiery were not conversant with French, for although all the French periodicals lauded to the skies the valour and "solidity" of the English, there were certain hints of mismanagement and backwardness on the part of the British generals which were unjust; and as these were in the columns of government organs, there appeared a *quasi* official authority about them which added force to the innuendoes thrown out. Many of the British officers felt this keenly, and there were murmurs in the British camp in high quarters. It is to be regretted that these hints obtained a more substantive form subsequently, but were promptly met by Lieutenant-general Sir de Lacy Evans, who wields the pen with as much genius as the sword. It is undesirable to interrupt the history of the siege by referring more particularly to the controversy which thus sprung up, but in a note below the reader can satisfy himself that the refutation given to these implications by General Evans, on behalf of the British, was as requisite as it was courteous and complete.*

* The following letter, addressed by General Evans to the *Times*, and which appeared July 2, 1855, will place the whole subject before our readers, as it refers with clearness and distinctness to the animadversions complained of, so as to render it unnecessary to quote them from the French and Belgian press:—

July 2nd, 1855.

"SIR,—In a recent letter in your columns from the pen of your excellent correspondent in Paris, special attention is drawn to an article on the Crimean battles published in the *Indépendance Belge*, and emanating apparently from some French military writer, perhaps a legitimist. This journal is said to be of extended circulation, especially in Germany. The article in question is calculated to disparage generally the British army. Among the passages quoted are those representing Marshal St. Arnaud as the 'sole and exclusive' victor in the battle of the Alma; and pointing out by name 'Sir George Brown and Sir de Lacy Evans, and their respective divisions,' as, in fact, only persuaded to face the enemy and perform their duty by the urgent remonstrances or exhortations of Marshal St. Arnaud. No one will deny that this distinguished chief, in remaining in his state of health at the head of the French army, gave proof of a noble military spirit. But, though he never before had seen British troops in action, he, doubtless, knew their character too well, as also the consideration due to senior generals not under his command, and who had tenfold

On the 29th various accidents took place, by which several officers were slightly hurt. Lieutenant-general Evans was severely injured by the fall of his horse, which rolled over him. He was very much contused, and the shock occasioned considerable pain and debility. The general had been suffering from diarrhœa for several days. He was obliged to go down to Balaklava, where he went on board the *Sismoom*. The command of his division devolved upon his senior brigadier, Pennefather, an officer in whom General Evans had entire confidence. The illness of Sir de Lacy caused the deepest regret through the whole army. Unquestionably he was the ablest general in the Crimea. The idea of appointing Lord Raglan, who never commanded a brigade, over the head of perhaps the most experienced general in the British service, was an injury to the country, and a crime against its interests and its honour. Lord Raglan had merits as a man and a soldier which all recognise, and all ought

greater experience than himself in regular European warfare, than to have addressed either the one or the other in the gratuitous tone thus described. As for Sir George Brown, I will hazard affirming that he had no intercourse whatever on that day with our gallant allies. With regard to myself the following were the facts:—Shortly after daybreak on the morning of this battle his Imperial Highness Prince Napoleon and General Canrobert did me the honour to come into my tent to confer on the co-operation of my division with that of the prince in the ensuing conflict. They informed me that this co-operation had been agreed to the previous evening between the two commanders-in-chief, expressed surprise that I had not been made acquainted with it, and showed me a well-executed plan by the French staff of the Russian position, and of the proposed lines of movement of the allied columns of attack. According to this plan, General Bosquet's troops and the Turks, supported by the powerful fire of the shipping, were to turn the enemy's left. The second British division, that of the prince, and two other French divisions, were to attack their centre. The whole of the remainder of the British army was to turn the enemy's right. I expressed the very great pleasure I should have in fulfilling my share of these operations, and with this view sent forthwith to Lord Raglan for permission—which was given—to place at once my right, as proposed, in contact with the left of the prince, which was promptly done. About three hours, however, elapsed before the armies (excepting the corps of General Bosquet) received orders to advance. To the unavoidable want of unity in command this delay was probably attributable. But before moving off both head-quarter staffs passed along the front. On reaching my division, Lord Raglan expressed to me a dissent from part of the plan alluded to, not necessary to observe on here; mentioning, also, in the course of his remarks, a disposition he supposed to exist on the part of the marshal or the French chiefs to appropriate me and my division altogether, which he could not allow; that he had no objection to my communicating and co-operating with, and regulating my advance by that of the prince's division, but could not consent to my receiving orders through any one but himself. On hearing this, I requested him to send to acquaint the marshal that such was his lordship's desire, as I believed a different expectation was entertained, which, if not removed, might lead during the action to misunderstanding. This his lordship immediately did. And it was arranged that Major Claremont, one of the British commissioners with the French army, was to be the medium of any communications to me which the French chiefs might find it desirable to make.

"The armies advanced. After about three miles a halt for a short interval took place by order of the commander

to recognise—but he had no claim, but that of seniority, to command such a man as Sir de Lacy Evans. Many a wish was expressed on the 29th of October, and more especially among his own poor soldiers, for his recovery. The urbane and courteous bearing of the veteran hero won the hearts of the troops as much as his intrepid bearing in the field, and the skill upon which the men were ever ready to place an implicit reliance.

The Turks who were brought up to work in the trenches were found on the whole efficient—their labour was not steady, but it was energetic. They were, however, in such a state of alarm lest the Russian shells should fall among them that the work was impeded. They did not endure this toil well, but fell off in great numbers, stricken with every form of disease known in the Crimea—dysentery, diarrhœa, intermittent fever, ague, and cholera; and, at last, typhus appeared in a malignant form, sweeping them away in a fearful manner.

of the forces. On the arrival of the second division in front of the village of Burluk, which, having been prepared for conflagration by the Russians, became suddenly for some hundred yards an impenetrable blaze, Major Claremont came to me in great haste, to say from the marshal that a part of the French army, having ascended the heights on the south of the river, became threatened by large bodies of Russians, and might be compromised, unless the attention of the enemy were immediately drawn away by pressing them in our front. I made instant dispositions to conform to this wish,—sending at the same time, as was my duty, an officer of my staff (Colonel the Hon. P. Herbert) to Lord Raglan, who was then a short distance in our rear, for his lordship's approval—which was instantly granted. We were already under rifle fire, directed by the enemy's skirmishers from behind the burning village. From that moment my division, and simultaneously on a line with it, the light division on our left, supported by the first, continued to advance as rapidly as possible against the enemy till their final overthrow. For the 'hailstorm of cannon and musket fire' under which this advance was made, I appeal to the despatch of Prince Menschikoff, who, I think, used this expression. And therein Sir G. Brown, and myself, and our divisions, completely, as I venture to feel assured, fulfilled our duty, and left not a particle of ground for the injurious terms directed against us in the *Independence Belge*. The combinations or movements before, during, and after that battle, as of all other battles, are no doubt fair and inevitable topics for criticism. But in this instance, whatever may be the motive, inaccurate statements affecting the reputation of officers and corps, such as that noticed by your Paris correspondent, cannot be allowed to pass current on the Continent without correction.

"I have the honour to be, Sir,

"Your faithful servant,

"DE LACY EVANS, *Lieut.-Gen.*"

"Bryanston Square, June 28."

It is obvious from the above letter that Lord Raglan had neglected to inform Sir de Lacy Evans of the agreement between him and Marshal St. Arnaud; while the latter and Prince Napoleon, to whom the arrangement was especially important from the position of his division, supposed General Evans to be in possession of Lord Raglan's orders to co-operate with the prince. Either there was gross misapprehension on the part of the French chief, or as gross negligence or want of promptitude on the part of the English commander. As to General Evans and General Brown, their divisions "bore the burning and heat of the day."

As they were under the command of Lord Raglan, the French did not send to them any medical aid—and the English surgeons were too few, and the medical stores inadequate. It was piteous to see them carried in groups down to Balaklava, not in ambulances or on litters, or in any manner such as was worthy of the honour of the English name, but on the backs of their tottering comrades, themselves scarcely less diseased. In the neighbourhood of Balaklava their dead crowded the place selected for burial, the stench from which polluted the atmosphere. Among all the dreadful sights created by official mismanagement and heartlessness, few equalled in horror the Turkish hospital and burial-place at Balaklava. It is absurd to cast the blame of this on the incompetency of the Turkish officers—these troops were attached to Lord Raglan's army, and worked in the British trenches. England is justly responsible for the shame of their neglect, and the guilt of their destruction.

The fire of the Russians upon the French lines was heavy; against the British it was slow and feeble. The enemy placed heavy guns on the heights overlooking their cavalry lines, in the vicinity of Balaklava, and otherwise fortified their positions. The British increased their defensive means in the same direction; a detachment of the English sailors and marines threw up a redoubt, and pitfalls were dug to prevent any sudden swoop of the Russian cavalry.

The night of the 30th, or rather early morning of the 31st, before one o'clock, the troops were aroused by one of those *alertes* so frequently occurring, and which we have already described. General Bosquet had planned a surprise, of which, either through a deserter or a spy, the Russians became aware: the result was that at the expected moment their infantry in the valley opened a continuous fire of musketry, which lasted for more than an hour. No enemy was near, but as Bosquet and his Chasseurs de Vincennes were expected, this was the reception the Russians imagined they were giving them. The sight, viewed from the heights occupied by Bosquet's division, was interesting—so constant and vivid were the flashes of the musketry, that the faces of the Russian soldiers could occasionally be seen.

The 1st of November opened with a bright moonlight over the camps and the defiant city, but it was piercing cold, and the men suffered severely. Some descriptions of illness seemed to be checked, while others increased, and rheumatism affected many of the English. As the morning dawned heavy mists overhung hill and valley, camp and city, and the shivering soldiers arose with chattering teeth and benumbed limbs from their unhealthy and inhospitable places of repose. The French opened fire after their long cessation, and worked their

guns with fierce energy for a time, but the enfilading batteries of the Russians replied with equal energy, if not with equal precision. Opposed to the British the cannon were almost silent, and the gunners seemed to be inadequate in number. The guns of the French, as usual, proved too light. The rifles of our allies did good service, pushing forward close to the besieged lines, and picking off the gunners through the embrasures. A high wind, which prevailed more or less all night, swept away the morning mists from camp and citadel, but added to the misery and illness of the British. The French seemed better off every way, and in better spirits.

On the morning of the 2nd November, about four o'clock, the Russians opened a sudden and tremendous fire. This was so unusual a proceeding at that hour, that astonishment was excited throughout the camps. It was soon found out that the Russians had received information of the hour at which the working-parties and workmen were relieved, and they hoped to effect some mischief as the reliefs moved up, and the parties on duty moved away from the trenches. No serious amount of loss was sustained. The Russians opened fire upon the Highlanders stationed near Balaklava. Some skirmishing also occurred, and various small affairs of outposts. The winter began to set in with great severity, and men and officers were sufferers: the physicians exerted themselves to the utmost, but the authorities did not co-operate with them. An artillery officer, describing the Crimean climate at this juncture, says:—"When a north wind whistled piercingly across the heights—when the dense fogs of November hung their grey drapery along the horizon, and rested in cold white masses on the hills—when the green turf became mire, and leafy coppice a texture of wet brown twigs and roots, and yellow turbid pools settled along the course of the ravines—it was no wonder that the tents of the Arab, who is at least dry and warm in his desert, seemed preferable to the camp before Sebastopol, and the hardiest soldier turned now and then a longing thought to the firesides of England."

A curious instance of Russian cajolery and enterprise occurred in the camp on the 3rd of November, showing that the Russians, of all nations, have the best spies. A French officer, as he appeared to be, passed quietly through the British lines: he was especially polite and agreeable, smoking and chatting with the English officers, and by degrees got into a discussion about the strength of the position at Balaklava. The English officers spoke frankly, as they might to an ally, admitting the difficulties of their position in general, and of the post at Balaklava in par-

ticular. An officer of the 79th Highlanders thought that the French officer did not speak in the accents of France, and yet only suspicious, he deemed it prudent to do nothing immediately, but to send off to Sir Colin Campbell, informing him of the presence of the dubious Frenchman. The Russian observed the movement, and detected the suspicion in the eye of the Highlander. He continued gradually to withdraw himself, as if passing towards Bosquet's division, and at last, quickening his progress to flight, he escaped to the Russian lines, conveying a mass of information to the enemy, which, no doubt, was found useful for the meditated attack of the 5th. The batteries and works of the allies assumed a formidable aspect at this juncture—the result of the continuous labour of the severely-tasked men. The appearance of the works was continually changing as the trenches were extended—zig-zags were cut, and batteries mounted or dismounted; but just before the approaching battle of Inkerman the allied lines assumed an attitude of strength greater than they had previously attained.

The Russians were as busy with their positions on the Tchernaya. They fortified the high grounds on their right by a large quadrilateral work mounting sixteen guns. On the opposite side, above and beneath the elevated village of Kamara, there were strong works, and in that direction they pushed their lines to the sea; so that, literally, the allied positions might be said to be invested.

On the 4th of November, the eve of the battle of the greater Inkerman, the Russians maintained a sort of minute-gun cannonade, which did little execution. The want of ammunition was still felt in the British camp—although on this day a supply arrived, it was utterly inadequate to the necessities of the army. Shot was landed in considerable quantities, of a size to fit none of the cannon employed! It was now obvious that the Russian army in the field was greatly augmented. It was alleged that the evening before more than 20,000 men had arrived. Whatever the precise number of these reserves, they were mustered in great strength on the northern heights of Inkerman. The czar had sent this imposing force, with almost incredible energy, over bad roads, roadless steppes, in Tartar waggons and on foot, by mules and horses, and in whatever way the country could advance their march. The 3rd *corps d'armée*, under General Dannenberg, which had garrisoned Bessarabia, arrived by forced marches. So great were the exertions of the Russian government, army, and people, that in one day the reinforcements coming from Odessa made a march of forty-seven English miles. On the night of the 2nd the rear-guard of these new

corps arrived, and continued to pour into the camp on the northern heights of the Tchernaya, to the night of the 4th. The day before this formidable alteration of affairs on the Russian side took place, a cavalcade entered northern Sebastopol with great pomp: this was the escort of the Grand Dukes Michael and Nicholas, the emperor's sons. Soon after another but less imposing cavalcade entered, escorting Generals Dannenberg and Soimonoff.

On the night of the 3rd, and early morning of the 4th, an attack was expected, but all passed off quietly; at the same time an impression prevailed in the English camp that Lord Raglan intended an assault. The prisoners that fell into our hands related circumstances which have generally been supposed sufficient to account for the ferocity of the Russian soldiers at Balaklava; but when it is recollected that the wounded Russians in the field of the Alma were as murderous and cruel as in any subsequent battle, the narratives which these prisoners supplied cannot be accepted as palliating any of the Russian atrocities. These prisoners stated that, while the allies were encamped on the Katcha, the Russian army was mustered in battalions, and addressed by the commanding officers, who assured them that the allies stripped and flogged the Russian prisoners, and inflicted other atrocities upon them of the most barbarous kind; and that, consequently, the Russian soldiers generally resolved to sell their lives as dearly as possible, and never to surrender as prisoners. This mode of stimulating the courage of the common soldiery is infamously worthy of the Muscovite army.

A few desertions from the English lines took place early in November; they were men of no character, and had been severely flogged. Rewards, in the form of pecuniary gifts, were distributed amongst a few of the British soldiers who had distinguished themselves by their valour. Amongst these the most conspicuous was Patrick M'Grath, who, being seized by three Russians, suddenly snatched from one of his captors his musket, shot him, bayoneted a second, and put the third to flight. The poor acknowledgment of his heroism was a five-pound note.

On the 3rd, Lord Raglan wrote home, continuing his report of the siege up to that date:—

Before Sebastopol, Nov. 3rd.

MY LORD DUKE,—Since I wrote to your grace on the 28th ult., the enemy have considerably increased their force in the valley of the Tchernaya, both in artillery, cavalry, and infantry, and have extended to their left, not only occupying the village of Kamara, but the heights beyond it, and pushing forward pickets and even guns towards our extreme right; and these yesterday fired a few shots, apparently to try the range, which fell somewhat short. These movements have induced me to place as strong a force as I can dispose of on the precipitous ridge in that direction, in order to prevent any attempt to get round to Balaklava by the sea; and the whole

line is strengthened by a breastwork which has been thrown up by the Highland Brigade, the Royal Marines, and the Turkish troops, thus circumscribing that part of the position; while immediately in front of the gorge leading into the town a strong redoubt is in course of being completed, which is to be garrisoned by the 93rd regiment and armed with several guns, and on the high ground behind and to the left is a battery manned by seamen, which terminates the position to be defended by the troops under the command of Major-general Sir Colin Campbell. Further to the left, and in a more elevated position, is the brigade of the first French division, commanded by General Vinôis, ready to move to the assistance of any of the British force that may be assailed, and maintaining the connexion between the troops in the valley and those on the ridge on which the main armies are posted.

The harbour of Balaklava is under the charge of Captain Dacres, of the *Sanspareil*, and Rear-admiral Sir Edmund Lyons is in the roadstead outside, and is in daily communication with me. Thus, every possible step has been taken to secure this important point; but I will not conceal from your grace that I should be more satisfied if I could have occupied the position in considerably greater strength.

With reference to the operations of the combined armies engaged in the attack on Sebastopol, I have the honour to state that there is no material diminution in the enemy's fire, and yesterday morning, two hours before daylight, the cannonade from all parts of the south front was heavy in the extreme, both on the French and British lines, and it occasioned, I deeply regret to say, some loss, but less than might have been expected under the circumstances. In the meanwhile the French, who have before them the town and real body of the place, have taken advantage of the more favourable ground, and are carrying on approaches systematically on the most salient and commanding part of the enemy's lines; and they have constructed and opened batteries, the precision of the fire from which has most materially damaged the Russian works, although, as yet, they have not succeeded in silencing their guns. The weather is still fine, but it has become extremely cold, and there was a severe frost last night.

I beg to submit to your grace the nominal returns of casualties among the non-commissioned officers and rank and file from the 22nd of October to the 1st of November, both days inclusive, and a list of officers killed and wounded between the 27th of October and the 1st of November. Captain Maude, of the horse-artillery, an excellent officer, is, I am assured, doing well. I likewise enclose the naval return of casualties.

I have, &c.,

RAGLAN.

There is a peculiar interest in the narra-

tives of individual officers who happened to be placed in circumstances to observe particular transactions. No officer, whether of high or low rank, can, from personal observation, record all the events of a siege or a battle; hence the experience of the subaltern, as well as the despatches of the general, is necessary to fill up the outline. The following extract is from the diary of a subaltern during this period of the siege:—"On the 29th I went on a covering party to the Sebastopol Road, which is situated in the ravine which separates our right and left attack. It was about the best place to be posted in during daytime, as it was some little distance from a battery, and few shot came near it. A covered way led from the Greenhill Batteries to this road, and latterly the sailors who were relieved from duty went home this way. On either side of the road were huge rocks, in which were many natural caves, which in the daytime were generally filled with our men, who lighted their fires and cooked their rations and coffee there; but at night they were moved down to a wall which ran across the road in continuation of the covered way. At night a subaltern's party of thirty men or so were sent out some little distance down the road, from which sentries were posted within three hundred yards of the Russian Redan, which yawned on us, and showed its huge black teeth. This was a wretched station to be on at night, as it was probable that if a sortie was made from the garrison, they would in all probability bring their artillery up this road under cover of the Redan, and we should not have been able to bring one gun to bear on them from our batteries. We could plainly hear the paddles of a steamer moving in the harbour, in all probability engaged in mooring a ship in a position to annoy us."

CHAPTER XLV.

THE GREAT BATTLE OF INKERMANN.

"The thick mist allow'd
Nought to be seen save the artillery's flame,
Which arch'd the horizon like a fiery cloud."

THE history of war presents no records of strife more terrible than that which raged on the slopes of Inkerman on the 5th of November, 1854. On the night of the 4th, silence and confidence reigned in the camps around Sebastopol. It was known to the whole of the allied armies that the enemy had received numerous and powerful reinforcements, but how they were likely to be employed was matter of vague and varied conjecture: a renewal of the attack on Balaklava, and perhaps at night, was

the most generally prevalent opinion. No notion was entertained anywhere that these hosts would be precipitated upon the position so long occupied by the brave and vigilant De Lacy Evans. Had he not been an invalid, the symptoms in the enemy's camp of approaching battle would not have escaped him; although it is likely that any remonstrances or requests of his to head-quarters, would have availed no more in awakening vigilance than those so often previously made by him. No extraor-

inary precautions, in consequence of the vastly increased forces of the enemy, were made by French or English. The pickets were not strengthened, nor were any directions given to watch the foe. Ammunition in the camp was scarce; there were great stores of it at Balaklava, but no pains were taken to have the exhausted magazines at camp replenished. Some regiments were almost without cartridges. The Russian batteries were all silent, and not a shot was fired from the allied works. The night was bitterly cold, the ground damp, the trenches contained lodgments of water, no soldiers were out except those on duty, and many men of the covering parties had their blankets about their legs and feet—the camps had not been so silent before. A few lights might be seen flickering in the lines, as the soldiers cooked their rations—the only sign of life visible. The silence was at last broken in a remarkable manner: at about eleven o'clock the church-bells in Sebastopol began to toll; the sound came slowly and solemnly upon the still and heavy air. At last these sounds died away, and all was again quiet for a brief space, when a single bell tolled sharply and continuously. The darkness was most profound, and the little air that moved brought every sound from the city with a distinct clearness into the camp. The outlying pickets reported that they heard chaunting, and described it as if arising from the united voices of vast multitudes. These things might have aroused the most stolid generals, but they did not stir the torpidity of the allied headquarters. All who had any knowledge of Russia, and the fanaticism of the Russo-Greek Church, might have foreseen that these sounds betokened the religious services of the newly-arrived hosts, invoking their patron saints to favour some enterprise of moment. From eleven o'clock on the night of the 4th, until two o'clock on the morning of the 5th, these sounds continued; after that they died away, the darkness grew denser, not a light gleamed from the camps, and a false and stupid security prevailed over the allied hosts. It was probably three o'clock when the out-pickets of the 55th, one of the regiments of General Evans' division at Inkerman, heard a dull rumbling noise, as if of heavy wheels in the Tchernaya Valley, at the foot of the heights on which the picket was placed. The noise was first heard by a sergeant, it was then recognised by some of the men, and at last reported to the officer. He, having heard similar noises on other nights caused by waggon entering the town, took no notice. The noise, however, continued for a longer period than that generally made by the convoys, and grew louder and more distinct, as if approaching the foot of the heights. It seemed to come

chiefly from the direction of Shell Hill, the eminence which overlooked the camp of Sir de Lacy Evans' division. The increased distinctness of the sounds produced no misgiving in the minds of the picket officers, even when the probability of their coming for a convoy passed away. Still the dull rolling sound crept nearer, and the men again and again reported to their officers. The decisive repulse given by General Evans, on the 26th, it was believed had discouraged the enemy, and rendered the post secure. The moral effect of the little Inkerman, it was deemed certain, had made it too hazardous for the enemy to attempt anything again in that direction. From the 26th to the 4th no enemy had shown himself there.

At about half-past four o'clock the French pickets of General Bosquet's division reported that Liprandi's army was in motion. Bosquet turned out his division with promptitude, and adopted such precautions as seemed requisite. He did not move his battalions, for although sounds came up from the Woronzoff Road, nothing could be seen, and no conjecture formed, of what the enemy intended. A few shots discharged against the works in that part of the plateau, although they fell short, led Bosquet to think that his position was menaced. About six o'clock the day dawned, struggling through heavy folds of chilling mist; a more gloomy morning, even in a Crimean November, seldom stole through the fogs of the Tchernaya Valley. At this moment several Russian soldiers, unarmed, showed themselves to the picket of General Evans' division, which was posted in the ravine on the left of Shell Hill. They were supposed to be deserters, as they beckoned to the British to come to them, who at once fell into the trap. As soon as they approached the supposed deserters, 500 men started to their feet from amidst the brushwood on each side of the ravine, and surrounded and made prisoners the officer and thirty men who followed him. This, fortunately, was in view of a few men of the picket, left behind for some purpose, who instantly ran to the nearest picket (that of the 55th), which was posted on the top of the hill. The enemy followed rapidly, and the party of the 55th had scarcely time to catch the alarm from the fugitives before the enemy was upon them. This regiment knew the ground better than any other British corps, having often before skirmished there; they accordingly fell back, contesting, with skilful step and desperate battle, every inch of ground against overwhelming numbers. Then began the battle of Inkerman. Before we describe the eddying crowds of struggling soldiery, it is desirable to convey some clear idea of the plan of action which the Russians entertained.

The point of attack was originally intended

to have been the position occupied by Lieutenant-general Sir Richard England. It was perilous in the judgment of that officer to weaken that post during the engagement, but he nevertheless contributed largely to the successful defence at Inkerman. General Soimonoff was to have passed stealthily along the west side of the ravine from Careening Bay, and to attack the British left, which was under the command of Sir Richard England. General Pauloff was to ascend from the Inkerman Valley, and to attack the right of the British, then under the command of General Pennefather (Sir de Lacy Evans being ill on board ship). During these movements a feigned attack was to be made at Kadikoi, the object of which was, so to engage the attention of General Bosquet as to prevent his rendering any assistance to Sir de Lacy Evans' division. The sortie from Sebastopol against the position of General England was that which was chiefly relied upon for inflicting defeat upon the British. This is not the view generally taken of the plan of attack, but this was really the idea of the Russian commander-in-chief. Dannenberg's *corps d'armée* had encamped at Tchorgoum on the 31st of October; Soimonoff entered Sebastopol with his division on the 3rd of November. Pauloff encamped before Balaklava with his division about the same time, and thus each division was in the right place, at the right time, for the execution of the intended project. According to the Russian accounts, Soimonoff commanded 16,000 men, and Pauloff very nearly as many. Thus powerful forces were arranged to act in combination on different points of attack, and these large bodies of men were so supplied with all the requisites of war, that the most sanguine expectations were entertained as to the result. This plan was certainly never carried into execution, as the following pages will show, but nevertheless it was the scheme of operations really intended. The actual attack was altogether upon the British heights overlooking Inkerman. This discrepancy between the battle which the Russians actually fought, and that which their plan contemplated, is thus accounted for. General Soimonoff was represented as having mistaken the instructions of his chief, General Dannenberg, or at all events to have mistaken his way—for he advanced along the east instead of the west side of the ravine, and arrived on the same heights as those ascended by Pauloff's division. There is some proof that this assertion is true, for the British were greatly confused by finding that on both sides of their position the Russians fought up the ascent. This false step on the part of Soimonoff (assuming the Russian allegations to be correct) involved serious disadvantages—because so contracted was the ground upon which *both* bodies of the Russian army

were precipitated, that Soimonoff and Pauloff were in the way of one another. There was no space for such vast numbers to deploy, and therefore the fire of the British Minié muskets and artillery made havoc unparalleled in the masses exposed to such a relentless fire. There was yet another feature in the grand plan of the Russian chief—a sortie from the south-western portion of Sebastopol. This was conducted by Major-general Timofeieff, and began later in the morning, full four hours after the battle had begun on the eastern slopes. Those troops emerged at the gate of the bastion No. 6, and crossed the ravine of the Quarantine Bay, and approached the siege works of the French. According to the Russian account this sortie spiked fifteen French guns, and inflicted terrible loss of men and munitions of war; but it is acknowledged a retreat was necessary, which was very brilliantly conducted, many French prisoners being borne into Sebastopol by the retreating Russians. The plan of the Russian chief, it will be seen from these accounts, was brilliant in conception, however imperfectly carried out.

The general character of the battle, the details of which we are about to furnish, was one of the most obstinate valour. The Russians, infuriated by an invidious nationality, bigoted religious zeal, and large supplies of an intoxicating spirit, rushed madly on, charging with the bayonet. The British with the same weapon withstood the attack, and poured in deadly volleys of Minié rifle balls as the enemy advanced. It was a series of desperate individual conflicts. The notion that the charge of the bayonet is seldom if ever resisted, was here confuted. The bayonet was the chief weapon of combat, and was used with desperate strength and determination. Assault and repulse, retreat and rally, the crashing of long bayonet lines, and the confused struggle of detached crowds of soldiery, mainly made up the chief portions of this huge fight. Men grappled hand to throat, scarcely recognising one another beneath the dense fog which spread its gloomy pall over the combatants. Mr. Russell says with much truth, in a small compass, "The battle of Inkerman admits of no description." It cannot be pencilled on a grand scale—it must be narrated as a series of fierce, bloody, and confused struggles, between bodies of men who scarcely fought under command, but sought by personal force and prowess to scale the height, or hurl from its summit the ascending foe. In the ravine—by the redoubt—on the slope—through the brushwood, men fought, irrespective of all leaders, with a tenacity and valour never surpassed—as if the gods contested the sovereignty of the world within the limits of Inkerman.

We shall here present the despatches which

will guide us through the details of the battle:—

Before Sebastopol, Nov. 8th.

MY LORD DUKE,—I have the honour to report to your grace, that the army under my command, powerfully aided by the corps of observation of the French army, under the command of that distinguished officer, General Bosquet, effectually repulsed and defeated a most vigorous and determined attack of the enemy on our position overlooking the ruins of Inkerman, on the morning of the 5th instant. In my letter to your grace of the 3rd, I informed you that the enemy had considerably increased their force in the valley of the Tchernaya. The following day this augmentation was still further apparent, and large masses of troops had evidently arrived from the northward, and on two several occasions persons of distinguished rank were observed to have joined the Russian camp.

I have subsequently learnt that the fourth corps *Armée*, conveyed in carriages of the country, and in the tightest possible order, had been brought from Moldavia, and were to be immediately followed by the third corps. It was therefore to be expected that an extensive movement would not be long deferred. Accordingly, shortly before daylight on the 5th, strong columns of the enemy came upon the advanced pickets covering the right of the position. These pickets behaved with admirable gallantry, defending the ground, foot by foot, against the overwhelming numbers of the enemy, until the second division, under Major-general Pennefather, with its field-guns, which had immediately been got under arms, was placed in position. The light division, under Lieutenant-general Sir George Brown, was also brought to the front without loss of time; the 1st brigade, under Major-general Codrington, occupying the long slopes to the left towards Sebastopol, and protecting our right battery, and guarding against attack on that side; and the 2nd brigade, under Brigadier-general Buller, forming on the left of the second division, with the 88th regiment, under Lieutenant-colonel Jeffreys, thrown in advance. The brigade of Guards, under his Royal Highness the Duke of Cambridge and Major-general Bentinck, proceeded likewise to the front, and took up most important ground to the extreme right on the alignment of the second division, but separated from it by a deep and precipitous ravine, and posting its guns with those of the second division. The fourth division, under Lieutenant-general Sir George Cathcart, having been brought from their encampment, advanced to the front and right of the attack; the 1st brigade, under Brigadier-general Goldie, proceeded to the left of the Inkerman Road; the 2nd brigade, under Brigadier-general Torrens, to the right of it, and on the ridge overhanging the valley of the Tchernaya. The third division, under Lieutenant-general Sir Richard England, occupied in part the ground vacated by the fourth division, and supported the light division by two regiments under Brigadier-general Sir John Campbell, while Brigadier-general Eyre held the command of the troops in the trenches.

The morning was extremely dark, with a drizzling rain, rendering it almost impossible to discover anything beyond the flash and smoke of artillery and heavy musketry fire. It, however, soon became evident that the enemy, under cover of a vast cloud of skirmishers, supported by dense columns of infantry, had advanced numerous batteries of large calibre to the high ground to the left and front of the second division, while powerful columns of infantry attacked with great vigour the brigade of Guards. Additional batteries of heavy artillery were also placed by the enemy on the slopes to our left; the guns in the field amounting in the whole to ninety pieces, independently, however, of the ship-guns and those in the works of Sebastopol. Protected by a tremendous fire of shot, shell, and grape, the Russian columns advanced in great force, requiring every effort of gallantry on the part of our troops to resist them. At this time two battalions of French infantry, which had on the first notice been sent by General Bosquet, joined our right, and very materially contributed to the successful resistance to the attack, cheering with our men, and charging the enemy down the hill with great loss. About the same time a determined assault was made on our extreme left, and for a

moment the enemy possessed themselves of four of our guns, three of which were retaken by the 88th, while the fourth was speedily recaptured by the 77th regiment, under Lieutenant-colonel Egerton. In the opposite direction the brigade of Guards, under his Royal Highness the Duke of Cambridge, was engaged in a severe conflict.

The enemy, under the cover of thick brushwood, advanced in two heavy bodies, and assaulted with great determination a small redoubt which had been constructed for two guns, but was not armed. The combat was most arduous, and the brigade, after displaying the utmost steadiness and gallantry, was obliged to retire before very superior numbers, until supported by a wing of the 20th regiment of the fourth division, when they again advanced and retook the redoubt. This ground was afterwards occupied in gallant style by French troops, and the Guards speedily re-formed in rear of the right flank of the second division. In the meanwhile, Lieutenant-general the Hon. Sir George Cathcart, with a few companies of the 68th regiment, considering that he might make a strong impression by descending into the valley, and taking the enemy in flank, moved rapidly forward, but finding the heights above him in full occupation of the Russians, he suddenly discovered that he was entangled with a superior force, and while attempting to withdraw his men he received a mortal wound, shortly previously to which Brigadier-general Torrens, when leading the 68th, was likewise severely wounded.

Subsequently to this the battle continued with unabated vigour, and with no positive result, the enemy bringing upon our line not only the fire of all their field batteries, but those in front of the works of the place, and the ship-guns, till the afternoon, when the symptoms of giving way first became apparent; and shortly after, although the fire did not cease, the retreat became general, and heavy masses were observed retiring over the bridge of the Inkerman, and ascending the opposite heights, abandoning on the field of battle five or six thousand dead and wounded, multitudes of the latter having already been carried off by them. I never before witnessed such a spectacle as the field presented; but upon this I will not dwell.

Having submitted to your grace this imperfect description of this most severe battle, I have still two duties to discharge, the one most gratifying, the last most painful to my feelings. I have the greatest satisfaction in drawing your grace's attention to the brilliant conduct of the allied troops. French and English vied with each other in displaying their gallantry and manifesting their zealous devotion to duty, notwithstanding that they had to contend against an infinitely superior force, and were exposed for many hours to a most galling fire. It should be borne in mind that they have daily, for several weeks, undergone the most constant labour, and that many of them passed the previous night in the trenches. I will not attempt to enter into the detail of the movements of the French troops, lest I should not state them correctly; but I am proud of the opportunity of bearing testimony to their valour and energetic services, and of paying a tribute of admiration to the distinguished conduct of their immediate commander, General Bosquet; while it is in the highest degree pleasing to me to place upon record my deep sense of the valuable assistance I received from the commander-in-chief, General Canrobert, who was himself on the ground and in constant communication with me, and whose cordial co-operation, on all occasions, I cannot too highly extol. Your grace will recollect that he was wounded at the Alma. He was again wounded on the 5th, but I should hope that he will not long feel the effects of it.

I will, in a subsequent despatch, lay before your grace the names of the officers whose services have been brought to my notice. I will not detain the mail for that purpose now; but I cannot delay to report the admirable behaviour of Lieutenant-general Sir George Brown, who was unfortunately shot through the arm, but is doing well; of Lieutenant-general his Royal Highness the Duke of Cambridge, who particularly distinguished himself; and of Major-general Pennefather, in command of the second division, which received the first attack, and gallantly maintained itself, under the greatest difficulties, throughout this protracted conflict; of Major-general Bentinck, who is severely wounded; Major-general Cod-

ington, Brigadier-general Adams, and Brigadier-general Torrens, who are severely wounded; and Brigadier-general Buller, who is also wounded, but not so seriously. I must likewise express my obligations to Lieutenant-general Sir Richard England, for the excellent disposition he made of his division, and the assistance he rendered to the left of the light division, where Brigadier-general Sir John Campbell was judiciously placed, and effectively supported Major-general Codrington; and I have great pleasure in stating that Brigadier-general Eyre was employed in the important duty of guarding the trenches from any assault from the town. Lieutenant-general Sir de Lacy Evans, who had been obliged, by severe indisposition, to go on board ship a few days previously, left his bed as soon as he received intelligence of the attack, and was promptly at his post; and, though he did not feel well enough to take the command of the division out of the hands of Major-general Pennefather, he did not fail to give him his best advice and assistance.

It is deeply distressing to me to have to submit to your grace the list of the killed, wounded, and missing, on this memorable occasion. It is indeed heavy, and very many valuable officers and men have been lost to her majesty's service. Among the killed your grace will find the names of Lieutenant-general the Hon. Sir G. Cathcart, Brigadier-general Strangways, and Brigadier-general Goldie. Of the services of the first it is almost unnecessary to speak. They are known throughout the British empire, and have, within a short space of time, been brought conspicuously before the country by his achievements at the Cape of Good Hope, whence he had only just returned when he was ordered to this army. By his death her majesty has been deprived of a most devoted servant, an officer of the highest merit, while I personally have to deplore the loss of an attached and faithful friend. Brigadier-general Strangways was known to have distinguished himself in early life, and in mature age, throughout a long service, he maintained the same character. The mode in which he had conducted the command of the artillery, since it was placed in his hands by the departure, through illness, of Major-general Cator, is entitled to my entire approbation, and was equally agreeable to those who were confided to his care. Brigadier-general Goldie was an officer of considerable promise, and gave great satisfaction to all under whom he has served.

It is difficult to arrive at any positive conclusion as to the actual numbers brought into the field by the enemy. The configuration of the ground did not admit of any great development of their force, the attack consisting of a system of repeated assaults in heavy masses of columns; but, judging from the numbers that were seen in the plains after they had withdrawn in retreat, I am led to suppose that they could not have been less than 60,000 men. Their loss was excessive, and it is calculated that they left on the field near 5000 dead, and that their casualties amount in the whole, in killed, wounded, and prisoners, to not less than 15,000. Your grace will be surprised to learn that the number of British troops actually engaged little exceeded 8000 men, whilst those of General Bosquet's division only amounted to 6000, the remaining available French troops on the spot having been kept in reserve.

I ought to mention, that while the enemy was attacking our right, they assailed the left of the French trenches, and actually got into two of their batteries; but they were quickly driven out in the most gallant manner with considerable loss, and hotly pursued to the very walls of Sebastopol.

I have, &c.,

RAGLAN.

His Grace the Duke of Newcastle, &c.

General Canrobert forwarded the following despatch to the emperor:—

Head-quarters before Sebastopol, Nov. 7.

MONSIEUR LE MARÉCHAL,—I have the honour to confirm my telegraphic despatch of the 6th of November, couched in these terms:—"The Russian army, increased by reinforcements from the Danube, and the reserves in the southern provinces, and animated by the presence of the Grand-dukes Michael and Nicholas, yesterday attacked

the right of the English position before the place. The English army sustained the combat with the most remarkable solidity. I caused it to be supported by a portion of the Bosquet division, which fought with admirable vigour, and by the troops which were the most easily available. The enemy, more numerous than we were, beat a retreat with enormous losses, estimated at from 8000 to 9000 men. This obstinate struggle lasted the whole of the day. On my left General Forey had, at the same time, to repulse a sortie of the garrison. The troops, energetically led on by him, drove the enemy from the place, with the loss of 1000 men. This brilliant day, which was not finished without loss to the allies, does the greatest honour to our arms."

The action, of which the above telegraphic despatch forms the summary, was most animated and warmly contested. At the first gunshot, the deserters who came to us revealed the real situation of the Russian army in regard to numbers, and enabled us to calculate the reinforcements it had successively received since the battle of the Alma. They are—1st contingent, from the coast of Asia, Kertch, and Kaffa; 2nd, six battalions and detachments of marines from Nicolaieff; 3rd, four battalions of Cossacks from the Black Sea; 4th, a great portion of the army of the Danube; and the tenth, eleventh, and twelfth divisions of infantry forming the fourth corps, commanded by General Dannenberg. These three divisions were transported by express, with their artillery, from Odessa to Simpheropol, in a few days. Afterwards arrived the Grand-dukes Michael and Nicholas, whose presence could not fail to produce great excitement among this army, which forms, with the garrison of Sebastopol, a total of at least 100,000 men.

It was under these circumstances that 45,000 men of this army attacked by surprise the heights of Inkerman, which the English army could not occupy with a sufficient force. Only 6000 English took part in the action, the rest being engaged in the siege works. They valiantly sustained the attack until the moment when General Bosquet, arriving with a portion of his division, was able to render such assistance as to insure their success. One does not know which to praise the most—the energetic solidity with which our allies for a long time faced the storm, or the intelligent vigour which General Bosquet (who led a portion of the brigades Bourbaki and Antemarne) displayed in attacking the enemy, who rushed upon their right.

The third regiment of Zouaves, under the chiefs of battalion, Montandon and Dubos, supported in the most striking manner, the ancient reputation of that force. The Algerian riflemen (Colonel de Wimpfen), a battalion of the 7th light (Commander Vaissier), and the 6th of the line (Colonel de Camos), rivalled each other in ardour. Three charges were made with the bayonet, and it was only after the third charge that the enemy surrendered the ground, which was covered with his dead and wounded. The Russian field artillery and artillery of position was much superior in number, and occupied a commanding position. Two horse batteries, commanded by M. de la Boussinière, and a battery of the second division of infantry, commanded by M. Barval (the whole under the orders of Colonel Forgeot), sustained the struggle during the whole day, in conjunction with the English artillery.

The enemy decided upon beating a retreat, leaving more than 3000 dead, a great number of wounded, a few hundred prisoners, and also several caissons of artillery, in the possession of the allies. His losses, altogether, cannot be estimated at less than from 8000 to 10,000 men. While these events were being accomplished on the right, about 5000 men made a vigorous sortie against our attacks to the left, favoured by a thick fog and by ravines which facilitated their approach. The troops on duty in the trench, under the orders of General de la Motterouge, marched upon the enemy, who had already invaded two of our batteries, and repulsed him, killing more than 200 men within the batteries. The general of division, Forey, commanding the siege corps, by rapid and skilful arrangements, arrived with the troops of the fourth division to support the guards of the trenches, and marched himself at the head of the fifth battalion of foot chasseurs. The Russians, beaten down upon the whole of their line, were retreating precipitately upon the

place with considerable losses, when General de Lourmel, seeing them fly before him, and urged by a chivalric courage, dashed in pursuit of them up to the walls of the place, where he fell severely wounded. General Forey had much difficulty in withdrawing him from the advanced position to which his brigade had been hurried by excess of bravery. The Aureille brigade, which had taken up an excellent position to the left, protected this retreat, which was effected under the fire of the place with considerable loss. Colonel Niel, of the 26th of the line, who lost his two chiefs of battalion, took the command of the brigade, whose conduct was admirably energetic. The enemy, in this sortie, lost 1000 men in killed, wounded, or prisoners, and he received a very considerable moral and material check.

The battle of Inkerman, and the combat sustained by the siege corps were glorious for our arms, and have increased the moral power which the allied armies have attained; but we have suffered losses to be deplored. They amount, for the English army, to 2400 men killed or wounded, among whom are seven generals, three of whom were killed; and, for the French army, to 1726 killed or wounded. We bitterly lament the loss of General de Lourmel, who died from his wound, and whose brilliant military qualities and conduct in private life seemed to promise future renown. I also have the regret to announce to you the death of Colonel de Camos, of the 6th of the line, killed at the head of his troops at the moment when it engaged with the enemy.

The vigour of the allied troops, subjected to the double trials of a siege, the difficulties of which are without a precedent, and to actions of war which recall the greatest struggles of our military history, cannot be too highly ulogised. I enclose my order of the day to the army for the battle of the 5th.

Accept, &c.,

CANROBERT, *General-in-Chief.*

The order of the day issued to the French army was as follows:—

Head-quarters before Sebastopol, Nov. 5, 1854.

Soldiers! you have had another glorious day. A great portion of the Russian army, favoured by the night and the fog, was able to establish itself, with powerful artillery, upon the heights which form the extreme right of our position. Two English divisions sustained an unequal fight with the invincible solidity which we know to be the characteristic of our allies; while a part of the Bosquet division, conducted by its worthy chief, came up to our support, and rushed upon the enemy with a boldness and intelligence to which I here render forcible homage. Definitively driven back in the valley of Tcheraya, the enemy left upon the ground more than 4000 of his men killed or wounded, and carried away at least as many during the battle.

While these events were in course of accomplishment, the garrison of Sebastopol made a sortie upon the left of our attacks, which afforded to the troops of the siege corps, and particularly to the fourth division, led most vigorously by General Forey, the opportunity of giving the enemy a severe lesson. The troops employed in retelling this sortie gave proof of an energy which much increases the reputation they had already earned by the attention with which they supported the onerous and glorious labours of the siege. I shall have to mention regiments and soldiers of all kinds and of all ranks who prominently distinguished themselves during this day. I shall make them known to France, to the emperor, and to the army. But I was anxious, at the first moment, to thank you in their name, and to tell you that you have just added a voluminous page to the history of this difficult campaign.

CANROBERT, *General-in-Chief.*

We annex a copy of the Russian despatch:—

Nov. 6th, 1854.

Yesterday, at Sebastopol, from the direction of bastion No. 1, there was a sortie, in which the following troops took part. Of the tenth division of infantry, the regiments of Catherinenborg, Tomsk, and Kolyvan; of the

eleventh division of infantry, the regiments of Selinghinsk, Yakoutsck, and Okhotsck; of the sixteenth division of infantry, the regiments Vladimir, Souzdal, and Ouglitich; and of the seventeenth division of infantry, the regiments of Boutyrsk, Borodino, and Tarontino. There was as much artillery as could be taken, considering the difficulty of passing the gates. A portion of the troops passed by the Inkerman bridge. The command of the troops was intrusted to the general of infantry, Dannenberg, commander of the fourth corps of infantry.

Our first attack upon the heights was very successful. The English fortifications were carried, and eleven of their guns spiked. Unfortunately, in this first movement, the commanders of the troops of the tenth division, who attacked the intrenchments and the redoubts, were wounded. During this period the French forces arrived to the assistance of the English. The siege-artillery of the latter was placed in position on the field of battle, and it was not possible for our field-artillery to contend against such an advantage. The superiority in number of the enemy's men armed with carbines occasioned a great loss of horses and men belonging to the artillery, and of officers of infantry. This circumstance did not allow of our finishing, without sacrificing the troops, the redoubts which we had begun to raise during the fight upon the points which the position of the enemy commanded even up to the town of Sebastopol.

The retreat was effected in good order upon Sebastopol, and by the bridge of Inkerman, and the dismounted guns were brought back from the field of battle to the place.

The Grand-dukes Nicholas Nikolaievitch and Michael Nikolaievitch were in the midst of the terrible fire which prevailed, and set an example of coolness and courage in the fight.

Simultaneously with this sortie the Minsk regiment of infantry, with a light artillery battery, under the command of Major-general of artillery Timofieff, executed another against the French batteries, and spiked fifteen of their guns.

Our loss in dead is not yet exactly known, but the number of wounded extends to 3500 men and 109 officers. Among the latter are Lieutenant-general Soimonoff, who received a ball through the body, and soon died from the wound; Major-generals Villebois and Ochterlohné; Colonels Alexandroff, commander of the infantry regiment of Catherinenborg, Poustovoitoff, ditto of the infantry regiment of Tomsk, Bibikoff, ditto, commander of the Chasseurs of Okhotsck, Baron Delwig, ditto of the infantry of Vladimir, and Vereuvkine-Scheluta, ditto, commander of the Chasseurs of Borodino. Major-general Kischinsky, chief of the artillery, received a contusion from the bursting of a shell; Major-general Prince Menschikoff, belonging to the suite of your imperial majesty, a contusion in the neck; Colonel Albedinsky, aide-de-camp of your imperial majesty, and Captain Greigh, of the cavalry, my aide-de-camp, a contusion in the head. General Dannenberg had two horses killed under him, and all the persons by whom he was surrounded were wounded.

The loss of the enemy cannot have been less considerable, and the sortie of General Timofieff cost the French dear; for, while he was pursuing them with formidable masses, they fell under a violent fire of grape-shot from bastion No. 6.

While these movements were being executed, the troops under command of Prince Gortschakoff made a strong demonstration against Kadikoi, and thus kept in inactivity the enemy's detachment at Balaklava.

Having presented to our readers the way in which the battle commenced, the plan which the enemy had in view, and the despatches which afford a general outline of the contest, we proceed to fill up the details. While the picket of the 55th regiment fell back fighting before the advancing foe, the alarm spread rapidly through the camp, and men flew to arms on every side. The brave picket fought with the greatest obstinacy,

yielding only to overwhelming force. As they gradually gave way, the guns which the Russians had drawn to the foot of the hill during the night were rapidly advanced up the ascent, and were placed in position at the top, on the spot which the Russian sergeant, who had deserted, previously advised the British quartermaster-general to occupy. This warning had been in vain, and also one still more significant—for, at the battle of the Little Inkerman, it was at that spot the enemy planted their formidable artillery. Its occupation by strong batteries was destructive to the British, and mainly aided the foe in resisting the indomitable courage of our troops.

Early in the morning, Brigadier-general Codrington, of the light division, visited the outlying pickets of his own brigade. This was the general's usual habit, and this vigilant usage was very serviceable on the present critical occasion. Captain Prettyman, of the 33rd regiment, was on duty, and conversed for some minutes with the brigadier on the possibility of a sortie being attempted under favour of so gloomy a morning, and that the enemy would calculate upon the drizzling rain and soaking mist spoiling the fire-arms of the pickets. It was when the brigadier turned from this conversation, in the direction of the lines of his brigade, that the first sharp rattle of musketry between the 55th and the enemy commenced. The general galloped in the direction of the reports, and came to the conclusion at once that it was not a mere *alerte*, or even sortie, but an attack in force upon our flank, and upon the most vulnerable point of the position. While admitting that this post was imperfectly defended, and concurring in the censure which ought to rest upon those whose neglect left it so, it is necessary to correct the impression that there was no work to keep the enemy at bay. The eloquent correspondent of the *Times* is only partly correct in the following strictures:—"No one suspected for a moment that enormous masses of Russians were creeping up the rugged sides of the heights over the valley of Inkerman, on the undefended flank of the second division. There all was security and repose. Little did the slumbering troops in camp imagine that a subtle and indefatigable enemy was bringing into position an overwhelming artillery, ready to play upon their tents at the first glimpse of daylight. It must be observed that Sir De Lacy Evans had long been aware of the insecurity of this portion of our position, and had repeatedly pointed it out to those whose duty it was to guard against the dangers which threatened us. It was the only ground where we were exposed to surprise, for a number of ravines and unequal curves in the slope of the hill towards the valley lead up to the crest and

summit, against the adverse side of which our right flank was resting, without guns, intrenchments, abattis, or outlying defence of any kind. Every one admitted the truth of the representations addressed to the authorities on this subject; but indolence, or a sense of false security, and an overweening confidence, led to indifference and procrastination. A battery was thrown up of sandbags, and gabions, and fascines, on the slope of the hill over Inkerman, on the east, but no guns were mounted there—for Sir De Lacy Evans thought that two guns in such a position, without any works to support them, would only invite attack and capture. In the action of the 26th of October, the enemy tried their strength almost on the very spot selected by them this morning; but it may now be considered that they merely made a *reconnaissance en force* on that occasion, and that they were waiting for reinforcements to assault the position where it was most vulnerable, and where they might speculate with some certainty on the effects of the surprise of a sleeping camp on a winter's morning. Although the arrangements of Sir De Lacy Evans on repulsing the sortie were, as Lord Raglan declared, 'so perfect that they could not fail to ensure success,' it was evident that a larger force than the Russians employed would have forced him to retire from his ground, or to fight a battle in defence of it, with the aid of the other divisions of the army; and yet nothing was done. No effort was made to intrench the lines, to cast up a single shovel of earth, to cut down the brushwood, or form an abattis. It was thought 'not to be necessary.' A heavy responsibility rests on those whose neglect enabled the enemy to attack us where we were least prepared for it, and whose indifference led them to despise precautions which, taken in time, might have saved us many valuable lives, and have trebled the loss of the enemy, had they been bold enough to have assaulted us behind intrenchments."

It is indubitably true that the representations of Sir de Lacy Evans were not attended to, nor his suggestions even properly discussed, although no officer in the Crimea had the slightest pretension to claim equal skill and experience in war with that general. It is questionable whether any general in the British army has rendered his country such varied and effective service as this man—whose heroism in the field, goodness in the camp, wisdom in the senate, and genius, constitute him one of the most remarkable men in our country and our age. It is not correct, however, that not "a shovelful of earth was thrown up." Nor was the defence to which Mr. Russell refers, as "a battery of gabions, and sandbags, and fascines," altogether the fragile work which he describes it. The work was solidly

constructed, and enabled the Guards to make a terrible and protracted defence with the Minié musket and the bayonet. Mr. Russell is in error in stating that nothing was done to make this defence efficient, for Sir de Lacy Evans, although he received no help for the purpose from head-quarters, set his men to the task; and, as far as their enfeebled condition in health and numbers allowed, he employed them in giving a somewhat formidable character to this work. Mr. Woods asserts that the battery had no *banquette*, but officers who well knew it, aided in its construction, and fought in its defence, aver that, however imperfectly made (for the reasons already named), it was not wholly destitute of that advantage.

Mr. Russell's assertion, that "no effort was made to intrench the lines, or throw up a single shovel of earth," is irreconcilable with the account of Colonel Hamley, who fought on the spot, and whose description we know, from other and still superior sources of information, to be correct:—"The first division was posted about half a mile in rear of the second. On its right a narrow path descended the steep boundary of the plateau to the valley of the Tchernaya, crossing a ford of the stream between the ruins of Inkerman and the cluster of heights where part of Liprandi's force was posted. About a third of the way down, a shoulder projected from the precipice like a terrace, and on this the French constructed a small redoubt, into which we put two guns, to fire down on the plain, and to sweep the terrace, and which was at first garrisoned by guardsmen, but afterwards made over to the French. The latter had formed an almost continuous intrenchment from their great redoubt on the plateau above the Woronzoff Road to this point; and we had begun, on the 4th of November, to carry it onward round the face of the cliff opposite Inkerman, so as to include the front of the second division. But the work proceeded but slowly and interruptedly; and up to that time, the ground, which had already been the scene of an attack, and was now again to become so, had only two small fragments of insignificant intrenchment, not a hundred yards long in all—and more like ordinary drains than field-works—one on each side of the road, as it crossed the ridge behind which the division was encamped. Amidst the many loose assertions and incorrect statements which have appeared in the public prints respecting the operations of the campaign, there is one frequently-recurring error which deserves notice, as it is calculated to mislead military readers in forming their estimate of the different actions. Every species of intrenchment which appears on a position is talked of as 'a redoubt.' At the Alma the

English force has been repeatedly described as storming intrenchments, and the battery where the great struggle took place is always mentioned as 'the redoubt.' The two-gun battery, where the Guards fought at Inkerman, is also a 'redoubt;' and one writer describes it as equipped with 'a breastwork at least seven feet high.' A remarkable breastwork, certainly, since the defenders, to make use of it as such, must needs be about ten feet in stature! There were no intrenchments, nor any works intended as obstacles in the Russian position at the Alma. The only works of any kind were two long, low banks of earth, over which the guns fired—intended, not to prevent our advance, but to protect the guns and gunners from our fire. The battery at the Inkerman was a high wall of earth, riveted with gabions and sandbags, sloping at the extremities, and having two embrasures cut in it for the guns to fire through: from end to end it was about twelve paces long. Now, premising that field-works are said to be enclosed when they afford on all sides a defence against an enemy, and that, when they are so constructed, that the defenders behind one face fire along the space in front of them, parallel to another face, the one is said to flank the other; a redoubt may be defined as an enclosed work without flank defence. It is either square, circular, or many-sided; and it is evident, to the least informed reader, that a continuous parapet and ditch, guarded from behind at all points by musketry, must be a formidable obstacle to assai, and must greatly increase the facilities of defence."

It is obvious that General Evans and the men of his division did all they could, with their strength and means, to make their position secure, and that their exertions in this way materially contributed to obstruct the advance of the Russians in this battle. General Evans' division, under Major-general Pennefather, was first under arms, and offered the first resistance to the enemy. The division had been so reduced by battle, and labour, and sickness, that it scarcely numbered 1500 men; but there was not in the whole army a body of men more trustworthy and gallant. Their discipline was perfect, and their confidence in their chief unbounded. They were not left to grapple alone with the foe for any long time, for Codrington had called out both brigades of the light division, and hastened to their relief.

The men of either division had not the slightest conception of the duty to which they were summoned, and they advanced carelessly and confidently, believing that it was one of the *alertes* so common in thick and clouded weather, or at most a sortie, and that the enemy would soon be driven in. On they

came with their reckless and forward bearing, but were soon undeceived as to the character of the encounter before them; for through the thick mist the flashes of innumerable musketry played incessantly, and the uproar of the enemy's approach sounded strangely, as if the surging of rushing and rising waters bursting their bounds below, and spreading upwards in a resistless deluge. The Russian soldiers had been intoxicated by strong drink and bigotry for the occasion, and in the frenzy of this double inebriety they came on less regularly than was their wont, and with a confused, but hurried and resolute tread, unlike that of the Russian infantry on ordinary occasions. They came up the slopes shrieking rather than shouting: it was not the voice of a gallant soldiery coming to the charge against a worthy foe, emulous of his fame and eager to win the laurel of the brave—it was a vindictive and drunken cry, a yell horrible to hear, the utterance of barbarous natures incited and goaded to a fierce and brutal onset. The light division moved to the ravine on the left side of Shell Hill, and scarcely had they drawn up when a Russian column came against them. The brigade (Buller's) nearest to the column waited until it arrived within twenty yards, and then poured in a deadly volley. It was difficult to see the enemy in the mist, but the men fired low, almost every shot told, and before the Russians could deploy, the "lights" charged with the bayonet, breaking the column into fragments, and driving the scattered groups headlong down the hill. It was a splendid charge, much like one of the old Peninsular feats, when the French came on in close column, and the "thin red line," discharging its volley, instantly rushed forward with the bayonet before the enemy could form into line. Just as at Waterloo, Picton's infantry received the French upon the left centre of the British line, dealing destruction among their columns at the moment when about to perform the manœuvre of deploying, so was it with the light division in this charge at Inkerman. While these troops were routing the enemy in this manner, the second division had moved forward to the brow of the hill in front of their own position, and drew up on the spot most menaced, the old Simpheropol Road, which ascended to the camp from the vale of the Tchernaya. The whole plan of the enemy, or, at all events, that part of his plan which involved the assault of this position was now revealed. The ground taken up by the second division was exposed to a raking fire of artillery from the summit of Shell Hill. It is difficult to say whether the action of artillery or infantry should be most noticed at this juncture; artillery officers always make the artillery conflict the battle, and the moments of closer com-

bat as subsidiary to the operations of the thundering guns; while officers of the other arm mostly represent the battle as being fought by it, and the artillery or cavalry as only auxiliary forces which were employed when wanted. In this instance, the cannon from Shell Hill appeared to rage against the camp as if conscious of the conflict, and sharing in the fierce resentment of the Russian nation.

The roar of cannon, the volleys of musketry, and the yells of the intoxicated enemy, mingled in strange confusion with the tread of hosts and the clash of steel in the pit-like darkness through which the combatants sought one another. The 41st regiment, and six companies of the 49th, were dispatched to occupy the two-gun battery, already so frequently referred to. Three guns of Woodhouse's battery accompanied them, under the command of Major Hamley. The battery afforded the men good shelter from the cannon on Shell Hill, as they lay down under the parapet. The moment they sought and found this shelter, the enemy changed the range of their guns, and swept the position occupied by the rest of the second division. So dim was the morning that this operation, so unfortunate for the second division, could not have been the result of any especial skill. While the guns from Shell Hill poured every description of death-dealing missile on the second division, that portion of it holding the two-gun battery was assailed by a fresh column of Russian infantry. They pressed forward, not with simultaneous shouts or cheers, but every man yelled as if under the influence of demoniacal possession; they rushed in their drunkenness and fury towards the battery—its defenders met them with a shower of Minié balls, which searched the column through. The men of the two regiments spread themselves on either flank of the battery, as its construction and space did not admit of their ranging themselves advantageously within it. The able correspondent of the *Morning Herald* says:—"Through the thick mist the yells came loud and long, and, rushing up with a dash and spirit for which we have not given them credit, the enemy threw themselves headlong upon the battery." Their assault could hardly be fitly described as made with dash and spirit—they charged rather like madmen, ignorant of motive or aim, and actuated only by an infuriated and impulsive desire for destruction.

Probably this body of the enemy numbered 5000 men. They came on in column, but so dense was the compact mass that the whole front seemed covered with it. It loomed through the fog as if a gigantic human machine, precipitated by an unseen hand against the post where it was resisted and broken. It is marvellous that the little band of Britons

could have ventured to receive so vast a body, but the position was the key of the English line—at all events at that part of the day; the men knew this, they determined to hold it, and never was determination more gallantly sustained. Silently the British waited, and just as the swarming multitude arrived within ten feet of the battery, a tremendous volley of Minié balls rang out from its embrasures and flanks, and 200 Russians lay dead before it. The enemy were appalled by the suddenness and destructiveness of this reception, and fell back, but after a short pause the front seemed to be pressed forward by the concourse in the rear, when, instead of flinging themselves headlong upon the battery (as Mr. Woods writes), trusting to their overwhelming numbers speedily to end the conflict, they opened a close fire for several minutes. The English fired each as fast as he could; no bullet missed—as if discharging their pieces into a vast wool-pack, the bullets entered the dense mass of the Russian soldiery, every shot telling upon more than a single foe. It was impossible for the Russian or any soldiery to remain under such a fire. So coolly, closely, steadily, and yet rapidly and surely, was it dealt forth, that the enemy went down before it in multitudes. As fast as they fell in front others pressed forward, but their fire did not produce much effect upon the English, who fought under the protection of the battery, and with perfect steadiness. Goaded by the reproaches of their officers, the foe at last rushed forward, passing through the embrasures and over the banks. The scene of struggle was now in the inward space, and it was bayonet to bayonet and hand to hand. The British used the butt-end of their muskets, beating down the Russian guard and smashing their bayonets. The suddenness with which the English, as if by a simultaneous impulse, resorted to this mode of combat, confused the Russians, and disconcerted their accustomed mode of handling their weapons. The enemy was driven out, or rather, we should say, seized with a sudden panic before the heroism they encountered, fled—for it was physically impossible for so small a band to drive back such a host.

The positions of the defenders at this moment were as follows:—The second division, under General Pennefather, held the front. One brigade, consisting of the 41st, 47th, and 49th, under Brigadier Adams, was the most forward. The 30th, 35th, and 90th, had supported them *en échelon*, until all became mixed in the confusion of the terrible *mêlée*, except the detachments holding the two-gun battery. To the left, nearest Sebastopol, General Sir George Cathcart's division took ground, consisting of the 20th, 21st North British Fusiliers, 46th, 57th, 63rd, and 68th. The general and his two

brigadiers, Torrens and Goldie, were at their head. A portion of the light division, as already described, had early moved under Codrington to the assistance of the second division, and was followed by Sir George Brown, and so much of the remainder of the division as could be collected for the purpose. The Duke of Cambridge and the Guards came up upon the right of the second division (that farthest from Sebastopol). Sir Richard England, with a portion of his division, also moved up—a circumstance generally overlooked by writers upon the war. One writer describes him as being in reserve. There was no reserve at Inkerman—the troops came up as fast as they could, by brigades, battalions, or companies, and took the ground most important to occupy at the moment. Very early in the morning, Sir Richard England's attention had been caught by sharp musketry three or four miles to his right, and as he judged, from the position overlooking the ruins of Inkerman; and after providing for the security of his own front, where 1200 men of the third division were already in the advanced trenches, he took the Royals and 50th, with some guns, to aid in repelling the attack. With these troops, and accompanied by his brigadier, Sir John Campbell, he joined the left of the light division.

Colonel Bell, himself a participator, thus describes the advance, position, and service of General England at this juncture:—"On the morning of the 5th of November, the moment we heard the rattle of musketry on our right, Sir Richard England ordered his division under arms, and moved off without delay to the scene of action. We did not muster strong, because part of the division was on duty in the trenches, and a force left in front and to support our pickets. The force Sir Richard England took into the field was very judiciously disposed of, and prevented the enemy from making any further advance to turn the left of our defensive army. It was indeed a bold measure, drawing away the third division at all from its own ground. Here, as at Alma, Sir Richard England met the wishes of other general officers, and readily accorded that aid which was so needful; and although his division was not so much engaged in the field as others, it was entirely the chances of war, for the third division was placed in what was considered the most dangerous and exposed position in sitting down before Sebastopol."

The battle in and around the two-gun battery continued to rage, and the men of General Evans' division did all that men could do to resist the foe. The weight of the enemy's masses at length overpowered the defenders, and the Russians took possession of the battery in such strength that all hope of dislodging

them seemed extinguished. At this moment the Guards advanced, and attempted this terrible task. They were led on by the Duke of Cambridge with skill and dauntless courage. They commenced their advance soon after the second division became warmly engaged, but it was some time before they could be brought into action—for the majority of them had only returned a few minutes before from the trenches, drenched with rain and nearly paralysed with cold, having been twenty-four hours on duty; 300 of them had been on picket; and all, like the men of the other divisions who hurried into the fight, were weary and fasting. The men, however, seemed eager to fall in and support their comrades already engaged with the ascending masses of the Muscovites. They arrived on the brow of the hill above the two-gun battery at the actual moment when the 41st and 49th had been driven out, and were falling back obstinately and slowly upon whatever support might be afforded to them. The bearing of the Guards was magnificent; the language might be applied to them—

"If a path be dangerous known,
The danger's self were lure alone."

The enemy were exulting in their victory with infuriated yells, which were soon lost in the bold cheer that rang out from the advancing lines of the household brigade. The Grenadier and Fusileer Guards charged with the utmost impetuosity, and the Russians, except the piles of their dead and dying, were literally swept from the two-gun battery and its vicinity. The Coldstreams, who arrived shortly after, took up position with the other battalions of their brigade, the whole of which only numbered the regulation strength of a battalion of the line on India service or in time of war. This fine battalion placed themselves in the centre of the battery, the Grenadiers taking their right and the Fusileers their left. The baffled and repulsed Russians were soon pushed forward again before the advance of increasing numbers, and the battery was assaulted by assailants more numerous and fierce than before. Some relate that fresh draughts of *raka* (a most intoxicating spirit) were supplied to them on the field, until the men ceased to be conscious of their real situation, but were inspired with additional strength to rush headlong to the assault. The battery was simultaneously stormed in front and on either flank by overwhelming numbers, and with intensified fury. Three times the parapets were scaled, and the enemy crowded into the long-defended space—and as often were they driven back with appalling slaughter. Still fresh numbers pressed forward, and the brave band of defenders were surrounded—

every man believing that all was lost, but determined to die rather than yield. So near were the contending parties that they fired into one another's breasts. A single shot into each wave of the enemy as it rolled up, was all that each man in the line of defenders could get time to fire—it then became close bayonet work;* but the Russians literally clambered over the heaps of their slain countrymen to renew the sanguinary contest.

The height of the walls of the battery prevented our men from firing over, except in some spots—nearly the whole of the fire, therefore, was directed through the embrasures. The Russians, perceiving this, gathered close in under the battery, and threw the muskets and bayonets of their slain countrymen over the parapets, and also huge fragments of rock which plentifully covered the ground thereabouts. The guardsmen proved themselves superior even in this rough practice—hurling the missiles back again with more rapidity and energy. This queer contest lasted longer than might be supposed; more than ten minutes elapsed before the Russians put an end to it by another desperate charge through the embrasures. This was as furiously resisted, and even the embrasures became choked with the Russian dead. The body of the enemy opposed to the Guards equalled a British division of infantry in its full strength. These were increased so much by fresh masses directed on the spot, that the Guards could no longer hold the post. The pressure on either flank was so great that both Grenadiers and Fusileers were pushed back behind the battery—the enemy at the same moment assailing the uncovered flanks of the work, and pouring in upon the Coldstreams in multitudes. The Guards were now surrounded, while the dense fog prevented their seeing anything but the gigantic mass of foes louring through the haze around them. The same cause prevented their desperate situation from being seen by any who could give them help—if there were any not themselves at the moment so dangerously engaged as to allow them extending succour to their comrades. In this terrible conjuncture the word was passed,

* Mr. Russell represents the antagonism of infantry with the bayonet as unknown before Inkerman, except at Maida. This assertion, made by many others before Mr. Russell, is, however, a mistake: repeatedly, in the war of the Peninsula, the French crossed bayonets with our men, not only in resisting their entrance by the breaches of fortresses, but in the open field. By consulting *Napier's History of the Peninsular War*, the reader will find instances. The Sikhs crossed bayonets, not only with the Sepoy, but with the British infantry. Bayonet charges also occurred between the French and Bavarians, and the French and Austrians, in the late wars. In none of all these, however, was so protracted and sanguinary a contest maintained, and never before did the decision of a battle depend so much upon a series of close and murderous bayonet struggles.

THE BATTLE OF INKERMANN

Charge of the Guards.

"Keep firm on the colours!" and a contest, the most bloody in the history of any field, commenced. Mr. Woods describes their efforts and their losses here, in the following words:—"The little band, now scarcely 1000 strong, dashed up the hill against their assailants, leaving in and around the battery mounds of Russian dead, and eight officers and 200 men of their own corps killed and wounded. As the enemy sprang into the work, the latter were instantly bayoneted. Some of the officers were found with as many as twenty bayonet wounds, and with their skulls smashed with the but-end of muskets. This was particularly the case with Sir R. Newman and Lieutenant G. C. Greville. After having distinguished themselves in the most heroic manner they were wounded, and left in the battery alive; when the Guards retook it, their corpses were scarcely recognisable. On the day before the battle I saw Lieutenant Greville—at ten o'clock in the morning of the 5th of November, while the fight was still raging, a body was shown to me which I was told was poor Greville's, but hardly a feature was distinguishable. Repeated blows (nearly all, I presume, given after death) had destroyed the face."

While the second and light divisions were maintaining an unequal contest on the brow of the declivity, and the two-gun battery was so well defended by the obstinate valour of part of the former division, and the brigade of Guards, a battle of artillery, if possible still more unequal, was being waged. Notice has been already taken of the fact that the first three guns which came into action were under the command of Major Hamley. This officer gives the most graphic and minute account extant, of what he calls the "duel of artillery" which then took place, which awoke the echoes of the mist-clad hills, and uttered in thunder the defiance of contending hosts:—

"Townsend's battery of the fourth division had arrived at the left of the position during one of the rushes made by the enemy. Four of the guns were taken almost as soon as they were unlimbered, the Russians being close to them in the coppice, unawares; but some of the 88th and 49th retook them before they had been many seconds in the enemy's hands—Lieutenant Miller, R.A., taking a leading part in the recapture of one of the guns of his own division of the battery. In all these attacks on our left, the Russians were prevented from turning that flank by Codrington's brigade of the light division, which, posted on the further bank of the ravine, skirmished in and across it with the enemy's infantry throughout the day. Four guns had been detached early in the battle to support this brigade, but they were met, whenever they came into

action, by so heavy a fire, that they were compelled to remain inactive, for the most part, under shelter of a large mound of earth. When the Russian infantry was driven back, a cannonade re-commenced along their whole line, to which our guns replied warmly, though overmatched in metal and numbers. The Russians were computed to have sixty pieces, of which many were guns of position, while we had six 9-pounder batteries of six guns each; but our gunners continued the fire with admirable steadiness.

"Soon after the Guards came up on the right, the three guns first sent there had been withdrawn for fresh ammunition, having fired away all in the limbers, and being separated from their waggons. I had then gone to the ridge where the road crossed it. The duel of artillery was at its height—there was not a moment when shot was not rushing or shells exploding among the guns, men and horses going down before them. Grape-shot, too, occasionally showered past, from which it would appear that the Russians had brought some iron guns into position—as grape fired from brass pieces would destroy the bore, from the softness of the metal. The ships in the harbour, and the battery at the Round Tower, also threw shot and shell on to the slope. This cannonade was the preface to another infantry attack, which now threatened our right, and a battery was ordered to that flank. While I was delivering this order a round-shot passed through my horse, close to the saddle, and rolled us over. He had shortly before been struck by a musket-ball in the haunch, which did not disable him; and had been wounded by a cannon-ball at the Alma, being one of the few horses that ever survived such an event. This was the poor fellow's last field; while on the ground another cannon-ball passed through him. A sergeant of artillery, a very fine young fellow, named M'Keown, ran to extricate me; he had just lifted me from under the horse, and I was in the act of steadying myself on his shoulder, when a shot carried off his thigh, and he fell back on me, uttering cries as if of amazement at the suddenness of his misfortune. I laid him gently down, resting on a bush, and looked at the wound; the leg was smashed and almost severed. Calling two men to carry him to the rear, I hastened to the right after the battery. Advancing in the thick bushes beyond the spot where the battery had come into action, I turned about and saw it retiring. It was already at some distance, and the movement was explained by the appearance of a line of Russian infantry suddenly extending along the upper edge of the slope, between me and our alignment, and at about forty yards' distance. On my left, lower down the slope, as I turned towards our

position, men of different regiments, principally guardsmen, were retreating from the two-gun battery. Being lame from a recent injury, I considered myself lost—the bullets cut the branches and leaves on every side, and all attempts to rally our men were met by the unanswerable reply that their ammunition was spent. At that moment the right of the position was absolutely without defence, and the enemy, by advancing resolutely, must have turned it. But from panic, or some other cause, they fortunately retired instead of advancing—a friendly slip in the ground afforded a shelter from their last shots, and the men who had retreated rallied and laid down under the low intrenchment already spoken of, while their officers distributed fresh packets of ball-cartridge. On this intrenchment a heavy fire of artillery was directed, which continued for nearly an hour. An officer whom I met there, to whom I was lamenting the death of my horse, told me he had placed his in a hollow close at hand, where he was quite secure; but, going to visit him presently afterwards, he found that a shell had penetrated this admirable retreat, and blown him to pieces. I saw a magnificent team of chestnut gun-horses prostrated here by a single destructive shell, and five of the six did not rise again."

It was nearly eight o'clock before Lord Raglan arrived upon the ground. His lordship and staff appeared filled with profound anxiety, as soon as they were able to obtain some glimpses of the state of the field: this was difficult, for the fog still continued dense, and rolled over the English position as if in successive waves. All the British troops that were engaged at any time through the day had arrived at their respective posts by that time. They had literally crowded along from their tents to the scene of tumult: some came without ammunition, some with a round or two; others with their Minié muskets wet and unserviceable; a few were without shoes, and most had on their great-coats, which encumbered them, and sometimes made it difficult for the artillery to distinguish them from their enemies. Lord Raglan placed himself at the rear of the second division, and was witness to the singular heroism of General Evans, who, from his sick-bed on board ship at Balaklava, went forth on hearing the first sounds of battle, and placed himself at the head of his division. Ever generous as brave, he refused to deprive his second in command, Major-general Pennefather, of the honour of heading the division before the enemy; but riding about with him as if he was his aide-de-camp, afforded that officer counsel from the ample stores of his experience, and encouragement from his dauntless and hopeful spirit. The conduct of General Evans on this occasion

was such as will not only give to his name one of the brightest places in the rolls of British military glory, but also cause it to be one of those to which history points all nations, when holding up the example of the brave and generous of whatever realm. Colonel Hamley pays this tribute to the bearing of the general:—"During the battle, Sir de Lacy Evans, who had been sick on board ship at Balaklava, rode up to the field with his aide-de-camp, Boyle, and, calling upon me by name, began to question me about the battle. He looked extremely ill, but was as cool and intrepid as he always is in action. While I was speaking to him, a shell, crashing through some obstacles close by, rose from the ground, passed a foot or two above our heads, and, dropping amid a group a few yards behind us, exploded there, wounding some of them—but Sir de Lacy did not turn his head."

Lord Raglan remained near the second division, which was the post of danger, during the remainder of the day, where his person was exposed to the hottest fire. The adjutant and quartermaster-generals, and the commander-in-chief of the artillery, were with him when he arrived on the ground. It soon became obvious to these officers that the day was going against the British—their numbers were diminishing rapidly, while the Russians poured up through the fog as if they were demons of the mist, and their numbers were exhaustless. At this hour the Guards, reinforced by two regiments of the fourth division, and supplied with ammunition, charged the two-gun battery, of which the enemy had kept possession since the Guards had been compelled to retire. The Russians, awed by their determined approach, fled from the work, followed by the fire of the 20th and 41st regiments. The 41st entered the enclosure, the 20th guarded the flanks, and the Guards fell back upon the old Simpheropol Road, to prevent the Russians from getting up that way and falling upon the rear of the battery. As soon as the Guards effected this retrograde movement—which could not have been observed from the veil of cloud which hung over it—the Russians, as if moved upon the old spot by some terrible instinct, again rushed up the ascent, and fell upon the battery, coming round the opposite flank; their artillery poured a deluge of shot, shell, and case upon the spot, and the 41st and 20th staggered back, amazed and broken by the ruthless fire. The enemy again entered, to be as promptly once more expelled; for the two regiments, instantly re-forming, charged with the bayonet and drove them out. The battery was now like a slaughter-house—its interior choked with dead and trampled men, and others lying across the embrasures; the embankments everywhere

stained with blood, and the slain and the dying, quivering in their last convulsive throes, strewn thickly around.

Such was the scene on the right of the short line of defence which the British had formed. At its centre the fight raged only with a little less fury. The Guards defended the old Simpheropol Road; lower down, and amongst the thick jungle of brushwood, the Russians maintained a bloody warfare with the 47th, 49th, 55th, 77th, and 88th regiments. A close musketry fire, followed by immediate concussions of the scattered groups, characterised the combat. The British fought by desultory charges, and a still more desultory fire: every man was a hero, and struggled as if England trusted to his arm alone. The battle of Inkerman has been called a soldiers' battle: it was as much an officers' battle, only that the officers fought like private soldiers—like them grappling hand to hand with the enemy, and never did the example of British officers so stimulate their men as on the declivities of Inkerman. The soldiery regarded with the highest admiration the chivalry of their officers, and gloriously emulated it.

The masses of the enemy were at last rolled down from the vicinity of the Simpheropol Road, and as they fell back, showers of Minié and musket-balls crashed through their dense columns. They were repulsed with a slaughter which astonished their victors—they fell in bodies of men, as if mowed down, by the close and steadily directed fire of the English. Relieved from the infantry in their front, the wearied men rested on their arms, but death gave them short respite, for the artillery of the enemy swept their positions, carrying destruction with every discharge. It was impossible to allow the British to fall back, for the enemy below were preparing for another onset: some lay down, but the Russian shot tore through the brushwood, and bounded among the serried ranks. At this instant, a louder roar of artillery was heard behind—the Russian guns opened upon the French siege-works, preparatory to the sortie already noticed as part of Menschikoff's plan of operations. The roar of cannon was then followed by volleys of musketry, and the sortie was made. It was repulsed so promptly, that had the French sufficient force they could have entered Sebastopol with the flying foe. A portion of the French did penetrate Sebastopol, but being unsupported, could effect little, and some were made captives. General Lournel fell. They dispatched officers to General Bosquet for support just as Lord Raglan's aide-de-camp also reached that general with a similar request. He, however, could not accord it to either. Liprandi manœuvred in the plain below, occupying the attention of Sir Colin Campbell at Balaklava,

and of Bosquet in his fortified position. Had Liprandi manœuvred better, the fate of the day had probably turned for the double-headed eagle, and two fine armies would have been his prey; but it soon became clear to the intelligent glance of Bosquet that Liprandi was only engaged in a feint, to prevent his dispatching assistance elsewhere. As soon as he became convinced that no attack would be made upon the rear by that general, Bosquet, with dispatch and judgment, sent assistance to the British, by whom it was then alone and urgently needed. Before this decisive event could influence the fortunes of the day, those fortunes were to remain chequered, and attended by many an incident such as gives to war its gloom and terror. General Strangways, esteemed by the whole army, was struck in the thigh by the splinter of a shell which fell among Lord Raglan's staff. The shell burst in the horse of Captain Raglan Somerset, and sent off splinters in every direction, killing the charger of Colonel Gordon, and wounding several men and horses. He mildly requested to be lifted from his horse, and they laid him upon the dark heath. Surgical aid was prompt, but all assistance was in vain—he languished an hour and died, as true a hero as ever breathed out life upon the field of war. Lord Raglan's attention was now called to the fact, that the Russian guns of position overmatched our field-batteries, and he immediately ordered up two iron guns, powerful 18-pounders, which were a match for Russian guns of far heavier metal. They were siege guns, and the only cannon of that description not actually fixed in the trenches. It is marvellous that his lordship did not issue this order as soon as he arrived on the field, for the overpowering weight of the Russian artillery was then as obvious as when the order was sent. Colonel Gambier, who commanded the siege artillery, brought up the guns with alacrity—but in doing so was wounded, and compelled to retire from the field. The command then devolved upon an officer every way equal to the task, Lieutenant-colonel Dickson. He at once saw the importance of silencing the enemy's guns on Shell Hill, the fire from which had covered the repeated advances of the Russian columns from the commencement of the battle. Colonel Dickson so brought his guns into position as to attack Shell Hill effectually, where they swept the artillerymen from the Russian cannon, and checked their fire.

While this judicious arrangement was proceeding, the columns of the enemy, which had been repulsed from the two-gun battery and the front of the old Simpheropol Road, were reinforced and again in motion, and this time they mounted the heights with a quickness of step at variance with the usual motion of Russian

soldiers advancing to attack, which is slower than that of the English and French in similar circumstances. Speedily the enemy's compact columns rushed up to the points of attack, so often and so ingloriously attempted by them throughout the morning. They advanced with a resolute mien, as if determined to accomplish their object or perish in the effort, and as confidently as if inferior numbers of the defenders had not so frequently repulsed their own confident predecessors.

At every step the fallen, who had before clambered these steep against British ball and steel, intercepted the advance of the new columns of attack—yet on they came, and with more apparent self-reliance than ever. It was afterwards alleged that this resolution was inspired by the presence of the imperial dukes, who accompanied them to the foot of the hill, and whom many of the soldiers believed to be in actual command. All the sacredness with which a Russian invests the czar now animated them: their holy Russia was represented in the field by the sons of her sacred chief; they must as true Russians die for the czar; the glory of conquering in the presence of his children, even at the expense of life, was the highest they could hope to attain on earth, and would open the gate of heaven. The column which was directed upon the two-gun battery—that centre of a narrow and sanguinary circle of destruction—drove out the 41st as a strong torrent sweeps away the branch that has fallen across its course; it was the resistance of a regiment to an army corps. Yet the gallant 41st fought fiercely as they retired, the officers sacrificing themselves to save and to encourage the men. The brave Colonel Carpenter and five of his officers fell in front of some fifty of the men on the fatal spot. The efforts of the British to retake the post were again bold and prompt. The Guards advanced from the position to which they had fallen back, and charged down the hill. Sir George Cathcart considered the most effectual mode of retaking the post was to descend into the ravine upon its right, and make a flank and rear attack. Several officers informed Sir George that if he descended into the ravine he must be lost, with any force which he could take with him, for the Russians had lined both sides of it in anticipation of any attempt on the part of the British to take advantage of its shelter. Sir George was one of the rashest officers, as well as one of the most forward and spirited in the English army; he, in keeping with his temperament, did not listen to the entreaties of these officers, but dashed precipitately into the ravine, followed by a mere handful of men. It consisted of four companies of the 68th regiment, and 150 men of the 20th and 46th. He also desired to take the Guards with him, but General Ben-

tinck wisely led them down the slope. Sir George had scarcely left his position, and got fairly into the ravine, when he perceived that he was surrounded; he then sought to retrace his steps, but in vain; the foe lined either ridge, and poured down their fire into the small band, who were thus sacrificed to their commander's precipitancy. Sir George himself paid the heaviest penalty which error can exact, except the loss of honour—he was shot through the heart.* As he fell, his intimate friend and aide-de-comp, Colonel Charles Seymour, rushed forward to assist him, and fell wounded by his side. Major Wynne and Lieutenant Barker shared their fate. The Russians, closing upon them, bayoneted the fallen repeatedly, lest the smallest chance of life should remain. We were at war with assassins, not soldiers.

The view here given of the mode in which Sir George Cathcart met his death, is that presented by persons who were well informed as to the details and general events of the battle. It is but just, while representing the gallant general's fall as the result of his own imprudence, to present another view of the case, given by one of his own officers, a subaltern of the 20th regiment. This officer states that the men had become engaged in the ravine, and Sir George lost his life by attempting to take them out; and the writer seems unconscious that the gallant chief rashly conducted them thither himself. The officer thus writes:—"A large column of Russian infantry was at this time pouring a deadly volley into the fourth division, which, Sir George Cathcart observed, was also out-flanking them; and portions of the different regiments of which his division was composed were maintaining a most unequal struggle against an overwhelming force. The gallant general observing this, rode down into the ravine in which they were engaged, and rallied them. The enemy had actually gained a hill in rear of the flank of his division; but still his coolness and undaunted courage, for which he was noted, never failed him, and riding at their head, he gallantly cheered them on. My regiment, the 20th, was one that was inspirited anew by his presence. Many of them had fallen, and K— amongst the rest was here grazed by a round-shot, which put him *hors de combat*. He was waving his sword and cheering on the men, when the shot struck the hilt and then grazed his shoulder-blade, which rendered him senseless for some little time. A cry at this time was raised that the ammunition was failing, when Sir George exclaimed, 'There is nothing left for you but the bayonet.' He then observed that a large body of men had gained a hill in rear of his

* Russell says through the head.

division, but whether friends or foes it was impossible to discern. A tremendous fire was poured into our scattered division, and Sir George led them up the hill, cheering them at the same time, when he fell from his horse, a shot having passed through his head. Our poor fellows were surrounded, and great numbers were killed and bayoneted on all sides; but they gained the hill with the loss of 500 or 600 men. Brigadier-general Goldie here met with his wound, which the day following proved fatal. Lieutenant-colonel Swiney, 63rd regiment, Major Wynne, of the 68th, and Lieutenant Dowling, of the 20th, were also killed, with numbers of men and officers; Brigadier-general Torrens was also severely wounded."

The foregoing description by the subaltern of the 20th differs so little from that of the *Times*' correspondent, that it would seem as if either the subaltern was not in the fight himself, or could see nothing where he was, and preferred to take his account off-hand from the *Times*. Both accounts are, we believe, inaccurate as to the cause and way of Sir George's death.

Fighting against desperate odds, and falling fast at every step, these fragments of Sir George's division extricated themselves from the ravine, and drew up, shattered and dispirited, upon the crest of the hill.

The ill-success of this manœuvre paralysed the action of the Guards, who formed upon the slope, while the Russians, securing the two-gun battery, ascended to the hill above it, where portions of the 20th regiment, under Colonel Crofton, who had endeavoured in vain to support the 41st at the battery, had retired with that regiment; thither also the Guards fell back, and portions of the 47th and 68th regiments had also formed up. Here the battle was renewed with the old obstinacy. The British were nearly without ammunition—the Russians were well supplied; the British were a thin, broken, and scattered line—the Russians came in numbers like the locusts, and as if, like them, havoc was certain in their track. Resistance seemed in vain; yet there the brave English remained, struggling in the brushwood with the bayonet against innumerable foes—realising Scott's description of another conflict:—

"The stubborn spearmen still made good
Their dark, impenetrable wood;
Each stepping where his comrade stood
The instant that he fell."

At this juncture the heroism of the Duke of Cambridge sustained the fortunes of the hour. According to Colonel Hamley, he ran the gauntlet of the Russian fire as he galloped before the despairing British, calling on them to stand to their arms and fire. Such of them

as had ammunition promptly responded to the call, and the whole line, as if by an electric shock, caught the spirit of the prince. What a contrast to the scions of the imperial house of Russia! while the latter, sheltered even out of cannon range the greater part of the day, the grandson of a King of England, and the cousin of his queen, rode along the front of danger, inspiring the drooping spirits of the men by his own chivalry. His royal highness narrowly escaped a warrior's death—the Russians turned their muskets upon him with deliberate aim, one shot entered his sleeve, another slew his charger, and he was bruised by the fall. His staff fell fast around him; Captain Clifton's horse was killed by a round-shot, and he was himself wounded in the face by a splinter of a shell; Major Macdonald, also on the duke's staff, lost his horse—as he did at Alma; a third officer in personal attendance on his royal highness was killed. This was Captain H. F. Butler, brother of the hero of Silistria. He was a noble officer, and while imitating his chief in cheering the drooping courage of the men, received a bullet in his brain, and fell down dead at the feet of his leader. Truly, the father of these gallant Butlers deserves the sympathy of his country, and long will the memory of these intrepid officers remain green in the hearts of the brave. Brigadier-general Bentinck was about this time wounded. Brigadiers-general Adams of the second division, and Goldie, of the fourth, were mortally wounded, and Brigadier-general Torrens dangerously. In another direction Sir George Brown fell: he had behaved in the most heroic manner, surpassing in glory even his conduct at the Alma, when he received a bullet in the arm and side. Mr. Russell thus refers to the incident:—"Sir George Brown was hit by a shot, which went through his arm and struck his side. I saw with regret his pale and sternly composed face, his white hair flickering in the breeze, for I knew we had lost the services of a good soldier that day." The loss of so many officers is partly to be accounted for by the directions which the Russian soldiers received to direct their aim as much as possible at the officers, and partly to the chivalrous manner in which they exposed themselves for the encouragement of the men. Our troops now gradually retired from the hills at the right, fighting with their usual tenacity as they fell back. The Russians pushed forward their forces, and finding cover in the brushwood (about four feet high) on each side of the road leading to the post of the second division, they kept up an unintermittent fire. As our men fell back under the galling fire of this fusillade, the Russians, rushing from the coppie, charged them repeatedly with the bayonet, but were in every instance repulsed with heavy slaughter.

Still our men necessarily fell back—it was impossible for their remaining numbers to make head against the swelling flood of bayonet and flame which rose against them. All order was gradually lost—men and officers fought in crowds or groups, according to their numbers, and irrespective to a great extent of particular corps. Every clump of scrub and brushwood was the scene of close and bloody conflict. Separate combats were waging in this way along the whole line of defence. The great danger which now existed was the attainment by the enemy of the summit of the ridge, so as to give them room to deploy upon the plateau, and thereby bring the remnant of our stricken bands under a wider range of fire. This was at last about to be accomplished, for the English were slowly and sullenly retiring upon the camp; the enemy had gained the head of the road, and began to display their numbers in an effective position. All seemed lost; some of the men cried out for ammunition, some exclaimed “It is all over—it is no use!” still they fought in their despair, and fell with their faces to the foe. It was at this terrible moment that Bosquet and his light division arrived. That officer, having detected the feint of Liprandi, and prepared his guns to give the cavalry of the Russians a warm reception, should they come within range of the crags on which his force was posted, moved his light troops rapidly forward to the right flank of the English line of battle. The sun had now triumphed over the rain and mist, and the whole field was bathed in that rich and mellow light which immediately ensues when the sky is cleared after showers; the contending armies could see one another at last. The Russians had reached the plateau, and were on the point of deploying there; the English, wearied and reeling before the mighty masses hurled upon them, were still bearing a front with the most desperate valour, when the blast of the French light infantry bugles resounded along the height, and a battalion of Chasseurs moved between the English and their assailants. They were received with a storm of shot, shell, canister, and musketry which utterly astounded them, and they fell back upon the British, still more disheartening the latter. Before any fatal effects could follow this new disaster, General Bosquet launched two regiments, each numbering about 1500 men, upon the Russian flank. The Zouaves formed the first line, the Chasseurs Indigènes the second; they charged on to the two-gun battery, sweeping the dark battalions of the enemy before them with fire and bayonet; their *vivats* rang over the now illuminated heights, gleaming in the display of hostile steel, echoing with the shouts and tread of the rallying hosts, and reverberating with the sound of innumerable arms.

Through all the danger of the conflict, the battle-cry of the gallant French rose up distinct and clear—and gladly did the English catch the sound, and as they caught it, with simultaneous feeling their shattered line rallied, responding with British cheers. The French regiment in the road mingled with the rallying English, and became inextricably mixed up with them as all charged on together against the daunted and surprised enemy. The Russians ran from the battery, pursued by the nimble Chasseurs and Zouaves, and the dense columns which were deploying on the summit were stricken as if by a single stroke, and went reeling down before the rallied and inspired soldiers they had with such difficulty forced back. It now became a massacre; the enemy was still far superior in numbers, but seemed to have no longer heart—they turned from the line of bayonets pointed so fiercely against them, and fled in every direction through the brushwood. Their retreat was ably covered by troops arranged for that purpose, but these also fell back, bravely preserving as much order as averted for the moment a complete rout. They were hotly pursued by fresh regiments of French until panic seized them universally, and they fled, flinging away their arms in their flight. Nothing could be more ignoble and dastardly than the manner in which the fugitives sought safety at the expense of one another, and cringed before conquerors to whom before they showed no mercy. Forty thousand Russians were chased from the field of battle by scarcely 12,000 British and French. On the left of the English line the resistance of the enemy was stouter. Two French regiments charged them in the ravine under Shell Hill. The fire of the Russians was for a few moments so terrible that these regiments showed symptoms of hesitation, but the English forming up in their support, the whole dashed upon the enemy with the bayonet, clearing both ridges of the ravine, and strewing its sides with dead.

The Russian guns on the heights—about ninety pieces, most of them pieces of position—now opened upon the conquerors with renewed fury, and many fell under this deadly cannonade. The camps of the second and light division were covered with shot and fragments of shell, and the tents were torn and shattered by the fire. This cannonade was preparatory to another attack; but, fortunately, Bosquet had brought up guns as well as infantry, and sent three field batteries to assist those of the English. A new “duel of artillery” now commenced, in which the Russians, from sheer weight of metal, would have had the advantage, had it not been for the two guns of position brought up by Gambier and Dickson. Captain D’Aigular now greatly distinguished himself in working these guns. They were fired

with slow but deadly precision against Shell Hill, until the enemy withdrew his batteries, leaving, as was afterwards discovered, 100 dead, two broken carriages, five broken tumbrils, and seven tumbrils in an unbroken state and full of ammunition. How many wounded they had borne away, and what works of *material*, could not be ascertained. During this cannonade, the Russian infantry were rallied by their officers with most creditable zeal and courage, but did not advance far—the fire of our fieldpieces breaking up their columns. Once more they were rallied, and the enemy threw forward his last reserves; but the musketry of the allies gave them a terrible reception—they did not wait for the bayonet, but sought safety in shameful and confused flight. When they reached the Tchernaya Valley their disorder and terror were pitiable. A marsh extended from the head of the harbour for some distance, which was made passable by a narrow stone causeway. As they crossed this in their flight, the French artillery made havoc among them—every shot told, and brought down numbers as it crashed into the dense masses of the fugitives.

General Bosquet had brought up his Chasseurs d'Afrique, who watched for an opportunity to charge, forcing their agile Arab chargers among the brushwood. They were followed by other detachments of the cavalry of our ally; but the ground was unsuited for that arm, and little was effected by them. The remnant of the British light brigade was also advanced to a position where it was supposed they might be of service, but their sabres were not employed; several officers and men were, however, put *hors de combat* by the enemy's cannon. During the latter part of the action, a portion of General England's division was of great service. The position necessarily occupied by that general did not give him the same chance of distinction as others; but no troops on the field were more eager to be forward in the van of war than the gallant third division; and their leader, Sir Richard England, was worthy of them. He had, however, a post to keep, which, until the proper juncture arrived, could not be left unguarded. At the right time, Sir Richard, with the portion of his division available, vigorously charged the enemy, and contributed to the fortunes of the day. The gallantry of the regiments of the third division was conspicuous on this occasion, and by the impetuosity of their charge prevented the enemy from rallying.

The following report of General England will disclose the nature of the service rendered by him and his division:—

*Camp, Third Division, before Sebastopol,
Nov. 7, 1854.*

SIR,—In conformity with your directions of yesterday, I have now the honour to acquaint you, for the information of his excellency the commander of the forces,

that on hearing musketry on the morning of the 5th instant, I ordered the third division to get under arms; and, finding soon afterwards that the fourth division had moved off to the scene of action, I occupied their position by half of the 28th regiment, under Lieutenant-colonel Adams, directing also the royal regiment of foot and the 50th, with two guns under the command of Brigadier-general Sir John Campbell, to proceed to the support of the first and light divisions. These I and the staff accompanied.

Meantime, Brigadier-general Eyre, somewhat reinforced, held the command of the troops in the trenches in our front, and the ground usually belonging to the third division, who was in like manner placed under the charge of detachments of different corps, which were in part employed on other duties, under Colonel the Honourable A. Spencer, 44th regiment. The demeanour of the enemy was at first of that character, and his number so great, that it was difficult to decide whether it was his intention to confine his efforts to an attack merely on the right of our line, or to assail generally and equally the left and centre of it—so that it was necessary to observe the whole space from the deep ravine on my left to the ground, upwards of two miles off, on which the light division was engaged; but I was glad to find myself soon enabled to give some very reasonable aid to the operations of Major-general Codrington in that quarter, as well as to supply the demand made for assistance by H. R. H. the Duke of Cambridge.

Individually, I placed myself on the ground to the left of the enemy's main attack, and opposite to his right, finding that I could at that point best direct any movements in which the third division could be called upon to partake; and I remained there the whole day, with the exception of making one rapid visit to the positions belonging to us on the left, for the security of which I considered myself equally responsible. The vigilance of the officers, however, who I had left in charge of that ground relieved me as to all apprehensions for its safety.

The loss of the third division in these matters on the 5th instant amounted to eleven killed and twenty wounded, but to the present period of the siege they have lost (exclusive of the casualties just mentioned) seventeen killed, and eight officers and 103 sergeants and rank and file wounded.* The reference to these numbers will perhaps plead my excuse for taking this occasion of recommending to the favourable notice of his excellency the commander of the forces, the commanding officers of the brigades and regiments; and I beg to assure his lordship that on all occasions their conduct has entitled them to my highest commendation.

It would be presumption in me to attempt to describe the action of the 5th instant, but I can safely assert that the officers and men of the third division did their best to bring it to a successful conclusion, and that, as at Alma, all exerted themselves to give those proofs of loyalty and devotion, which indeed the whole army seems so desirous to evince; and thus I trust to be pardoned for mentioning the names of Brigadier-general Sir John Campbell,† Brigadier-general Eyre, C.B., Colonel Bell of the royal regiment of foot, Lieutenant-colonel Waddy of the 50th regiment (wounded), and Lieutenant-colonel Lowth† of the 38th regiment; also of Colonel Cobbe† of the 4th foot (wounded at Alma), Colonel the Honourable A. Spencer of the 44th foot, and Lieutenant-colonel Adams of the 28th regiment. Further I beg also to mention in high terms of commendation Major J. S. Wood and Major the Honourable H. Colborne of the adjutant and quartermaster-general's departments respectively, and Captain Stewart Wortley of the latter; also Captain Neville, and the other officers of my personal staff, together with Major the Honourable C. Hope and Captain Danielli of the 38th regiment, the brigade majors serving with this division.

I beg to add that Doctor C. Forrest, deputy inspector-general of hospitals, has at all times earned my warmest approbation by the strict attention paid to the sick, and that Mr. Assistant Commissary-general de Fonblanque has discharged with great success the duties of his department.

I have the honour to be, Sir,

Your obedient servant,
R. ENGLAND, Lieutenant-general.

* There was some small increase to these numbers discovered afterwards.

† Since killed.

Sir Richard England, both at Inkerman and Alma, was placed in a position of great utility and importance, for which he received but little public credit. All military men of rank and talent have been prompt to do honour to the services of Sir Richard, but the popular mind is necessarily swayed by the more obvious aspect of matters; and, as at Alma and Inkerman, Sir Richard's division suffered very little, the general public supposed that he was less forward than other officers. At Inkerman the post occupied by General England prevented the left of our position from being turned. At Alma his division was in *support* (not in reserve, as was generally represented) of Sir De Lacy Evans' division, to which he rendered the greatest services in the hour of need. During the most critical portion of the struggle at Alma, General Evans sent to General England for the aid of his guns; the latter not only afforded the guns, but accompanied them himself, crossed the river, and exposed himself in the thickest of the fire. Let any of the detractors of this brave man ask General Evans how he behaved on that occasion. Sir De Lacy is too noble-hearted and gallant himself, and too justly desirous of the good opinion of his country, not to do justice to every soldier, whether fortune smiles or frowns upon him. The author has heard the friends of each of these officers speak in the highest eulogy of the other, as to their conduct at Inkerman and Alma. General Evans not only felt grateful for the promptitude with which Sir Richard sent forward the guns, but invariably testifies to the unostentatious gallantry of General England in offering his personal aid. The following letter will establish this fact:—

Bryanston Square, Feb. 14, 1855.

In reference to your letter, I beg, in reply, to say that, as is usual in such cases, the generals commanding the three divisions principally engaged at the battle of the Alma (namely, the second, light, and third divisions) were required to transmit reports to the commander of the forces, relative to the operations respectively executed under their directions.

In my report, only a small part of which was published, there was a passage, I believe, nearly in the following words:—That towards the latter part of the battle, Sir Richard England, who commanded the third division, in reserve to the second, sent to me, by a staff officer, to ask if I required any assistance from him. I requested that he would send me to the front the whole of his artillery. It was my fault that this request had not been previously made. Sir Richard England, without a moment's delay, rapidly came up himself, with twelve pieces of cannon, and thus contributed to enable us to open, a few minutes subsequently, a battery of about thirty guns, which produced destructive effects in the masses of the enemy. This fact, honourable, as I think, to his zeal and promptitude, and of considerable importance, was officially reported by me at the time—and it would ill become me to forget it.

Yours very truly,

DE LACY EVANS.

To the Hon. —, M.P.

The following letters from Colonel Bell and Colonel Stuart confirm also our views of the gallant general's conduct:—

3, Crescent Row, Exeter, Southernhay,
Feb. 28, 1856.

DEAR SIR,—Your letter, with its inclosure, followed me from Liverpool here, and I have much pleasure in bearing my humble testimony to the soldier-like conduct of Sir Richard England, at the battles of the Alma and Inkerman. Sir Richard was conspicuous in leading his division within the range of the Russian guns at the Alma. He was halted by command, as a reserve to the second division, being himself under fire; and so far from keeping his men back, that he seemed most anxious to push on to the aid of some gallant regiments in our front, who were suffering much from the enemy's rapid fire. I received Sir Richard's orders through an aide-de-camp to move my corps (the Royals) to the left and to the front, to be ready for anything. Seeing the 23rd regiment falling fast, I dashed my corps across the river to their support; but just as I formed up on the left bank, the Russians here gave way.

I am, dear Sir, faithfully yours,
GEORGE BELL, Colonel.

Aldershot, April 9, 1856.

MY DEAR SIR,—I have just received your letter of yesterday, and its inclosures (the latter I beg to return). I lose no time in acquainting you that with the exception of the third division having been represented at the Alma, in Colonel Bell's letter, as being in reserve instead of in support, I most cordially concur in every word he has stated relative to the forward conduct of Sir Richard England, and the disposition of the troops under his command, both at the Alma and Inkerman.

I have always considered that, in the former battle, the third division was in *support*, and *not* in reserve. Its first brigade, and one regiment of the second brigade, were in support of the second division; the other two regiments of the second brigade in the same position to the Guards' division. I do not think my memory misleads me when I say, that when moving off from our bivouac on the morning the action was fought, Sir Richard England was informed that the third was to *support* the second division, and that, on our coming in sight of the heights of the Alma, Sir Richard England received orders through a staff-officer to assist the Guards' division (which was to the left of the third, and in support of the light division), should our left be too hardly pressed. I will here remark that Sir Richard England and the staff crossed the river immediately in rear of the 30th regiment, and were for some time on its right, when it was drawn up in line on a hillock to pour its fire upon three Russian regiments that were in column in rear of the battery which caused so much destruction to our Guards and light division. Hoping that I have made my description of the position of the third division at the Alma intelligible to you, believe me to remain,

Yours truly,
STUART.

The following is a faithful account of the services of General England and his division during their services in the East, up to the battle of Inkerman, furnished by a gentleman perfectly conversant with the facts:—

"The third division of the army, to which Sir R. England was appointed, being stationed at Gallipoli, he relieved Sir George Brown at that post in the end of April, 1854. The troops were employed in fortifying a line of defence selected by the allied engineers, from the Sea of Marmora, on the right, to the Gulf of Xeros, on the left. These duties pressed a good deal on the brigades, but the division was healthy and in high order. It was reviewed by Marshal St. Arnaud, Canrobert, and others, who here borrowed for the adoption of the French our method of forming squares and other evolutions. Hospitalities were exchanged, and

our gallant allies preserved with us the most cordial 'fraternity' to the last.

"In July, the third division embarked for Varna, and like the rest of the army was employed in hard labour to make gabions and fascines preparatory to the descent on the Crimea. The cholera thinned the ranks of the army severely at this juncture. When the troops effected their landing at Old Fort, they moved up by divisions to a position from which that landing might have been easily opposed by the Russians. The night which followed was a very fatal one to many who had a tendency to cholera. We had nothing on shore, and it rained in torrents. In moving to the Alma, the third division supported and marched behind the second, whilst the first division supported the light; the fourth division was considerably in the rear. In this manner the attack was made; but as the fire became warmer, Sir R. England galloped to ask General Evans how he could best assist him. They then brought their united batteries to bear on the retiring columns of the enemy, and the third division was in the act of deploying between the Guards and the French, when intimation reached them that the latter did not intend to advance further that day. The vexation of our troops at this announcement was extreme. This division especially had only, as it were, just come into action. They had lost twenty-two men, and saw that the day was ours, and that they were not to be allowed to take advantage of the victory.

"On the 23rd, the march was resumed to the Katscha through an endless jungle, each division moving independently, with orders to steer south-east; and they all debouched at McKenzie's Farm, at which point the rear of a Russian column moving out of Sebastopol was caught by our troops, some ammunition blown up, and the third division placed so as to watch its progress, and cover the rest of the British army in their descent to the Chernaya.

"On the 27th, the third division moved from the plains of Balaklava towards Sebastopol, and having assisted at the first reconnaissance of that place, took up various positions until that ground was allotted to it opposite the dockyard, which it held to the end of the operation; having the fourth division under General Cathcart on its right, and the French division, commanded by Prince Napoleon, on its left. The siege operations now began, and daily sickness and daily casualties in killed and wounded soon told upon our effective strength until the battle of Inkerman:" where General England's services were important, although the loss of his division was but slight.

It was three o'clock in the afternoon before the battle terminated; by five the Russians

had entirely disappeared, and their guns were withdrawn from the heights. The chill, dull winter evening set over the victors and the vanquished; and over the blood-stained slopes of Inkerman, the dead and dying were thickly strewn. The plan of Menschikoff was completely frustrated—his sortie was repulsed by the French with signal defeat. The feint of Liprandi against Balaklava, and the position of Bosquet was discovered in time by the French general, and succour was sent in the crisis of the battle. The contemplated attack upon the trenches of the third division (the extreme left of the British attack) was never made—the Russian general missing his way, and coming where he was neither expected nor desired, he increased the confusion of the assailants at Inkerman, and added to the fearful numbers of the Russian slain. The grand attack was itself repulsed by the enduring courage of the British, and the impetuous charges of the allies, united, at the close of the hard-fought day. It was a great struggle of blood, the like of which, considering the numbers engaged, had never been witnessed in the hardest fought battle. Sixty thousand Russians had been hurled back to the feet of the imperial princes from before whom they had advanced in the confidence of numbers, of the Divine blessing, and with the inspiration of exuberant loyalty, religious zeal, national enthusiasm, and military pride. The Russian soldiers had been all taught that no army could stand before that of their emperor, and that he had a right to subjugate the power and appropriate the spoils of all nations. The events of Inkerman did a great deal to dispel the illusions of the Russian soldiery; and had a true account found its way into Russia, it would have probably opened the eyes of the Russian people, or such of them as could read, as to the futility of their czar contending with the alliance of nations against him.

The night of the 5th of November was one of sadness to the victors—they had gained a great battle, but at terrible cost. Still, when the losses were computed, the French lost more in proportion than the English as to numbers and the time in which they were engaged. So badly directed was the aim of the Russian musketry, and so unequal were they to the British in close combat, that the loss of the English in slain was not one tenth that of their opponents, and of these many were murdered after they fell wounded. Even Russian officers joined in this work of assassination: one major was seen, limping about the field, thrusting his sword into the wounded English. One of the Duke of Cambridge's staff took him prisoner, and the Duke intimated the probability of his being hanged as an example. He afterwards attempted to make his escape, but was again wounded. Before opportunity was

found for bringing him to trial, he died—it was believed of shame and remorse. The loss of the British was in killed 462, wounded 1952; and 198, including officers, were reported as missing—some of whom were afterwards discovered to have been made prisoners, others were proved to have fallen, and some were never heard of. The officers killed amounted to 43, the wounded to 102; the sergeants killed were 32, wounded 123. Four generals were killed—Lieutenant-general Sir George Cathcart, and Brigadiers Strangways, Goldie, and Torrens. Four generals were wounded—Lieutenant-general Sir George Brown, and Brigadiers Bentinck, Buller, and Adams. The French loss was 1726 killed, wounded, or missing. The estimates of the Russian loss were various. Prince Menschikoff reported that he was unable to ascertain, but that the wounded were more than 3000. It is probable that the killed, wounded, and prisoners amounted to nearly 20,000—a third of the whole army. The carnage was frightful, and justifies this high computation of the havoc in the Russian battalions.

During the battle there were many acts of the most chivalrous and romantic courage. Colonel Hamley noticed a guardsman thrust down a number of his adversaries with prodigious strength, and the most persistent courage, until at last he fell. After the battle, the colonel had the curiosity to look for him, and found him slain, with fifty bayonet wounds in his body. He turned back his collar, and saw stamped on the blue blouse shirt he wore, the un-English name Mastow. A private soldier named MacLaghan, an Irishman, performed prodigies of valour. The gallant conduct of Sir R. Newman and Lieutenant Greville will long leave their names dear to the admirers of patriotism and courage. Sir Thomas Troubridge, when desperately wounded, losing both feet, still fought, laying hold of such support as he could find, and encouraging the men to persevere. His name is still often pronounced by officers and men who fought at Inkerman. A French officer, an ensign, leaped upon the parapet of the two-gun battery, and continued to wave the tricolour amidst showers of shot until the enemy was driven out. A British sergeant was attacked by five Russians, he slew three, and fell exhausted and wounded; according to his own account his eyes failed, and he had nearly swooned, when a French officer galloped up, sabred the two Russians, and with powerful hand lifted up the prostrate Englishman upon his horse, and riding with him to the rear, placed him under surgical attendance, and kissing his hand, returned to the fight. It was supposed that this noble Frenchman himself subsequently fell, as the performer of the generous deed could never be traced.

Many of the wounds inflicted upon the British were horrible—they were so frequently struck by bullet and bayonet. The most extraordinary case is that of private Thomas Walker, 95th regiment, who was in hospital nearly twelve months, during which time he had thirteen pieces of his skull removed by Dr. Parry. He was wounded at Inkerman by the bursting of a shell, which carried away a portion of his skull, laying open the brain, and he was discovered some hours afterwards wandering about in a state of total unconsciousness. His recovery is considered very extraordinary. This brave fellow on his arrival at home was seen by her majesty, who made him a present of £10.

Several prisoners were taken by the Russians in the commencement of the engagement, some of whom were well treated, others were used most barbarously. It mainly depended upon the disposition and rank of the captors how the poor prisoners fared. The following is from the *United Service Gazette*, and may be taken as a specimen of the treatment of our officers. It accounts also for both the hardships and amenities of Russian imprisonment:—

“Captain James Duff, of the 23rd regiment, was taken prisoner the day of the battle of Inkerman, while on picket in the White House Ravine, leading to Careening Bay. He attributes the fault of his capture to a party of men of the — division on his right, who fell back without passing on the alarm. Captain Duff and his picket were fighting in front, and had nearly expended their ammunition, when, to their surprise, they suddenly found some of the enemy on their flank. The men perceived they were being surrounded, and attempted to fall back. As they did so, one man who kept close to Captain Duff was knocked over. He then tried to make for a path leading up to the hill, and had proceeded a few yards when he met some Russians in front directly opposing his further progress. They had got round them. Eight or nine men then closed upon Captain Duff, and, as he still struggled to escape, one man gave him a tap on the head with the butt-end of his musket, which slightly stunned him. The Russians then carried him off in triumph; they would not let him walk. He soon recovered from the blow on his head, and while going along was fully aroused by a volley of Minié rifle balls, which came whistling among his escort. Two or three of them were wounded, and the remainder then allowed him to walk with them to the rear. Some of the men spat upon him, and he thought they would have shot or bayoneted him, had it not been for the protection of the soldier who particularly regarded him as his own especial property. It appears that every Russian soldier who captures an officer, and can produce him alive,

gets the order of St. George. In case of the officer being dead, the private would not be believed were he to state that he had made a prisoner of him while alive. Unless, therefore, under extreme excitement, the Russian soldier will do what he can to keep his prisoner safe, that is, provided he can hope to remove him to a place of security; if the prisoner be badly wounded, and there is a chance of his not being able from any cause to reach the place where the soldier could establish his claim, there is no doubt he will receive little mercy at his hands. But it is rather a satisfactory thing to know, in case of accident, that, if taken, it will be an object of interest with the captor to try and present his prize to his superiors in a state of living entity and personal completeness. Captain Duff remained on the field during the whole of the battle of Inkerman, and saw the fight from the Russian position. He appears to have been greatly surprised at the number of guns which the enemy had contrived to get into position on the heights during the night. During the first part of Captain Duff's imprisonment he was treated badly enough. His uniform was taken from him, and he was supplied with clothes of a very coarse description. He was marched through the country with a gang of convicts—felons of the worst description—who were being removed for transportation to the penal settlements of Siberia. With these men, and with two soldiers of the guard, one on each side of him, he slept at night and had his meals, and they were taught to regard him and call him their '*camarade*.' As they passed through some villages the bigoted peasantry pelted them with stones. There was no opportunity offered for ablation, and the state of dirt and neglect into which they fell became most repulsive. The condition of the prisoners, however, could hardly be expected to attract attention, for it would seem that the officer who commanded the guard over the prisoners of war and the convicts, though unfettered by restrictions, exhibited as little anxiety about the surface of his own person as he did about those of the men he was guarding. When the insect visitors who honoured him with their presence became too numerous and too importunate, his servant was desired to remove a portion of them, and the occasions for this interference were rather frequent. Once during the long march the officer was seen to apply soap and water to his person, but only once during the rout of 700 miles to Moscow. At last Moscow was reached, and here not only the scene was changed, but the condition of the British prisoners. A house was given up to them, and they received frequent civilities and attention from the better classes of society in the city. They were invited to *fêtes* and parties, and in certain circles, more espe-

cially among the ladies, were made especial objects of compassion, and became the lions of the day. No difficulty was experienced in getting bills on certain London houses cashed, and a premium was given on the exchange. They found also at Moscow a clergyman of the Church of England. At Odessa they experienced the same kind of civility as at Moscow, but the social parties and entertainments were wanting. The news of the battle of the Tchernaya and its termination had reached this latter place before Captain Duff left, and the attempt against the allied position was admitted on all sides to have been defeated. The failure produced general and marked depression of spirits. Strange to say, the Russians pretend not to regard Alma and Inkerman as defeats; they say that their general ordered the troops to retire from motives of policy, but were not driven back. The battle of the Tchernaya, according to them, was our first real victory."

The aspect of the field was awful, when on the morning of the 6th it could be seen. The correspondent of the *Morning Herald* relates that "some 400 or 500 Russians, killed and wounded, were lying among our tents; and here also were many, too many, corpses of Zouaves and French infantry of the line." The able author of that letter does not explain how all these corpses of friends and enemies came there. It is to be presumed that they were wounded men who died under treatment of our medical officers, as the Russians never penetrated to the tents of the camp, but the tents of the second division were almost all swept away by the fire from Shell Hill.

The wounded English were taken from the field on the evening and night of the 5th, so that before dawn of the 6th a great many were removed. The soldiers generally refused to take in the wounded Russians until our own men were provided for; after that they showed a kindness to their enemies nobly contrasting with the infamous conduct of the Russians to the wounded English. Immediately after the battle, the English might be seen giving water to the fallen Muscovites, placing knapsacks under their heads, and wrapping them in blankets to protect them from the biting air of the Crimea winter night. It was horrible to witness the contortions, convulsions, and writhing agonies of those who died of bayonet stabs; those who fell by the bullet seemed to die in comparative peace. Puncture wounds caused tetanus, and other symptoms of agony, which our tired soldiers often stopped to soothe, but their efforts were too frequently in vain. The writer last quoted was an eyewitness to the shocking spectacles presented, and he thus writes:—"A little above the line of tents was the brow of the hill overlooking Inkerman Lights. Here was the spot where

the allied artillery engaged that of the enemy after the retreat, and here the sight was sickening indeed. There is nothing so awful as the spectacle of the bodies of those who have been struck down by round-shot or shell. One poor fellow of the 95th had been struck by two round-shot in the head and body. A shell afterwards burst on him and tore him to pieces, and it was only by the fragments of cloth, with the regimental buttons adhering, that you could tell that the rough bloody mass which lay in the road had ever been a human being."

The aspect of the field after the battle was perhaps more terrible than that of any other, not excepting Waterloo. Many of the British had perished of bayonet wounds, and it was remarkable that very few seemed to have fallen by a single thrust. The number of English or French who had died by musket or rifle-balls was very small, and the French fell victims to the bayonet in a smaller proportion than their allies. The artillery, however, made sad havoc of both—taking off heads, cutting bodies nearly in two; some had a leg carried completely away, others had an arm, and some both legs or both arms, or legs and arms together. The most heart-chilling sights of mutilation were presented where the Russian shells fell, or the round and case-shot tore through the thin line of the English or advancing columns of the French. Where the Guards had been compelled to retire from the defence of the wall above the Inkerman Valley, the British had suffered terribly:—"Across the path, side by side, lay five guardsmen, all killed by one round-shot. They lay on their faces in the same attitude, with their muskets tightly grasped in both hands, and all had the same grim, painful frown upon their faces, like men who were struck down in the act of closing with their foes. Beyond this, the Russians, guardsmen, and line regiments, lay thick as leaves, intermixed with dead and wounded horses. The latter, with fractured limbs, were now and then rising, and after staggering a few steps, rolling over among the corpses, snorting and plunging fearfully." From the wall just named to the two-gun battery through the brushwood, the trampled track was slippery with blood. From the battery the sight was such as no pen, however graphic, could describe, and no mind, however familiar with fields of carnage, could conceive. More than 2000 dead bodies were stretched in their gore, and stiffening in the cold night air, around the parapets of that contested earthwork. The wounded were also numerous, and their groans were pitiful in the ears of those who offered their assistance, which for many came, alas! too late. The cries of the wounded horses were painfully expressive of suffering; and for hours

during that dreadful night of woe and victory, above all sounds, the wailing of a faithful dog—which had followed its master's fortunes in march, by bivouac, and through the tide of battle—arose; crouching by the prostrate form of its master, or standing upright over him, the animal raised its head, and pierced the night with its lamentations. It was horrible to witness the contortions and writhings of those, who, dying of punctured wounds, were frightfully convulsed. All these sights could be witnessed, for the moon rose resplendently over the valley of Inkerman, and from the English heights the opposite heights could be distinctly seen, and the slopes far down into the vale, and the Tchernaya, reflecting the silver moonlight, gliding peacefully between the over-frowning hills. The slopes of Inkerman sparkled with the scattered weapons, which flung around, by reflection, the strong moonlight. Every sound, as well as every sight, appealed with distinctness to its appropriate sense. So serene and still was the evening, that the gurgling in the throat of the dying, and the faint moans of those exhausted by loss of blood, smote the ear with painful perspicacity. Some of the dying seemed to forget their own condition, and to think only of the loved ones far away; their last words were the dear names of those who fostered their childhood, whose parting tokens blood-stained, were now clasped to their breast.

A poor Irish youth, a mere boy, called, in the rich and sorrowful tone so peculiar to his native land, upon his mother; and up through the listening night the pitiful words came from his lips, faintly and still more faintly, "My mother—oh, my mother!" until his spirit passed from the scene of strife and anguish. Another soldier, also an Irishman, articulated with a singular distinctness, as if his very soul spoke, while a comrade bent over him, "Mary—shall I see you no more, Mary!" Whether this was to wife, or sister, or love, his dying heart was true to her, and uttering the fond name, his lips ceased to speak for ever. A tall guardsman called aloud upon his father, until the bearers of the wounded, attracted by his cries, carried him off the field. Some of the prostrate lost reason, and seemed as if they had a preternatural strength, although the injuries they had received prevented their rising; they called out to charge the Russians, challenged comrades to come on, vowed dreadful vengeance, shouted wild hurrahs, and recounted, incoherently, the events that had befallen themselves or others during the hour of carnage. One sergeant swore by St. Patrick he had only killed four, and seemed in his frenzied or bewildered state bitterly to accuse himself of such remissness. Many of the wounded lay calmly and quietly awaiting help, or resigned

to the will of heaven, and some less severely stricken than their fellows, soothed them with words of hope, placing their heads or persons in less painful attitudes. "Keep up a good heart, Peter," said one poor fellow as he adjusted the head of another upon a shako that was near, "keep up a good heart, Peter; we'll see the old people at home yet, and Peggy will be waitin' for you, you know." The accounts given by gentlemen, both officers and civilians, published and unpublished, of what they saw and heard while the wounded were being assisted that night, and while they sought for friends who were missing and supposed to have fallen, would constitute a large and painfully interesting volume.

It was a trying task for those who, with lanterns, turned up the faces of the slain to look for officers or comrades. The conduct of the soldiery to the wounded was exceedingly tender and humane—removing them with the greatest care and softness of manner, although they had been themselves engaged all day in the exhausting strife. These men were kind also to their wounded enemies, who requited them with looks of fierce resentment, muttered curses, or efforts of impotent rage. Our men could be easily distinguished by the ambulance parties, although generally in their grey great-coats; for their superior stature and better figures, and their more open and manly countenances, as they often lay with their faces upturned to the moonlight, did not easily admit of mistake. One of the most distressing scenes of that sorrowful night, was the efforts of the English women, the wives of soldiers, to find the bodies of their husbands who had not returned when the fight was over. With a sudden jerk they would drop the head of some dead soldier, whose figure and uniform led them at first to apprehend that it was the loved one they sought. Sometimes their suspicions would be confirmed, and then the hill-side rang with the shrill lamentations of their grief. Oh! what cries of despair burst from the hearts of these poor English soldiers' wives as they found, thousands of miles from home, their only friends and protectors on earth—perhaps the father of their children—stark, cold, and bloody, by the hill-side of Inkerman! Some found their wounded and still living husbands, and brought them timely solace and succour; others laid them down amidst the dripping brushwood, and clasped their dead in a lust and wild embrace, until some generous hands separated it, and bore them wailing or swooning away to the camp.

The appearance of the dead was as various as the causes of their fall:—"Some lay as if asleep; others were horribly contorted, and with distended eyes and swollen features appeared to have died in agony, but defying to

the last. Some lay as if prepared for burial, and as though the hands of relatives had arranged their mangled limbs; while others again were in almost startling positions, half standing or kneeling, clutching their weapons or drawing a cartridge. Many lay with both their hands extended towards the sky, as if to avert a blow or utter a prayer; while others had a malignant scowl of mingled fear and hatred, as if indeed they died despairing. The moonlight imparted an aspect of unnatural paleness to their features, and as the cold damp wind swept round the hills and waved the boughs above their upturned faces, the shadows gave a horrible appearance of vitality; and it seemed as if the dead were laughing, and moving to rise. The Russian soldiers were inferior in appearance to those at Alma. In all that relates to discipline and courage our late antagonists were far superior. They were all clean, but ragged in the extreme. None had knapsacks, but merely a little canvas bag of that disgusting, nauseous-looking stuff they call their bread. No other provisions were found on any. The knapsacks, I presume, were left behind, in order that they might scale the heights on our right with greater facility. Every man wore strong, well-made Wellington boots, of a stout but rough-looking brown leather. On none that I have heard of were found either money or books. On many were miniatures of women and locks of hair. They appear to have been veteran troops, as a large number bore the scars of previous wounds. The dead officers, as at Alma, were with difficulty to be distinguished from the men. They behaved very well indeed. Trenches were dug on the side of the hill for the Russians, as they lay. Into them, till they were full quite to the surface, the enemy's dead were thrown in ghastly heaps, sixty or seventy in each pit. As fast as they filled, shovelful of earth were loosely scattered over them, and that was all. Before the winter was over, the heavy rains had washed the scanty covering from the dead, and disclosed them fully to our view, with their features undistinguishable from corruption, but with their hands still clenched upon the tattered flesh, and their arms still pointing to the sky. The English and French lay side by side in deep graves by themselves. In the ravine in the side of Shell Hill was a large limekiln, this was used as a vault, and filled to its summit with Russians."

The whole of the night of the 5th and morning of the 6th was expended in conveying the wounded to the hospital tents; by noon this sad work was accomplished, but the whole day was consumed in carrying them in French ambulances, Turkish arabas, Tartar waggons, and English stretchers to Balaklava. The work of burial now engaged the British

and French, and a number of lives of the allies was lost in its performance, as well as in carrying the wounded off the field. The Russian ships in the harbour were careened, and flung shot and shell over the heights upon the slopes where the battle had raged. Great havoc was made among the Russian wounded who still lay upon the field, and the unburied dead of all the contending armies were mutilated horribly. The indignation of French and English was great, and it is marvellous that the poor soldiers exposed to this galling fire, should continue to show such kindness to the wounded Russians, and to the few prisoners taken under such ferocious and cowardly provocation. Lord Raglan sent a flag of truce to Prince Menshikoff, inquiring in indignant terms whether the war was to be conducted with honour and on civilised principles, or with the barbarity of savages. Lord Raglan also called the attention of the prince to the fact that, as at Alma and Balaklava, the Russian wounded were seen ferociously stabbing the wounded French and English, contrary to everything previously known in warfare.* The reply of the Russian commander-in-chief was evasive and dishonourable. He doubted whether the wounded were killed, except perhaps in some cases where provocation had been given, and that he would punish those who did the like, if proof were afforded to him of their guilt. The firing, he said, was not directed against the burying parties, but against the Turks, who were intrenching the position. The prince must have presumed that the allies would set about that necessary operation, for in fact they did not begin to intrench until the 7th. He excused the barbarities of both acts, by alleging that the Russian soldiery were much incensed by the French pickets having plundered the Church of St. Vladimir, which was situated outside the Russian lines. This church was erected on the site of one of the most anciently erected Greek churches, and was a sort of *sanctum sanctorum* for the Russians in the Crimea. It was supposed by them that the French in stripping it were actuated not merely by the love of plunder, but by the envy which they supposed inflamed the Latin Church against the orthodox. The French appreciation of Prince Menshikoff's complaint was shown in their afterwards gutting the church of all its furniture, and they even took down the timbers of the roof for firewood.

The sincerity of the brutal and bigoted Menshikoff may be judged by the fact, that no Russian soldier was subsequently punished for slaying the wounded, although they who had done so made a boast of it in the garrison;

and the shelling of the burying parties from the ships went on after the return of the flag of truce from Sebastopol, as it had done before. Throughout the whole campaign the Russians stained their arms with dishonour, by the most cruel, vindictive, and cowardly practices. No advantage was too small to take, even although dearly paid for,—and they were always willing to fling death among their own troops,—if there were the smallest chance of thereby injuring an enemy. It became necessary, in order to save our men from the fire of the ships, to withdraw the ambulance as well as burying detachments, and numbers of wounded Russians were therefore of necessity left to a miserable end upon the cold heath. That this would be the probable consequence of his conduct was well known to Menshikoff; but reckless of human life, amongst countrymen or strangers, this heartless apostle of the orthodox church scattered the brands of death everywhere, though only one heretic soldier might perchance be stricken.

On the 7th of November, the attention of the opposing armies was concentrated on the siege; and the battle of Inkerman, and the scenes which were witnessed on its field of slaughter, when the events of the battle had passed away, were matter of history. Few pages have been set apart to war, by the muse of history, over which fame sheds so bright a halo of glory, or pity weeps such compassionate tears.

This is an appropriate place in which to present to our readers a very curious and somewhat instructive account of the battle, which appeared in a German paper, and which was written obviously under Russian influence. The account was published in Berlin. "The plan of the battle of Inkerman was thus devised. Soimonoff, who was with the tenth division in the town, was, supported by some regiments of the sixteenth and seventeenth divisions, to break up from there, to march along the left of the Malakoff Hill, proceed along the west side of the ravine running into Careening Bay, and fall upon the left wing of the English army; while General Pauloff, with the eleventh division, from the northern camp at Inkerman, was to cross the Tchernaya bridge, mount to the plateau at the side, after passing along the defile, and attack the English on their right flank. For the purpose of detaining the French, and preventing them from coming to the assistance of the English, there was to be, in addition to a general cannonade from the ramparts, a sham attack made on their left wing by General Timofegen. General Gortschakoff was to operate against the Sapoune Heights, for the purpose either of fettering General Bosquet to that position, or of enticing him down to the valley."

* This likewise occurred in India, where the wounded soldiers of Tippoo Saib stabbed the wounded Sepoys.

For the purpose of preventing or remedying any mistakes that might arise in the execution of this widely-combined plan, a semaphore was erected on the heights behind Inkerman, so as to convey instructions either to Sebastopol or to Tchorgoum, Gortschakoff's head-quarters. During the battle Menschikoff kept his station at this telegraph. General Dannenberg had the immediate conduct of the action, and attached himself to the second column under Pauloff.

"On the 4th of November, the dispositions for the attack of the ensuing day were forwarded to the different commanders. The heights above Inkerman were to be attained, and if possible a firm footing was to be gained there. Soimonoff, with three regiments of the tenth division, three regiments of the sixteenth division, one regiment of the seventeenth division, twenty-two heavy and sixteen light guns, was, at six o'clock A.M., to execute the movement above described. Pauloff, with three regiments of the eleventh division, two regiments of rifles, of the seventeenth division, with their artillery, was also at six o'clock to throw a bridge over the Tchernaya, near Inkerman, and then advance rapidly to effect a junction with Soimonoff, at which moment General Dannenberg would take the combined command. Gortschakoff was to co-operate with his troops at Tchorgoum, was to effect a diversion, and endeavour to get possession of one of the approaches to the Sapoune Heights. Lieutenant-general Moller, with the garrison of Sebastopol, was to watch the course of the action, to cover the right flank of the attacking troops with his guns, and if any confusion were visible in the enemy's batteries, he was to take possession of them."

At General Dannenberg's suggestion, the hour for marching was altered to five o'clock for both Soimonoff and Pauloff. The former was to place his reserves in the rear of his right wing, in the calculation that his left would be covered sufficiently by the ravine leading to Careening Bay. (The words of the order communicated to Soimonoff required him to march along the *left* side of the ravine; he understood this as the side on his own left hand when advancing up the ravine; Menschikoff had, however, meant the left side of the ravine, according to its course towards the sea. To the mistake, which brought Soimonoff, instead of to the left to the right wing of the English, where Pauloff had already as many men as the *terrain* would admit of handling, the Russians mainly attribute their want of success.) The Russian official lists are quoted, to show that, on occasion of the battle of Inkerman, of which the above is the plan, the Russian forces actually engaged amounted only to 29,700 men, viz.:—

UNDER SOIMONOFF.

	Bayonets.
Twelve battalions of the tenth division.—Regiments Catherineburg, Tomsk, and Kolyvan. . .	8100
Twelve battalions of the sixteenth division.—Regiments Vladimir, Souzdal, and Ougliche	5100
Four battalions of the seventeenth division.—Regiment Boutyrsk	2400
	16,200

UNDER PAULOFF.

	Bayonets.
Twelve battalions of the eleventh division.—Regiments Selinghinsk, Yakoutsck, and Okhotsck . .	8400
Eight battalions of the seventeenth division.—Regiments Borodino and Tarantino.	4800
Half a battalion of 4th Rifles	300
	13,500

The writer then describes the driving in of the English pickets, which agrees substantially with our own account. The troops who conducted this operation are thus referred to, and the way in which, from a Russian point of view, the British conducted themselves, is thus criticised:—

"It was, on the one hand, the advanced guard of Soimonoff's column advancing from Sebastopol; on the other hand, it was the two regiments of rifles (Borodino and Tarantino), from Pauloff's column, approaching through the nearest defiles, with their sharpshooters in advance, and beginning to climb the precipitous heights from the Inkerman side; the fog and their grey cloaks kept them invisible till they were close at hand. The pickets of the second English division, on the extreme right wing, had only just distinguished, through the drizzling rain, the Russian riflemen climbing up, when they were compelled by the whistling of their bullets to retire to the crest of the hill, defending, however, every yard as they went. Immediately afterwards the pickets of the fifth or light division found themselves attacked from the town side, and compelled to retire. The English now supposed they had to do with a sortie on a large scale; but what puzzled and confused them entirely was, that not only on the left and in the front there was a heavy fire of artillery, but that also in the rear, on the heights towards Balaklava, there were heard volleys of artillery and musketry. On the left there was the fire from the walls of the town, flashing out of the grey mist in a circle of flame, to which Soimonoff's guns soon added their lightning flashes; in the rear it was Gortschakoff's troops effecting their diversion against the Sapoune Heights. As the French on the hills above briskly answered the fire with heavy guns, though at random, on account of the mist that shut out everything from sight, the English commanders in camp were at a loss to tell on which side the real attack was. In this uncertainty they had, for the moment, nothing else to do but to defend themselves when they

were attacked, but at first their movements were vacillating and uncertain."

The arrangements (if such they could be called) of the English are then taken almost *verbatim et literatim* from Mr. Russell, and the description of the Russian operations is resumed.

"The Russian movement and attack proceeded. General Soimonoff, a meritorious officer, had commenced his march in the grey dawn of the morning, but, without a guide or a map of the locality, he had in the darkness, instead of crossing over to the left or west side of the Careening Bay ravine (so as to fall upon the centre and left wing of the English), remained upon the right side, and advanced to the attack there, by which movement he came into collision with their right wing, which was to be attacked by Pauloff's column. The disadvantage of this false direction was that, from the confined nature of the ground, his troops were very much in the way of Pauloff's column, and neither the one nor the other could find space to deploy. Everywhere, as they were compelled to move in columns, they suffered extremely during the long way they had to march from the severe fire of their antagonists, who from their small number at first had the advantage of presenting a small front, and could more frequently supply it with fresh troops. While the Russians were moving about in columns of companies the English were drawn up in a line two deep, and their long-ranging guns enabled them to inflict mortal wounds on the Russians at a time when the latter were unable to reach them at all with their fire-arms. . . . Nevertheless, thanks to the courage and unshakable steadiness of the Russian soldiery, the action wore, at the commencement, a favourable aspect; not so much in consequence of their numerical superiority, as on account of the unexpectedness of the attack, the surprise in the fog, which, by magnifying every object in its dim obscurity, showed the English large masses everywhere (at least we must conclude so from their ridiculously exaggerated reports, in which a few battalions are made to figure as 10,000 and 20,000). In this first episode there were engaged on the Russian side Soimonoff's three foremost regiments, and the two regiments of rifles from Pauloff's column. The rest of the troops, that is to say, the greater part of Soimonoff's column (four regiments), and the main body of Pauloff's column (three regiments), were situate partly in the rear, as reserve, and partly only came up at a late hour, along the Sappers' Road. Thus there were not more than twenty battalions of Russians, or 13,000 bayonets, engaged in this first stage of the engagement, against which the English had gradually collected their entire force, also amounting to 13,000 men. Campbell's, Codrington's, Buller's, and

Goldie's brigades stood opposed to Soimonoff's troops. The other four brigades—Torrens', Pennefather's, Adams', and Bentinck's—were opposed to Pauloff's rifles.

"Hardly had these two latter regiments of rifles (Borodino and Tarantino) mounted the heights, driving the English outposts before them, when they, although out of breath with climbing, threw themselves furiously upon the nearest troops (Pennefather's and Adams'), forced them back, and deployed towards the redoubt; while, on the other side, the Tomsk and Kolyvan regiments of rifles, supported by that of Catherinenborg, driving in the pickets of the fifth division, stormed wildly against the left side of the English front (Codrington and Buller's brigades, supported by Campbell's and Goldie's). Thus the conflict commenced almost simultaneously along the whole line of battle, enveloped as it was in fog, and as the Russian soldiery gave themselves little time for firing, but rather, in the proud consciousness of their valour, sought to reach their enemy as soon as possible with cold steel, it soon came to the most embittered bayonet engagement. With astonishment did the English see these attacks with the bayonet; they had flattered themselves with the delusion that no troops in the world could compete with their powerful well-fed men, and here did the Russians, whom they looked down on so superciliously, venture to challenge them to it, to attack them, and what is more, several times to put them to the rout; for the Russians' favourite weapon, ever since Suwarow's time, has been the bayonet. Thus along the whole extent of the confined *terrain* there commenced a furious fight—now with the bayonet, now with fire-arms, but without a decisive result, for the forces of each side were equal. The Russian artillery, however, twenty-two 12-pounders and sixteen 6-pounders, belonging to Soimonoff's column, did the English great damage. The grenades, which they threw with great precision, were constantly bursting in the midst of the English ranks, and with their massive fragments of iron hurled death on all sides, while their balls tore open great chasms in the lines, threw down or tore to pieces the tents of the encampment, and wounded or killed the people engaged in camp service. Three battalions (Tomsk and Kolyvan) rushed boldly on the little redoubt in front, took it, spiked the Lancaster guns there, and hewed the carriages in pieces. Further and further they penetrated into the camp, now open to them. Two battalions (Catherinenborg) for want of room crossed over to the other side of the Careening Bay ravine, attacked the camp there, and also spiked four guns. But they were driven out again, being too weak for want of support. The English rallied all their powers, and obsti-

nately defended every inch of their encampment. In this the light troops of Brown's division, all practised shots, armed with capital Minié rifles, did good service, by picking down the Russian generals and officers, and also the artillerymen and horses. It was thus that the action was brought to an equipoise, and soon it took a turn to our disadvantage, for the most distinguished leaders had already fallen. Not only the colonels of the three foremost regiments, even the commanders of the battalions, and a great part of their officers, were put *hors de combat* by death or by wounds. Among them were the commander of the artillery, Colonel Lagoskin, Brigadier-general Villebois, and General Soimonoff. Deprived of all their superior leaders, and thus become uncertain and wavering, the combatants gradually gave way; and as the English, hereby inspired, made all the more furious attacks, they fell back into the upper portion of the ravine, through which the old post road leads, and endeavoured to rally here under cover of their heavy guns. These latter had been posted by General Shabokritzky—who had followed slowly with the other four regiments of the column—on an acclivity, from which they could take the English line point-blank and askew; he had covered it on both sides by the regiments Ouglitche and Boutyrsk, while he kept the regiments Vladimir and Souzdal behind him in reserve. Thus was a stop put to the whole active operations on this side—only the artillery continued the engagement without interruption; as fast as a battery had exhausted its ammunition, or become injured, it was retired and replaced by another.

"On the left side, also, where the rifle regiments of Borodino and Tarantino were, the action had lasted a long time with varying fortune. The battle raged forwards, backwards, beneath, above, among bushes and underwood; above all, the redoubt on the wing had been the object of many an attack, till at length General Bentinck led up his Guards—the *élite* of the English army. These chosen troops pressed irresistibly forward to the redoubt, tore it from the Russians, and consigned it to the safe keeping of the Coldstreams. As about this time two battalions and a half of the French joined the English, the two Russian regiments were still more hardly pressed, and at length were compelled, together with Soimonoff's troops, to retire into the ravine, where they, however, did not, like the latter, remain, but quitted the field of battle altogether, and proceeded to the valley of Inkerman. Thus ended the first act of the bloody drama, which was soon followed by one still more sanguinary. In spite of the resolute attacks of the Russians, the English had given another proof of their military virtues, and had made an heroic defence."

Notwithstanding the compliment paid to the military virtue of the British, we must not be tempted to accept the statement of this historian. The account we have given of the action shows that the French force alleged to have come to the assistance of the Guards, is an incorrect version of the real occurrences of that portion of the day. The narrator again draws upon the *Times'* correspondent for his facts on the English side, and, by keeping too close to that excellent authority, obviously without consulting any other, he admits several errors into his narrative. He then resumes that part of the story in which we are interested—the course of events within his own lines.

"General Dannenberg, who had arrived on the ground early, was distributing his orders from a rising ground near the batteries, and assigning to each column as it came up the direction of its attack. Around him also death was busy, and struck to the ground by his side, adjutants, officers of the *état-major*, officers bringing reports, or fetching orders; for a long time, he and his beautiful brown charger remained unhurt. On a sudden, his horse sank beneath him, struck by a grenade on the shoulder, and another horse was brought him by an orderly. At the moment the general was about to mount this fresh horse, another ball laid it also low, and a third was procured. Death was ranging abroad, and spared neither the highest nor the lowest, but yet could not subdue the courage, the resolution, and the invincible steadfastness of all. At the very beginning of the action, the commander of the French corps of observation, General Bosquet, had galloped from his position near the telegraph into the English camp, followed by four companies of *Chasseurs de Vincennes*, and two battalions of the 6th and 7th regiments of the line, together with two mounted batteries. In the vicinity of a mill he met with the two English generals—Cathcart and Brown—and offered his assistance. But the old English pride revolted at the idea of requesting, or even of accepting, aid from Albion's ancient rival. The generals declined the offer, as they had their reserves still, but requested him to cover their right flank. After leaving his two and a half battalions and two batteries at the spot indicated, General Bosquet repaired to a height to examine into the nature of the attack made upon his own position, and ascertained that it was only a feint, and, while disposing his troops to take part in the general action, he received notice from various English officers that his assistance would be very welcome on their right. General Bosquet then moved rapidly to his left with two brigades of his own division (Bourbaki and Antemarre), and one

brigade of the first division (Monet); altogether about 9000 men. General Canrobert had also joined Lord Raglan, that he might be at hand in case his forces were required; and, while there, received a wound in the arm, which, however, did not compel him to leave the field."

The accounts of General Bosquet's interview with the British generals at the beginning of the action, and their refusal to accept assistance, are purely fabulous. The entire number of troops sent by the French to the aid of their ally scarcely exceeded 6000; they were not 9000, therefore, as this writer asserts. He admits that 3000 of the 9000 remained in reserve, but the whole force sent by Bosquet to the succour of Lord Raglan did not much exceed 6000 men.

"It was now about eight o'clock, the battle was waxing hot again on the heights of Inkerman, and the second act commenced. General Pauloff's three regiments, with their guns, that had come by the Sappers' Road, arrived at that time, just as Soimonoff's troops gave way. These were the men who had fought at Oltenitza, and Dannenberg sent them immediately up to the front—the regiment of Okhotsck first, that of Yakoutsck second, and Selinghinsk last. The struggle that ensued was even severer than the former. The Okhotsckers attacked with the bayonet, and succeeded in driving back the English until they got up to the redoubt, and attacked it; but there the Coldstream Guards, although surrounded and cut off from the rest of their division, maintained their post in spite of repeated attacks. The guns that Pauloff had posted on the opposite side of the ravine caused them great loss, and they had already lost more than 200 of their number before they burst out and cut their way through the approaching succours. The Okhotsckers also lost most of their superior officers; their colonel, Bibikoff, was severely wounded.

"In the meantime, the two other regiments, Yakoutsck and Selinghinsk, had crossed the ravine; the first-mentioned succeeded in driving the Coldstreams out of the redoubt again, although reinforced by the two other regiments of the Guards, and by troops from Cathcart's and Buller's brigades; on this occasion, the Guards lost twelve of their officers, and Brigadier Bentinck was wounded in the arm. The Guards, Cathcart's division, Sir de Lacy Evans', together with the French battalions that had co-operated, were driven back by Pauloff's valiant troops; the other redoubt in the centre of the English lines, was already taken after a severe struggle, and the Russians were again in the English camp. A party of Russian skirmishers had crept up through the brushwood, and picked off the horses and

gunners of a battery of six guns, stationed on an eminence in the midst of the English camp; a Russian column swept along the road against it, and the artillerymen succeeded only in saving four out of the six pieces, in spite of the determined resistance offered by the English, firing by companies as they drew back. The battle had now attained its climax; it was raging among the tents on the flank and in the rear of the second division. Most of the English generals were *hors de combat*; the Britons, sadly reduced in numbers, and exhausted by the length of the struggle, defended themselves but faintly. More and more the fortune of the day inclined to the Russians; they had still four regiments unemployed, while the enemy had brought up all his reserves. It was about eleven o'clock when, on a sudden, the shrill tones of horns were heard above the rolling and rattling of the fire. The third act—the turning point of the battle—commenced; the French arrived.

"In the same proportion as the assurance of this timely aid revived the sinking spirits of the English, it discouraged the Russians, who felt themselves at once on the point of being deprived of the fruit of five hours' hard fighting. Close after the three battalions of Zouaves, Chasseurs de Vincennes, and Chasseurs d'Algers, there came up, also, Bosquet's remaining troops on the right of the English, thus outflanking the Russians. The English had by this time no more than 8000 men capable of continuing the fight. Bosquet's three brigades brought them 9000 fresh men, of whom, however, one brigade (Monet) remained in reserve; therefore, say 6000 men (French) came to the assistance of the 8000 English. Opposed to these 14,000 men were only Pauloff's three regiments (Okhotsck, Yakoutsck, and Selinghinsk) that had mustered before the action 8500 men, and now hardly counted 6000. Of Soimonoff's column, the three regiments of his tenth division had been perfectly disorganised by the loss of all its superior and so many subaltern officers, and took no further part in the action. The two regiments of rifles (Borodino and Tarantino) had entirely disappeared from the field of battle; the other remaining four regiments of Soimonoff's column were stationed in the ravine as reserve, or for the protection of the artillery. Thus, these troops of Pauloff were now opposed to a force of more than twice their number, after a three hours' fight, after a night march along a sticky soil, and after climbing steep acclivities. Victory, under those circumstances, was out of the question. Their task was now to retire with as little loss as possible of men, guns, and honour. This was, indeed, difficult, posted as they were on the edge of precipitous ground, with an over-

powering enemy ready to crush them, supported by the combined English and French batteries. They had to rescue their guns from the heights on which they were, and bring them off along the roads by which they had come. The slightest wavering would have seen them hurled over the steep sides of the plateau; they gave way, therefore, gradually, and maintained their steady retreat, step by step and troop by troop. Although deprived of the invigorating hope of victory, they repulsed all the attacks even of the fresh French troops; the 6th French regiment had even at one time lost its colours in a hand-to-hand encounter, and it was only the immense exertions of Colonel Camos, and at the expense of his life that they regained it. The English light cavalry did not venture to show itself. The Russians had no cavalry at all, on account of the *terrain*. It was not till all their guns were brought off that the Russians commenced their actual retreat under a massacrering fire of artillery; and this retreat, crowning as it did all the achievements of that day, has gained for them the respect and admiration even of their enemies. It was in this retreating fight of man to man that the English recovered the two guns they had previously lost; they were not recaptured as has been reported—they were simply left behind by the Russians, from the horses that were dragging them having been shot. This retreat of the Russians was like that of a lion followed up by the hunters.

“General Dannenberg now advanced one of his two reserve regiments (*Vladimir*) to cover the retreat of the troops towards the town and towards the Sappers’ Road into the Inkerman Valley, and over the bridge into the camp on the north. The combined English and French did not venture to pursue them further than the old post road, on account partly of the resolute bearing of the *Vladimir* regiment, partly on account of the fire of the retiring artillery, and partly on account of the frightful ravages produced in their ranks by the enormous shells thrown from the decks of the steamers *Chersonese* and *Vladimir*, which had, as a measure of precaution, been anchored in the bay at the mouth of the Tchernaya. Thus ended this battle, one of the most sanguinary on record, at two o’clock P.M., after lasting eight hours.

“And what was it that foiled the Russian attack?—The bravery and steadfastness of the English? Undoubtedly much must be laid to this account, for they were splendid, and the British soldier fought worthy of his best days. But the Russian fought no less bravely, and bravery alone did not decide it. Was it the superiority of the English army—the use of the Minié rifle? This weapon certainly produced great effects; at the distance of 1500

paces it deprived the Russian regiments of their officers; on the other hand, the Russian sharpshooters—only ninety-six to each regiment, with guns that could kill only at 1000 paces—killed and wounded as many English officers, and more generals. Was it the false direction that Soimonoff took? In great measure, for the reasons already given—to which must be added that of his own death, which completed the disaster, and rendered his regiment ineffective for the remainder of the day. Another disadvantage was that the columns, instead of arriving at their destination simultaneously, came up one after the other. All these circumstances conspired to the disadvantage of the Russian attack; but that which was most fatal was the incorrect execution of the sham attacks or diversions, more particularly of that one which failed to prevent Bosquet’s coming to the assistance of the English, and it was that decided the fortune of the day.”

Deeply interesting as the perusal of this account must be to our readers, they cannot fail to perceive that it is, by a cleverly assumed air of candour, an obvious attempt to cover the disgrace of the Russian arms. The number of the enemy actually found dead upon the field of battle, is sufficient proof that forces were brought into the field far superior to what it is here pretended constituted the attacking army. The retreat of the Muscovites was only well conducted while they were under the cover of their guns; as soon as they were deprived by their position of the protection of the artillery, they fled in the utmost confusion. According to the admissions of this writer, the inferiority of the Russian army, as an army, to the allies, is beyond dispute. He allows that the British fought with unabated heroism and skill when their chiefs were picked off by the Russian rifles; he affirms that the loss of their officers caused the Russian soldiery to waver and despond. The conduct of the Muscovite generals he severely criticises; and if his critique be founded upon facts, they seem incapable of carrying out a well organised or complicated scheme of movements. In another portion of his narrative, after defining the nature of military feints and diversions, he points out that General Timofegen carried out his feint admirably on the French left; while General Gortschakoff, who had to operate against Bosquet, thoroughly failed in his object by negligent and unskilful conduct. To him and to Soimonoff, more especially to the former, the Russians attribute the defeat at Inkerman. Liprandi ought to have his full share of their censure, for had he so handled his men as to keep Sir Colin Campbell and Bosquet in suspense about the rear of the allied positions through the day, Bosquet

would not have stirred, Sir Colin would have been obliged to claim assistance for the defence of Balaklava, and the commanders-in-chief would have been embarrassed, and perhaps their forces beaten.

Every account, Russian, French, or English, bears the same testimony to the indomitable bravery and endurance of the English, both officers and soldiery. The charge at Assaye, the whirlwind attack at Salamanca, the obstinate courage of the squares at Waterloo, have not added to the pages of English military story more lustre than the conduct of the men who maintained the deadly and protracted bayonet conflicts of Inkerman.

There remains now only to furnish the reports of Generals Forey and Bosquet to complete the picture of the battle in all its varied parts and details. These reports are in themselves a confutation of those features of the Russian story to which we have objected—even allowing for the desire of Forey and Bosquet to place matters in a light favourable to their own troops. There is no account extant which gives the details of the Russian attack upon the French trenches. Mr. Russell, of the *Times*, proceeded to the French lines, but only remained for a short time, turning away to the more important contest of Inkerman. Mr. Layard remained at the French position, but has given no narrative of the events which fell under his cognisance. General Forey's report to General Canrobert is, on the whole, a faithful representation of the attack and repulse. Bosquet's account of what occurred at his position is also exclusive: no British officer or visitor was there to record the occurrences. The account given by the French general is, with the exception of some minor detail, one of fidelity.

It will be more consecutive, as to the order of events, to present first the report of Forey, and then that of Bosquet.

GENERAL FOREY'S REPORT.

Before Sebastopol, Nov. 7, 1854.

MY GENERAL,—I have the honour to acquaint you that on the 5th of November, at nine o'clock in the morning, the left of our attack against Sebastopol was assailed by a Russian column, composed of four battalions forming the regiment of Minsk, one battalion of the regiment of Wolhynsk, and of a certain number of volunteers who joined them. This column, 5000 strong, supported by a battery of artillery, left the city by the bastion of the Quarantine, and proceeded along the ravine situate on the left of our lines. Its march, favoured by a thick mist, could not be immediately arrested, and it threw its force upon the batteries Nos. 1 and 2, which it reached; the occupants of these batteries having been compelled to retire towards the battalions of the 39th and the 19th regiments of the line, and upon four companies of the Foreign Legion charged with the defence of the trenches. These battalions, or portions of battalions, were also compelled to retire before the efforts of the Russian column, but they vigorously resumed the offensive when two companies of the 19th battalion of Chasseurs, in reserve at Clocheton, and four companies of the Foreign Legion, from the building of the Carrières,

arrived at the scene of the conflict. The General de la Motterouge, who occupied his post at the trench in the first parallel, rapidly advanced with some companies of the 20th Light Infantry upon the points attacked. When he reached the batteries Nos. 1 and 2, they were already abandoned by the enemy, who was thrown back upon the opposite side of the ravine, at a little distance from the trench. Encouraged by the general, our soldiers advanced with ardour beyond the first line of defence, pursuing the enemy, and subjecting him to a murderous fire. They stopped themselves at the height of the building called 'Du Rivage,' taking up a position behind the walls, whence they continued their fire.

While these events were going on, and at the first report of the *fusillade*, I mounted my horse and adopted the following dispositions:—I ordered General de Lourmel to proceed directly upon the burnt house, and General d'Aurelle to march in advance of his front along the Sebastopol Road which borders the sea. His Imperial Highness Prince Napoleon was instructed to hold his division under arms, and it advanced as far as the Maison du Clocheton to support my right, while an effort was being made on the left. Levailant's division having taken the place of the brigades of Lourmel and Aurelle at the moment of their departure, went in advance of their front in columns by brigades. General Levailant placed himself at 500 metres behind this line, to judge of the moment when his aid would be necessary. I placed myself at the head of the 5th battalion of Chasseurs, and of my artillery, and I followed the ravine of Carrière perpendicular to the Sebastopol Road, for the purpose of cutting off the retreat of the enemy in case he should have advanced beyond the batteries No. 1 and No. 2. Such were the general dispositions which I took to put myself in a condition to be prepared for every event on the side of the *corps de siège*. I was briskly attacked; I heard the fire in the direction of Inkerman; I knew that you were then smartly engaged; but not being able to judge from what side the most violent effort would be made, I felt bound to advance to the combat with my first lines, supported by the whole of my reserves. The brigade of Lourmel, carried away by indescribable ardour for their chief, bore down the enemy before them as soon as they met. Two battalions of the 26th regiment of the line furiously pursued the Russians, who retired in disorder. It was then that General de la Motterouge, perceiving General de Lourmel arrive on the height of the Quarantine, where he was in position, followed him in his movement of offence. Our troops, stimulated by the ardour of success, very nearly reached the walls of the fortress, impelling before them the mass of Russians; while the section of artillery, commanded by Lieutenant de la Hitte, poured upon them a shower of shells and balls. I had taken position, with the five battalions of Chasseurs, on the right flank of General de la Motterouge, and on the height of the Quarantine.

Thinking that the pursuit of the enemy was carried much too far, I sent the Chef d'Escadron Dauvergne, and le Capitaine d'Etat-Major Colson, to bear orders to the generals to retire immediately. There was much difficulty in effecting this movement, so great was the ardour of the chiefs and the soldiers. The retirement was supported by the position which I occupied on the right with the five battalions of Chasseurs; in the centre by the rest of the brigade of Lourmel, *échelonnée*; and on the left by General d'Aurelle. This general officer had inclined towards the sea-shore, and had taken by main force, in the midst of a mass of projectiles discharged from the bastions of the town, the buildings of the Quarantine, which he occupied with the first battalion of the 74th regiment of the line. He had left in second line, in a dominant position, Colonel Beuret with two battalions, ready for every event. The occupation of this building was very useful. It protected effectually the retreat of the brigade of Lourmel, and I cannot too much approve of this disposition, adopted by General d'Aurelle, for it put an end to the desperate *fusillade* by the Russians, who, having been brought again in advance, bordered anew the opposite (the north) side of the Bay of the Quarantine. The fire of the 74th regiment, directed with certain aim, forced them to retreat a second time, and to retire into the fortress. It was upon the opposite side (the north) that I wished to arrest the pursuit of the

enemy, if, impelled by a warlike ardour, which I deplore, the brave General de Lournel had not led his troops beyond. In this pursuit, seriously wounded by a ball which traversed his chest, he gave up the command to Colonel Niel, who was obliged to effect a retreat under an extremely violent fire from all the batteries of the place—a movement which did not terminate until they reached the back of the ravine of the Quarantine. Our losses have been very considerable; but I do not believe I am far from the truth in calculating at about 1200 the number of the Russians killed, or placed *hors de combat*. The enemy obtained no advantage in compensation for his losses, for our trenches are intact; and of the eight guns spiked, six renewed their fire immediately, and the other two did so to-day.

I cannot give too much praise to the troops engaged on the 5th of November. I was most completely supported by every one—generals, officers, and soldiers. The officers of my staff, from the commencement of the siege, and in particular during the day of the 5th, have never ceased to distinguish themselves by their bravery and *sang froid*. General d'Aurelle exhibited a high degree of military intelligence during this day. General Lournel who, though wounded very seriously, did not give up his command until his strength was exhausted, has been the admiration of all. He has succumbed to his wound. I cannot express to you the grief this misfortune occasions me. The army loses in him a general whose chivalrous bravery knew no obstacle, and a chief for whom there seemed to be reserved a high destiny.

You will remark, general, by the number of officers put *hors de combat*, that they were the special object of the fire of the enemy. The French officers, proud of their position, do not disguise their rank, like the enemy, under the *capote* of the soldier.

I am, with respect, &c.,

* The General commanding the Siege Force,
FOREY.

REPORT OF GENERAL BOSQUET RESPECTING THE BATTLE OF INKERMEN.

Before Sebastopol, Nov. 7, 1854.

At the break of day, on the 5th of November, the enemy showed themselves in position upon three points of our lines, namely—1. Upon this side of the bridges of Inkerman, opposite the right of the English. 2. In the plain of the Tchernaya, menacing the English redoubt. 3. In face of the telegraph. They had occupied these positions under cover of the night, and of a thick fog, and they opened their fire about half-past six o'clock before Inkerman and before the telegraph. I ordered the whole corps of observation under arms, and I went myself beyond the mill. General Bourbaki followed me with a battalion of the 7th Light Infantry, a battalion of the 6th regiment of the line, four companies of the Foot Chasseurs, and two horse batteries. I there met the two English generals, Sir George Brown and Sir George Cathcart, together. I offered them my aid, informing them that I was followed by the troops which I have just mentioned, and by others which I could withdraw from the lines if the serious attack should occur in front of the English. They thanked me, and assured me that they had at that moment reserves, but that they had no one towards the right in rear of the English redoubt, and they begged me to secure them at that point, which I at once did. I then went to ascertain for myself what would be the effect of the two attacks by the Tchernaya and the plain of Balaklava in face of the telegraph. They were evidently false attacks.

I was examining the nature of the threatened attack in face of the telegraph, when some English officers came to inform me that the fire had become serious on their right. Colonel Styl especially gave me excellent information, and I instantly caused General Bourbaki to proceed towards the English right. At the same time I gave orders that a battalion of Zouaves, and a battalion of Algerine Tirailleurs to march in the same direction. Finally, a little after, General Antemarre received instructions to march towards the same attack with a battalion of Zouaves and the two battalions of the 50th. The two battalions of the second division had been directed, since the break of day, upon the telegraph; I

sent one of them to the English right, in order that they might join the two horse batteries already in motion. I rejoined the troops led by General Bourbaki as they were about to form in line. All the ground in front of the English right was unoccupied, having no one upon it but the guard, who preceded, by a distance of twenty paces, the first row of tents. I did not hesitate to push my two battalions in advance, with the four companies of Foot Chasseurs, who charged the enemy with extreme bravery, and very nearly reached the small advanced redoubt on the right. Upon the arrival of the battalion of Zouaves (Dubos commanding), and the Algerine Tirailleurs, I made a fresh charge, and continued it as far as the crest which commands the ravine of the road. I reckoned that the English would be able to support my left beyond the road, but they were prevented from doing so. The enemy turned my left by the road, and for a moment I was, I may say, surrounded. The Zouaves of the Commandant Dubos took the heads of the columns, which turned us in the rear, and completely stopped them. It became necessary for me to re-form my line for a moment, in order to resume the charge, which this time also succeeded in a marvellous manner. But the enemy, crushed by the fire of the British artillery, and of the French artillery, which I had caused to assemble on the crest in rear of my left, at length offered no further resistance, except while flying.

In these encounters with the bayonet, our field of battle was covered with dead; it was a real butchery; several officers had their horses killed under them. The 7th Light Infantry, commanded by Chef de Bataillon Vaissier, showed an ardent and brilliant courage, which merits particular notice, as likewise the skill and enthusiasm of the Foot Chasseurs of the 3rd battalion. The battalion of the 6th regiment of the line charged most brilliantly, and well revenged the death of their brave colonel, M. de Camos, who fell amid the ranks of the enemy. The battalion of Zouaves, commanded by Dubos, manoeuvred with that intelligence and bravery at every turn, which is never disturbed, even when surrounded by the enemy. The Algerian Tirailleurs leaped as agile as panthers through the brushwood. This day does them honour, and likewise their colonel, De Wimpfen. The other battalion of Zouaves, and the two battalions of the 50th, gave us vigorous support, without having occasion to charge the enemy. During this combat, the two horse batteries, under Commandant La Boussinière, and the battery of the second division, directed by Commandant de Barval, had to maintain a fierce duel with the Russian artillery, which was composed of 24 and 30-pounders in position, and of a considerable number of fieldpieces. Our batteries, aided by an English battery of 9-pounders, had the honour of extinguishing the Russian fire, and reducing it absolutely to silence. This combat of artillery was directed by the brave Colonel Forgeot, who rendered me, during this day, the greatest services. Finally, at the moment when the Russian fire was extinguished, I caused to be led to the last crest a divisional battery supported by two battalions, which covered with shells and balls the bridge of Inkerman, over which the Russian troops rushed in great disorder, and we had the pleasure of seeing them fly in a complete rout. But this rout was protected by the marshes of Inkerman, which we unfortunately could not traverse, for otherwise our cavalry would have ended the day gloriously.

The brigade of General Monet, arriving in second reserve, had no occasion to act. It, however, experienced losses by the cannon-balls of the enemy, fired from pieces having an extreme range.

Before the telegraph we had only one cannonade without wounded, but I feel real pleasure in here expressing how much the detachment of marines, under Captain de Cautensens, served those excellent 30-pounders, which kept the enemy's line very distant, and caused them to experience a severe loss.

I have thanked the Generals d'Antemarre and Bourbaki, who so valiantly headed their troops; and Colonel de Cissay, my chef d'état-major, who has most energetically aided me. I wish I could mention all the brave men who so well fought at Inkerman—but this would be to name every one.

The General of Division commanding the Corps of Observation,
BOSQUET.

When the news of the battle of Inkerman reached western Europe, the feeling was one of blended sympathy and exultation. The noble stand of the English was praised in France in every variety of panegyric. The battle of Inkerman was the theme of the French periodicals, and the conduct of their own troops was depreciated in comparison with that of the English. In the Parisian and even provincial theatres, representations of the warfare in the Crimea were popular; and whenever a *quasi* English soldier appeared upon the stage, he was hailed with loud and continued *vivats*. Considerable numbers of the English officers, and some of the common soldiers, came home by way of France; and on these occasions the demonstrations at Marseilles, Toulon, and Paris, were of the most enthusiastic kind. British officers, perhaps wounded, and with stained and worn uniforms, were frequently at this time seen in the streets of Paris; and wherever they went, the populace crowded around, and kindnesses were lavished upon them. The imperial court and government were also most courteous in their attentions to the wounded English coming home through France. A sentiment of the most profound admiration for British valour animated the whole French nation. They were the heroes of all the popular French songs, whether adapted to the theatres, the saloons of the fashionable, or the circles of the populace.

In Great Britain, the enthusiasm was not less, and the pride was greater; there was, however, a lurking feeling in the English mind, that bad generalship left exposed a position in itself not only important, but tempting the attacks of a vigilant and self-sacrificing enemy. There was much indignation expressed on this head in the metropolitan and provincial press, and in all circles in the empire, except perhaps a few of the more courtly. Still the word Inkerman stimulated the war-like enthusiasm of the English—they felt themselves to be indeed sprung from “fathers of war-proof;” they had, as a nation, lost nothing of the martial daring, enterprise, or pride of those from whom they derived this heroic spirit. If the Alma spread a sense of glory through the nation, so Inkerman sent its light of exultation like an electric flash through every part. There was no colony of England too remote, nor peopled by a race too little English, to feel the pride, and exult in the renown of Inkerman. In the London clubs—in the meanest taproom—in the workshops of Birmingham, Manchester, Sheffield, Leeds, and Nottingham—in the furnace-rooms and forges of Warwickshire and Staffordshire—among the hills of the Celtic Scot, and in the remotest glens of Ireland,—the word was pronounced, and all heard a triumph in its

enunciation. Never did a great battle make a nation at once so proud, so exultant, and so solemn, as this made the whole British people. In the palace and in the parliament, the popular feeling was participated. The conduct of the Duke of Cambridge added alike to the pride and gratulation of court and people. Her majesty could not but be proud of the part her gallant cousin bore on the memorable day; and the people rejoiced that a prince of the house of Brunswick bore himself so bravely. Memorials and addresses poured in upon her majesty, the Duchess of Cambridge, and the Princess Mary, upon the noble conduct, and congratulations upon the safety, of the illustrious prince—now more illustrious than ever—so nearly related to them; and thus the royal household and the humblest of the people triumphed together.

The populace had another triumph which was all their own. *The hero* of Inkerman was one of themselves—a man who owed nothing to the court, although a gentleman by birth and education; one of their own most trusted representatives in parliament—Sir de Lacy Evans. He had so signalised himself, that never, even in the most heroic ages, and the most heroic nations, was a finer instance of self-negation, patriotism, loyalty, military spirit and courage shown, than by that gallant man. The electors of Westminster, who had so often before had reason to congratulate themselves on their choice of a representative in the Commons, were now flushed with satisfaction and joy at the noble behaviour of General Evans, so eloquently described in Lord Raglan’s despatch. Stray where one might within the city of Westminster, or London, everywhere the name of General Evans was sure to be the subject of popular eulogy. The government and parliament promptly acknowledged their sense of the services of the British army. The Duke of Newcastle addressed a letter to Field-marshal Lord Raglan, from which we have taken the following extract:—

Her majesty is desirous of expressing her gratitude for the noble exertions of her troops in a conflict which is unsurpassed in the annals of war for persevering valour and chivalrous devotion. The strength and fury of the attacks, repeatedly renewed by fresh columns with a desperation which appeared to be irresistible, were spent in vain against the unbroken lines and the matchless intrepidity of the men they had to encounter. Such attacks could only be repulsed by that cool courage, under circumstances the most adverse, and that confidence of victory which have ever animated the British army. The banks of the Alma proved that no advantages of position can withstand the impetuous assault of the army under your command. The heights of Inkerman have now shown that the dense columns of an entire army are unable to force the ranks of less than one-fourth their numbers in the hand-to-hand encounters with the bayonet which characterised this bloody day.

Her majesty has observed with the liveliest feelings of gratification the manner in which the troops of her ally the Emperor of the French came to the aid of the divisions of the British army engaged in this numerically unequal contest. The queen is deeply sensible of the

cordial co-operation of the French commander-in-chief, General Canrobert, and the gallant conduct of that distinguished officer, General Bosquet; and her majesty recognises, in the cheers with which the men of both nations encouraged each other in their united charge, proofs of the esteem and admiration mutually engendered by the campaign and the deeds of heroism it has produced.

The queen desires that your lordship will receive her thanks for your conduct throughout this noble and successful struggle, and that you will take measures for making known her no less warm approval of the services of all the officers, non-commissioned officers, and soldiers, who have so gloriously won by their blood, freely shed, fresh honours for the army of a country which sympathises as deeply with their privations and exertions as it glories in their victories and exults in their fame. LET NOT ANY PRIVATE SOLDIER IN THOSE RANKS BELIEVE THAT HIS CONDUCT IS UNHEEDED; THE QUEEN THANKS HIM, HIS COUNTRY HONOURS HIM.

Her majesty will anxiously expect the further despatch in which your lordship proposes to name those officers whose services have been especially worthy notice. In the meantime, I am commanded by her majesty to signify her approbation of the admirable behaviour of Lieutenant-general Sir George Brown, and her regret that he has been wounded in the action. Her majesty has received with feelings of no ordinary pleasure your lordship's report of the manner in which Lieutenant-general his Royal Highness the Duke of Cambridge distinguished himself. That one of the illustrious members of her royal house should be associated with the toils and glories of such an army is to the queen a source of great pride and congratulation.

To Major-general Bentinck, Major-general Codrington, Brigadier-generals Adams, Torrens, and Buller, your lordship will be pleased to convey the queen's sympathy in their wounds, and thanks for their services.

To the other officers named by your lordship I am directed to express her majesty's approbation. The gallant conduct of Lieutenant-general Sir de Lacy Evans has attracted the queen's especial thanks. Weak from a bed of sickness he rose at the sound of the battle—not to claim his share in prominent command, but to aid with his veteran counsel and assistance the junior officer upon whom, in his absence, had devolved the duty of leading his division.

Proud of the victory won by her brave army—grateful to those who wear the laurels of this great conflict—the queen is painfully affected by the heavy loss which has been incurred, and deeply sensible of what is owing to the dead. Those illustrious men cannot indeed receive the thanks of their sovereigns, which have so often cheered the soldier in his severest trials; but their blood has not been shed in vain. Laid low in their grave of victory, their names will be cherished for ever by a grateful country, and posterity will look upon the list of officers who have fallen as a proof of the ardent courage and zeal with which they pointed out the path of honour to no less willing followers.

The loss of Lieutenant-general the Hon. Sir George Cathcart is to the queen and to her people a cause of sorrow which even dims the triumph of this great occasion. His loyalty, his patriotism, and self-devotion, were not less conspicuous than his high military reputation. One of a family of warriors, he was an honour to them and an ornament to his profession. Arrived in his native land from a colony to which he had succeeded in restoring peace and contentment, he obeyed, at a moment's notice, the call of duty, and hastened to join that army in which the queen and the country fondly hoped he would have lived to win increased renown.

The death of Brigadier-general Strangways, and Brigadier-general Goldie, has added to the sorrow which mingled in the rejoicing of this memorable battle.

The queen sympathises in the loss sustained by the families of her officers and soldiers, but her majesty bids them reflect with her, and derive consolation from the thought, that they fell in the sacred cause of justice and in the ranks of a noble army.

I have the honour to be, my lord, your lordship's obedient humble servant,

NEWCASTLE.

Field-marshal Lord Raglan, G.C.B., &c.

Another communication, announcing her majesty's intention to bestow certain military decorations on the occasion, was also forwarded to the general commanding in chief.

MY LORD,—I have received the queen's commands to signify to your lordship her majesty's gracious intention to confer a medal upon all the officers and soldiers of the army who have been engaged in the arduous and brilliant campaign of the Crimea. This medal will bear on it the word "Crimea," with an appropriate device, a design for which has been ordered to be prepared.

It is also her majesty's desire that clasps, with the names of "Alma" and "Inkerman" inscribed upon them, shall be accorded to those who have been in either, or both, of those hard-fought battles, and that the same names shall in future be borne on the colours of all the regiments which were engaged on those bloody and glorious days.

Your lordship will be pleased to convey to the army this royal command—an additional proof of her majesty's appreciation of its noble services, and her sympathy with its valour and renown.

I have the honour to be, my lord, your lordship's obedient humble servant,

NEWCASTLE.

Field-marshal Lord Raglan, G.C.B., &c.

The Emperor of the French was not less congratulatory to his army; he thus addressed General Canrobert:—

Palace of St. Cloud.

GENERAL,—Your report respecting the victory of Inkerman has excited deep emotion in my mind. Express, in my name, to the army my entire satisfaction with the courage it has displayed, with its energy in supporting fatigues and privations, and its warm cordiality towards our allies. Thank the generals, the officers, and the soldiers, for their valiant conduct. Tell them that I warmly sympathise with their misfortunes and the cruel losses they have experienced, and that my constant solicitude shall be directed to the task of softening the bitterness of them. After the brilliant victory of the Alma, I had hoped for a moment that the routed army of the enemy would not so easily have repaired its losses, and that Sebastopol would soon have fallen under our attacks; but the obstinate defence of that town, and the reinforcements received by the Russian army, have for the moment arrested the course of our success. I approve of the resistance you made to the impatience of the troops who wished to make the assault under circumstances which would have entailed too considerable losses.

The English and French governments direct their serious attention to their army in the East. Already steamboats are travelling the seas with considerable reinforcements. This increase of assistance will double your forces, and enable you to assume the offensive. A powerful diversion is about to take place in Bessarabia, and I receive the assurance that from day to day in foreign countries public opinion becomes more and more favourable to us. If Europe should have seen without alarm our eagles, so long banished, displayed with so much *éclat*, it is because it knows that we are only fighting for its independence. If France has resumed the position to which she is entitled, and if victory has again attended upon our flags, it is—I declare it with pride—to the patriotism and to the indomitable bravery of the army that I owe it.

I send General de Montebello, one of my aides-de-camp, to convey to the army the rewards which it has so well merited.

In the meantime, general, I pray God to have you in his holy keeping.

NAPOLEON.

CHAPTER XLVI.

LETTERS FROM OFFICERS, SOLDIERS, AND CIVILIANS WHO ACCOMPANIED THE ARMY,
CONCERNING THE BATTLE OF INKERMAN.

"Now set the teeth, and stretch the nostril wide;
Hold hard the breath, and bend up every spirit
To his full height!—On, on, you noblest English,
Whose blood is fetch'd from fathers of war-proof."—SHAKESPEARE.

THE correspondence from the Crimea immediately after the battle of Inkerman was most interesting to the British public. Every new account was read with avidity—every heart was strained in yearning sympathy for the surviving brave, and in reverential compassion for the fallen. Perhaps the tidings of the battle of Waterloo alone vied with those of Inkerman in producing this kind of excitement, often as the news of victory had elated the hearts of Englishmen during the present century. A chapter containing the impressions of those who fought, of those who were witnesses, although not actually engaged, and of such as, passing among the victors or the vanquished, obtained information fresh and recent, cannot fail to place many of the events of the dreadful day of Inkerman more vividly before the reader than any history, however carefully compiled and minute in detail, could without such a chapter present them.

We shall first give an extract from the journal of Sir Edward Colebrook, who, in company with Mr. de Lane, Mr. Layard, and Mr. Kinglake, was witness of many of the great events of this war. Sir Edward has printed his journal for private circulation among his friends only, but has obligingly presented the author with a copy. He was not present at the battle of Inkerman, but witnessed the reconnaissances and preparations of the enemy up to the evening of the 3rd. His account of the appearance of affairs just before the attack, proves how remiss the allied commanders were in not more effectually providing against the surprise, and the imminent peril of the greater disaster of a defeat:—"Joining Sir Colin this morning, I found all on the *qui vive*. Signals from the hill on the right announced that the enemy were advancing, and some force was seen in motion along the mountain height. Sir Colin all life at the prospect of action. A couple of guns opened against the hill, but the shells exploded in the intervening ravine, and the Russian showed no desire to bring their fieldpieces nearer. Some skirmishers could be seen pushing forward through the brushwood, but a shot or two from our guns sent them to the right-about. All was silent. We waited patiently to see if this would be followed up by a demonstration in our front, but the ridge remained bare as ever. I rode up the hill to the right,

but the Russians had now quite withdrawn. Their force in the distant valley has certainly been very much increased since my last view, and officers on the hill told me that it has been reinforced during the last two days. Two fieldpieces seem quite unequal to the defence of a position, whose importance is such, that, if carried, our other batteries would be taken in reverse, and Balaklava would be untenable. Sir E. Lyons, whom I met on my return, thought the object of the Russians to-day had been to ascertain whether English or Turks held this important point. It struck me that they wanted to know what guns we had, but the reconnaissance had probably both objects in view."

The following letter was written by a civilian to a friend in the Temple, and is a graphic and faithful account of what fell under his own observation.

Caradoc, Nov. 10th.

"I am on my way home; but as this letter will reach you some days before I can follow it, I take the opportunity of sending you a rapid account of what I have seen since I last wrote. You know, of course, from other sources, that a tremendous battle has been fought, and *how* it was fought. I shall as usual, therefore, relate only what I witnessed myself.

"We were at breakfast on board the —, on Sunday the 5th, when indistinct sounds of heavy firing attracted our attention; and Captain — mentioned that he had noticed them ever since dawn. Of course, the gig was soon manned, and took a strong party ashore. — got a pony, but most of us, myself included, were compelled to walk. After a mile or two, I was obliged to diverge from the rest, as I meant to go in the first instance to my old camp-quarters, there to borrow —'s mare (he had got well again, and had returned to work), and to join him and the general on the field. It was a seven-mile up-hill trudge. The occupation of the valley by the Russians had closed the shortest way (by the telegraph); and the nearest road, moistened by a Scotch mist, had been churned by ammunition-waggons and horses' hoofs into unctuous mud. When, therefore, I had climbed to the crest of the plateau, I cut across country. The fog prevented one's seeing far ahead, but the sharp reports of musketry, and the roar of artillery, were quite enough to mark the direction, even without the stream of French and English soldiers,

bearing on their backs, and on stretchers, the wounded to the rear. I did not stop to question these men, but tried to read in their faces the fortune of the day. They all looked grave, and behaved with a silent, manly propriety, in good keeping with their sad office; but quite at variance with the stories one reads of the conduct of soldiers when relieved, as these were, from surveillance.

"On arriving at the road which leads to my old quarters, I found it full of waggons carrying ammunition to the field, and wounded from it. But I was surprised to perceive, when at last (about one) I arrived, that my friend —, and a brother aide, instead of being in the thick of the contest, were in camp. Their looks showed that something wrong had happened, and I soon heard, with great concern, that poor general — had been badly wounded, and was then lying, faint from loss of blood, in what used to be my tent. A shell had also hurt, but not severely, —'s knee. Both my friends were naturally absorbed in devising means for conveying their gallant chief to some place where he would be more fitly sheltered than under canvas. But they found time, in a few hurried words, to describe the carnage which they had witnessed, and pointed out the spot (easily visible from the tents) where the battle had raged the most fiercely. No nag, of course, could now be lent me, nor was there any one whom I could join in the field. The fight, however, had become purely one of artillery; and the best point of view—as well as the safest—for seeing the practice on both sides, was some position opposite the centre of the line of fire. Having ascertained that a place called the Five-gun Battery (in reality the right Lancaster Battery), answered to this description, I decided on going there.

"The Five-gun Battery is between the Round Tower and the tents of the second division. It commands the best view I have obtained of Sebastopol; and, now that the fog had cleared away, the city appeared to great advantage. There was a mound behind the battery, four or five feet high, so situated as to conceal persons lying down under it from the Russians in the field, but not from the garrison in the town. Nor was it quite steep enough, I should think, to have stopped a rolling round-shot from any direction. Though, however, both the enemy's field-artillery on our right, and the fort and ship-guns on our left, commanded the position, our party was too small to be much noticed. It consisted of General England and his staff, and a troop of horse-artillery. The horses of the latter, which the mound could not conceal, were probably the occasion of the very few missiles that actually lit near us. The Round Tower was firing over our heads at the allied armies. The Russian park of artillery, on the

other hand, had enough to do with the antagonists before them, who, already (it was not quite two o'clock) were slowly gaining ground. In fact, the only narrow escape I had, was from a shell, which did me the honour to burst within a few yards of me, when my ears were, for the first and last time, regaled with the peculiar *hum* which marks the near approach of the flying fragments of those uncomfortable projectiles (I picked up a hot bit as a memento). Still, though we were comparatively safe, I was amused, considering all things, by the politeness of an officer present, who on lighting his cigar from mine, expressed an artistic regret that he should 'spoil so beautiful an ash!'

"At this time, the aspect of the battle, as seen from our position, was as follows:—Two large bodies of the allied troops stood, or rather lay, close before the foremost tents of the second division, a little below the long low rounded outline of the hill on which these are pitched, and which, on its furthest side, descends to the Tchernaya. Another mass occupied a place (as seemed to me) about a hundred yards in advance, on the very profile of the hill. The whole of this ground, I should tell you, rises gradually for two or three hundred yards in front of the tents. Crossing the highest portion of its outline, was a fourth body of the allies. The ground then makes a dip for about four hundred yards, when it makes another gradual rise of the same rounded character, until it reaches an elevation somewhat higher than the hill occupied by the French and British troops. Here I counted six bodies of the enemy. I suppose the two armies were seven or eight hundred yards apart. All parties were pounding away with their artillery, and the wind carried off the smoke, so that we could clearly see the spectacle. About three, the allied troops gradually advanced, till their foremost park of artillery occupied the bottom of the valley between the two hills. In half an hour more, the Russians were in full retreat towards Sebastopol. I could see them in their long grey-coats marching past us, with their arms shouldered, and in good order.*

"My sketch of the ground was now completed, the victory won, and I got up and prepared for my long trudge, so as to be in time for dinner on board the —; but I had not walked many paces, when one of our regiments was brought forward past me, to fire at the retreating foe. Stretchers were being carried behind them; and though I had often seen such implements used in carrying the wounded, I confess it gave me a shock to see them borne close behind these soldiers, now walking well and erect, their faces full in my view—in *anticipation!*—an anticipation soon

* A little later in the day the enemy lost all order; their retreat was a discreditable flight.

realised. Directly they arrived at the place where I had been lying, it seemed alive with round-shot, throwing up the dust in all directions; while the stretcher-bearers were running here and there—I knew too well for what reason. It did also occur to me (why will thoughts cross one at the wrong times?) that, perhaps, it was lucky for a certain person that these poor fellows did not come up before; that had that happened, he might have presented himself at a particular nook of the Temple with a wooden leg; but with no honours, no pension, to show for it—only sharp shafts of ridicule, and ‘*Que, diable, allait-il faire dans cette galère?*’ Ah, ha! you have lost that triumph! But to return—a very long way—the Lancaster gun in front is said to have done good service at this juncture, by mauling the retreating columns of the enemy. I confess I looked hard with my glass, and could see no gaps made, nor any approach to unsteadiness. That however proves nothing; as a battle is such a huge complicated affair, and there is so much difficulty in getting a full view of it, that it is only by comparing the accounts of a large number of witnesses, that a correct notion of the whole can be obtained by any one. As I had to return in time for —’s dinner, I could not, as some of my friends did, go over the field that evening. It was dark when I got to Balaklava, and, as usual, a boat was not to be had for love or money. A *deus ex machinâ*, however, at length appeared, in no less a person than Admiral —, who kindly gave me a seat in his gig. His Turks rowed so well, that my contempt for the tribe was in complete abeyance till I got on board the —. Here I was rejoiced to learn that the general had been safely brought. His cot was swung between two great guns, with a curtain drawn before it, in the cabin where we dined. Every one was glad when, during our dinner, he rallied from his loss of blood sufficiently to put in now and then a word from behind his screen. He was lying in the cot I had myself slept in up to that day. Is it not a curious string of coincidences that, when wounded on the field, he was given to drink some weak brandy and water, which I had mixed for the purpose of giving the wounded at Balaklava (the flask being part of the kit I had sold to one of his aides), that he was next put upon the stretcher and in the tent that had belonged to me, and that he was now lying in the cot which I had occupied?

“The morning after the fight, I again walked to the front, and went over a portion of the field. No English wounded, I rejoice to say, were visible. I made many inquiries of the stretcher-bearers, while they were engaged in picking up those Russians who had

lived through the night, and from what they told me, I infer that all, or nearly all, our poor countrymen were removed the evening before. The slope on the other side of the tents is not very steep: in fact, a pony which I had borrowed in camp walked up and down it quite easily. There was a good deal of low oak scrub, but it was not thick enough to prevent one picking one’s way through the place. Our men were digging large pits for burying the dead. The horrors I had heard of as having been witnessed on the field by those who went there directly after the action, were to a great degree abated. The Russians who yet survived were too faint to do more than groan faintly. They seemed grateful, poor fellows! when I gave them small portions of brandy from my flask; but, as I had not tempered it with water, and wished to distribute it as widely as possible, I poured out only a tablespoonful for each man. It might, perhaps, have served to keep them alive, after the cold night, till they could be taken to hospital. I could see comparatively few English and French among the dead. The former, as you know, fought in their grey great-coats, from their not having been time to take them off; and the inconvenience which this occasioned, by confounding friend and foe, will, I should think, cut short the clamour against the hue of our line uniforms. Those writers at home who have been running at red, like mad bulls, ignore the circumstance that the French—pretty good judges in such matters—make their infantry wear trousers of the same colour. No doubt, it is an inconvenience for troops to be seen plainly by the enemy; but it is a greater one not to be seen plainly by their own comrades; especially when, as happens in our case, the latter shoot the best of the two. Many of the Russian dead had been stripped, and appeared to be good specimens of men. Most of them had blue eyes, regular features, coarse brown complexions, and averaged, I should say, rather more than the height of Frenchmen. They were provided with what looked like little bolsters, but which were really bags of crumbled brown biscuit. It did not taste bad, and I suppose it is given them broken up for the purpose of being made more readily into porridge. Each man had four days’ provisions—a circumstance which, with the fact of their having brought gabions and fascines, shows how confidently they expected to establish themselves on Sir De Lacy Evans’ position. The attitudes of the dead were most startling. I think I told you that I found the hussars, who were sabred by our heavy dragoons at Balaklava, lying flat on the ground. Here, on the contrary (and the same is said to have been the case at the Alma), the dead were strewed about in every imaginable pos-

ture. Arms were stretched upwards, as if warding blows, or dealing thrusts. Bodies were half-raised; the head bent forward, the nether lip bit in, the eyes open—but for the glassy stare and marble feet, you might have thought them springing at your throat! The suddenness of the stroke had fixed the last moment of volition. Those who had bled to death lay placidly.

"You will have heard of the atrocities committed by the enemy on the wounded. As I returned from the field, I met two or three hundred prisoners being taken into Balaklava, upon whom, as they passed, all kinds of abuse were being lavished by our men. I saw one of these Russians, in particular, signalise a private who was smoking to give him a light; but it was refused with the most hearty maledictions. Now, as vindictive feeling towards the conquered is the very last sentiment that enters the breast of an English soldier, these are symptoms of the extent to which the barbarities in question are beginning to inflame the minds of our army. Let the irritation go on a little longer, and 'quarter' will be unknown.

"On the 8th I obtained, by Captain Derri-man's kindness, a passage in the vessel from which this is dated. She is bound for Constantinople, whence, as I have not time to deliver my letters at the Embassy, I shall proceed at once to England. Dining on board her, before she started, were the Duke of Cambridge and his staff, General Bentinck (wounded in the arm), Major Nasmyth, and others. H. R. H. mentioned many interesting circumstances connected with Inkerman, and told us that a ball had penetrated his overcoat, but had glanced off in consequence of striking against a gold cuff-button of his shirt. He was suffering from aguish symptoms, but looked well, considering the amount of rough work which he had gone through.

"About nine p.m., I saw the last of the—. On board her were all those to whom chiefly it was due that my visit to the Crimea was an enjoyable one."

An officer of Sir George Cathcart's division, who was on duty in the trenches the night of the 4th, and the whole day of the 5th, describes the anxiety and suspense felt by him, and those similarly situated to himself, during the dreadful hours through which the battle raged, and the scenes he witnessed when, released from trench duty, he returned to the tents:—

"The only account we received on the right of the trenches was, that the fourth division was engaged, and that its gallant general had fallen: but we could gain nothing further that day, until our rations were sent to us the following morning, with orders to remain on

duty twenty-four hours more, when the sad truth was revealed. The total loss of my regiment was—1 officer, 2 sergeants, 10 rank and file, killed; 8 officers, 17 sergeants, 1 drummer, 104 rank and file, wounded; 28 rank and file missing. We were much disappointed at not being relieved from the trenches, and enabled to see our poor wounded brother officers. We were sitting down in despair when an order came from Brigadier-general Eyre, in command, that the fourth division were all to be relieved. This news was most welcome, and we hurried home; but, what did our camp look like? All was disorder, and groans poured forth from the tents, and came piercing on our ears. I went into my tent, and found my friend and messmate, K—, in bed; but, as usual, in capital spirits,—and I congratulated him sincerely on his narrow escape, for one inch more and his shoulder-bone must have been smashed. I then continued my visit to the other tents, and found many sufferers, though none appeared in immediate danger: there was, indeed, great hope that all would recover.

"Poor Dowling had, however, received a mortal wound, and his body was found on the field that day (6th), stripped of all but his flannel shirt: his watch had been taken from him. His wound was through his forehead, and his death must have been instantaneous, which was some comfort to know—as those savage barbarians with whom our brave fellows had to contend, were not content to see them on the field wounded, but took advantage of their helplessness to bayonet and mutilate their bodies in the most frightful and barbarous manner.

"Several of our men died: they had fewer comforts than the officers, and certainly their case was more pitiable; but they received every attendance and care which it was possible to afford under the circumstances.

"The melancholy duty of burial over, we returned to camp, a hundred yards below, and heard from our officers and men their own anecdotes of escapes, and the deeds done that day. The colonel had some slight wounds, and his sword and brass scabbard were crumpled up like paper by a shot: a bullet had actually struck the plate of his belt without hurting him. Colonel C— had the fore-finger of his right hand much shattered. Captain B— had a shot through the upper part of his arm, but this did not prevent him from continuing to command his company, the Grenadiers, and bringing them out of action. Major S— received a bad wound in his back from a wounded Russian, whilst leading his company, but the ruffian who inflicted it had his brains blown out immediately by S—'s right hand man. Captain W— received a contusion,

which laid him up for some time. Lieutenant B—— was supposed to have received the most serious wound of all in his back, and when he was carried home and lifted out of the stretcher, a ball was found on it. Lieutenant P—— had his ribs blackened by a ball. K—— also told me, that when he came to his senses he found himself in a most perilous position, the bullets whistling about him. He therefore managed to crawl behind a small stack of hay; but had scarcely left his former position when a cannon-shot struck the place, and killed another wounded man just beyond him. It was most fortunate that he escaped the Russian bayonets. Soon afterwards he was taken to his brother-in-law's tent in the light division, and was able to ride home on his pony. On the 6th, Captain G—— and H. D—— rode over to see him, and sat with us in our tent for some time.

"We were much shocked to hear of the death of Sir R. N——, of the Grenadier Guards. He belonged to the same county as ourselves. We met him often in the camp, and he lunched with us but a few days before the battle. His kind disposition endeared him to all who knew him, and his sad fate will be long and deeply lamented.

"The manner in which the enemy's fire was kept up was wonderful; and Brigadier-general Pennefather, who had seen other fierce battles in India, said that he had never heard anything like it before. This gallant officer was also heard to say, 'I shall never forget the left wing of the 20th regiment;' this, coming from such lips, was highly complimentary. The wounded were being brought in on litters this day, and large parties were sent to bury the dead. Wounded Russians were also brought in and placed in a yard not far from our camp. The loss of horses was enormous, and I heard that sixty artillery-horses alone had perished.

"Lieutenant Duff, of the 23rd, was taken prisoner on picket, on the morning of the 5th, together with some men. A strange circumstance is connected with his capture. When he saw that all chance of escape was over, he threw his watch into the cave where he was, or placed it under a stone. Some time afterwards he wrote to a brother officer from Sebastopol, and told him to go to the cave for the chance of finding it there. The officer accordingly went there, and secured the watch for his friend.

"The enemy were very expeditious in getting their guns up, and were on us before we knew where they were. A great deal of this was to be attributed to the arms of the men on picket being drenched with rain, and not going off in sufficient numbers to give timely alarm."

The following was written by Captain Kingcote to his father, Colonel Kingcote. The

letter, in a literary sense, is without merit, and gives a very desultory account of the action; but as the captain was on Lord Raglan's staff, and rode beside his lordship throughout the day, it derives importance from that circumstance. He gives a particular account of the narrow escape of the Duke of Cambridge, and the intrepid conduct of Dr. Wilson, whose conduct was perfectly heroic upon the occasion. Colonel Kingcote relates a circumstance, not in his son's communication, that a Russian battery kept moving about in the direction of Lord Raglan and his staff, and this is made to account for the death of Strangers, and the narrow escapes of his lordship's aide-de-camps. It is very much to be doubted whether the Russians paid such very particular attention to the British commander-in-chief, for the fog was so thick during the greater part of the action, that it was impossible for the enemy to take such precise aim against his lordship. The risks incurred around his person were less than those around the person of any of the generals of division or brigade; but so dreadful was the artillery-fire of the enemy, and so long and so closely did the battle rage, that no position was exempt from danger, and death was busy everywhere. The captain does no more than justice to the calm and dignified bearing of Lord Raglan, who, during the Peninsula war, when attached to the staff of his kinsman and great chief—the Duke of Wellington—frequently attracted the notice of that illustrious commander by his imperturbed courage. Captain Kingcote is not correct in his assertion, that no men were drawn away from the trenches. To remove any thence was, however, most hazardous. It is somewhat surprising that an aide-de-camp of Lord Raglan should be so indifferently informed as to represent the two-gun battery as being held through the day only by the Guards. Some *lapsus penne* must account for this. The various troops by whom the battery was held, as the successive storms of battle burst over it, are mentioned with accuracy in the narrative we have given. With these qualifications, Captain Kingcote's letter will be read with interest. A less "rollicking" style would have been more becoming the subject:—

Head-quarters before Sebastopol, Nov. 8.

"Your letters of the 17th reached me on the night of the 5th, after, as you will have heard by the electric telegraph, we have had a more severe engagement even than at Alma, having been attacked about 6.30 A.M. on our right by the enemy in immense force, almost before we were prepared for it, as it was a foggy morning, and they were able to bring their guns up the heights unseen by our pickets. Our second division being on the ex-

treme right, were first engaged, the brigade of Guards coming up immediately, and the fourth division following. The Russians sent up masses, column after column, at the same time keeping up a terrible fire, the ships also throwing shells at a terrible rate. Our men shot away nearly all their ammunition, and had to retire at several points. On the extreme right there was a small redoubt with two embrasures, but the guns were not in it; it was held by the brigade of Guards, and three times did masses of the Russians come up to it and regularly surround it, and were driven back. The fourth time they came up, our men were obliged to retire, so few being left; but, some more coming up, it was re-taken immediately, bayonets being crossed in every direction. Two French regiments came up, shortly followed by a brigade, and then another with artillery; but still the Russians came right up to our guns at our centre, but were compelled to retire with great loss, though their guns still kept up a tremendous fire. We then got up two 18-pounders, which made beautiful practice, and cleared the heights; we were not in a position to follow them, but the French followed, and sent them away a little faster, it being about four P.M. before all firing was over. Our loss has been dreadfully large. (Captain Kingcote here states the loss.) The French lost about 1400. Poor Sir George Cathcart was killed. Charley Seymour, also at the same time at his side, was wounded and bayoneted by the Russians. Poor General Strangways was shot through the leg when riding by Lord Raglan's side, and died shortly afterwards. Paulet Somerset had his horse killed under him, but, further than his leg being bruised from the horse falling on it, was not hurt, and I am thankful to say none of us were touched, though we were under heavier fire, and for a considerably longer time, than at Alma. How we escaped I know not, but, thank God, we did so. The poor brigade of Guards suffered most severely, our regiment less than the other two, as far as officers went. The Coldstreams had eight officers killed and five wounded; the Grenadiers, three killed and three wounded. Our regiment one, poor Blair, killed; Colonels Walker, Hughes, Drummond, Gipps, Baring, and Blane, wounded, but none at all dangerously, I am happy to say. We furnished several pickets, which took off several officers. By the despatches you will have a far better account than I can give—and a more correct one—and you will see the terrible list, which makes one dreadfully melancholy to write or think about it; and, as I know no officers, either killed or wounded, that you know in particular, I shall leave you to see the names in the papers. The escapes every one had, the way small bodies of our men

were surrounded and cut their way out, and such like stories, would fill volumes. The Duke of Cambridge was quite surrounded once, and, had it not been for Dr. Wilson (who was in the 7th Hussars) drawing his sword, and cheering some men on, I believe he must have been taken* or killed. The brutes of Russians bayoneted our wounded men on the ground, and many lives were lost in that way. A letter has been sent to Menschikoff, from Lord Raglan and General Canrobert, in remonstrance, which I hope will be of some use. The Russians have suffered tremendously—some estimate their loss at 15,000, no one under 6000 or 7000. People said they never saw the dead lie so thick as they did at Alma, but here they lie three times as thick; and, round the redoubt I mentioned, which was unenclosed, and held by the Guards, they lay literally in heaps—lying dead in the embrasures, having been bayoneted—so it shows how they fought. Our men, at one time, being out of ammunition, actually flung stones at them. Not less than 50,000 infantry came against us, and, from what we can make out, not more than 7000 of our men were engaged; so it shows how nobly they fought; indeed, beyond all praise. From what the prisoners say, it appears that most of the troops were a new division, brought up from Wallachia and Bessarabia by forced marches in waggons and conveyances of all kinds; that one of the grand-dukes had arrived and upbraided the general for not attacking us, holding out threats of Siberia, &c. Up they did come at us, and most determinedly, too, and well they know how to bring up their guns, and where to place them; and another thing, also, they know how to get them away; though they left six or seven tumbrils and more than sixty dead horses, with one limber, yet they got every gun away. Their great strength is in artillery, which is of very heavy calibre. Their infantry fought better than I thought—but then they were fresh troops. The field of battle was covered with thick, stunted brushwood up to one's waist. Our men had their great-coats on, unfortunately, as they were turned out so early, whereby many mistakes arose. The French came in the nick of time, and fought well; the artillery and the Zouaves particularly. General Canrobert was in the thick of it, and helped us nobly; General Bosquet also. Now, indeed, there can no longer be any doubt of the French and English fighting side by side, as I saw many of our men lying dead by a Frenchman's side, and they carried off our wounded, and we theirs.

"The Turks were not engaged, but we make them useful in digging, &c. The enemy made a feint on Balaklava, and a very poor

one. Owing to our loss, the generals have determined to fortify the right very strongly, and to wait for reinforcements before they attack the town; and if, as we hope, we can make a battery to command the Inkerman, we shall stop their force by that road, and it will be near towards investing the place, as they will have only water communication left. We are to keep as quietly as possible at the siege, to save ammunition. Had they not had a tremendous licking they would have attacked us again before this, and at present they seem to have retired towards the Belbek. I suppose we must make up our minds to be here for the winter, or until we take the town, and I hope some time or other we shall clear the Crimea of the Russians; and, depend upon it, some day or another they will get paid out, after we have licked them, by our being in a position to follow them up, and make their retreat a regular flight. They went away in great confusion the other day, and they actually brought fascines and gabions to make a lodgment. The prisoners say their force is 120,000, but that cannot be true. I am afraid my description is very bad, but you will see plenty of others. Every one had wonderful escapes the other day. A shell pitched on the flap of my saddle behind my leg and sword, which it bent, fell on the ground, where I saw it fizzing, but before I could kick my horse out of the way it burst, without touching me or my horse. Why the horse's ribs were not broken I cannot conceive. I rode Fusileer again until two o'clock, when my other came up, Fusileer being done up and lame. He is all right now. Lord Raglan rode Shadrach the whole time. Charles and Yates are both quite well. Of course every one is cut up at losing so many good fellows, but officers and men are particularly cheerful, and ready to be at them again. Even though we have licked them so tremendously, it does not seem so great a victory as the Alma did. But then one was new to it, and it was the first flush of victory. I never saw anybody so beautifully calm and collected as Lord Raglan during the whole fight, and there were many anxious minutes for him, our force being small, and we did not dare draw any man away from the trenches and our left."

The next letter is from a bombardier of the Royal Artillery, and describes the efforts and sufferings of that arm of the service:—

Scutari Hospital, Nov. 15th.

"DEAR WILLIAM AND KATHERINE,—I take this opportunity of writing to you these few lines, to let you know that I am well in health, thank God! hoping when this reaches you it will find you in the same. My dear brother and sister, I am sorry to inform you that I got wounded on the 5th inst. from a

round-shot striking me on the outside of the left ankle while engaged with the enemy. They commenced about six o'clock in the morning, and did not finish till about a quarter to four P.M. I got hit about half-past twelve, but was treated very well by the officers of the 55th regiment, who dressed my ankle for me, gave me blankets to lie upon, and as much brandy as I wanted. About six A.M. we were aroused by a fire of musketry; our battery being on duty, we were hooked in and ready. We then moved up to the support of the infantry, and came into action front, there being about fifteen to one of infantry, and six to one of artillery against us. Their motive was to force our position (which was a strong one) and gain our heights, which, if they had, good night to us, as they have got their Danubian army in our rear and right, and a very strong force in Sebastopol. Dear Bill, I hope you will return an answer by the first mail, and give me all the news and a paper, for I am beginning to weary already. I wrote about the battle of Alma, but I can assure you that it was child's play to that of the 5th. We had only three batteries (eighteen guns) to keep them in check for about four hours—viz., Turner's, Franklin's, and Woodhouse's, and horses, wheels, limber-boxes, and men were strewed about in all directions. We were then supported by twelve guns from Captain Paynter and Captain Thomas's old company. We kept firing shot and shell, but to no effect, for on came their infantry till within 100 yards of us. Our battery got the word to limber up and retire, but it was of no use; we were determined to give them a parting dose; so my gun and the one next to it loaded with common case, and gave it to them, causing them to stagger and turn. They were then within thirty yards of us. Our infantry rallied, cheered us, and charged them. They then retired in great disorder, we pitching into them as fast as we could load our guns. Their artillery then opened on us, doing great execution. This continued for about an hour and a half, when up came their infantry again in masses. Our infantry had fired away all their ammunition, and could only keep them back by throwing stones at them. However, we opened fire on them again, but we were forced to limber up and retire, not till our battery lost three guns (left half-battery). My gun had a very narrow escape, six of my gun numbers and four horses being unfit to do anything. Lieutenant Broughton, two others, and I had to limber up the gun with great difficulty, the Russians being only five or six yards from us. We retired about 150 yards, and were met by the French artillery and infantry coming to our support. It would have done your heart good to hear the cheering and to see shakos,

red nightcaps, &c., tossed in the air when they passed us. Then it was that the enemy caught it in earnest. The French retook our left half-battery from them and drove them back from the heights. Very shortly after that, while going to change a broken wheel, I was struck, and carried to the rear half-an-hour afterwards; the wounded were sent on board ship. I arrived in Scutari on the 9th, and, as the mail went on the 10th, I wrote to Hannah. Dear brother and sister, I hope you will cheer her, and tell her that I am not badly hurt, and also hope to see all very soon. I saw M'Gooney about a week before I met with this, and he was then in good health. It was getting very cold in the Crimea when I left. I think Sebastopol will fall this month. I will try to remain for a month or six weeks in hospital, so as I shall be able to receive an answer to this letter from you. Dear Bill, if you can send me a paper with an account of the battle of the 5th I shall be very glad, because, while Sergeant Henry (who was bayoneted at his gun) and I were lying on the ground, Dr. Perry and the captain came and visited us, and told us both that he would not forget either of us for our bravery, and I expect he has spoken to the general about us. My kind love to you, Katherine, and Margaret. Please tell Hannah and the children I hope to see them soon, crowned with laurels. About 9000 of the enemy killed, wounded, and prisoners. Hoping to hear from you by return of post,

"I remain your affectionate brother,

"A. BISHOP."

The following letter is from a British officer who was on picket; it confirms the suspicions entertained by the British, that the cruelty of the Russian soldiers was at the instigation of their officers—at all events in some cases:—

Camp before Sebastopol, Nov. 7.

"The action on the 5th lasted about nine hours; nearly all the available English and some of the French were engaged. The Russian loss was very great indeed. We also suffered very much. I was commanding a company in support of the pickets; when I went out I had fifty men, and when I returned twenty-three were absent! I was not hurt, but a musket-ball passed between the lining of my forage-cap and my head, just cutting off a little hair, without injuring the skin. They fire very badly—up in the air. They always kill the wounded; I saw them myself. I saw many English bayonet the Russians in grand style. Alma was a joke to the fire we were under part of the time. The say in the camp that the Russian loss was about 20,000 men; that may be a little over, but it was certainly prodigious—they cover the plain everywhere.

My company and our light company behaved splendidly. I made use of Dean and Adams three times. I was about to fire another time, when the Russian threw down his musket, and I took him prisoner. We asked some of the prisoners how it was they murdered our wounded; they replied, 'it was by order of their general.' I saw one ruffian at some distance kill a wounded man; I fired my rifle at him and knocked him over. The Guards were hard pressed, and behaved as guardsmen should, but they suffered very much. If government do not send out clothing and great-coats soon, our poor fellows will be badly off. The medical department has been sadly deficient."

As the Guards bore so prominent a part in this battle, it is appropriate that a letter from one of the soldiers of that brigade should be cited. In that which is furnished to our readers, ample notice is taken of the gallant conduct of the Duke of Cambridge, whose heroism at Inkerman can hardly be too much lauded:—

"We have had another general engagement, on the 5th of November. Well shall I remember that day. I ought never to forget the goodness of God in bringing me off the ground safe and without a scratch. And now I will endeavour to give you an account, as far as I am able, of the battle; but I must tell you that on the night preceding the battle it was very foggy, and the morning was misty. The Russians availed themselves of it. A strong force, about 40,000 men (we are informed), under the command of General Osten-Sacken, from Odessa, with numerous artillery, got possession of some heights, and when the mist cleared away opened fire, drove in the outlying pickets, and got possession of the hills overlooking the second division tents. It was about a quarter past six A.M. When the firing commenced I was just up, and saw the second division falling in. Some men were killed in front of their tents. We fell in anyhow. We had only six companies—two on picket; the Grenadier Guards, five companies, and I believe, the Coldstream Guards, seven companies. The brigade of Highlanders are guarding Balaklava; the second division is encamped on our right. We went up, and a fearful sight it was in going through the second division encampment; the shells were bursting over our heads, and the cannon-balls rolling through us, knocking down tents, and poor bāt-horses were knocked to pieces by them. We were, of course, all taken by surprise, finding the enemy being so near, and had gained possession of a redoubt; and the Duke of Cambridge, with only the Guards and two companies of the 48th, said, 'You must

drive them out of it.' Well, then, they were only twenty yards from us, and we were firing at each other. The pioneers and drummers, with the stretchers, were told to find the best shelter they could, and so I myself, with our drum-major, were lying down behind a small bush, and we both expected every moment to be shot, the bullets actually passing within a few inches of our heads, and breaking off the branches over us as we lay there. Well, they succeeded in driving the Russians out of the place, and got them down the hill, when they were ordered to retire. They retired, and the Russians came up with redoubled strength, and completely surrounded us. The Russians took possession of the redoubt. The Duke said, 'They must come out of it again.' The Russians cheered, as also did the Guards. Things now looked desperate, as we had no support, except the Almighty, and He defended the right. At it they went, and for half-an-hour things seemed to favour the enemy. We were all surrounded—no getting out. The Grenadier Guards nearly lost their colours; they had only about forty men to defend them. We gave another cheer, and out of the redoubt they went again, and the Grenadier Guards managed to keep their colours. We drove them out at the point of the bayonet down the hill. The Guards were ordered to retire again, but would not, and, in fact, could not; if they had got down this steep hill, they could not have got back again well. The brave French came up to our assistance, and kept them at bay while we retired and got our ammunition completed, and then the brigade of Guards were formed into one regiment of six companies, and at it we went again, and by this time, plenty of assistance coming to us, we managed to do them, but at a great loss to us. Officers behaved bravely. The Coldstreams had eight officers killed on the field; the Grenadiers, three officers. Only picture to yourself eleven officers being buried at one place and time! There was not a dry eye at the funeral. We had Colonel Walker wounded in three places. Colonel Blair died, and was buried to-day. He had only joined three weeks ago. He was shot in the breast. Our adjutant, Captain Drummond, Captain Gipps, Colonel F. Seymour, and Mr. Elkington, were all wounded. Colonel Ridley and Colonel Dalrymple left us to-day, sick. We have scarcely any officers now left. We had two sergeants, four corporals, and thirty-one privates killed on the field, and eleven have since died of their wounds.

"The brigade of Guards now would not number one regiment. After I had had some supper, and helped myself to a drop of rum, I went and helped the doctor to dress the wounds of

the men—an awful sight to see; but I can stand anything now, I am as hard as a flint. I have some of the poor fellows' blood on my hands now, and I am sure you cannot form any idea of a field of battle without you actually see for yourself. If I am spared to come home, you will never believe my stories."

A correspondent of the Parisian journal, the *Presse*, communicated some remarkable information concerning the Russian preparations for the battle:—"The new reinforcements which have come to the assistance of the Russians had been already announced to the commander-in-chief from Perekop. It was known that this army, commanded by General Dannenberg—the most able, we are assured, of all the Russian generals—and by the two Archdukes Michael and Nicholas, was composed of the 10th, 11th, and 12th divisions. Each of these corps consists of sixteen battalions of infantry, of two batteries of artillery, and of a force of cavalry, the number of which is not accurately known. Altogether, 30,000 men have arrived at Sebastopol, post-haste, having left their baggage behind at Nicolaieff. Having reached a forest two leagues to the north-east of Sebastopol, the army halted, and the two archdukes put themselves in communication with Prince Menschikoff, who paid them a visit. A council of war was held on the 3rd, at which the two archdukes, Prince Menschikoff, and General Gortschakoff, were the only persons present. It was decided at the council that an attack should be made upon the allied forces two days afterwards. The army was to advance towards Inkerman, to take possession of the fortified works which crown the heights, and surround the plain of Inkerman. After having accomplished this, the army was to attack the eastern side of the French works towards Balaklava. At the same time a vigorous sortie was to be made to help these operations. The point chosen was a spot between the Fort Quarantine and the Southern Fort. A portion of the garrison of the city and of the southern port was to attack and destroy the first and second French batteries, which are causing considerable damage in the town. Matters being thus arranged, Prince Menschikoff reserved to himself the command of the town and the disposition of the columns which were to make the sortie. The army and the reinforcements which had come up were placed under the command of General Gortschakoff. The army of operation was to receive also draughts of troops from the garrison of Sebastopol. The archdukes were placed on the staff. Measures were immediately taken to insure the due execution of these plans. On the 4th a solemn celebration took place. A mass was chanted with all due solemnity by bishops who had come with the archdukes. At the

end of the mass the troops were assembled, and one of the prelates addressed them. I should have been incredulous as to the details which I am about to communicate had I not received them from a Russian officer, at present a prisoner at Balaklava, and if they had not been confirmed by special investigations which I have made for the purpose of ascertaining their truth. The bishop began by reminding the soldiers of their duty to the czar and their country, and drew their attention to the two archdukes, who had come to share their dangers. He then spoke of their enemies, and gave an explanation of the battle of the Alma calculated to flatter the self-love and to elevate the courage of the imperial army. The English came under the special notice of the bishop. He said they were poor soldiers, destitute of all energy, and hostile to the cause of God. His allusions to the French were a mere echo of the proclamation of the czar at Moscow in the year 1812. The most remarkable point, however, was the strange conclusion of the address:—‘If you are conquerors,’ cried the bishop, ‘great joy is in preparation for you. We know from unimpeachable sources that these English heretics have in their camp an enormous sum, which God will give into your hands. This sum amounts to 30,000,000 roubles. The emperor makes you a present of

the third part of this tremendous sum. The second third is reserved for the purpose of the rebuilding of Sebastopol, which you are on the point of relieving. The remainder will be divided among the princes and officers who will to-morrow be your commanders in the battle. Every one of you soldiers will receive 580 roubles. To the wounded the emperor promises a month’s pay and rations. As to those of you chosen by God for a glorious death, your emperor will permit you to dispose of your share in the booty by will. Whatever may be the wishes of any of you, they will be respected solemnly.’ The speech was terminated by an appeal to the God of armies to bless the soldiers of Russia. A distribution of medals and coronets followed. The officer who has given me these curious details is a person of high family, with a spice of Voltairianism in his composition; but he assures me that the scene was almost sublime. It was calculated to make a great impression on the soldiers, on whom the recollection of the battle of the Alma had operated most prejudicially. Whatever may have been the cause, whether it were the exhortation of the bishops, the presence of the princes, greed for gold, or any other reason, there is no doubt that the Russians fought most admirably on the morrow.”

CHAPTER XLVII.

THE FALLEN HEROES OF INKERMEN.

“Far brighter the grave or the prison
 Illumin’d by one patriot name,
 Than the glory of all who have risen
 On liberty’s ruins to fame.” MOORE.

NEVER did men deserve better of their country than those who fell on the fatal hill of Inkerman; for their bravery, devotion, and death, are embalmed in their country’s memory. In another part of this History faithful memoirs of some of these men will be found, sketching their military career up to the breaking out of the war: their conduct from the landing at Gallipoli to the gloomy morning of Inkerman, will be found in the general narrative of the events which transpired during that period. Sir George Cathcart, Generals Torrens, Goldie, Adams, and Strangways, had their part in our brief record of the leaders of the host; but there were many who fell that day of humbler rank, who were scarcely inferior in genius, and not at all inferior in valour to those noble chiefs. Of these we now give such sketches as our space allows.

LIEUTENANT-COLONEL CARPENTER, who fell at the head of the 41st regiment, was one of those whose life was most signally sacrificed to

his country’s service. He was the only son of General Carpenter. He entered the gallant 41st as an ensign, on the 1st of October, 1818, was made lieutenant in a year and a half, purchased a company in five years after he became lieutenant, was named major by brevet after the long interval of thirteen years, purchased a full majority in seven years more, and in 1850 attained to the rank of lieutenant-colonel, after having served thirty-two years. When brevet-major, he served with his regiment in the Affghan war, where it fought and suffered much. He took part in the contests at Candahar, Ghuznee, and Cabul, and was in many minor actions during that war. In the expedition to Kohistan, Major Carpenter bore a part, and in the storm and capture of Istaliff. The Bolan and Khyber Passes, where petty but dangerous and adventurous contests gave officers and men opportunities of showing their personal prowess, witnessed also the good conduct of this gallant soldier. At Alma the 41st suffered very little. At Inkerman, as we

have shown in a previous chapter, the regiment was engaged in the hottest of the fight—five officers, two sergeants, and thirty-two rank and file were killed; six officers, four sergeants, and nearly ninety rank and file were wounded—the regiment was decimated. Bravely fighting at their head, Colonel Carpenter fell cheering on his men to the charge. When the 41st were compelled to retire from the two-gun battery, so dense was the smoke that the men could not see where their beloved commander lay, and therefore could not carry him out of action. The regiment, reinforced and supported, retook the battery, but found their colonel, who was not mortally wounded when they retired, pierced with several bayonet wounds, and his face and head beaten with the butts of the enemy's muskets. He was borne to the rear, and died the next day. The chaplain of the division gave the following touching account of him:—"Poor Colonel Carpenter, of the 41st, was dreadfully wounded. He received me most warmly. He told me all that had befallen him. He appeared quite aware of the dangerous condition he was in, and gave utterance to a long and fervid prayer. I could not restrain him from speaking. At last he seemed exhausted, and the surgeon, who just then came in, evidently considered him dying. Next morning I was surprised to hear from the surgeon that he was better, but in the course of the day he died. He was pierced through the stomach. He expressed anxiety about his poor wife and children; he joined fervently in prayer, casting his care upon God. He was calm and resigned, but in extreme pain."

LIEUTENANT-COLONEL M'KINNON was the son of W. M'Kinnon, Esq., M.P., of Hyde Park Place, London. The family, as the name imports, is Scotch, and many members of it have distinguished themselves in the military profession. The subject of this notice did not enter the army so early as most of our young officers do. In the nineteenth year of his age he was gazetted to an ensign-lieutenancy in the Coldstream Guards. In five years he became lieutenant and captain, and in six years more, captain and lieutenant-colonel. He had only been eleven years in the service altogether when he fell, with the rank of lieutenant-colonel. He had purchased his way up, and had high military connexions and political influence—therefore, and not from any peculiar merits of his own, he was a lieutenant-colonel in the twenty-ninth year of his age! Our readers can see from previous pages of this History how many years it required for Sir de Lacy Evans, Sir George Brown, Sir Colin Campbell, and many other officers, after passing through numerous battles and forlorn

hopes, to reach that rank. In this instance, however, purchase and favouritism—the blights of the British army—raised rapidly into rank a deserving man. Early in the campaign he was invalided, and left in command of the invalids at Varna. An order arrived there to send on to the Crimea all convalescents and the gallant colonel, although still an invalid, in his ardour for active service, nominated himself as one of the convalescent. He had not long arrived before his services were required in the two-gun battery at Inkerman. He dropt wounded in front of the Coldstreams; the mode in which he fought and fell is thus recorded by one who saw both:—"M'Kinnon of the Coldstream Guards, who, to my knowledge was ill—too ill to be on duty at all—advanced to the front of his men, flourished his sword, and shouting to them to charge, fell while in the act of waving his hat. He was avenged by his men, as also was poor Cowell, who fell not far from him." After the action, he was found bayoneted in several places, the enemy having treated him in a manner similar to that of Lieutenant-colonel Carpenter. He was married, and his last words were a wish that his death might be so gradually broken to his wife as not to injure her by the shock. This gallant officer distinguished himself by his forward courage, even where all were heroes.

LIEUTENANT-COLONEL COWELL has been named in the foregoing notice as having fallen beside M'Kinnon. He also was the son of a soldier and a general. At the age of twelve years, he became a page of honour; at the age of sixteen, he was gazetted to an ensign-lieutenancy in the Coldstreams. After less than seven years' service, he obtained a lieutenant-captaincy; and in another seven years became a captain and lieutenant-colonel, without having seen any active service, or fired a shot in the front of an enemy. He began in the right way to obtain military promotion in England—by being a royal page. To be the son of a lord or a general does far more to ensure promotion than to lead half-a-dozen forlorn hopes, or suffer wounds and losses for the country's honour. Of course, Lieutenant-colonel Cowell *paid the regulation price* for being appointed to a position of responsibility and command. As in the former instance, so in this—the man was good, although the system which promoted him was bad. No man fell more heroically at bloody Inkerman than Lieutenant-colonel Cowell. Like his intrepid compeer, M'Kinnon, he displayed the greatest eagerness for action, and at his own expense: not brooking the delay of a government vessel, he reached Varna, and joined the forces at a moment when his activity and hopeful spirit

rendered him a useful accession. On the day of the battle in which he fell, he was on picket where, according to the rule of duty, he should have remained; but hearing that the battle was going against our forces, and that the Coldstream Guards had lost many officers, he delivered his charge of the picket to another officer, and hastened to share the perils to which his regiment was exposed—where he nobly distinguished himself, and “foremost fighting, fell.” He was borne to the rear, but his wound was mortal. His last words were (doubtlessly referring to the fact that he had left the picket to join the battle), “I hope I have done my duty—at least, I die a soldier’s death.”

LIEUTENANT-COLONEL CHAMPION, of the 95th, was one of the commanding officers of regiments who perished in this great battle. This officer was born in Edinburgh, 1815, and descended, by both his paternal and maternal ancestry, from some of the best blood in North Briton. He was educated at Sandhurst, and, like most of the officers having the advantages of that military school, was an accomplished member of his profession. At the early age of sixteen, he entered the army as an ensign, and served in various parts of the world. His travels were subservient to the cause of science and taste, being an excellent botanist and zoologist. Kew Gardens and the British Museum acknowledge and are enriched by many of his gifts. To all the scientific, and some of the literary institutions of Great Britain, he is well known. Lieutenant-colonel Champion, then major, was second in command of the 95th in the Crimean expedition; it was attached to General Evans’ division—a commander with whom, from his scientific attainments and literary tastes, Major Champion was likely to sympathise. At the Alma, the lieutenant-colonel of the regiment was disabled, and Champion took the command, and conducted it in such a way as to entitle him to the respect of those under his authority, and those to whom he was responsible. Lord Raglan highly commended him to the Duke of Newcastle for his valour and intelligence at the Alma. His only fault, as the commanding officer of a regiment, was his excessive zeal for the service, and anxiety to fulfil to the letter every duty that was expected of him. His attention to outpost duty was severe, and his health suffered from it. He concurred in the apprehensions and cautions of Sir de Lacy Evans, his chief, as to the danger of leaving the post at Inkerman no better defended; and his conviction that the enemy would come on in some early morning of fog and darkness, was constantly expressed. At the battle of the Little Inkerman, fought on the 27th of Oc-

tober, the 95th regiment, with the 30th, literally chased the enemy from the field. Two corps more worthy of a gallant rivalry could not be selected in the army, for no regiments have more honours on their standards than the 30th, and the old 95th. When the 41st were giving way at the ever-memorable battery, Champion, with a wing of his regiment, rushed to their assistance, and perhaps saved, at the moment, the 41st from terrible disaster. Scarcely had he performed this duty, than he was ordered to support the Guards, and again showed his quick courage and practised skill. His seniors having fallen around him, the command devolved upon him, and, heading a desperate charge upon the two-gun battery, as he mounted the parapet he was shot in the heart. He held on to the parapet until the charge was successful: carried to the rear, his wounds were dressed, and, placed on ship-board, he was brought to Scutari, where, on the 30th of November, death ended his honourable career.

MAJOR ROOPER, of the *Rifle Brigade*.—Edward Rooper was born at Wick Hill, Brighton, and was the son of a clergyman—the Rev. Thomas R. Rooper, formerly rector of Abbots Ripton, Hants. On his fifteenth birthday, January 24, 1834, young Rooper was gazetted to a second lieutenancy in the *Rifle Brigade*. Having served nearly five years, he was nominated first lieutenant. During the Caffre war, Mr. Rooper served under Generals Sir Harry Smith and Sir George Cathcart. From both those distinguished officers, Mr. Rooper obtained the highest eulogies for his activity, intelligence, and enterprise. When peace was proclaimed in the colony, he was appointed local magistrate in the district of East London, Buffalo River Mouth. There he distinguished himself by his assiduity and attention to business, gaining the marked approbation of the governor. His excellent qualities were not lost upon the settlers any more than upon the superior authorities. The following address was presented to him upon his removal from the district:—

“To Edward Rooper, Esq., Captain of the *Rifle Brigade*, Resident Magistrate, &c.

East London, Buffalo River Mouth,
April, 1850.

“SIR,—On the eve of your quitting this post, and your necessary retirement from the office of resident magistrate for East London, it would not be common gratitude were we to witness your embarkation without previously recording the very high sense we entertain of the uniform kind and affable deportment which, during your residence here, you have observed towards each and all; of the very honourable and impartial manner in which

you have administered the duties attached to your magisterial office; and also of the great interest you have invariably taken in the welfare of this town; that we may here state, with perfect sincerity, that the line of conduct you have thus pursued, has endeared you to us all, and that deeply we regret your leaving our port. We pray that, wherever your steps may hereafter lead, the blessing of the Almighty will be your invariable lot.

"With every respect, we remain, Sir,

"Your most obedient servants," &c.

Subsequently, Captain Rooper was appointed, by Sir George Cathcart, one of the commissioners for inquiry into the claims of settlers, on account of the losses they incurred by the cattle raids of the Caffres. In this invidious position, Captain Rooper behaved with great moderation and prudence, again meeting with approbation from the superior authorities, and the people among whom his delicate duties were performed. Captain Rooper was a man of taste and scientific attainment: he explored the botany of Caffraria and its neighbourhood successfully, sending home various specimens of rare, and some of previously unknown plants. His talent as a draughtsman, and his general taste and skill with the pencil, were highly appreciated by the army in Caffraria. Some of his drawings of the scenes and events of warfare among these wild tribes became subjects of much public interest. On the breaking out of the eastern war, Captain Rooper accompanied the Rifle Brigade. His services were highly appreciated by the "rough and ready" commander of the light division, and by the general-in-chief. At the Alma he behaved most gallantly, and, during the siege, up to the battle of Inkerman, he was most actively employed. On that dreadful day, he fought with desperation; but little opportunity was afforded for skill—courage and energy won the day; and Major Rooper, amongst the energetic and the brave, signalled himself as he had previously done when prudence and moderation were the qualities requisite in his situation. He escaped the field of Inkerman with life, but with a mortal wound, which at first did not appear formidable. On the evening of the battle, he wrote to his venerated father, expressing a hopeful sense of his situation. The letter is a beautiful specimen of the filial feeling of a brave man:—

November 5, 1854.

"MY DEAR FATHER,—It has pleased God that, in a severe action this morning, I should receive a wound in the shoulder. We have so many hit, that the doctor cannot quite determine about my case. I hope and trust, though, it is only a slight hit. I will not fail to write

again as soon as I know. In God's hands I leave the event. I hope my mother will bear up against it. We have lost my poor friend, Sir George Cathcart; our brigadier-general is badly wounded. Poor Cartwright killed, Bullock wounded, and a great many men. I had no support, and in a sharp and fierce fight I did my duty, which is some consolation. With best love to all, and praying my mother will not feel the misfortune too much, I remain, with best love to all, your affectionate son,

"EDWARD ROOPER."

"P.S.—I am in little or no pain, but cannot sit up to write."

The next day he again wrote; the letter is still hopeful, and the references to the battle give information on some points of detail not elsewhere attainable:—

November 6, 1854.

"MY DEAR FATHER,—I know you will expect daily bulletins from me, so I write again, having sent one hurried letter to you yesterday. It is now twenty-four hours since I was hit, and no bad symptoms to induce the doctors to alter their first favourable opinion. I think it has pleased God to spare my life, and if so, the wound is, I think, unimportant. The bone is not broken, and I am in little or no pain. We had a terrible fight. An enormous battery charged me while I had only fifty men of different regiments; but we managed to get to the guns before them, and these were limbered up, except one, which the enemy took in our entrenchments. However, we rallied the men, charged, and drove them back with great loss. I had my jacket-pocket cut out by a ball. We drove them back, and retook an intrenchment lower down across the road, and held it against a fearful fire from sixteen guns, and vast numbers of their men, for half-an-hour. We were firing at 100 yards. Of course, some of the men did not like it. Ours were scattered all over the place. I never had ten together after the first affair, having to go up and down to incite the men to fight. It was sharp, but necessary work. Our brigadier, Goldie, was talking to me when he fell, badly wounded. One other, Torrens, is very badly hit. Of poor Sir George I wrote yesterday. I have lost many friends. My old company went into action thirty-six men, and came out sixteen. Two sergeants, including my old John [his faithful servant], are in the number killed. He was close by me, and did his duty well, as all our men did. The enemy's loss is very great—600 prisoners and more, and their dead lay very thick. Still their number was so great we had difficulty in holding our ground. I never got reinforcements at my place, which, if they had taken, they would have gone right up to the camp.

One general wounded, and since dead; one colonel of engineers killed—such victories are very dear. Poor little Agar Cartwright killed, Coote and Buller badly wounded in the thigh, but going on well. We had only 300 men and eight officers in action. Of those, eighty-three wounded; killed and missing, about thirty; one officer killed and two wounded; indeed a third, Mr. Flower, who got a scratch somehow. Horsford was knocked down by a shell bursting close by him, but was unhurt, though a narrow shave for his remaining eye. He had a ball through his cloak too. Our loss is said to be 2500—that of the enemy enormous. General Cathcart is said to have put it at 20,000; but he did not tell me so, and I rather doubt it. I am writing on the 7th, and had a deal of sleep in the night, ate a lot of breakfast, and am sitting up, almost and entirely without pain. Please God, matters will continue satisfactorily. I am told, however, under the present favourable circumstances, I cannot expect to be fit for duty for six weeks at the earliest, and perhaps shall go to Scutari to get under cover from the cold, which we expect will soon be severe. Pray write to Clifford, of Temple Lane, to send me this week's *Punch*, as I do not fancy it will be very lively work there. Horsford commands our brigade for the present, our three generals, and many of their staff, being killed or wounded. Unluckily, I cannot command the regiment in case of another fight, but I do not quite abandon hope as to getting on. Poor General Goldie, who was with me, is since dead of his wounds, or no doubt he would have spoken of me; however, I shall be thankful if nothing worse happens than at present appears. Poor Sir George (Cathcart) is very much regretted by all officers and men of the regiment; he was very kind to us, and had the highest opinion of us. In taking us up he told General Pennefather, 'He brought a regiment to help him who could and would do anything.' The fight was far more severe than at Alma in every way, where the Russians were supposed to have about a similar force to that we had. I know not why, but though I sent repeatedly for reinforcements, I could not get any. The French came up and helped us, in good time too, for we were being driven back at all points just then. I do not think we could have had 8000 men engaged. Our engineers neglected to imitate the French, or were too stupid to think of defences; except little places thirty or forty yards long, there was nothing to stop the enemy. Our allies have a proper ditch along their whole front. I hear we are doing the same now. The Russians during the battle made a sally on the French lines, and were driven back. The French entered the town with the enemy, though not in sufficient force

to stop there. A feigned attack was also made on Balaklava. The two combined had the effect of bothering the generals, and preventing them concentrating their forces on the real point. I hope to write to you next week a more detailed account of the matter. With best love, and entreaties to my mother not to let this little mishap worry her,

"Your affectionate son,
"E. ROOPER."

Having been sent with others of the wounded to Scutari, he died *en route* on board the *Golden Fleece*, and was committed to the deep by Commander Scales, with the solemnities due to the occasion. He sleeps the sleep of the brave.

MAJOR THOMAS NORTHCLIFFE DALTON, of the 49th regiment.—This intrepid officer was the son of John Dalton, Esq., of Herringford Park, North Yorkshire. He was educated at the military academy, Sandhurst; and was gazetted to an ensigny in the 61st regiment of foot, at the age of eighteen years, in September, 1837. In three years he obtained the rank of lieutenant, and in three years more that of captain. During the campaign of 1848-49, in the Punjab, the 61st was actively and most severely engaged, and the subject of this biographical notice behaved admirably on all occasions. In 1851, he was promoted to the rank of major; before the breaking out of the war he exchanged into the 49th, and held the command of that gallant corps in going out to Turkey. At the battle of the Alma his horse was killed. On that occasion his conduct was perfection—officers and men were filled with admiration of his coolness; he imitated successfully in this respect his divisional chief, Sir de Laey Evans. In the battle of the Little Inkerman, the 49th fought like a battalion of chosen heroes, and amongst them Major Dalton was conspicuous for cool intrepidity, attracting the notice and approval of General Evans, whose eye never fails to mark the brave, and whose pen never omits to do them justice. At Inkerman, as will be seen from the foregoing pages, the 49th was in the very hottest of the fight, and Major Dalton, as at Alma and the Little Inkerman, was as the soul of chivalry among them. In cheering his men against the fearful odds they had to encounter, and setting them an example of dauntless duty to their country, he fell. One of his own poor soldiers thus wrote concerning him and another gallant officer of that corps, no less brave if less conspicuous in rank:—"All of us lament the death of Major Dalton and Adjutant Armstrong. They were well liked both by officers and men; and if ever there was a brave man, Major Dalton was one. In the heat of action I could not but admire his cool collected way. He gave the word of com-

mand the same as if he was on a common parade." After the battle, the officers of the regiment sent an address to his father, which contains this honourable testimony to his merits:—"He was as good and gallant an officer as ever graced the British army. His kindness had won him the esteem of all his officers, his gallantry the confidence of his men, and one universal feeling of regret was felt by his comrades in the loss they had sustained by the fall of such a commander."

CAPTAIN EDWARD STANLEY was born in Dublin, and was a nephew of the late Sir Edward Stanley; the family being an offshoot from the house of Derby. Seldom has a passion for the military profession been developed so early in life, as in the case of the subject of this notice. In his sixteenth year he entered the service of the Queen of Portugal, and during the struggles of Donna Maria for her throne, young Stanley fought with conspicuous gallantry, becoming a favourite with all the more forward and gallant soldiers among our Peninsular friends. The author of *Our Heroes*, gives an admirable sketch of Mr. Stanley's conduct in the Peninsula:—"Young Stanley was appointed an ensign, and his Spanish comrades hailed the light-hearted and dashing Irishman as one who was entitled to be made much of. He had not been many months in the Portuguese service before he distinguished himself by his daring. On two occasions, at the head of a small detachment, his gallantry was conspicuous. In the first affair he was surrounded by the enemy, and his men saw nothing for saving their lives short of immediately surrendering their arms. Stanley, however, had read too much of the history of Wellington's campaigns not to know that the Portuguese soldiers, when properly led, might be made to emulate the best troops in the world. He ordered them to fix bayonets, fire on the rear, and then charge in front. The order was obeyed, and he succeeded in bringing his detachment out of the hands of the enemy, with a loss of only four men. In the next encounter, he, with only twenty men, took, after a smart engagement, which lasted an hour, thirty prisoners. At this period he was but a mere boy. In the general action at Oporto, fought in July, 1833, Stanley earned the commendations of his superior officers. In this important affair he headed, not only his own company, but when a brother officer was shot down, he joined his corps to that of the latter, which, unofficered, was in a state of confusion, and about to fall back, but for the manner in which he rallied them. The men acted with his own as bravely as he could desire, and under his spirited leading they succeeded in doing great service in the battle. Young Stanley, however,

in this action, was severely wounded in the arm. He remained in Portugal until matters in Spain assumed such dimensions as to invite one of his enterprising character to share in them. He soon, however, grew tired of the Spanish service; and now having had his prowess in Portugal duly honoured by its queen conferring on him the Order of the Tower and Sword, he returned to England early in the year 1835, with the intention of entering the British service." It was not easy to obtain a commission in the British service at that juncture; but a romantic circumstance, which had occurred long before, offered him the opportunity of serving his own country. When William IV. was a midshipman, he visited Halifax, Nova Scotia, where a ball was given in honour of the young sailor-prince, destined to be afterwards known as "the sailor-king." During the ball, Prince William danced with a young lady of great personal attractions, and of so graceful a mien and manner as to make a strong impression upon the taste and respect also of the royal midshipman. At the conclusion of the dance, he expressed himself as most agreeably influenced by her society, and promised that, should he ever attain to power, and she ever need patronage, it would only be necessary for her to send him the music of that dance, and he would grant any request that might be reasonably proposed. After the lapse of many years, the beauty of the Halifax ball became a grandmother, her grandson became the dashing young officer in the army of Don Pedro, while the royal midshipman was seated upon the throne of Great Britain and Ireland. The lady wrote to his majesty, pointing out the soldierly qualities of her grandson, and requesting for him a commission without purchase in the English army; the music of the dance in which the prince and the young Irish lady were partners at Halifax was enclosed in the envelope with the petition. A prompt reply, in the handwriting of the king himself, acknowledged a perfect remembrance of the happy evening, and the obligation it inspired, and announced that Edward Stanley was nominated an ensign in his majesty's 57th regiment of foot. The youthful but experienced aspirant for military renown hastened to join his regiment at Madras. He was soon promoted to the rank of lieutenant, and in 1845 was senior captain of his corps. The regiment was attached to General Cathcart's division in the Crimean expedition, and was not engaged in any very severe encounter with the enemy until the 5th of November. It was then in Goldie's brigade, upon which so much of the fierce contest devolved. It may be said, without exaggeration, that no officer of his rank contributed more to the victory than Captain Edward Stanley. He fell, leading on

a fragment of his regiment to the final bayonet charge.

CAPTAIN WILLIAM KENT ALLIX, *1st Royal Scots*.—He was born in the year 1823, at Willoughby, near Grantham, and was educated at Harrow. Choosing the military profession, his education was completed at Sandhurst, where he produced a strong impression of his genius for the calling to which he aspired. His attainments at the military college attracted the marked attention of the authorities, and he was rewarded with an ensigncy without purchase. Having joined his regiment at the depot, Buttevant, near Mallow, in the south of Ireland, his attention was given to the active details of his profession, in such a manner as to attract the notice of the superior regimental officers. A detachment of the royals were ordered to head-quarters, at Gibraltar, and Ensign Allix went with them. He served two years in that garrison, and became lieutenant. His attention to discipline, and knowledge of our regimental system, made him a suitable person for the post of adjutant, to which he was soon appointed. This appointment he retained until shortly before the breaking out of the war. During the interval, Lieutenant Allix saw much service in America. When the Chobham experimental camp was formed, Captain Allix was selected by General Evans as his brigade-major. The general, with his keen discrimination of talent, saw the superior qualities of the young captain, who was proud of his general, and successfully imitated his military virtues. He attached himself to Sir de Lacy during his divisional command, and when the health of the general compelled him to retire on board ship, shortly before the battle of Inkerman, Captain Allix then remained in the camp, rendering his efficient services to General Evans' successor. At the battle of the Alma, the gallant aide-de-camp won Sir de Lacy's approval, who recommended him for promotion, as did also Lord Raglan. On the ever-to-be-remembered 26th of October, he behaved with great intrepidity and skill, fighting at the outposts, and prolonging their resistance until time was gained to bring up the division. The general gave him his thanks in terms that must have been most encouraging to any officer, coming from the hero of half a hundred battles. At Inkerman this skilful and gallant young officer was numbered among the slain, having to the last performed his duty to his country, entitling his name to his country's honour.

CAPTAIN JAMES FRANKLYN BLAND, *of the 57th*.—This gallant officer was born at Derryquin Castle, county of Kerry, Ireland, but the family

is English. He was only twenty-four years of age when he fell, nobly seconding the desperate and heroic efforts of his senior officer, and friend and countryman, Captain Edward Stanley. He entered the 57th as an ensign, in 1847, when seventeen years of age; his promotion was rapid, for on the heights of Inkerman he was a captain. When Stanley led on his little line of less than fifty men in the last fearful bayonet charge, he ordered Bland to keep open the communication; but Bland, seeing his senior officer fall, led on the little band committed to his care, and, putting himself at the head of both detachments, charged the enemy, sweeping them back, until at last he fell at the head of his glorious followers. An officer of rank thus wrote concerning the courage of our hero:—"Like an avenging angel, he dealt death to every Russian within the sweep of his weapon. How it was he escaped so long unhurt, I know not, as balls were whistling around him, and bayonets dozens of times lunged at his body. I never imagined a man could be so cool and so fierce at the same moment. They are brutes, those Russians, or they would not have killed so brave a fellow when they might have taken him prisoner. They appeared to me to have marked him for their vengeance; but he certainly sent some ten fellows to their account, within twenty or thirty yards of where I was keeping my men on the defensive. I had only known him for five days up to Inkerman. Had he lived to the end of this war, he must have gone up high. I am always thinking of him as he appeared before my eyes on that day. His regiment had but 170, or some such number in the field, but they did the work of ten times their number. Only fifty or sixty of the glorious fellows escaped the murderous onslaught. Poor Bland, he has three terrible wounds in the head, either of which was more than sufficient to settle him. He died after a magnificent display of bravery; and I feel certain that he did fearful execution on the enemy, well persuaded that for him there was no escape."

CAPTAIN AUBREY CARTWRIGHT, of the Rifle Brigade, was born in the year 1825, at Flore, Northamptonshire, the seat of his father, Colonel Cartwright, a Peninsular and Waterloo hero. On the 15th of October, 1841, Aubrey entered the Rifle Brigade as second lieutenant, and had the good fortune to make his way up to the rank of captain in seven years. He was engaged under Sir Harry Smith in suppressing the Boer insurrection in South Africa, where, the Rifles being much employed on outpost duty, young Cartwright saw a great deal of active service. In August, 1848, a contest of some magnitude

occurred between the queen's troops and the insurgents, commonly known as the battle of Boem Plaats; it was the gallantry displayed by Mr. Cartwright in this action, which obtained for him the command of a company. Captain Cartwright accompanied his battalion on the Eastern service, and entered into all the duties it involved with alacrity and zeal. At the Alma, the captain was noticed for his coolness and courage. He escaped unhurt from that battle, and through all the skirmishes around Sebastopol up to the day of Inkerman. Well as all who fought there deserve the laurel, amidst the meritorious Cartwright found opportunity to distinguish himself. After enduring, at the head of his company, the incessant attacks of the enemy for hours, his men fell so fast around him, that the speedy annihilation of the remnant seemed inevitable. At their head he still kept the enemy at bay, exclaiming, "Stand firm—for the honour of England and the Rifles!" The enemy, perceiving his influence over the gallant few who stood with him—who coolly maintained their fire, bringing down one or more at every shot—directed their muskets almost exclusively upon him. It was miraculous how he escaped; but for nearly half an hour he seemed to bear a charmed existence. At last, this constant fire took effect; and, while shouting "Firm, my men!" he staggered forward and fell, pierced with balls. His brave Rifles paid their last tribute of fidelity to him by still "standing firm," until they fell around their fallen leader. The men of the Rifle Brigade still talk of the glorious death of Captain Cartwright.

LIEUTENANT ROSS LEWIN, *30th foot*.—This spirited young officer was born in the county of Clare, province of Munster, Ireland. His father, Major Lewin, fought in the Peninsula and at Waterloo. It was a family of soldiers—not holiday soldiers, but men of valour and of the field. In 1847, Ross became an ensign, and did not obtain his lieutenancy until the year the war broke out. At the Alma he led a party of skirmishers as his division (Sir De Lacy Evans') advanced to cross the stream. At the Little Inkerman, Lewin commanded a company. His own account of the part he took in it is well told; the letter was written to his family, and marks some little incidents that did not fall within the scope of our narrative of that battle:—"The Russians," he observes, "attacked our position on the right, in the morning of the 26th; the 30th furnished three advanced pickets. I had the honour of forming one of them with the company I command. Captain Acherly's and my pickets met the Russians as they advanced in skirmishing order, and remained at about sixty

yards from them, keeping up a direct fire. This lasted for about half-an-hour, when the Russian columns and artillery appeared, and we had to fall back, being only about seventy men. We again made a stand on a slight knoll. The Russians advanced cheering, which was rather uncalled for, considering that their 8000 drove in for a time seventy men of ours. Again we had to retire another 100 yards, and then some of our artillery opened fire, close over our heads. Their practice was very good; but still the Russian columns came on slowly through the brushwood. The pickets were now reinforced by the rest of the 30th, and we advanced with a cheer in skirmishing order. This made the enemy waver. Their fire was very heavy, but not well directed. Our Minié balls told tremendously on them as the regiments that arrived on the hills in the rear commenced firing, with sights fixed, at 400 yards. We now advanced in all kinds of parties, different batches of men following different officers. As we kept cheering and firing, the Russians began to retire in the most unmistakable manner. They were pressed very closely, and several were driven into a gorge where they got blocked up. An officer of the 41st, myself, some sergeants, and thirty men came up, and fired right into them. Every shot told, and if men could have been brought up in time, the pass would have been filled with their dead. The general (Pennefather) met our party returning, and shook hands with me, saying that we 'gave them a good slating.' He added that the '30th behaved like gentlemen.' They certainly had the honour of the day. They had seven killed and twenty-three wounded—a very small loss, considering the fire they were under. Alma was a great battle, but yesterday's was much more exciting, as we came sometimes within twenty yards of the Russians: in fact a few were bayoneted. Their loss was about 550 men." At the greater Inkerman he again commanded a company, and continued fighting at its head until it had nearly disappeared beneath the bullet and bayonet of the enemy, and until he himself dropped mortally wounded. It was in the last great bayonet charge he was stricken down. Repeatedly during the progress of the action he was in extreme danger, and as often extricated himself by his activity and daring. On one occasion he was surrounded by the enemy, but he cut his way through, leaving three of their number victims to his sword. He was carried off the field, and survived until the 7th. His remains were laid that night beside those of Captain Connolly, who had distinguished himself so much both on the 26th of October and the 5th of November. His dying words were, "I am quite resigned; it was a glorious victory, gentle-

men." He was an enthusiast in his profession to the last. Alas! that war should exact such sacrifices; and that the young, the gifted, the brave, must sink mutilated in premature death to satisfy, it may be—as it was in this case—the ambition of a cruel prince or a blood-thirsty nation!

LIEUTENANT GIBSON, 30th foot, was the second son of Mr. Wood Gibson, of Cross Street, Manchester. He was born in the year 1830, but did not enter the army until he was twenty years of age, when he was gazetted ensign of the regiment in which he fell. His lieutenancy was obtained in 1852. No soldier was ever more devoted to duty. At the battle of the Alma he persisted in going into action, although under the influence of fever: his excitement and courage bore him up through the conflict. The command of his company devolved upon him, and it was proud of its young leader. The next day the fever resumed its power, and he was sent to hospital. Before his recovery was established he rejoined his corps, time enough to take a glorious part in the lesser Inkerman. He took a prominent part in the magnificent charge of the 30th and 95th, when they chased the enemy to the very entrance of Sebastopol. At the greater Inkerman he maintained his position for some hours unhurt, but was at last struck in the breast by a musket-ball. Sergeant Jamieson, of his company, endeavoured to remove him from the field; but he replied, "No, sergeant, I am badly hurt, but not mortally, and I will not therefore quit the field." In this state, and weak with loss of blood, he led two bayonet charges of his company; in the second, a musket-ball entered his brain and killed him on the spot. Such chivalrous devotion as this young man exhibited was not rare in the British army, nor confined to any rank, or any arm of the service; but who can refuse the tribute of eminent respect where those who were thus devoted are numbered with the slain?

CAPTAIN EDWIN RICHARDS, 41st regiment.—This brave officer was born at Ravindor House, county of Carlow, Ireland; the house of his father, Captain Edwin Richards, R.N. He was educated in the Royal Naval School, New Cross, near London; but preferring the army to the navy, he was sent thence to the Prussian military school at Bonn. In 1849, when nearly twenty years of age, he entered the 41st regiment, and rose rapidly, having obtained a company before he fell. His promotion, however, was by purchase; he was another of the superior men who found opportunity of early promotion by means of a bad system. Having served with his regiment in his native country, and in the Mediterranean, he embarked with

the 41st for the East. He was well acquainted with the Greek language, ancient and modern, and with the Greek character, which knowledge he found available during the expedition. When the troops embarked from Varna for the Crimea, the youngest captain of each brigade was ordered to remain behind with the invalids. This was to the impetuous spirit of Captain Richards a severe trial, and after great efforts he succeeded in exchanging with an invalid officer at Scutari, and rejoined his regiment before Sebastopol. He missed the Alma and the flank march, but was in time for the opening of the trenches before the besieged city. He took part in the well-fought battle of the 26th of October, under Sir de Laey Evans. His account of his part in that action is given with a lively and confident air, and, short as it is, notices some peculiarities that ought not to escape attention:—"We had a pretty hot affair yesterday for almost an hour and a half. We were attacked by about three times our number; and it ended by our driving the enemy back with a loss of at least a thousand killed and wounded on their side, and only fifty-eight and five officers on ours. They did very well indeed when opposed to our pickets, who always wear great coats; but when we came on in red, and our men yelling like savages; they could stand it no longer. I believe there is something in the colour which frightens them. I do believe we are the kindest enemy in the world. It is wonderful to see the attention our soldiers pay to the wounded Russians; and our surgeons take as much pains with them as with our own. The enemy are certainly not to be despised. Two of their battalions advanced yesterday like men, under a heavy fire of our artillery. I have not got over the loss of Alma yet; but still I cannot grumble, as I am the only captain who managed to get away from the depot at Varna yet!" At the great battle of Inkerman, Richards was one of the first officers who hurried to the front to receive the enemy, and support the pickets. During the day he fought with obstinate valour. Captain Donovan, a friend and fellow-countryman, wrote home to their mutual friends, giving an account of how he fought and fell.

*33rd Regiment, Camp before Sebastopol,
Nov. 7th, 1854.*

"The 41st picket was attacked by the enemy on Sunday morning before daylight. Edwin's company was ordered out to strengthen them, but before he had advanced far he was surrounded by Russians. Refusing to surrender himself a prisoner, he shot four of his opponents and killed two with his sword; thus dying the noblest and most glorious death a man could die, without pain. Shot through the body and stabbed by several bayonet wounds,

he suffered no pain, as death must have been instantaneous. The Colonel (Carpenter) was killed; poor Edwin's subaltern was killed, and several others of his regiment. It was an awful day! After eight hours' hard fighting, most of it hand to hand (under the fire of seventy pieces of heavy artillery), we drove the enemy from the hill, which Edwin and others had so gallantly died in defending. Edward (cousin of Captain Richards) and I went over the field as soon as we could stir from our posts, to look for poor Edwin, but he had been brought in, and was buried with four other officers by the chaplain of the second division next morning."

ENSIGN CLUTTERBUCK, 63rd regiment.—James Hutton Clutterbuck was son of Robert Clutterbuck, of Watford, Herts, and grandson of the author of the *History of Hertfordshire*. This youth had not attained his twentieth year when he died at Inkerman, having received a bullet in the neck, which descended to the chest and pierced the lungs. He had been in the army only sixteen months. How he fought and died has been well described by an humble soldier of his regiment, in the following letter:—"The regiment, with the 21st, formed line. We charged gloriously. We routed thousands—and as fast as we could run in pursuit and load our pieces, they fell, for we could not miss them, they were so thick. We chased them for the best part of a mile—past their own intrenchments, and close up to that in the thick of the whole of it, fell poor Mr. Clutterbuck, who was carrying the queen's colours, and cheering the men on. I think the last words he said were, 'Come on 63rd!' when he received a shot right through the neck, which killed him instantly. He died gloriously. I never saw a braver man than him in the field that day, although it is with sorrow I have to record his death. I was by his side the whole of the time; it was between eight and nine o'clock on the morning of the 5th, that he received his death-wound. After the fight was over I went to him, and had his remains removed to the camp. I took a small piece of his hair, which I send to you, to give over to his respected friends. His disconsolate father may well be proud of having such a son, for he fought and died bravely with the queen's colours of the 63rd regiment in his hand. We lost General Cathcart and Colonel Seymour, adjutant-general; Mr. Clutterbuck was laid alongside of them."

LIEUTENANT SWABY, 41st regiment.—This valiant young officer was a son of George Swaby, Esq., of Mount Pleasant, Jamaica. The subject of this notice received a military education in France and Prussia; and in August,

1850, was appointed to an ensigncy in the 41st, then serving in Ireland. Thence he accompanied his regiment to the Mediterranean; it was doing garrison duty in Malta, when the war breaking out, more active engagements awaited it, and Mr. Swaby obtained the step of lieutenant. At the Alma, before Sebastopol, and in the Little Inkerman, the gallant young officer behaved with coolness and intrepidity. During the whole of the Crimean expedition, up to the 5th of November, his gallant behaviour attracted general notice, and much respect in his own regiment particularly. He was a good draughtsman, and employed his pencil in various departments with taste and ability; several admirable pictures were sent home by him. His genius for caricature afforded much amusement to his messmates, and the pictorial pages of *Punch* have borne occasional testimony to his love of drollery, and his power of conveying amusement by his sketches of men and things. On the 5th of November, he did his desperate part in the ranks of the 41st. His services that morning were called for on picket, and knowing well that everything depended upon keeping the enemy at bay until a sufficient force could be collected to resist the attack, he obstinately contended for every inch of ground against the rising wave of Russian soldiery. His superior officer ordered him to fall back, and the men, who were much attached to him, besought him to retire, as he kept his person in front of his few soldiers, exposed to a terrible fire from the enemy. It is supposed that he did not hear the voice of his commanding officer, for he did not retire, but maintaining his post to the last, fell, covered with wounds. Major Goodwin wrote to Lieutenant Swaby's brother, an officer in the 18th Royal Irish, thus:—"His men, seeing themselves surrounded, begged of your brother to retire, but he answered, 'No, I shall not; I will fight to the last.' He was seen to fire his revolver several times, and then to use his sword. His body was brought in three hours after the battle, pierced with nine wounds, the fatal one being a gun-shot through the abdomen. By his side was the dead body of a Russian officer with a deep sword-cut through the head. He was buried the next morning, the chaplain of the division reading the funeral service, and the whole regiment attending. His men speak of him with the deepest regret, and are unanimous in admiration of his gallantry and courage."

LIEUTENANT-COLONEL SIR THOMAS TROUBRIDGE, Bart.—Thomas St. Vincent Cochrane Troubridge, son of Admiral Troubridge, was happily not among the slain at Inkerman, but he was among those who were desperately wounded; and as his valour was singularly

conspicuous, we take an opportunity in this place of describing his heroic conduct. He was born in the year 1816, and in his eighteenth year joined the 73rd regiment, and was promoted in two years afterwards to a lieutenancy in the 7th Royal Fusileers. In six years he was made captain, and in eight years more became major, which rank he held in the expedition to the Crimea. During the occupation of portions of Roumelia and Bulgaria, the activity and fine spirit of Major Troubridge made him a favourite, not only of his corps, but of the light division. Sir George Brown was known to entertain the highest confidence in his gallant major. There is an honour which has not been accorded to Major Troubridge, but which the annexed note will attest,* and for which the author offers his cordial thanks to the writer.

At the battle of the Alma, the subject of this notice greatly distinguished himself. He led his regiment up the heights, exposed to the hottest fire of the enemy. Next to Sir de Lacy Evans' division, the light division suffered most at Alma, and went through the severest fighting; and foremost among the gallant regiments that composed it, Troubridge led his Royal Fusileers. He escaped the dangers of the day, although his uniform was torn by the bullets of the enemy. At Inkerman, he was field-officer of the day for the first brigade of the light division. The care of its outposts devolved upon him. He was one of the first officers who descried the foe mounting up against the position of General Sir de Lacy Evans. The position occupied by Major Troubridge was the Five-gun Battery, upon which the enemy directed an appalling fire. There the gallant soldier cheered all around him by his brave and hopeful spirit, although his companions in arms fell fast. Towards the close of the battle, a large shot struck him, carrying away his right leg and left foot. He fell close to a gun, and as the men were about to remove him out of fire, he ordered them to

place him upon the cannon. There he lay through the remainder of the battle, his wounds bandaged up, which prevented his bleeding to death. From that position he gave his orders with the greatest coolness, resisting all persuasions to consent to be removed. Major Bunbury, upon whom the more active command of the battery devolved, in vain implored him to allow the men to carry him to the rear. He determined to remain until death or victory terminated his duty there. Never was there a more majestic act of courage. Victory declared for our arms, and *then* he was borne away on a litter, and received surgical aid; his life was spared, and his heroic fortitude has become a glorious episode in the history of war. In his corps, the name of the gallant Tom Troubridge is a pride to every soldier. His country is proud of him. Her majesty is not less so; for when her hands hung upon his breast the Crimean medal, she burst into tears. He was promoted to the rank of lieutenant-colonel, and a baronetcy was conferred upon him. A soldier writing home shows with what feeling the men regarded his promotion:—"Our brave Major Troubridge did not care about the Russian balls, for, after he lost his legs, he placed his stumps on the gun-carriage in the battery, and said, 'Fire away, lads!' and he bleeding, as we all thought, to death! He wouldn't hear of being removed until we had beaten the enemy; every one says he'll be made a lord; in our regiment we think he ought to be made two lords—one for the right leg and one for the left. When Sir George Brown heard of the brave deed, he said, 'Tom Troubridge is a glorious fellow!' We all hope he'll get as well as ever, only of course he won't have his legs. They may talk of the bravery of other commanders in the battle of Inkerman, but they can't take the shine out of the 7th Royal Fusileers—God bless Sir Thomas for it!"

Sir Thomas Troubridge is an officer of intellectual claims as well as valour. He is enthusiastically attached to his profession, and has studied it in all its branches. His books are of high authority in the army:—*Minor Operations of the War*, the *Military Manual*, and the *Battalion Drill Table*, are productions of his pen. It is no small satisfaction to us that we are able to number Sir Thomas Troubridge with such men as Sir de Lacy Evans, Sir John Burgoyne, Sir Richard England, the Earls of Cardigan and Lucan, and other of the great actors in these great exploits, among the subscribers to this work. Upon its pages no braver name is recorded than his.

We must here dismiss our record of the brave who fell at Inkerman; but in closing the chapter it is appropriate to notice the scene which followed the dreadful tragedy when the fallen chiefs were collected and consigned to

Vice Royal Lodge, Dublin,
April 17th, 1856.

"MY DEAR SIR,—Having just seen your *History of the War*, I observe that in a note you express a doubt as to which regiment landed first in the Crimea. I therefore think it only an act of justice to inform you, that a company of the 7th Fusileers, under Major Sir T. Troubridge, was in my boat; and that the only boat near us was one belonging to, I think, the *Sanspareil*, and having Rifles on board. Sir G. Brown had previously landed with Captain Dacres, R.N. As you have done me the honour of mentioning me, I may say that mine were the first troops landed in the Crimea. But you have made a mistake in spelling my name, it being spelt with an E, not an A. I only write this that you may do justice to a regiment that I have known long, and that is second to none in the British army.

"I remain, my dear Sir,

"Truly yours,

"C. VESEY, Com., R.N., A.D.C."

"Professor Nolan, PH.D., L.L.D."

their cold resting-places on the bleak plateau before Sebastopol.

The burial of the superior officers was an occasion of painful interest in both camps of the allies. The body of Sir George Cathcart was recovered; it was pierced by one bullet and three bayonet wounds. The officers and men of his division whose duties allowed of their attendance followed his remains to the grave with the most profound sorrow, for he was much beloved. The bodies of Sir George Cathcart, Brigadiers-general Strangways, R.A., and Goldie of the fourth division, were interred in separate graves. The heroes sleep

side by side, in the old battery on the hill above the camp of the fourth division, the senior officer in the centre. Near them were also laid, with military honours, Colonel Savoury of the 63rd, Captain Blunt of the 57th, Lieutenant Dowling of the 20th, Major Townsend, R.A., and many other officers who were deeply regretted by the army. It was a mournful procession, to which the lines of the late Mr. Slater well apply :—

"Their weeping friends, with sorrow deep opprest,
Moved slowly on, to bid them form to rest
In peace and quiet, free from every care,
Their slumbers guarded by the soldier's prayer."

CHAPTER XLVIII.

BEFORE SEBASTOPOL AFTER THE BATTLE OF INKERMAN.—THE GREAT STORM, AND LOSS OF STORES AND SHIPPING.—NARROW ESCAPE OF HIS ROYAL HIGHNESS THE DUKE OF CAMBRIDGE.

"Fierce howls the warring blast,
The waves leap high, my heart within me fails,
Come to my help, O Lord! the storm assails;
Let me not sink at last!"

H. HOGG.

WHEN the sad office of burying the dead was performed, men began to review and to discuss the events of the battle of Inkerman, and the circumstances which produced it. Seldom were the proceedings of a commander-in-chief more severely criticised by an army. The obstructions thrown in the way of General Evans' desire to put his position into a proper state of defence were, in spite of the personal popularity of Lord Raglan, severely animadverted upon; nor did his orders given on the 7th, two days after the battle, to intrench the position and otherwise make it defensible, much mollify the angry feeling which prevailed. The temper of the army was also severely tried by the accumulated proofs of cruelty to the wounded English on the field, and the admissions of deserters. The *Invalide Russe* and the *St. Petersburg Journal* asserted that the cruelties of the French to the Russian wounded at the Alma, were avenged by the exasperated Russian soldiers upon the English at Inkerman. Justice to our ally demands the confutation of this libel, so industriously circulated by the German and Belgian press throughout Europe.

Only eight days before the battle of Inkerman, Lord Cowley wrote a despatch to the French minister, enclosing a report from the British commissioner at the head-quarters of the French army, after the allies had left the Alma, and encamped upon the Katcha. This report, from such a man as Brigadier-general Rose, is worthy of all reliance :—

Paris, Oct. 27, 1854.

MONSIEUR LE MINISTRE,—I have the pleasure of transmitting to your excellency, on behalf of her majesty's

principal secretary of state for foreign affairs, the enclosed copy of a despatch sent to her majesty's government by Brigadier-general Rose, who testifies to the humanity displayed by the French officers and soldiers towards the Russians.

I embrace this opportunity, &c.
COWLEY.

Head-quarters of the French army,
(left bank of the Katcha), Sept. 23, 1854.

MY LORD,—Your lordship will learn, with great satisfaction, I am sure, that the conduct of the French officers and soldiers towards their wounded enemies, at the battle of the Alma, has been humane in the highest degree. I saw, upon the field of battle itself, French soldiers giving food and attending to the wants of the wounded Russians, and saw a Russian by the side of a Frenchman carried off on litters. Obeying the inspirations of a great heart, Marshal St. Arnaud had given orders that the enemy should receive the same attention as his own soldiers. When the Zouaves had carried the telegraph by storm, they uttered enthusiastic cries for the emperor, and several of them, surrounding me and shaking me by the hand, shouted acclamations for the queen, adding, that nothing could stand against the united French and English.

ROSE.

A third cause of murmuring in the army was the reports of certain prisoners, of the existence of a road along the south side of the harbour, by which it was assumed the Russians brought out their guns, and were nearly enabled to surprise the camp of the second division. The quartermaster-general, Airey, was much censured for acting upon the supposition that no such road existed. This general impression was, however, wrong; there was no such road, as we have before asserted, although a track existed. No road by which guns and munitions of war could be brought in or out of Sebastopol had been then completed. The prisoners were not acquainted with the topography of Sebastopol nor its neighbourhood,

for they belonged to corps which had only recently arrived under Dannenberg; the old garrison had been removed, or had fallen by the sword and disease. The importance of this question, as affecting the generalship of the allied commanders, and the qualifications of the English staff especially, can hardly be exaggerated. Mr. Woods is especially the champion of the opinion that a road existed; in noticing the discontents of the army, immediately after the victory, he thus expresses himself:—"The discontent on this head was by no means lessened when the result of the examination of the prisoners taken gradually transpired, and it was known, beyond a doubt, that a road along the south shore of the harbour into the town did exist. This road, which had been finished and used for traffic since July, 1854, ran straight under the cliffs of the south shore, and joined the old Simpheropol Road, about a mile below the part where it began to enter the English camp. The night before the battle of Inkerman, the Russians had muffled the wheels of their artillery, and brought them silently to the very foot of the hill on which the out-pickets of the second division were posted. At dawn, which, as everything seemed to favour the enemy on this day, was thick and foggy, the picket itself was surprised, an alarm avoided, and the guns got into position to command the English camp, while the troops still slumbered. When the battle gave General Airey such fearful proof of the existence of the south road, his only reply was, that he had been misled by wrong information."

In a former page of this History it was asserted, on the authority of Mr. Upton, and of officers of intelligence and rank, that the road in dispute had never existed in fact. Mr. Upton having assured General Airey, and Colonel Steele, the military secretary, that no such road had been formed, the commander-in-chief acted upon that testimony. After the battle of Inkerman, General Airey (as is intimated by Mr. Woods) changed his view upon the subject, and then charged Mr. Upton with giving him false information, on which account that injured gentleman was most unfairly used. Mr. Bracebridge taking a deep interest in the fact, and regarding Mr. Upton as the object of injustice, directed inquiries in various directions, which issued in the conviction on the part of the former gentleman, and all concerned, that there was no road—unless a track passing by the water's edge, by which a man or horse might go, could be called one. The Russian cannon and other material could be conveyed by boats, and were so taken. The following letter from General Evans to Mr. Bracebridge, and the extract of evidence given by Mr. Upton before a

board of inquiry appointed in the Crimea under the authority of the commander-in-chief, will set the controversy at rest, however reliable the opinions of such men as the correspondents of the *Morning Herald* and of the *Times* may be:—

*Bryanston Square, London,
March 12th.*

"DEAR SIR,—I am glad you have approved of what I wrote to Mr. Upton. It was no fault of his, but his misfortune, that his dwelling and property were under the fire of the besieged and besiegers of Sebastopol. Your object you state, however, is to assure me that there was no road such as that respecting which Colonel Steele, as you say, suspected him of having used some deception. My staff and myself were under an impression that the road did exist. You inform me that Major Mills, of the 52nd, ascertained the non-existence of this supposed road. Further, I have understood from Admiral Sir S. Lushington, that he ascertained that there was no such road. In short it is now, as I believe, quite certain that the doubt cast on Mr. Upton's conduct on this point had no foundation. I think he has been inequitably used, and as you take an interest in his fate, I shall be glad if this declaration of my humble opinion can be made to assist in any way towards obtaining him reparation of the inconsistent severities to which he has been exposed.

"I remain, very obediently,

"DE LAZY EVANS."

"C. H. Bracebridge, Esq."

The next is an extract from a letter written from the Crimea in the spring of 1856, by another officer of eminence, whom we are not authorised to name:—"The road does stop before you get to the head of Careening Bay, but infantry could pass along, and cavalry, in single rank, file along to the town by the docks; but artillery certainly not, it might have been brought in boats, and landed opposite Inkerman."

Sir Edward Colebrooke, who visited the field of Inkerman before and immediately after the 5th, and after the fall of Sebastopol perambulated the city and suburbs, thus writes:—"I heard accusations directed against Mr. Upton, for having misled the quartermaster-general's department as to the existence of a road in this direction. What I saw of the ground satisfied me that the information given by this Russianised Englishman was substantially correct. The road from Inkerman to our camp was well known, and in fact the second division was encamped upon it. The road leading from the town was not known, because it did not exist, and it was the good fortune of the Russians, or the neglect of our people, that

enabled them to bring up their artillery without interruption. In the excellent Narrative of the Campaign by Colonel Hamley, it is assumed that the Russian artillery was brought up to Shell Hill by the old post-road : and Mr. Woods, the correspondent of the *Morning Herald*, in his published account of the war, also assumes that the force from the town formed a junction with that beyond the Tchernaya before advancing; and dwells much on the supposed ignorance of the quartermaster-general, of the road from the town to Inkerman, which enabled the Russians, as he thought, to bring their artillery by this circuitous route. In what I have said of this double attack, I have followed substantially the account of the Russians themselves, which is confirmed by what was told me by Sir T. Troubridge, the force under whose command met the fire of the Russian columns as they passed along the edge of the ravine, and drove them successively inwards. This must have had an important effect on the action. I do not pretend to speak confidently as to the precise point at which this division ascended the height, for my survey of the ground was a hasty one."

In addition to this unquestionable evidence, we present Mr. Upton's reply to the suspicions entertained by the military authorities against him concerning this road :—

"With reference to the road said to have been constructed along the south side of the water leading to Inkerman Bridge, I decidedly gave it as my opinion that no such road existed at the time I was taken prisoner. I grounded that opinion on the fact of my never having heard of it; on the difficulty of constructing one along the precipitous cliffs near to the powder-magazine, and across the deep ravine at the Careening Bay; also upon the fact that the troops after the battle of the Alma entered Sebastopol by the road which I positively asserted to be the post-road, up to the time I was taken prisoner, round the windmill, and on the Woronzoff Road into the town. And again, I became more convinced when I read in Prince Menschikoff's despatch in the English newspapers, that, after the battle of Inkerman, the Russian troops retreated across the bridge at Inkerman by the north side into Sebastopol. But even supposing this road to have been commenced, as I now have been informed by many deserters it was, in the month of July last year, it agrees with written evidence laid before the board, of my having asserted that if a road existed it must be one recently constructed. However, I consider the importance of the existence of this road very much lessened by my having remarked at the time, that the canal could easily have been converted into a road; and this canal runs along the south side

of the water from the immediate neighbourhood of the bridge at Inkerman to the Dockyard Creek, and from many points, if converted into a road, might have had communication with the plateau above. I was not questioned as to whether a road existed by which Sir de Lacy Evans' division could have been attacked, but as to whether one existed by which supplies could be conveyed into the town. I should have thought it easier to have made a road for that purpose, either from Inkerman or the town, as then there would not be the difficulty of making a long embankment at the Careening Bay. And there was nothing to prevent a large force coming out of the town near the Malakoff Tower and from Inkerman by the then existing roads. I never said that Sir de Lacy Evans' division was safe from attack, as I could not form an opinion on that subject. Neither did I say that it was impossible to make a road, as stated by the quartermaster-general—for having said the canal could be converted into one, it would have been absurd."

It must appear extraordinary to every one why more confidence was not placed in Mr. Upton's information.

The Russians seemed anxious to leave an impression with the allies that they were able to support the defeat at Inkerman; for, on the day after the battle, there were symptoms of renewed attacks, which kept the British on the alert, and part of the fourth division remained under arms all the ensuing night; and the second division, after all its struggles on the previous day, was again called out, the drums beating an alarm.

The next night a working party of the 20th regiment were employed to throw up a trench across the Sebastopol Road, very near the Redan. This party was accompanied by the quartermaster-general of the fourth division, and two officers of engineers. The night was one of beautifully clear moonlight, but the Russians did not discern the workers, and the grim Redan was silent. Before midnight an intrenchment was formed, another was begun in the rear of the pickets, and some progress was made in its formation before it was necessary to remove the men. Had they been detected, and the guns of the Redan had opened upon them, the brightness of the night would have exposed them to certain and heavy loss. The officer who commanded this party observes:—"I was often surprised that the Russians never attempted a sortie at this point. The men were worn out, and it was difficult to get them to work with any rapidity or energy; but it was naturally to be accounted for—from being over-worked, and not having proper food. I have seen men in the trenches, by my side, eating raw salt pork and beef

like cannibals; and when asked why they did it, their reply was, 'We have no time to cook it, sir.' Could we expect anything but disease from the effects of such a diet? The coffee was also a great part of the time in an unroasted state; and how was it possible that this could be used by those who had not time to fry it, even if they had materials for so doing? Up to this time we had received our rations pretty regularly, until the bad weather set in, and the rain rendered the roads almost impassable. The commissariat used every means in their power; but when the provisions did fall short, it was evident that they had not sufficient stores, if any, in camp, and nothing was to be obtained by them nearer than Balaklava. The trenches had now become in a most dreadful state of mud and filth, and it was very necessary to be cautious when we sat down in them, as there were many unpleasant little animals in the shape of lice to be picked up there, which did not add to our comfort: the tents of the men were also full of them, as well as the occupants themselves."

On the 7th of November a council of war was held at Lord Raglan's quarters. General Canrobert was unable to attend, being still disabled by the contusion he received at the battle. The impressions of the council were of discouragement. The siege-guns were nearly worn out, while the enemy's defences had been repaired with incredible diligence, and their supply of artillery was inexhaustible. The victory just gained had added renown to the allied arms, and crowned the soldiers of England with unfading laurels; but the moral influence of the commanders suffered both in their own armies and in those of the enemy. The troops, both French and British, were greatly reduced in numbers: Mr. Woods computes the former at 30,000, which seems too low an estimate, as large reinforcements had been received after the battle of Balaklava; the British he calculates at 13,000, which is probably correct, and not much above that stated by Mr. Russell, which caused so great a sensation in England.

Whatever were the decisions of the council, the appearance of the generals was remarked by the officers and soldiery as gloomy and dispirited. The Duke of Cambridge left immediately for Balaklava, and went on board the *Caradoc*, to take passage to Constantinople. His royal highness had suffered from illness and anxiety, and received several contusions at Inkerman. His departure was deeply regretted by the whole army, and by the French; but his own gallant Guards, whom he led with such heroism, chiefly lamented his loss. While rewards and honours have been showered upon various officers, it is natural to inquire, Is it because his royal highness is so near the throne,

that it has been deemed expedient to pass him over without such promotion as would be equivalent to those titles his high rank renders it impossible for him to receive?

After the 7th the Russians, with the exception of one infantry division and the cavalry under Liprandi, were posted on the opposite banks of the Tchernaya, apparently awaiting reinforcements to resume the offensive once more. The allies made vigorous preparations for such a contingency. The 46th British regiment arrived most opportunely—a very fine body of men; their band accompanied them, playing "Cheer, boys, cheer," as they marched up to the lines: the "boys" *were* cheered by the arrival of such a body of fine soldiers. Nearly 3000 French arrived with the 46th, and about 2000 Turks. All these were set to work in intrenching and strengthening the allied positions. The British intrenchments in front of the second division were rapidly perfected; those in the rear of the light division were armed with heavy guns. The Two-gun Battery was at last armed. General Bosquet placed the ridge overlooking the valley of the Tchernaya in as perfect a state of defence as French engineering could effect. The Turks rendered valuable assistance to the general in accomplishing this object. The entrance to Balaklava was also made stronger, although the same vacillation as to occupying the harbour seemed to continue at head-quarters—as if some fatality doomed the British authorities to expose the transports and shipping to the greatest possible amount of danger.

Colonel Hamley describes the works made immediately after the battle in these terms:—"The ditch and parapet already in front of the second division were enlarged, completed, rendered continuous, and armed with batteries. Three redoubts, two French, and one English, were constructed on commanding points, *ours being on the ridge occupied by the Russian guns of position* in the battle. In advance of these, other works and batteries were extended to the verge of the heights, looking on the head of the harbour, *on the causeway across the marsh*, and on the last windings of the Tchernaya. To oppose these the enemy threw up batteries on the heights on their side of the valley, and opened fire from the nearest of them; while, further back, long lines of intrenchment extended along the hills."

The words in italics show what ought to have been done by Lord Raglan before the battle, and what would have been done had General Evans been in the chief command, or his suggestions and requests been heeded by the chief to whom the safety of the army and the success of the enterprise had been entrusted. When the new works were constructed on both

sides, the warlike precaution and power presented around Sebastopol were truly enormous, and such as may well excite the surprise of men for centuries to come. The Russians outside the town destroyed the bridge over the Tchernaya; this arose from reports made to them concerning the reinforcements of the allies, which were greatly exaggerated.

The condition of the Russian army in the field was reported by deserters to be extremely wretched. Many of the men had no knapsacks—none had tents; they were badly supplied with necessaries, and had no comforts. The heights were exposed to cold, cutting north winds, alternating with thick drizzling rain. No bivouacs could be more doleful than those of the Muscovite troops on the eastern heights of the Tchernaya. The cold and bleak positions of the allies on the western plateau was not so trying. The muddy waters of the Tchernaya justified at that season the name of the stream—"black river;" this was the only drink the "Muscovs" possessed. Every effort was made by the Russian government to forward supplies; but the state of the roads, the weather, the disloyalty of the Tartars, the peculations of officials, and the blockade by the allied fleets, prevented the execution of the bold and vigorous plans of the czar.

The French made timely preparation for the winter. Great coats arrived with hoods, which delighted the soldiery; and those eccentric sons of Mars, the Zouaves, appeared still more eccentric in this novel garment. Sheepskin jackets, *à la Tartar*, were also served out from the French clothing depots, and were sources of comfort to the wearers, and of amusement to the beholders. The English did not make their preparations with similar activity; but Mr. Commissary-general Filder exerted himself greatly in regularly distributing to the troops their rations, which were ample in quantity, but often not the best in quality. The amount of military stores landed immediately after the battle of Inkerman was prodigious. The English brought guns and mortars of a very large calibre from Malta, and both fleets landed ordnance of the heaviest metal. With these the trenches were armed, and some of them placed in an excellent position to annoy the Russian shipping in the harbour. The siege went on languidly notwithstanding all this preparation. The guns of both attack and defence were only fired at intervals.

On the evening of the 12th, the garrison deviated from the feebleness of its fire, and cannonaded the French trenches with vehement fury. This was alleged by deserters to have been occasioned by an apprehension of an assault. Very little injury was inflicted by this storm of artillery; the French opposed

to it a steady and converging fire, from which the town suffered much. At no previous period were the French guns served so well, or the French batteries injured so little by a heavy cannonade. It is probable that the reports of the deserters of the motive for the Russians opening so formidable a fire were erroneous, and that it was done to cover a sortie upon the French lines, which was made that night. The French repulsed it with promptitude, losing only fifty men; the enemy left 300 dead and wounded before the trenches.

An English officer, in command of a large covering party, describes his experience in the trenches this night as follows:—"On my arrival, I found a Pole there, who had deserted, and come in over the parapet. The soldiers were very kind to him, and he made known to them, by signs, that it was posted about Sebastopol, that the allies cut off the ears and noses of those who deserted to them. How agreeably surprised he must have been when he found the scissors were not applied to him! Those in charge of him were anxious to hand him over to my tender care, but I thought he would be of much more use at head-quarters, and would not accept him; accordingly he was taken to the camp, and appeared very happy under existing circumstances. About midnight we were aroused by a report of rifles, and bullets whizzing over our heads. It appeared that the Russians in 'the Ovens' were blazing away at our advanced sentries, and the French on the left. Accordingly we fixed bayonets and stood to arms, and I received orders from the officer in command of the trenches, to be ready to charge them outside the parapet, in the event of the enemy advancing on us. A salvo was fired on the French works, as usual, and volleys of musketry; but nothing further occurred, and we settled down on our haunches again. It was a bitter cold night, and the wind searched into every corner and crevice of the batteries. I felt very unwell, and reported it to the commanding officer, who kindly said he would dispense with my services, but that if I remained until the morning, he should not require me to be relieved by another officer. Knowing how hard the work was, and how short of hands we were, having only five subalterns for duty, I determined on remaining, and proceeding home at the dawn of day. Heartily glad was I to crawl home when it arrived. I immediately went to bed, and was laid up for some time with rheumatism and fever. The rain fell in torrents that day, and our poor men had great difficulty in cooking their provisions. The whole camp was like a well-trodden ploughed field, nothing but mud and slush. Our tent was so old and thin, that the rain came through in great quantities; but I

fortunately had a waterproof sheet, which I laid over my bed, and it rendered me great service. But the men, however, had not these luxuries, and had to fight against the elements as best they could. The tents were crowded to excess, and for some time they had as many as twenty men in each, and consequently swarmed with vermin. The men's clothes were torn and in a filthy state, and their boots were in tatters on their feet. No one can form an idea of the wretched picture the English soldier presented at this period, or of his emaciated appearance."

The weather became now truly formidable to the allies—the prospect out at sea was menacing, piles of dark clouds gathered on the horizon, and sudden gusts swept in deluging showers over the plateau. These were the presages of the dreadful hurricane of the 14th.

An illustration of the utter mismanagement in the principal departments of the army is given by Mr. Woods, in relation to the death of Captain Williams:—"Captain Williams distinguished himself at the battle of Balaklava. He had only come off picket, after twenty-four hours' duty, a few minutes before the battle commenced, and though in a high state of fever, he insisted on being at the head of his troop. The day after the battle, his fever increased and dysentery set in. He sought shelter with Mr. E. J. Smith, the postmaster to the forces, a gentleman who was then, and is now, well known among all our officers for his acts of friendship and kind-hearted hospitality. Though tended with a brother's care by Mr. Smith and Major Nasmyth, poor Williams sank fast; and his medical attendant saw that, unless he got instant change of air, his recovery was hopeless. A medical board to grant the requisite sick-leave was applied for, several times promised, and several times postponed, though each delay diminished the patient's chance of life. Williams's friends, and he had many, advised his leaving at once, and getting a medical board at Constantinople to sanction the step he had taken. But the gallant young officer was reluctant to take any step which could be perverted, even by the most scrupulous, into an apparent breach of the regulations of the service. He waited patiently for the medical board, but it never met, and each hour that passed lessened the hope of its being of any service to him. At last, his remonstrances were overruled by his friends, and he suffered himself to be placed on board the *Caradoc*, for passage to Constantinople, and to take his chance of meeting with a medical board there that would adjudge upon his case. He arrived at Constantinople, and was instantly taken to Messire's Hotel. But the change came too late, and within two or three days

after his arrival, he breathed his last. My readers will scarcely credit the fact, but I have been informed on the very best authority that, the day before his death, Captain Williams was actually placed under arrest for being absent from his regiment without leave; *i. e.* without the formal permission of a medical board, in endeavouring to get which he had literally lost his life. Comment in this case is indeed needless."

The dreadful storm of the 14th of November greatly influenced the condition of the opposing armies and the fortunes of the war. It will be recollected by the reader, that in consequence of the partial success of Liprandi at the battle of Balaklava, and the alarm excited by the results of that engagement at the British head-quarters, the shipping was ordered out of the harbour. No vessel could enter without the orders or consent of Captain Dacres. The loss of the *Prince* steamer during the tempest was felt very severely by the British, and may be attributed wholly to that circumstance. This magnificent vessel arrived off the harbour on the 8th of November. She let go an anchor, which "ran out;" the same thing happened upon her letting go a second; both anchors were lost in more than thirty fathoms of water. Thus deprived of her anchors she stood out to sea, and afterwards returned, and was affixed by a hawser to the stern of the *Jason*, while another anchor and cable were got ready for her. This accident has been accounted for by the *Morning Herald* in the following plausible and probably correct manner:—"It is a very common thing for newly-built vessels, hastily getting ready for sea, to take on board their anchors and cables, and, coiling away the latter in the cable tier, leave the ends out for clinching at a more convenient period. This was most likely done in the case of the *Prince*, and in the hurry of her after preparations, the clinching was forgotten entirely. Such a thing as cables drawing the bolts and running out, after having been properly secured, was never yet heard of with any vessel, much less a steamer anchoring in still water." As soon as the *Prince* was made fast to the *Jason*, Lieutenant Baynton, R.N., the admiralty agent, went into the harbour in his gig, and reported himself to Captain Dacres. He then reported himself to Captain Christie, who was in the *Melbourne* steamer, which, like nearly all the transports, was anchored outside. On the morning of the 9th, the vessel anchored off the port with one anchor. Captain Christie instantly sent Captain Hutchinson, R.N., to Captain Dacres, to state the situation of the ship, and to request that a tug should be sent to assist in bringing her in. Captain Dacres refused, and alleged that there was no room for her in the harbour. Captain Christie re-

paired to his senior, pointing out the fact that there was room enough, but his remonstrances were unavailing. All this time the weather was very bad, and storms seemed gathering on land and sea. On the 11th, the weather improved, and Captain Christie, whose activity and vigilance seem to have been beyond praise, again sent to Captain Dacres, more urgently if possible than before, pleading for the admission of the *Prince*. His remonstrances were again in vain, and the unfortunate *Prince* remained outside; although the lull in the gale that day was of short duration, and the weather continued to grow worse, until the great storm burst over the defenceless ships, strewing them in wrecks over the agitated sea and stricken shore.

We have been thus particular in relating the preliminary facts in connection with the *Prince*, as the loss of that vessel produced a sensation in England so much greater than that created by the wreck of any other ship which perished in the disaster of the 14th. It is evident from the foregoing remarks, the truth of which may be relied upon, that the ship was sacrificed either to the incompetency of the harbour commander, or the directions given from headquarters. Captain Christie was afterwards greatly blamed, and painful allegations as to his incompetency were made in the press and parliament of England: that officer, however, had not the charge of the harbour, but of the commissariat vessels; and it was in spite of his entreaties and warnings that the *Prince* and other transports were left beating about after the beginning of those gales which were the forerunners of the hurricane of the 14th. That Captain Christie was not blameworthy, there is abundance of other evidence in existence, from which we make a single selection. When, in the early part of 1855, it was intended to try Captain Christie for the loss of the *Prince*, and of another ship called the *Resolute*, Captain Baynton, of the royal mail steam-ship *Medway*, son of Lieutenant Baynton, the admiralty agent of the *Prince*, addressed to that ill-used officer the following letter:—

“MY DEAR CAPTAIN CHRISTIE,—I have, as you may imagine, a very vivid recollection of all the circumstances connected with my poor father's loss; and in reply to your question as to my knowledge of the cause of the steamer *Prince* not being brought into harbour on her arrival off this port, I distinctly remember my father to have told me, that on reporting his arrival to Captain Dacres and requesting his instructions, he was informed that there was no room in Balaklava harbour for her reception, but when convenient, an officer would be sent out to assist her in. I have no hesitation in saying that there was plenty of room in this

harbour for the *Prince*, as I feel confident that there are at present at least double the number of ships now lying here, which in my opinion renders the fact indisputable.

“Yours very truly,
“EDWARD BAYNTON.”

The *Resolute* already referred to was a powder-ship. Captain Lewis, the master, in vain sought for permission to bring her in. As in the case of the *Prince*, Captain Christie could do no more than use his good offices; and Captain Dacres was either determined to act against light and reason, or he issued with fatal fidelity the stupid orders of his superiors. That the fault did not rest altogether with them is evident from the fact that General Airey, the quartermaster-general, being anxious to obtain the warm clothing which was on board the *Prince*, sent down to Balaklava, inquiring when she could be taken into port and her cargo discharged. Captain Dacres replied, “If the weather moderates, the *Prince* will be brought into the harbour, but while this wind lasts, it will be impossible.” This was on the 10th.

On the 11th, Captain Lewis of the *Resolute*, being very uneasy for the safety of his ship and her valuable cargo of powder, went on board the *Trent* to consult Captain Ponsonby. The latter described the anxiety and impressions of Captain Lewis about the strange way in which his ship was kept beating about in the heavy gales in the following terms:—“Lewis told me that he had represented to Captain Christie that the *Resolute* was in a dangerous position, and that Captain Christie replied she should be taken inside as soon as he could possibly get her in; and Lewis added, ‘I think there is some *contra* order from a higher authority, which Captain Christie cannot get over. I wonder if Lord Raglan has anything to do with it?’” On the 12th, those two officers again consulted, and Captain Dacres was again applied to without success. Lewis declared that his ship could not remain where it was in such weather. Captain Dacres replied, “*I have nothing to do with it; but why do you not go to sea?*” Captain Lewis answered, “I have the working stock of powder on board, and cannot go. What would be said if powder was required, and I was not at hand? The whole siege would be stopped, and the responsibility I would incur would be more than my position is worth.” Captain Lewis then added, “There is an excellent berth where I lay before, and my old moorings are still there: let me come in at once, as I cannot answer for the consequences of another night like the last.”

It would appear that, however anxious the quartermaster-general might have been for the

landing of the warm clothing, he did not desire the admission to harbour of the *Resolute*, and that the fear at head-quarters of an attack on Balaklava had some influence over the mind of Captain Daeres; for Captain Ponsonby (already referred to) relates what occurred after the above conversation between the master of the *Resolute*, and the naval commandant of the harbour, thus:—"I then volunteered to go outside with the *Trent*, and tow the *Resolute* in; but Captain Daeres said, 'I have no authority to allow a powder-ship to come in, but I certainly think she ought to be inside.' Captain Lewis then told Captain Daeres that he had got the promise of Captain Christie that he should be brought inside as soon as possible. After this interview we went on shore, and Admiral Lyons happened to be on the beach. Captain Lewis went to him, and requested him to allow him (Captain Lewis) to bring his ship inside the harbour. What answer Admiral Lyons made I cannot say, but it was very unsatisfactory to Captain Lewis, who came to me and said, 'It is a very hard case that I am compelled to lay outside, and lots of room in here, and with my ship deep with the very sinews of war. Captain Christie would let me come in, were he not overruled by a higher authority.'"

It is difficult to account for Admiral Lyons' acquiescence in these arrangements. Much as we feel honoured by having the gallant admiral's name among those of the subscribers to this work, we cannot but participate in the feeling expressed by the correspondent of the *Morning Herald*, in reference to his share in the matter, and which impartial truth requires us to notice:—"On the 12th of November, Admiral Lyons, who had anchored outside the harbour in the *Agamemnon*, quitted and rejoined the fleet off the Katcha. A great many transports, and four vessels of war were then outside; and Admiral Lyons may, therefore, be said to have tacitly approved of their being there, as he made no remonstrance or remark about them. Even when, as we have seen, the case of the *Resolute* was brought under his notice, he declined to permit the ship to enter. Either, therefore, Admiral Lyons must have thought the anchorage a safe one, or else he was aware of the reasons which induced Captain Daeres to refuse to let the ships inside, and thought them sufficient. At this time most of the vessels had been compelled to let go both anchors, and veer out 120 and 150 fathoms of cable. The *Prince*, the most valuable and important vessel of all, had, as we know, only one anchor, but kept her steam up. On the 12th, it blew a gale, with cloudy weather. On the 13th, the weather was moderate, but it still blew fresh, with thick clouds and incessant rain. On the afternoon of the 13th

November, Captain Christie received a letter from Admiral Lyons, which was delivered by Mr. Layard, M.P. It was only a letter of introduction, in which Admiral Lyons presented the bearer as his 'friend;' and after one or two ordinary commonplace praises, went on to say, 'He (Mr. Layard) is not very well, and I am really anxious that he should have a comfortable passage to the Bosphorus. This I hope to secure for him through your kind offices, in one of the good transports going soon. What weather!'

'Yours faithfully,

'EDMUND LYONS.'

'What anxiety you must have had with your transports in these gales!'

Although the fate of the *Prince* and the *Resolute* created the greatest stir at home, there were various other ships, laden with important cargoes, left outside and wrecked; many others would doubtless have been lost had it not been for Captain Christie, and Mr. Commissary-general Filder. These ships ran in and delivered their cargoes under the orders of the commissariat, and in the teeth of those of the naval governor of the harbour, with whom a constant conflict of remonstrance and complaint and opposing authority was kept up by the commissariat service. In fact, the commissariat, like the medical department, was treated by certain officers of the united service with utter contumely, and their arrangements were often and insolently embarrassed, to the injury of the expedition. On the morning of the hurricane, there were anchored outside the harbour her majesty's steam-ships, *Retribution*, *Niger*, *Vesuvius*, and *Vulcan*; the steam-transports, *Prince*, *Avon*, *Melbourne*, and the *City of London*; the sailing transports, *Resolute*, *Mercia*, *Lady Valiant*, *Caduceus*, *Pride of the Ocean*, *Kenilworth*, *Medora*, *Wild Wave*, *Rip Van Winkle*, and *Sir Robert Sale*; the freight-ships, *Progress*, *Wanderer*, and *Peltoma*, with a private Maltese brig—making a total of twenty-one ships. Inside, there were four men-of-war, eight steam and seven sailing transports—making nineteen ships. There were also four tugs, and several private ships belonging to camp sutlers. There were in all thirty ships inside the harbour; it has often since held 200. All the vessels outside might, therefore, have been moored within; this, indeed, would not have wholly protected them from the violence of the tornado, which swept the land-locked harbour with fury; and although the water was but little agitated, because of the shelter afforded on every side, yet the masts and rigging caught the tempest as it rode on in its fury, sparing nothing which it could reach.

Before describing the tornado which broke

upon the ships under circumstances which left the great majority of them so little prepared, it is necessary to show how the harbour itself was governed. Perhaps never before, in the history of the English navy, did such gross mismanagement exist where officers of that navy held authority. There were no written or printed harbour rules distributed among the shipping; no harbour-master and his assistant staff to superintend, with vigilance and activity, the execution of previously concerted and published orders. The dangers were many, and scarcely any precautions were taken against them. Ships laden with powder, shells, and other combustibles, were moored up quite close to the houses. A fire, even if no explosion of powder and shell took place, would have been necessarily most destructive—town and shipping must, in such case, have suffered seriously. It would, however, have been next to impossible for a fire to have taken place in any ship without extending, reaching the ammunition vessels, and causing explosions that would have destroyed everything in Balaklava itself, and upon its waters. Such a catastrophe might have proved the ruin of the army. Yet, will it be believed, lights might be seen at all hours of the night on board every craft, fires were constantly burning, drunkenness prevailed to a shocking extent amongst the crews; broils and disorders, in the town, in the boats, on the decks of the transports, in their holds and cabins, were notorious. How these things did not lead to the destruction of ships, town, and stores in the harbour and on the shore, is inconceivable. It was the common amusement of the mates and other officers on board the merchantmen to practise with “Colts” and rifles during the day, so that persons rowing about in the harbour, either for amusement or business, were in constant danger. These improprieties were in vain made matters of complaint there, and matters of publicity in England. The naval authorities abroad, and the Admiralty at home, were alike indifferent: confusion was allowed to reign, and a reckless anarchy characterised everything at Balaklava.

Such a state of affairs assumes a graver importance when it is known that all the stores of the army were either on shipboard or on shore at Balaklava. It has been seen by the reader, that again and again our brave soldiers were sacrificed for want of ammunition. At the battle of Inkerman, when His Royal Highness the Duke of Cambridge exhibited a prodigality of courage seldom exhibited in battle, and called to his men to fire, he was answered by his brave Guards with the thrilling cry that there was no ammunition. When Sir George Cathcart and a portion of his division were surrounded in the same battle,

and he called on the men to fire, he was met by the same terrible response. It would have seemed like a mockery from any general less trusted and less loved, to have answered, as he did, “Have you not your bayonets!” they had indeed their bayonets, but bayonets could not reach the enemies who, from the sides of the ravine above, poured upon the gallant band a deathful fire.

Before the storm broke out on the 12th, Commissary Filder wrote to Lord Raglan, exploring his lordship to form a depot near the camp, containing a month’s supply of everything—as the only security against accident at Balaklava, or the difficulties of the road to the camp when mud or snow should render it impassable. No notice at all was taken of the rational and important request. The day after the storm, the commissary had the foresight and the sense of duty to renew the request. This time he got an answer—it was a refusal. Yet, when the authorities at home thought it necessary to blame somebody, the Horse Guards sought to make a scapegoat of Commissary Filder, that he might carry away “into the wilderness” the sins of more courtly sinners.

The disorder on shore at Balaklava was only not quite so bad as the disorder at sea. Nobody knew where anything was which was required. Commissary Filder was expected to do everything; had he possessed the eyes of Argus and the feet of Mercury, he could not have performed a hundredth part of what was expected from him. An ubiquitous functionary would indeed have been a blessing, if an official so gifted could be found in the quiet nooks of the Ordnance or Horse Guards—for nothing seemed so great a riddle to our officials at Balaklava, as the particular thing he was meant for. Scarcely any of these gentlemen could be met with who was not capable of commanding a fleet or an army, of taking Sebastopol, reforming the Turkish Empire, teaching the czar a lesson, or succeeding Lords Newcastle and Aberdeen; but the distinct limits of their own official functions, or how far they might venture across the bounds in a desperate emergency, were things inscrutable to themselves and everybody else. The whole fraternity seemed born for red-tape purposes exclusively—administrative capacity there was none; yet this wretched want of adaptation to new circumstance, and of any fertility of thought in an emergency, was accompanied by a self-sufficiency and an air of self-importance truly wonderful. Routine seemed to them the philosophy of all government, and of all individual management, whosoever men might be cast, and however varied the circumstances by which they might be surrounded. Such was Balaklava, and so was it governed, as to its naval and civil affairs, when the storm rushed forth upon it,

and changed one aspect of confusion for another—adding to disorder, wreck, ruin, and death.

The state of things at Balaklava at this period is apologetically noticed by Sir Edward Colebrooke in his private journal. After admitting that no forethought for a winter campaign had been exhibited, he adds:—

“But this neglect is not surprising to those who knew the uncertainty of our tenure of the place after the battle of Balaklava. From that day until I left the country, we lived only for the day, and thought only of the day; every disposable hand was employed in strengthening our defences, and any preparation for a winter residence in a place from which we might have been ousted at any moment would have been folly, until the works were secure against attack.

“With regard to the deplorable state of the army during the winter, I think there can be now but little difference of opinion as to the immediate causes. There was a want of foresight in not preparing for an approaching winter, arising from the peculiarity of the campaign, which at one time promised a rapid and successful issue; and there were defects of organisation in the management of our transports, and in the state of the harbour here, which increased the distress of the army, but which seem to me to have been much exaggerated. The two causes which throw all others into the shade, were the excessive work of the trenches, and the defects of the land transport. They are both traceable to one and the same cause—the error of undertaking so great an enterprise with insufficient means. The enterprise so nearly succeeded that it would be impossible to mark it out for strong censure, but it cannot be denied that every presumption was against us. Fortune favoured us during the first two months in a wonderful way; we had no equinoctial gales, and the communication with the shipping, on which the army directly relied, was scarcely interrupted for a day. Then came the extraordinary gale of the 14th November, which exposed all the perils of our situation in having all our magazines afloat, and the deficient system of land transport broke down when the first strain was put upon it.

“I dwell more particularly on these two sources of distress and difficulty, because they were those in which the French had a decided advantage over us. Their men were not worked as ours, and their land transport was effective compared with our own. [I leave this passage as I wrote it. I have since had reason to doubt whether the French land transport was ever superior to our own. They had great advantage over us in their communications. Our principal difficulty in regard to

transport was to find men and keep them. It was easy to import cattle, but very difficult to find drivers who knew their work and would face it.]”

From the 8th of November to the 13th, the state of the weather in the Sea of Marmora, the Bosphorus, the Black Sea, and along the neighbouring shores, was fitful and gusty, as the reader has already perceived from our narrative of the doings and misdoings of the authorities at Balaklava. Sometimes the weather was beautiful and bright, as on the pleasantest October day in England. Suddenly the brightness would be overcast, vast piles of cloud gathering in the horizon, and assuming the most grotesque and indescribable appearances. These would dissipate as rapidly as they formed, the wind breaking in short sudden puffs over the water, which seemed to tremble as if conscious of the approach of a power that could lash its mighty masses into foam. The sun would again smile upon sea and rock, and with a genial warmth, such as in our climate is unusual in November. A few hours more, and the distant heavens would appear as if marshalling all their stores of thunder, pent within the voluminous clouds which gathered there; mountain of cloud piled on mountain rolling on as if driven before an omnipotent hand, and about to be rolled over the rocks and heights in a deluge of desolating waters. These compact masses seemed to break and disperse, as if each warred with the other, and strong gusts would burst forth with a rushing noise like that of shells passing between the combatants before the city. Several nights previous to the 13th, the wind blew gales which strained the camp tents on the plateau, endangered the shipping at anchor off Balaklava, the Katcha, and Eupatoria, and severely tried the qualities of ships sailing between the Bosphorus and the Crimea.

On the 13th, all day it blew fresh, but there were no other indications of worse weather than had existed for five or six days before; the night set in very fine, the wind blew from the south-west, and its temperature was warm for the time of year. Occasionally, however, through the night, the wind rose, but fell again; and no unusual precautions were taken on land or sea, nor did such appear to be required. Towards daylight, the wind sprung up and increased rapidly to a gale; by seven in the morning it became a hurricane, the most dreadful, perhaps, ever remembered. No descriptions of tempest which have ever met our eye, no terrors such as the storm-fiend has so often been represented as sending forth in the Chinese seas or in the West Indies, equal in destructiveness the descriptions of the hurricane of the 14th of November, which have been given by those who suffered

under its strength. The blast burst over the camps on the exposed heights, tearing through the lines of tents as if the wing of an avenging angel smote them. The wearied troops were at rest—the fineness of the night, and the quietness of the enemy, allowing a universal repose—when suddenly they were awakened by a loud and piercing scream, as if some struggling spirit of vast power and energy, yet suffering, passed among the sleepers. Mr. Woods tells us that half the tents of the English were swept away; Mr. Russell informs us with more accuracy, for he was a sufferer (Mr. Woods was on his way from Constantinople), that only three tents were left standing upon the plateau—those of the judge-advocate, Colonel Dickson of the artillery, and another officer. Scarcely had the shriek of the tempest pierced the ears of the sleeping soldiery, than the whole camp tents fell, as if by the sudden stroke of an unseen wand. The condition of the occupants was distressing in the last degree. The tents were in many cases blown down on the sleepers—broken poles, swords, rifles, wet canvas falling on their beds, wounding, and nearly suffocating them. After struggling from beneath the ruin of their domiciles, the officers and men were exposed, undressed, to the pelting of the pitiless tempest. The rain which accompanied it fell in torrents—the camp overflowed with water; where the earth was heavy, it was turned into mud, and that was blown up into the air, falling in showers of filth around the astonished and bewildered men. The thunder now burst with long, loud, deafening peals, and echoed again and again over the vast area of hill, vale, and rock, around the theatre of war; the sleet fell upon the earth in sheets, or swept over its surface, and hail descended like showers of bullets. The bearing of the men of the two armies was very different: the French literally fled as if before a pursuing foe; the sturdier English laboured to repair or avert disaster, or stood sternly by their prostrate tents when all hope of re-erecting them was necessarily abandoned.

The sufferings of the outposts and covering parties were overwhelming; the trenches were filled instantly with water; the pickets, with their faces towards the living enemy, dared not for a moment relax their watching, while the elements made fierce and unexpected war upon them. The sick suffered most of all; their tents were blown down upon them, so that in their helplessness the difficulty of extricating them was excessive. The French had erected wooden tents as receptacles for the sick and wounded, where they were treated with great care; but these buildings were in less than half an hour scattered in every direction, scarcely a plank remaining to show where they had been. The bedclothes of the patients

were whirled up into the air, and the poor invalids lay under the descending torrent, and were beaten by the tempest, until death in some cases put an end to their endurance. It was, however, a curious fact, account for it as medical philosophers may, that not a few of the wounded, and even sick, bore the frenzy of the storm better than those in health; and some, whose recovery seemed hopeless before, rallied immediately. Some notion of what the British officers endured who were confined to bed, may be gathered from the relation of Lieutenant Peard, *ex uno disce omnes*:—“Being ill, and not likely to be called out, I had unfortunately undressed myself, and I had not time to put on my clothes before our tent was blown quite over our heads, inside out, the pole at the same time falling on my head, with swords and things which hung around it. The wind was blowing so furiously that the sea of mud which was before us was blown up in our faces, and covered everything about us. I looked in despair at S—, who was in a roar of laughter; while our servants were standing around, unable to move for amazement. All the neighbouring tents had shared, or were sharing, the same unhappy fate. My eye caught R—’s tent still standing, and I told my servant to carry me in my bedding to it. The poor wretch stopped half-way, and looked in my face, as much as to say, he could carry me no further, and I was in the greatest fear of being precipitated headlong into the mud: however, he staggered on, and deposited me in the tent on R—’s bed, which he most kindly prepared for me. I found him holding on, in the most determined manner, to his tent-pole, which was reeling about very suspiciously. Tentless friends came in all the morning, and they were sworn into the service, and by their united exertions it weathered the gale; others were walking about in their cloaks, drenched to their skin, seeking shelter from the pitiless storm. Eyes were cast to the other divisions, and we found they were in the same plight as ourselves; all except the Turks, who seem better to understand the art of tent-pitching.”

The violence of the tempest on the plateau may be judged of by the fact that the most ponderous articles of tent furniture were carried far over the heights—chairs, tables, tent-poles, were driven about with as much levity as caps, boots, garments, and bedclothes. At Balaklava, the tiles were carried from the roofs across the harbour, and some of the roofs driven to distances which could not have been conceived as possible. The cavalry horses, British and French, broke loose and sought shelter under the lee of any rugged elevation they could find, or dashed on terrified towards Sebastopol, falling into the ravines, or sinking exhausted beneath the storm.

The experience of Mr. Russell will furnish a specimen of what all had to undergo. It is written with an air of jocularly unsuited to so grave an occasion, but nevertheless characterised by his usual aptness in describing incidents of a striking character:—

“The sound of the rain, its heavy beating on the earth, had become gradually swallowed up by the noise of the rushing of the wind over the common. . . . It had a harsh screaming sound, increasing in vehemence as it approached, and struck us with horror. As it passed along we heard the snapping of tent-poles and the sharp crack of timber and canvas. On it came, ‘a mighty and a strong wind;’ the pole broke off short in the middle, as if it were glass, and in an instant we were pressed down and half stifled by the heavy folds of the wet canvas, which beat us about the head with the greatest fury. Half breathless and blind, I struggled for the door. Such a sight as met the eye! The whole headquarters’ camp was beaten flat to the earth, and the unhappy occupants were rushing through the mud in all directions in chase of their effects and clothes, or holding on by the walls of the enclosure as they strove to make their way to the roofless and windowless barns and stables for shelter. Three marquees alone had stood against the blast—General Estcourt’s, Sir John Burgoyne’s, and Major Rakenham’s. The general had built a cunning wall of stones around his marquee, but ere noon it had fallen before the wind, and the major’s shared the same fate still earlier in the day. Next to our tent had been the marquee of Captain de Morel, aide-de-camp to the Adjutant-general Estcourt. It lay fluttering on the ground, and, as I looked, the canvas seemed animated by some great internal convulsion—a mimic volcano appeared to be opening beneath it, and its folds assumed the most fantastic shapes, tossing wildly about in the storm. The phenomenon was speedily accounted for by the apparition of the gallant owner fighting his way out desperately against the wind, which was bent on tearing his very scanty covering from his person; and at last he succeeded in making a bolt of it, and squattered through the mud to the huts. . . . Right before us the camp of the Chasseurs d’Afrique presented an appearance of equal desolation and misery. Their little *tentes d’abri* stood for a few minutes, but at last the poles snapped, and they were involved in the common ruin. . . . Woe betide the Russians had they come on that day, for, fiercer than the storm and stronger than all its rage, the British soldier would have met and beaten their teeming battalions. The cry was all throughout this dreadful day, ‘Let us get at the town; better far that we should have a rush at the batteries

and be done with it than stand here to be beaten by the storm.’ Scenes of wretchedness met the eye. The guard tents were down, the late occupants huddled together under the side of a barn, their arms covered with mud, lying where they had been thrown down from the ‘pile’ by the wind. The officers of the guard had fled to the commissariat stores near Lord Raglan’s, and found there partial shelter. Inside the commissariat yard, overturned carts, dead horses, and groups of shivering men were seen—not a tent standing. Mr. Cookesley had to take refuge among his stores, and was no doubt glad to find it, even amid salt pork and rum puncheons. Nearer to us hussar horses were dead and dying from the cold. With chattering teeth and shivering limbs each man looked at his neighbour. Lord Raglan’s house, with the smoke of its fires steaming away from the chimneys, and its white walls standing out freshly against the black sky, was indeed ‘the cynosure of neighbouring eyes.’ Our generals’ marquees were as incapable of resisting the hurricane as the bell-tents of the common soldiers. Lord Lucan was seen for hours sitting up to his knees in sludge amid the wreck of his establishment, meditative as Marius amid the ruins of Carthage. Lord Cardigan was sick on board his yacht in the harbour of Balaklava. Sir George Brown was lying wounded on board the *Agamemnon*, off Kamiesch Bay; Sir de Lacy Evans, sick and shaken, was on board the *Sanspareil*, in Balaklava; General Bentinck, wounded, was on board the *Caradoc*, at Constantinople, or on his way to England. The Duke of Cambridge, sick and depressed, was passing an anxious time of it in the *Retribution*, off Balaklava, in all the horrors of that dreadful scene at sea. But General Pennefather, Sir R. England, Sir J. Campbell, Brigadier Adams, Brigadier Buller—in fact, all the generals and colonels and officers in the field, were just as badly off as the meanest private. The only persons whose tents weathered the gale, as far as I could hear, were Mr. Romaine, deputy judge-advocate-general; Lieutenant-colonel Dickson, Royal Artillery; and Captain Woodford. The first had, however, pitched his tent cunningly within the four walls of an outhouse, and secured it by guys and subtle devices of stonework. They were hospitable spots, those tents—oases in the desert of wretchedness; many a poor half-frozen wanderer was indebted almost for life to the shelter he there received. While all this writing is going on, pray never lose sight of the fact, as you sit over your snug coal fires at home, that fuel is nearly all gone here, and that there are savage fights, even in fine weather, among the various domestics, for a bit of shaving or a fragment of brushwood. Never forget that all this time the storm is raging

with increased violence, and that from half-past six o'clock till late in the day, it passed over the camp with the fury of Azraël, vexing and buffeting every living thing, and tearing to pieces all things inanimate. Now and then a cruel gleam of sunshine absolutely shot out of a rift in the walls of clouds, and rendered the misery of the scene more striking. Gathered up as we were under the old wall, we could not but think with anxious hearts of our fleet at sea—of our transports off Balaklava and the Katcha—of the men in the trenches and on picket. Alas! we had too much reason for our anxiety. Towards ten o'clock matters were looking more hopeless and cheerless than ever, when a welcome invitation came through the storm for us to go over to the shelter of a well protected tent. Our first duty was to aid the owner in securing the pole with 'a fish' of stout spars. Then we aided in passing out a stay from the top of the pole to the wall in front, and in a short time afterwards a cup of warm tea was set before each of us, provided by some inscrutable chemistry, and, with excellent ration biscuit and some butter, a delicious meal, as much needed as it was quite unexpected, was made by my friends and myself, embittered only by the ever-recurring reflection, 'God help us, what will become of the poor fellows in the trenches and on the hill!' And there we sat, thinking and talking of the soldiers and of the fleet, for hour after hour, while the wind and rain blew and fell, and gradually awakening to the full sense of the calamity with which Providence was pleased to visit us. Towards twelve o'clock the wind, which had been blowing from the south-west, chopped round more to the west, and became much colder. Sleet fell first, and then came a snow-storm, which closed the desolate landscape in white, till the tramp of men seamed it with trails of black mud. The mountain ranges assumed their winter garb. French soldiers, in great depression of spirits, flocked about our head-quarters, and displayed their stock of sorrows to us. Their tents were all down and blown away—no chance of recovering them; their bread was '*tout mouillé et gâté*,' their rations gone to the dogs. The African soldiers seemed particularly miserable. Poor fellows! several of them we found dead next morning outside the lines of our cavalry camp. We lost several men also. In the light division, four men were 'starved to death' by the cold. Two men in the 7th Fusiliers, one man in the 33rd, and one man of the 2nd battalion Rifle Brigade, were found dead. Two more of the same division have died since, and I fear nearly an equal number have perished in each of the other divisions. About forty of our horses also died from the cold and wet, and many will never recover that fatal day and night.

But the day was going by, and there was no prospect of any abatement of the storm. At two o'clock, however, the wind went down a little, and the intervals between the blasts of the gale became more frequent and longer. We took advantage of one of these halcyon moments to trudge away to the wreck of the tent, and, having borrowed another pole, with the aid of a few men we got it up all muddy and filthy, and secured it as far as possible for the night; but it was evident that no dependence could be placed on its protection, and the floor was a mass of dirt and puddle, and the bed and clothes dripping wet. I mention my own tent only, because what was done in one case was done in others, and towards evening there were many tents re-pitched along the lines of our camps, though they were but sorry resting-places. Although the tents stood, they flapped about so much, and admitted such quantities of snow, rain, and filth from outside, that it was quite out of the question to sleep in them. What was to be done? Suddenly it occurred to us that there might be room in the barn used as a stable for the horses of Lord Raglan's escort of the 8th Hussars, and we at once waded across the sea of nastiness which lay between us and it, tacked against several gusts, fouled one or two soldiers in a different course, grappled with walls and angles of our houses, nearly foundered in big horse-holes, bore sharp up round a corner, and anchored at once in the stable. What a scene it was! The officers of the escort were crouching over some embers of a wood fire; along the walls were packed some thirty or forty horses and ponies, shivering with cold, and kicking and biting with spite and bad humour. The hussars, in their long cloaks, stood looking gloomily on the flakes of snow which drifted in at the doorway or through the extensive apertures in the shingle roof. Soldiers of different regiments crowded about the warm corners, and Frenchmen of all arms, and a few Turks, joined in the brotherhood of misery, lighted their pipes at the scanty fire, and sat close for mutual comfort. The wind blew savagely through the roof, and through chinks in the mud walls and window holes. The building was a mere shell, as dark as pitch, and smelt as it ought to do—an honest unmistakeable stable—improved by a dense pack of moist and mouldy soldiers. And yet it seemed to us a palace! Life and joy were inside, though melancholy Frenchmen would insist on being pathetic over their own miseries—and, indeed, they were many and great—and after a time the eye made out the figures of men huddled up in blankets, lying along the wall. They were the sick, who had been in the hospital marquee, and who now lay moaning and sighing in the cold; but our

men were kind to them, as they are always to the distressed, and not a pang of pain did they feel which care or consideration could dissipate. A staff-officer, dripping with rain, came in to see if he could get any shelter for draughts of the 33rd and 41st regiments, which had just been landed at Kamiesch, but he soon ascertained the hopelessness of his mission so far as our quarters were concerned. The men were packed into another shed 'like herrings in a barrel.' Having told us, 'There is terrible news from Balaklava; seven vessels lost, and a number on shore at the Katcha,' and thus made us more gloomy than ever, the officer went on his way, as well as he could, to look after his draughts. In the course of an hour an orderly was sent off to Balaklava with despatches from head-quarters, but, after being absent for three-quarters of an hour, the man returned fatigued and beaten, to say he could not get his horse to face the storm. In fact, it would have been all but impossible for man or beast to make headway through the hurricane. We sat in the dark till night set in—not a soul could stir out. Nothing could be heard but the howling of the wind, the yelp of wild dogs driven into the enclosures, and the shrill neighings of terrified horses. At length a candle-end was stuck into a horn lantern, to keep it from the wind—a bit of ration pork and some rashers of ham, done over the wood-fire, furnished an excellent dinner, which was followed by a glass or horn of hot water and rum—then a pipe, and, as it was cold and comfortless, we got to bed—a heap of hay on the stable floor, covered with our clothes, and thrown close to the heels of a playful grey mare who had strong antipathies to her neighbours, a mule and an Arab horse, and spent the night in attempting to kick in their ribs. Amid smells and with incidents impossible to describe or to allude to more nearly, we went to sleep in spite of a dispute between an Irish sergeant of hussars, and a Yorkshire corporal of dragoons, as to the comparative merits of light and heavy cavalry, with digressions respecting the capacity of English and Irish horse-flesh, which, by the last we heard of them, seemed likely to be decided by a trial of physical strength on the part of the disputants. Throughout the day there had been very little firing from the Russian batteries—towards evening all was silent except the storm. In the middle of the night, however, we were all awoke by one of the most tremendous cannonades we had ever heard of, and, after a time, the report of a rolling fire of musketry came down on the wind. Looking eagerly in the direction of the sound, we saw the flashes of the cannon through the chinks in the roof, each flash distinct by itself, just as a flash of lightning is seen in all its length

and breadth through a crevice in a window shutter. It was evident there was a sortie on the French lines. The cannonade lasted for half-an-hour, and gradually waxed fainter. In the morning we heard the Russians had sallied out from their comfortable warm barracks on the French in the trenches, but that they had been received with an energy which quickly made them fly back again to the cover of their guns. It is said that the French actually got into a part of the Russian lines in chasing their troops back, and spiked some of the guns within an earthwork battery.'

Coming the next day into Balaklava, he thus describes the scene:—"The white-washed houses in the distance were as clean-looking as ever, and the old ruined fortress on the crags above still frowned upon the sea, and reared its walls and towers aloft uninjured by the storm. On approaching the town, however, the signs of the tempest of yesterday grew on one, and increased at every step. At the narrow neck of the harbour, two or three large boats were lying, driven inland several yards from the water; the shores were lined with trusses of compressed hay which had floated out of the wrecks outside the harbour, and pieces of timber, large beams of wood, masts and spars of all sizes formed large natural rafts, which lay stranded by the beach, or floated about among the shipping. The old tree which stood at the guard-house at the entrance to the town was torn up, and in its fall it had crushed the house so as to make it a mass of ruins. The soldiers of the guard were doing their best to make themselves comfortable within the walls. The fall of this tree, which had seen many winters, coupled with the fact that the verandahs and balconies of the houses, and a row of very fine acacia trees on the beach were blown down, corroborates the statement so generally made by the inhabitants that they had never seen or heard of such a hurricane in their lifetime, although there is a tradition among some that once in thirty or forty years such visitations occur along this coast."

The most remarkable proof of the force of the hurricane was, that heavy bodies, which could only be moved by great labour of man or horse, were scattered about. Laden arabas were overturned, broken, and their fragments and contents dispersed in every direction. Trusses of pressed hay, each weighing two hundred pounds, were hurled over the heights and down the ravines to Sebastopol. A large flock of sheep, which belonged to the fourth division, was dispersed and driven, some into the sailors' camp, and some into the city—nearly all were lost to their proper owners. When the rain, hail, and sleet abated, and the storm subsided, a fall of snow covered hill

and plain; winter began his sway, and the troops had a bitter foretaste of his power.

The condition of the Russians was no better than that of the allies. The valley of the Tchernaya was like a marsh, and the opposite heights were stricken by the utmost fury of the hurricane. Liprandi's forces could not but have suffered intensely. It was afterwards ascertained that many of the Russian troops died under the hardships of that night, and its events contributed not a little to the subsequent retreat of Liprandi from his menacing position against the flank and rear of the allies.

Thus terrible was the tempest in all the camps, and around the war-beaten city. In the little town of Balaklava, the devastation was as signal. A Russian gentleman, then on parole there, declared to the author that, although familiar with the Crimea and southern Russia from his boyhood, he had never witnessed such weather, or contemplated the possibility of such a scene as he witnessed at Balaklava that day. His description of the heavy articles of household furniture, empty casks, tiles, house-tops, doors, &c., forced upwards and borne a considerable distance on the wind, portrays a scene of tempest truly appalling, and such as we never before met with. The filthy little town was choked with portions of shattered dwellings, up-turned waggons, broken boats, prostrate mules and horses, beds, bedding, doors, shutters, chairs, hay-trusses, horse-boxes, pieces of wrecked shipping, and unaccountable material of every kind, such as the presence of a fleet and army in the neighbourhood might bring there. Barrels filled with various commodities were driven bounding along the narrow street, over the various wrecks, until they also were stove in, and their contents dispersed.

A number of sick at Balaklava were scarcely less sufferers than those in the French huts or British tents nearer the camps. Many sick Turks lay in the streets, exposed to the unmitigated fury of the elements—their poor countrymen exerting themselves in their behalf with a quiet and resigned air, themselves nearly as much to be pitied as those they aided. At sea, however, destruction had its grandest scope. Property to a vast amount was lost in the waves, or driven, damaged, upon the shore, and many brave men sunk beneath the raging waters; no human aid could avail them. From daylight the gale blew violently outside the harbour; at half-past eight the ships felt its utmost fury: yet no means were adopted to bring in any portion of the shipping, while that was practicable, although every experienced mariner must have seen that a resistless storm was breaking forth. Captain Cargill, the master of the *City of London*, put out to sea, steaming steadily with her head to

the wind. As he passed the *Prince*, he hailed her commander, warning him that the weather would soon be more severe, and urging him to follow his example. This warning was not taken, nor did any other ship profit by the prudence of Captain Cargill. At nine o'clock the elements were furious, as if under the direction and impulse of evil spirits. Sea and sky appeared to mingle; the wind swept along the waters with a screaming sound, and struck the sea with rapid and tremendous gusts as if bolts were flung into it from heaven.

There is always exaggeration in the descriptions given of the height to which waves rise in a storm, and philosophers have made inductions on this subject, which show that, were waves to rise to the height supposed by ordinary observers, nothing could live at sea for a moment. On this occasion it would be difficult to exaggerate—the rush of waters rose half way up the tall cliffs of the iron-bound coast of Balaklava. The ships were swept onward to the rocks in spite of every effort, which skill and steam could lend to keep them off. The first ship which succumbed was one of our fastest sailing transports, the *Rip van Winkle*. She parted both anchors, and at once rushed upon her fate; a wave, rolling “mountains high,” as it is customary to describe such, bore her upon its summit, and dashed her, broadside on, against the shore. There were many spectators of this sad catastrophe, and they unite in describing the shock of the ship against the cliffs as if of an explosion—she struck, and instantly fell to pieces. Not a soul escaped, the whole crew were instantaneously engulfed. In a very few minutes two other ships were also swept in upon the rocks—these were the *Wild Wave* and the *Progress*. Their crews met with instant death, except two or three men of the *Wild Wave*, who were driven upon a shelving rock, to which they clung, until, when the storm abated, assistance reached them; they were nearly dead with cold, bruises, and despair. The *Kenilworth* was next in the sad series of wrecks. She did not go to pieces at once, as the other ships which have been mentioned, but after being hurled a few times against the cliffs, she parted and went down, all hands perishing. The mists, spray, rain, sleet, and hail, blinded those who made desperate efforts on the shore to afford some help, and the wind smote them repeatedly to the earth, driving them back as often as they attempted to deserv whether there were any whom they could succour. Suddenly the mists cleared, and a lull ensued, which inspired those who had gathered upon the heights with the hope that they could do something to mitigate the sufferings and lessen the chances of destruction of those below. The mariners

who found a space to cling to on the friendly shelvings were now discovered, and a cry arose for ropes; one brave man descended, and succeeded in rescuing them—they and their gallant deliverer were drawn up. Scarcely was this feat of courage and humanity performed, when again the storm resumed its power—a long wailing moan came over the sea—a burst like a thunder-clap struck the walls of the cliff—the sleet and hail fell in floods upon the heights, and the tempest, with a sustained roar, seemed to go forth in vengeance upon land and sea. The men on the heights fled for refuge wherever it could be found—all attempts to render assistance were given up. Strong men were struck to the earth, and, bruised and bleeding, had to seek cover from the strong pursuer. The mists again cleared, but the storm did not abate. Many turned and faced the enemy, moved by anxiety for friends, or a brave desire to see if anything could still be done for those on the more exposed element. The heights were again crowded with men clinging to the cliffs, and looking out to sea. A sight now presented itself which excited the deepest commiseration; and if human courage could have effected anything, the men who witnessed it would have incurred any risk that might have afforded the least hope to the objects of their commiseration. The *Wanderer*, which had held on with wonderful tenacity, dragged her anchors, and drifted towards the fatal shore. She seemed to have been abandoned by her crew, who, it was supposed, took to the boats early in the gale, and perished. Two boys were distinctly seen upon her deck, trying to cut away her foremast, and thereby secure for her a better chance of floating. Before they could effect their purpose she reached the shore, and was lifted up by a huge wave, and dashed by it, as if with conscious vengeance, against the cliffs. The vessel floated away in fragments, and the youths were seen no more. A thrill of terror ran through the spectators—a common cry of mingled pity and horror broke from every breast. While these feelings were finding full expression, a still more awful sight was presented. The *Prince*, the pride of the transport service, and one of the finest ships that ever carried a cargo, had held on valiantly by her single anchor. She had put on her full power of steam, and resisted the fatal tendency to the shore with all her force. It was in vain; steam availed nothing against the power which scattered the fleet as a man would cast from his hand the shells of nuts. The crew, perceiving that the vessel was rapidly yielding, began to cut away her mizen-mast. This was the turning event in her evil fortune; the mast fell just as the ship seemed to gain a position which gave her a

chance of safety, and when the wind sensibly lessened. The mast falling across her “fouled her screw,” and her force against the storm being lost, she rolled onward, and was hurled against the cliffs as if the sea and storm united in that moment their utmost violence. The good ship survived this stroke; but another effort of her enemies, and the victory over her was secured—a wave came with extraordinary velocity and threw her up against the rocks. The crash was louder than the storm; she parted midships; another giant wave struck the wreck on the instant, and completed the destruction. One hundred and fifty-three human beings went down with her into the boiling surge; some were thrown upon the rocks by the waves which crushed her. Lieutenant Inglis, of the Royal Engineers, had gone on board the previous evening to arrange the disembarkation of the apparatus with which an experiment was to be made to blow up the ships across the harbour of Sebastopol: this intelligent officer was among the lost.

To leave such a vessel to ride with one anchor, under the circumstances which we have described, was a matter of criminal neglect somewhere. The omission as to the proper clenching of the cables originally was equally criminal. It is but just to mention that it was afterwards denied that the cables were not in proper order, and the accidents to them were attributed to the violence of the gale; these representations are very doubtful—we fear that those given in a previous page place the affair in its correct light. The vessel was lost through sheer and disgraceful neglect of duty, or as criminal an abuse of authority. The *Resolute* was the next to strike. Her fate was similar to that of the *Prince*; her heavy cargo of ammunition, especially of powder, most valuable and much wanted, was scattered or sunk like the bales of clothing, scientific apparatus, provisions, &c., on board the *Prince*. The loss of the *Resolute* was the more to be regretted because of the strenuous efforts, already recorded, made by her master to enter the harbour. Several of the men and one of the mates of this ship were saved. Cut and bruised they clung to peaks of rock upon which the waves flung them; but none dared to offer help, so violent was the tempest, until Captain Liddle set the example, and soon found brave followers. Ropes were procured, and with great danger to the adventurous rescuers, the men were taken up. The *Peltoma*, with masts and yards all taut, was lifted up and precipitated against the rocks; her sides were stove in the first stroke, the next knocked her to pieces, and her wreck drifted along the shore. The Maltese brig never reached the coast—she went down, foundering beneath the weight of water

that broke over her. All the remaining ships seemed to the spectators to be drifting, and the mariners were straining every nerve in cutting away masts and otherwise lightening them. The *Avon*, of the West India Mail Company's service, was in great danger; her engines, of the finest make, were 800 horsepower, but her captain felt that the strain upon his cables could not much longer be borne, and he boldly slipped them and ran into the harbour, driven at the rate of ten knots an hour. He had watched his opportunity, and, during the lull already noticed, placed his vessel in a position which secured her going in by the force of the wind, while he so worked his engines as to check the rapidity with which she was sent before the storm. Her passage through the narrow entrance was most providential; her escapes were wonderful, as she scudded through the narrow winding passage by which the harbour is attained. Even when she entered her peril did not cease, for she was driven among the other shipping, causing much damage although she received little.

The most remarkable escape, however, where so few did escape, was that of the *Retribution*, one of our best steam frigates. The Duke of Cambridge had taken a berth in this fine ship—his bruises, fatigues, and illness, rendering it no longer possible for him to remain at the head of his division. When the storm began, the *Retribution* held on by three cables, each of 140 fathoms length. To prevent dragging, she steamed full power against the wind. She was, however, beaten by this king of storms, and dragged half-a-mile in the first hour. Nearing the rocks, two of her cables parted, and all hope of saving the ship was nearly lost. The anchor by which she still held was her smallest, and it was not expected to keep ground half an hour. Her stern was at this moment within ninety yards of the rocks, and 100 tons of water were on her main deck. Whatever prospect of salvation now remained, was by throwing her guns overboard, and thereby lessening the strain on her cable. In trying to throw overboard a long ten-inch gun, a heavy lurch broke it from the tackle, and it was hurled about the deck, smashing everything in its devious course; pitched from side to side with every commotion of the frigate, it wounded a number of the men, causing broken limbs and dangerous confusions. It was at last thrown aft, as the foreship rose on a high wave, and there the men continued to throw around it hammocks and sailcloth, so as to confine the range of its tossings and boundings. Guns, shot, and shell, were then thrown over, until the ship was greatly lightened. All hands flew to the pumps, and she was eased of much of her weight of water. The strain was sensibly relieved, and she weathered the storm

contrary to the expectations of the most sanguine of her officers. The Duke of Cambridge, invalid although he was, showed the same coolness and courage which he displayed on the rugged slopes of Inkerman under the especial fire of the Russian columns. It was reserved for the prince to know the dangers of the sailor as well as of the soldier—to partake of storm as well as battle in the service of his royal cousin and of his country; and on each occasion his conduct was such as justly to make both queen and country proud of him.

The extraordinary power of the tempest may be better conceived by what happened inside the harbour than even amidst the scene of destruction without. It is land-locked, there are no tides; even during the storm the water was not so agitated as to endanger any vessel upon it; yet the ships were driven from their moorings by the power of the wind alone, and the *Sanspareil* was in this way sent upon the steep shore several feet. The masts of the vessels were broken across, and several ships heeled over almost to their beam-ends. The damage to shipping in the harbour was very great, but there were no wrecks and no lives lost. Incredible as it may appear, it is nevertheless true, that heavy ships-boats were lifted up out of the water, and several were carried a considerable distance inland. The gig of the *Bride* was by the water's edge, and two men were lying in it—it was lifted up, the men of course thrown out and injured, and the gig itself blown over the houses, falling against that inhabited by the commissary-general, and driving in the partition of his bedroom. The strong iron paddle-boxes of some troop tugs were also carried into the streets.

At the mouths of the Katcha and the Belbek, where the fleets were, the force of the tempest was not felt quite so much; but there also it was such as might have caused the stoutest heart to quail, and it entailed extensive destruction. Six English transports were wrecked, but the presence of the fleet and the nature of the anchorage prevented loss of life—the crews were with difficulty saved. Our allies lost two transports, which went down at their anchors, and all on board perished. Indeed, the ships of our allies did not weather the hurricane with the same steadiness as ours—for all the war-ships, French and Turkish, suffered much more injury than the ships of the British navy. Three fine French liners nearly sunk at their anchorage. The flag-ship of Admiral Dundas barely escaped a similar fate. A beautiful Turkish screw-frigate was thrown on shore, her crew escaped; she was got off after the storm, and although extensively injured, was not actually wrecked. At Kamiesch the French transports were nearly all driven on the beach, but very few lives were

lost—the facilities for succour were many, and the organisation of the harbour perfect. The cargoes also were saved although damaged; the vessels were, however, much shattered.

Still further north the storm seems to have raged more furiously, for at Eupatoria the loss of life was awful, and the damage extensive, although it was thought that the roads of Eupatoria furnished a very safe anchorage; but no shelter could altogether secure a ship in the waters of the Crimea during the prevalence of this tornado. A Turkish line-of-battle ship of 90 guns was anchored at some distance off the harbour, and foundered; all on board perishing with her. Dreadful as the contemplation of such an event must be to every humane mind, it was hardly more distressing than the wreck of many of our own ships. The French line-of-battle ship *Henri IV.*, 100 guns, perhaps the best screw line-of-battle ship in the possession of France, was blown up on the beach and wrecked. The crew were saved. The *Fulton*, French steam-frigate, was also similarly destroyed. While the *Henri IV.* was stranding, the Cossacks descended, expecting to make her crew an easy prey, but they fled after a few shots. There is an authentic account of the wreck of this fine three-decker extant, written by the chaplain, the Abbé Bertrand. It is as follows:—"Our magnificent ship was wrecked on the 14th, at six o'clock in the evening. The tempest commenced at seven in the morning, and, in spite of all our care, our activity, and our energy, we had to yield to its violence. Since our arrival in the bay of Eupatoria, we have had two anchors thrown out, because the approach of winter was felt, and it was necessary to guard against the bad weather. When the hurricane came on, the captain had out a third anchor and a fourth. We thought we should be able to resist. Alas, no! The *Henri IV.* was destined to share the fate of several other vessels that were hourly broken to pieces on the coast. What a terrible spectacle! The sea was furious, and bellowed so as to prevent us from hearing each other, and the ship groaned beneath the blows she received from it. The whole of the furniture was flung from one part to the other with the rapidity of a railroad. I had remained in the captain's cabin after breakfast, and while he was on the quarter-deck, in order to direct the movements of the vessel, every article in the room was flung from one side to another, and for my own part, I was near losing my senses. We resisted for a good while: though two of our chains had broken, we held on with two, and the wind began to calm down. But what a sad thing it was to see the beach, on which a dozen merchant vessels had been just dashed to pieces! Alas! such also was the fate re-

served for us. About half-past five o'clock the captain and I were about to sit down to dinner, when all of a sudden we felt a shock, and a man rushed in and cried out, 'Captain, the two last chains have just been broken.'—"The two chains broken!' the captain said; 'impossible!' He went up on deck again, which he had only left five minutes before. It was but too true—the ship was on her beam-ends. There was no further hope; the sea and the wind were too violent for us to hope to get out to sea. We had only to resign ourselves to our fate. All that was left for us was to be thrown on that part of the coast where the bottom was sandy. You cannot have an idea of the anguish we all felt, expecting every moment the first shock when the ship touched the ground. We did feel the first shock, the second, the third—and yet the good ship held out. We were aground, but we knew not at what distance from the shore, as we were in darkness. The weather continued awful. At last the day dawned, and we found ourselves at 200 metres from the shore, and our ship had not a single drop of water in her hold. At some yards from us a Turkish vessel had been wrecked at eleven o'clock at night, three hours after us. She drove on a bank, which threw her on her side, and we saw the whole of the crew clinging to the masts and shrouds, not being able to remain on the deck, which was completely under water. At last, after a night passed in indescribable anguish, fearing each moment that the ship was breaking asunder, the day dawned, and we found ourselves so near land that, in the event of any great accident occurring, it would not be difficult to save ourselves. Fortunately, the ship is new, five years having scarcely elapsed since she was launched. We shall all be saved, as well as the stores. We are, however, on the enemy's coast, and the Cossacks, who crowded down to us in the morning, have been received with musketry. I do not think they will return in haste. Oh! that Sebastopol were once taken! Perhaps we are to remain here until the ship is got off, and she is so noble and so beautiful a vessel that it would be a pity to abandon her. For the present, however, we have nothing to fear."

The only ship at any of the anchorages which had ridden out the gale without damage was the *Vulcan*, iron troop ship. This powerful ship was built by Mr. Mare, of Blackwall, and he deserves whatever credit is to be attached to the endurance of this vessel.

The losses of the French it would be difficult to estimate, the government not allowing the same publicity as ours. Our Turkish allies lost 1000 men and several good ships, but not much property. The English loss was probably a thousand lives, and property worth one mil-

lion and a half sterling, independent of the value of the ships themselves. The cargo of the *Prince* was estimated by many good judges at half a million. Mr. Sidney Herbert, who ought to know, computed it at £180,000; but the estimates and opinions of that gentleman, before the war broke out, were among the causes of our misfortunes, when, almost unprepared, we had to encounter a well-armed enemy. When the vast stores of clothing on board the *Prince*, and of ammunition on board the *Resolute*, are taken into account, with all the other less valuable cargoes lost, such an estimate as that which has been generally received cannot occasion surprise.

When the losses were computed, the following lists were made out:—

AT BALAKLAVA.

The *Prince*. A total wreck. Crew all lost except seven.
The *Resolute*. Wrecked. The third mate and eight seamen saved; the remainder of the crew lost.
Rip van Winkle. A wreck. All on board drowned.
Kentworth. Wrecked. Crew drowned, or dashed against the rocks and killed, except three men.
Wild Wave. Wrecked. All lost but one boy.
Progress. Wrecked. All lost but two men.
Wanderer. Wrecked. All lost.
Peltoma. Wrecked. All lost but captain.
A Maltese brig. Wrecked. All lost.

VESSELS INJURED.

H. M. S. *Vesuvius*. Bowsprit, masts, and paddle-boxes gone. Much injured in hull. Almost a wreck.
H. M. S. *Retribution*. Lost rudder, guns, and stores, and otherwise much damaged, with several of crew hurt.
Melbourne. Masts gone. Narrow escape from wreck.
Mercia. Totally dismantled.
Lady Valiant. Totally dismantled.
Caduceus. Totally dismantled.
Pride of the Ocean. Totally dismantled.
Medora. Totally dismantled.
Sir R. Sale. Totally dismantled.

AT KAMIESCH.

About twenty small French transports were driven on shore, the cargoes were saved. A large number of these transports were totally dismantled, but no accurate return of their loss ever appeared.

AT THE KATCHA, AMONG THE FLEETS AND TRANSPORTS.

H. M. Ships *Queen*, 116; *Trafalgar*, 120; and *London*, 90—lost rudders. Steamers *Ardent*, *Terrible*, *Spitfire*, and *Samson*—much damaged, and very leaky.
French fleet. *Ville de Paris*, 120; *Findland*, 100; *Bayard*, 90; *Suffren*, 90—lost rudders, sprung their masts, and were otherwise damaged.

The transport *Tyrone* went ashore and was lost—crew saved; *Pyrenees* went ashore, and was set on fire—crew saved; *Lord Raglan*, totally lost—crew saved; *Ganges*, set on fire—crew saved; *Rodsley*, went to pieces—crew saved; and *Damube*, steamer, drove on shore.
The French transports *Annie* and *Marseille* went down at their anchors, with all on board; and the Turkish frigate, *Muhbiri Surur*, of 36 guns, was dismantled, and nearly wrecked.

AT EUPATORIA.

H. M. S. *Cyclops* had a narrow escape from total destruction.
The *Fulton*, French steam-frigate, got ashore, and went to pieces. Crew partly saved.
Henri IV., 100 guns, went ashore, and was lost. Crew all but seventeen saved.
Foiki Messeret, Turkish two-decker, went down with all on board.

The scene at sea, immediately after the hurricane, and during the evening of that day, has been described by one whose opportunities of seeing it were very peculiar—the special correspondent of the *Morning Herald*. This gentleman embarked at Constantinople just in time to arrive on the coast of the Crimea when the storm fell, and the scene of desolation along the shore presented its full horrors. In the following brief account the dreadful picture is placed vividly before us:—"The vessel in which I had come up from Constantinople joined the fleet at Belbek a few hours after these disasters had occurred. From what we had experienced of the weather *en route*, we were quite prepared to hear of dreadful catastrophes; but the truth surpassed our worst anticipations. I only saw the shore from Belbek to Balaklava, a distance of about thirty miles, but along this whole extent of coast there was hardly a spot upon the beach which was not covered with the fragments of some vessel or its cargo—masts, spars, sails, pieces of boats, oars, hatches, barrels of rum, cordage, bales of clothes, beds, blankets, rafts of timber, fragments of furniture, boxes and chests, trusses of hay, tents, and in fact a considerable proportion of all the numberless sundries which are necessary for the subsistence of a large fleet and army, lay floating about wasted and ruined. Some of the wrecks upon the shore which had been emptied, were set on fire and were blazing fiercely; others were surrounded by boats, which were bearing off everything of use or value before the hulls were abandoned to the mercy of the elements. Parties of men were landed upon the beach, interring, as fast as they came on shore, the mangled corpses of the transport seamen. I am sorry to say that this melancholy duty alone kept parties of men-of-war's men constantly employed. But at Balaklava the scene was worse. In the narrow rocky little roadstead outside the harbour, the whole surface of the still raging sea was covered with masses of wreck and hundreds of mangled bodies. Inside the harbour was quite choked with drift-wood, broken horse-boxes, and hundreds of trusses of pressed hay. After one in the day the violence of the hurricane abated; but it was questionable whether many of the vessels which still survived would be able to hold on throughout the night. Impressed with this idea, several of the transport captains, with a number of seamen, volunteered to go out in a boat and fetch the crews of those vessels which had dragged, and were in greatest danger, near the rocks. But none of the transports had a boat large enough for such dangerous service, and the captains who were going went to the *Sanspareil*, and applied for the loan of one of their large boats fit for the purpose. The first time Captain Daeres

was not on board, and after a short interval the captains returned again, when the officer of the watch told them Captain Dacres could not be seen, and that no boat of the *Sanspareil's* could be lent. Fortunately the fears of the gallant men who thus volunteered to risk their lives were not realised, and as the wind moderated the vessels outside held their ground. That night fifteen men died at camp from exposure and cold. On the 15th the full extent of the disaster which had overwhelmed the transports, and injured our fleets, was fully known. Never in so short a space of time had a gale done so much mischief. Of the vessels anchored off Balaklava nearly half were totally lost, and the rest were mere wrecks."

The scene on shore was briefly and graphically depicted by the special correspondent of the *Times*, under dates of 15th and 16th of November. Having described his experiences during the memorable day of the 14th, and the scarcely less miserable night which followed it, he says:—"With the morning came a bright cold sky, and our men, though ankle deep in mud wherever they went, cheered up when they beheld the sun once more. The peaks of the hills and mountain sides are covered still with snow. As rumours of great disasters reached us from Balaklava, I rode into town, after breakfasting in my stable, and made my way there as well as I could. The roads were mere quagmires. Another day's rain would have rendered them utterly impassable, and only fit for swimming or navigation. Dead horses and cattle lay all over the country, and here and there a sad little procession might be seen wending its way slowly towards the hospital marquees, which had been again pitched, charged with the burden of some inanimate body. In coming along the ridge by the French lines I observed the whole of the troops were turned out, and were moving about and wheeling in column to keep their blood warm. They had just been mustered, and it was gratifying to learn that the rumours which had been circulated respecting lost men were greatly exaggerated. Our men were also busily engaged in the labours of the camp—trenching, clearing away mud, and preparing for duty. The Russians in the valley were very active, and judging from the state of the ground and the number of loose horses, they must have been very miserable also. Turning down by Captain Powell's battery, where the sailors were busy getting their arms in order, I worked, through ammunition mules and straggling artillery-waggons, towards the town. Balaklava lay below us—its waters thronged with shipping—not a ruffle on their surface. It was almost impossible to believe that but twelve hours before ships were dragging their anchors, drifting, running aground,

and smashing each other to pieces in that placid lake. . . . The narrow main street is a channel of mud, through which horses, waggons, camels, mules, and soldiers and sailors, and men of all nations—English, French, Turks, Arabs, Egyptians, Italians, Maltese, Tartars, Greeks, Bulgarians, and Spaniards—scramble, and plunge, and jostle, and squatter along; while 'strange oaths,' yells, and unearthly cries of warning or expostulation fill the air, combined with the noise of the busy crowds around the sutlers' stores, and with the clamorous invitations of the venders to their customers. Many of the houses are unroofed, several have been destroyed altogether, and it is quite impossible to find quarters in the place, the preference being given apparently to the sutlers and store-keepers, who swarm on shore from every ship, and who are generally Levantines, with most enlarged notions of the theory and practice of buying in the cheapest and selling in the dearest market. The *City of London*, Captain Cargill, returned to Balaklava to-day, and entered the harbour. She was the only vessel which succeeded in getting out to sea and gaining a good offing during the hurricane of the 14th, and the captain told me, in all his experience (and, as an old Aberdeen master, he has passed some anxious hours in sea-water) he never knew so violent a wind for the time it lasted.

November 16.

"There was an affair of pickets last night between the French and Russians, in which a few men were wounded on both sides, and which was finished by the retreat of the Russians to their main body. This took place in the valley of Balaklava, and its most disagreeable result (to those not engaged) was, to be kept awake for a couple of hours. A good deal of clothing has been saved from the *Prince*, the bales floating up from the deep, proving how completely the ship must have been broken up by the rocks. Within the last month 3500 sick and wounded men have been sent to Scutari from Balaklava. The Turks are very unhealthy, and lie about the streets near the hospitals in abject misery. Their filthy habits increase the horrors of the place."

The conduct of the Russians when they ventured to approach the coast was, if possible, more infamous than when, after the battles of Alma, Balaklava, and Inkerman, they murdered the wounded. Several of the men cast on shore in the neighbourhood of the Belbek, Katcha, and Eupatoria, were massacred by the Cossacks; and when, after the storm subsided, boats were employed by the allies to pick up any men who might be found under the cliffs, the Cossacks from above fired upon the boats to deter the crews from accomplishing their

humane work; and, again, as the boats put off with the disabled and wrecked sailors, volleys from the cliffs were fired into them. Some of these poor fellows escaped the raging elements to fall by the bullets of their fiercer foes. On one wreck some thirty persons were clinging, still expecting deliverance—as the wreck drifted towards the cliffs volleys from the Cossacks' carbines were fired among the helpless sufferers: among them were several women, some of whom were wounded. Ultimately, the Russians brought field-pieces to bear upon the wrecks. Several Russian officers of distinction rode out in carriages and on horseback from Sebastopol, and to their interference it was to be attributed that these enormities were not carried to a greater extent. The sailors were disposed to risk all dangers, and incur every extremity of suffering, rather than fall into the hands of so barbarous an enemy.

The storm had scarcely subsided when the Cossacks appeared in force on the crest of the hill near the town of Eupatoria. They expected to find the batteries deserted in consequence of the violence of the gale, or that the sailors and artillery who manned them would be called off to assist the wrecked. When they discovered the gunners at their posts, they preserved their reconnaissance until cannon arrived, when they opened fire with fourteen pieces. The fire was returned with such spirit and precision that, after an hour's combat, the enemy retired, carrying away their killed and wounded.

The effect of the great storm upon camps and garrisons was to convince them that winter had at last set in, and that a new enemy was about to make war upon all the belligerents, the allies being more especially exposed to his ravages.

The Russian prisoner on parole at Balaklava, already alluded to, favoured the author with his experience, and the appearance of matters as presented from his residence, and from the beach, during and after the hurricane:—"On Friday evening, November 10th, there was a tremendous wind at Balaklava, which threatened to wreck the vessels in the vicinity; but fortunately it terminated without any calamitous results. Having heard the remarks that were continually made by captains of transports, of the danger to which vessels were exposed when anchored outside the harbour, and seen myself the danger that must attend those vessels, supposing a high wind should drive them on shore, I rejoiced to think that this danger had passed without accident,—as I supposed the authorities would then at once take the necessary precautions to avoid such danger for the future, and no longer disregard the verbal and written protests the commanders of vessels in that exposed situation had continually made to the authorities. However,

things remained in the same state until the 14th, on which day, soon after daylight, a storm commenced, which in a short time increased to a hurricane or tornado. The sea increased to an extraordinary degree, so that the largest vessels at anchor in the harbour of Balaklava were tossed about until many of them went on shore, and the remainder jammed together in such a way that it took many days before they could be released from their almost inextricable position. Of course a tremendous smash took place; few, if any, were uninjured. I recollect a long row of them wedged together side by side; then a long sharp steamer forced in lengthways between this row, and then another—the cutwater having entered deeply into the side of the first vessel of the second row. The house I occupied was opposite the centre of the bay, near the shore. The large screw-steamer *Sanspareil* lay broadside on just before our windows, having been swung round by the violence of the wind. Two merchant brigs got in between it and the shore, where they were soon aground; and the huge man-of-war having shared the same fate, was seen rolling over them and driving them further on shore. Fortunately the mud was deep there, or they must have been soon knocked to pieces. Warps were carried out, and every effort made, but nothing could withstand the violence of that mighty element. A chain cable was carried round a small building—but it soon crumbled and disappeared, the cable passing through it. Others were made fast to trees, but these were uprooted. A fine row of poplars, which had stood for many years, were blown down; and it was a curious sight to see them lying afterwards in one straight line, the upper branches of the first covering the roots of the next, and so on. It would appear that the house I lived in stood on a spot where the wind eddied, for notwithstanding its elevation and overhanging roof, it did not suffer from the storm, which was carrying tiles and every description of loose *débris* over it in one continual stream, such as can never be understood by those who have not seen something of the same kind, which it had never been my fate to witness. After the storm abated, the streets were strewn with broken tiles from the roofs, and many of the projecting verandahs were blown away. It seemed very wonderful that all the roofs were not blown off. I stood most of the time in the greatest fear lest this should occur with us, or that the windows should give way, and we be left houseless. The result must appear the more extraordinary when it is recollected that the Bay of Balaklava is situated in a hole, into which it would appear that the wind could not possibly penetrate. The harbour, after the storm, was covered with the pieces of wreck and the

GENERAL SIR DE LACY EVANS, K.C.B. &c.

cargoes of vessels that had been lost; trusses of hay and broken boats forming the principal feature. Now and then the corpse of a sailor would float into the bay, and I recollect one of them being buried afterwards close to the water's edge. Sailors were employed to save men with ropes and tackle let down over the sides of the steep cliff; and I believe great success attended the unremitted efforts that were made in this way. A cannon was placed on the top, from which a shot with a cord might be thrown across a vessel in danger. A fine three-masted transport was wrecked inside the harbour, and the masts were seen for some time afterwards in what was called Castle Bay. While this storm continued I could not think of leaving my family; but the next morning I hastened to the heights overlooking the sea, and could then form a good idea what must have been the feelings of those on board the vessels that had endured the

horrors of that storm outside the harbour. Most of those that remained were dismasted, which I believe effected their delivery, and every possible effort was being made to get them into the bay. Of those that were lost I cannot speak, as I had no opportunity of seeing them; but one that had a narrow escape, the *Pride of the Ocean* (according with the name it bore), I think one of the most perfect sailing vessels I ever saw. It was built in America, and no expense had been spared in fittings and decorations. The great depth of the anchorage was the principal cause of the disasters that occurred, as the vessels were borne down by the additional length of cable on their bows, which prevented them rising over the waves; and in some instances they were cut in two halves, from the bows to the stern. I believe Sir Edmund Lyons, in the *Agamemnon*, weighed anchor before it was too late."

CHAPTER XLIX.

RETIREMENT OF GENERAL EVANS.—PAUCITY OF GENERAL OFFICERS IN THE CRIMEA.—DIFFICULTIES IN CARRYING ON THE SIEGE.—SKIRMISHES AND COMBATS.—SUFFERINGS OF THE TROOPS.

"Long have ye heard the narrative of age,
The battle's havoc and the tempest's rage!
Long have ye known reflection's genial ray
Gild the calm close of valour's various day!"—ROGERS. *Pleasures of Memory*.

WE have carried on our relation of events to the day following the great tempest, in order to maintain consecutiveness in the narrative.

An incident of much importance to the army took place on the 11th. Lieutenant-general Sir de Lacy Evans, to whose rare qualities as a man, a soldier, and a general, we have so frequently had occasion to refer, resigned the command of his division. The letters between the gallant officer and the commander-in-chief place both men in a light the most favourable. The self-sacrificing and heroic character of Sir de Lacy Evans is brought out naturally, and the gentlemanly and amiable spirit of his superior in authority, although his inferior in military skill, experience, and enterprise, is not less conspicuous. Sir de Lacy Evans dated his resignation from the flagship of Admiral Dundas, on the 11th of November. It was as follows:—

MY LORD,—On the 30th ult., an aide-de-camp of mine had the honour of informing your lordship that after being confined to bed in my tent for nearly two days, I had a severe fall on my head, my horse partly rolling over me, which, added to previous suffering from illness or exhaustion, rendered me totally incapable of duty. Your lordship immediately granted me such leave of absence as I might require, and had the goodness even to send your carriage to convey me to Balaklava. Hearing on the 4th, however, that some attack against the enemy was intended, I wrote the military secretary to ask when it was to be, being desirous, if possible, though far from

well, to be at least present at it. Colonel Steele was so obliging as to reply, "Lord Raglan begs me to say you must not think of moving until you are quite strong." On hearing heavy firing on the morning of Sunday, the 5th, though the weather was bad and I had taken mercury, I proceeded as fast as I could to the point of attack, and remained there till the close of the battle, but felt neither justified nor fit to take the command of the division from General Pennefather, which he had exercised with so much ability in the previous part of the day. Your lordship, on hearing that I was on the field, sent for me, and with your usual kind consideration desired me to go back to the ship I had been staying in—which, acknowledging my inability for any useful active service, I obeyed. But the fatigue and exposure to weather I had undergone did me injury.

I have now for nearly a fortnight had the benefit of the greatest care and hospitality possible, and a warm cabin, from my generous naval friends, Captain Daeres in the first instance, and now no less so from the admiral-in-chief in the *Britannia*. But five months without cessation under canvas, with some unavoidable privations and alterations of temperature, latterly at night not unfrequently severe cold, with the shock occasioned by my fall, have had their effect on one in his sixty-eighth year. Indeed, owing to the chances of the service, I believe no other officer of the same advanced age and rank has had the same continuous test to bear up against. And with all my present rest and advantages I am still left with but little feeling of strength or freedom from ailment. This has been greatly added to by the heavy and peculiar responsibility that lately fell to my lot for almost a month—namely, from about the 4th, I think, till the 30th of October.

The post I was charged with during that long period was, I believe, deemed of the utmost importance to the safety of the French and English armies. Frequently but few troops remained to me for its defence, against sometimes tenfold our numbers of the enemy, within a

short distance from our front. I had the honour of frequently submitting my opinion of the weakness and precariousness of the position of the second division to your lordship, and, indeed, also to General Canrobert, and of the small means at my disposal to place it in more security. Its liability to be suddenly attacked at all times it was also my duty to represent. But the various exigencies to be provided for on other points at that time scarcely left it possible, I believe, to afford us any material reinforcement, or means for the construction of defence. I have ventured into these details to account for the harassing nature of the duty alluded to, and of the anxious and almost sleepless nights and days it occasioned me. I feel in consequence much depressed, worn out, and exhausted; a severe chronic complaint I am subject to having been also extremely aggravated during the cold nights we latterly had in camp, and which are now becoming more frequent and severe with the advancing winter season. I should not, however, have been so prolix, for in your lordship's letter of the 31st you were pleased to refer to some of these circumstances as follows:—"Nothing can have been more satisfactory than the whole of my intercourse with you, and it is painful to my feelings to see it interrupted. But, unfortunately, no man can command health, and you have had to undergo not only great fatigue but anxiety of mind, since your division has occupied the important position it now holds, and so gallantly maintained under your directions a few days ago." Such expressions of approval, from your lordship, are indeed a great happiness to me to have received.

About a month ago, when the generals of division were summoned to head-quarters to receive a communication, your lordship may recollect my mentioning that I had only been able to attend by taking ammonia and other stimulants. During the occasional northerly winds I was obliged, sometimes, to have my tent for twenty-four hours together wholly closed, and gave and received orders through my unopened tent doors. Some also of your lordship's staff will remember how often, in bringing me orders, they found me on my bed, or rather in my blankets on the ground, when I ought rather to have been, if I could, on horseback. I was well aware, though others may not have been, that this invalid condition prevented my attending to many other things which I knew it was urgent I should have personally seen to and executed. Under these circumstances, instead of asking your lordship for longer leave, which I am sure you would grant, I think it the more proper course to solicit your lordship's permission to resign my staff appointment with this army, the very arduous executive duties and responsibilities of which my impaired health and want of strength render me no longer adequate to. And I trust that the several wounds I have received, and the services I have faithfully endeavoured to perform in various parts of the world, will be deemed to render me deserving to close at length my active duties, when unable to continue them with justice to the public service or to myself.

I have now only to repeat my expression of warm gratitude for the uniform kindness and indulgence I have been treated with by your lordship, and have the honour to remain,

Your lordship's most humble and obedient servant,

DE LACY EVANS.

To General the Lord Raglan, G.C.B.

Lord Raglan replied to this communication as follows:

Nov. 13th, 1854, at night.

MY DEAR GENERAL,—Your letter of the 11th only reached me this afternoon, when I was engaged preparing my despatches for the mail, and I have not until now found a moment to reply to it.

It contains what is to me, and will I am sure be to the second division, and many others your gallant companions in arms, most painful intelligence—your desire to be permitted to resign your staff appointment with the army, which your impaired health and want of strength render you disqualified for in your own estimation. Every man is the best judge of his own feelings and bodily powers; and I am grieved to have to acknowledge that you may be right in your impression of them; but I, and

those whom you have so recently commanded with such advantage to the public service, know that your mental faculties and gallant spirit enabled you, no longer ago than the 26th of last month, to meet the enemies of your country in the field, and successfully to repel a most powerful attack on the position occupied by the second division. I view the loss of your assistance with the deepest regret, but I cannot ask you to stay after the statement you have brought before me, of your sufferings from illness, anxiety of mind, exposure to the weather, and over fatigue. You will be at liberty to go when you please, and be assured that you will carry with you my best wishes, and those of all with whom you have been associated. I trust that English air, and the comforts of home life, will gradually restore you to health, and enable you long to enjoy the reputation your services have acquired for you.

I cannot close my letter without sympathising with you on the death of your aide-de-camp, Captain Allix, who appeared to me to be a most promising officer, and fully to deserve your confidence and good opinion.

Believe me, my dear general,

Very faithfully yours,

RAGLAN.

Lieutenant-general Sir de Lacy Evans, K.B.

General Evans landed at Folkestone, having come home through France, where the imperial court and French public treated him with the distinction due to his high position and glorious deeds. Before leaving that salubrious watering-place for his own house in Bryanston Square, an address was presented to him from the inhabitants of the Cinque Ports, together with a sword, the value of which was 160 guineas. On his arrival in London, the inhabitants of Mary-le-bone, the electoral district of the metropolis in which he resides, made every demonstration of respect for their fellow-citizen that is customary for public bodies to make, when the most renowned persons are the objects of their favour.

His constituents of Westminster, for which city Sir de Lacy Evans has a seat in parliament, headed by their other member, Sir J. Shelley, presented him with an address expressive of their sympathy with his illness, their congratulations in his safety, and the pride they felt in having as their representative a man whose genius in peace and war made him so competent to the duty, and so worthy of the honour. His fellow-representatives were nearly as prompt to do homage to his deserts as were his constituents; for the House of Commons resolved upon a vote of thanks to the general in person. February the 2nd, 1855, was the occasion selected for this just tribute to their fellow-commoner. The House assembled for the express purpose; and at four o'clock the general entered in full uniform, wearing the orders and military decorations which had been bestowed upon him for his heroic services in so many fields. As soon as he appeared, a loud cheer—such as has seldom rung through the Commons House of Parliament—burst forth from all sides; his old political opponents, and the men who derided his military talents from political motives, were as demonstrative as his

friends, or as his friends could wish, in their tokens of respect. Every member uncovered, and remained standing until the general took his seat. What a noble scene was this—the representatives of 25,000,000 of people standing uncovered in the presence of a man who derived nothing from birth, although a gentleman and of illustrious lineage; who held no relation to the court or courtiers, although one of the most devotedly loyal subjects of his queen; and who owed nothing to military favour or routine, although endowed with military rank, experienced in high command, and his breast glittering with the insignia of military glory! On the floor of that house, as a faithful member of parliament, he had as often battled for his country as he had with arms in his hands upon the fields of war. The men with whom he waged the warfare of debate, and whom he opposed and thwarted with patriotic vigilance and constitutional jealousy, now crowded the opposite benches to do him honour, and declare in the face of the empire that his fidelity to his country was attested by his fortitude and valour. When the members had resumed their seats, the Speaker rose, and thus addressed the honourable and gallant member:—

“Sir, I have to inform you that on the 15th of December last the house agreed *nemine contradicente* to a resolution that the thanks of this house should be given to Lieutenant-general Sir de Lacy Evans, Knight Commander of the most Honourable Order of the Bath, and several other officers therein named, for their gallantry, ability, and distinguished exertions in several actions in which her majesty’s forces have been engaged with the enemy. Sir de Lacy Evans, it is with feelings of pride and satisfaction that the house welcomes the return of one who has borne so distinguished a part in the brilliant achievements which have characterised the present war. At the battle of the Alma you encountered and overcame with admirable coolness and judgment the almost insuperable difficulties to which you were opposed, and with the assistance of the gallant second division gained possession of the heights. You repulsed the attack of the Russians on the 26th of October, and the energy and valour with which you led your troops on that occasion will ever be honourably recognised. But it was on the heights of Inkerman you displayed that undaunted courage and chivalrous conduct which have called forth the admiration of your country, when, rising from a bed of sickness, you hastened to assist with your council and experience the gallant officer in temporary command of your division; and you refused to withhold from him the honour while you shared the danger of the encounter. Your conduct throughout this memorable campaign has been marked by the same intrepid gallantry which distin-

guished your early military career, and which has justly earned for you the highest honour that it is in the power of this house to confer. It is, therefore, my agreeable duty, in the name and by the command of the commons of the United Kingdom, to deliver to you their unanimous thanks for your zeal, intrepidity, and distinguished exertions in the several actions in which her majesty’s forces in the Crimea have been engaged with the enemy.”

Sir de Lacy Evans rose, and with deep emotion, yet in a firm tone of voice, replied:—“Sir, I beg leave to assure you and the house that I appreciate most deeply the very high honour now conferred on me. I am fully impressed with the conviction that there is no honour to which a British subject can aspire with more ardent anxiety, or be more justly proud of, than the recognition of his services, whatever they may be, by the representatives of his fellow-countrymen in this house; and I shall be pardoned if I very imperfectly express my feelings on this occasion. It is true that it is almost a novelty to me to be received in this manner on account of my military services; for I certainly do think that I was as good an officer some twenty years ago as now. I did feel, then, that I had a much more difficult and intricate duty to perform, and I performed it, however imperfectly, with success at least equal to that with which I have performed the less important one which I recently endeavoured faithfully to discharge. When I allude to that circumstance, I cannot abstain from tendering my thanks to those honourable gentlemen who do not concur with me in political opinions for the kindness they have manifested towards me on the present occasion. I am, indeed, more grateful for the reference made to the second division, which I had the honour to command, than I am even for the terms of approbation used in respect to myself; for I should not, in fact, have had the remotest chance of obtaining the kind and honourable mark of regard which I have this day received at the hands of the house, if it had not been for the noble gallantry and devotion of that division, from the highest officer down to the commonest soldier. I repeat that my position at this moment here is almost exclusively attributable to the noble conduct and complete devotion to their duty of that division. I must confess that I am under the necessity of saying that when the vote of thanks which I am now here to receive at your hands was moved by the noble lord lately representing the government in this house, the noble lord’s official statement made on that occasion very much astonished me, because he appeared to take a totally different view of the operations of the army, or, at all events, of the particular part acted by the division I had the honour to command,

from that taken by the commander of the forces. I am sorry to be obliged to allude to this subject, but when nearly one-half of that division has perished from the chances of battle, or by other causes, I think I should be wanting in gratitude to them if upon this occasion I did not endeavour to place the matter upon a more just footing. The noble lord gave a sort of theatrical description of the battle of the Alma, which reminded one of the opinion of the witty Sydney Smith, who we all know said that the noble lord considered himself capable of commanding the Channel fleet. Now, it is evident that the noble lord considered himself a better judge of the transactions of the battle of the Alma than Lord Raglan. The noble lord described this battle rather minutely, and seemed to imply that the battle was won by the first and light divisions, and omitted all notice of the conduct of the second division. Now, the fact is that Lord Raglan has represented in his despatch that the two leading divisions on that occasion were the light and second. It is quite clear that the noble lord passed the second division by from a total obliviousness of its services, and thus caused inferences to be drawn perhaps which might reflect grievously upon it. The noble lord then approaching the two lesser actions of the 25th and 26th of October, gave all due credit and honour to the gallantry displayed on the 25th of October, but he entirely passed over the much more successful action on the subsequent day—an action that was deemed worthy of the highest approbation by her majesty, and by the commander of the forces, and also deserving of notice in a despatch from the general-in-chief of the French army. The noble lord, however, in his official statement to this house, took no notice of that action. With respect also to the battle of Inkerman, in which the second division was engaged as much as in any other of the battles, in which, too, it suffered so severely, and where it had to stand for some time the brunt of an attack from about 20,000 men, not the slightest reference was made by the noble lord in his speech to the conduct of that division on that occasion, though it was the only division prominently engaged in three general actions. I therefore think that that division and myself have some reason to complain of an official statement of that kind coming from the noble lord. I beg pardon for this unpleasant digression, but I think I have some claim to indulgence, not on my own account, but on account of the men whom I had the honour to command. I feel deeply grateful for the honour now done them and myself, and I should like to say a few words, though I am aware that this is not the proper occasion for the purpose, with respect to my fellow-countrymen so gloriously struggling in the present contest. Though not prepared to take an

arduous or constant part in the transactions of this house, I hope I may find some opportunity of expressing my opinion on the subject to which I have just referred. At all events, I may now add that I am convinced that the manifestation of the approbation of the house on the present occasion in respect to so humble an individual in the army abroad as myself will have an animating effect upon the feelings of my brother soldiers. I again repeat that I feel most deeply grateful for this expression of your kind regard."

Lord Palmerston then rose:—"I rise to perform an office in respect to which I am satisfied I shall receive the unanimous and cheerful concurrence of this house. Sir, there is no function belonging to the individual who fills the chair which you so worthily occupy that can be more agreeable or more honourable in its discharge than that which you have just performed—namely, the function of conveying the thanks of parliament to men who have distinguished themselves by noble exploits in the field, and who have earned by a long career of military services the gratitude and admiration of their country; and I will venture to say that there never was a Speaker who had the opportunity of being more completely the faithful organ of the feelings and opinions, not only of this house, but of the nation at large, than it has been your good fortune to have on the present occasion. The eloquent and feeling expressions in which you have conveyed to the honourable and gallant officer the thanks of this house ought to remain a perpetual record for the encouragement of others to pursue the same career as my honourable and gallant friend has nobly followed, and for the satisfaction of those brave comrades in arms whom he has so ably headed in the field of battle. I beg, therefore, to move that the words spoken by Mr. Speaker, in conveying to Lieutenant-general Sir de Lacy Evans the thanks of this house, together with so much of the observations which have fallen from the honourable and gallant member as contains his expression of gratefulness for those thanks, be printed in the votes of the house."

Mr. Walpole, in seconding the motion, said he did so with the heartiest desire to concur with the noble lord in every word he had uttered, and also in the words which had been so well addressed by the Speaker to the honourable and gallant general. He would add no more than that he seconded the motion most cordially. The question was put in form, and agreed to *nemine contradicente*.

The mode in which Sir de Lacy Evans vindicated the claims of the second division to the high distinction of having had the post of danger and honour in every battle, was censured by many as not in good taste upon such

an occasion. Had the manner of Lord John Russell been less marked, and had it not been notorious that there existed a jealousy with a section of the ministry in reference to the popular opinions of the general,—his sympathy for the common soldiery, his want of confidence in the capacity of certain parties at headquarters, and his disapprobation of the ministerial management of the war,—his lordship's omissions would not have had such significance as to make it a duty for General Evans to vindicate the honour of his division, and call the attention of the country to the sly attempt to "damn with faint praise," which Lord John Russell, so much at home in such performances, had practised. The eulogy of Lord Palmerston, coming from the greatest living statesman of England, was as high a compliment to General Evans as the vote of parliament itself. The Horse Guards have never done justice to Sir de Lacy: he and Sir George Brown have been too frank, manly, and independent for the moral atmosphere of that region. These two generals, therefore, who endured most of the toil and perils of the early part of the war, remain unrewarded. Such men as Generals Airey, Simpson, and Codrington, had honours heaped upon them; they were from various causes favourites with the commander-in-chief, and certain persons to whom even the commander-in-chief defers; but Generals Brown and Evans were honest, outspoken men, good soldiers and bad courtiers, and the result was they remained lieutenant-generals, while men who had not seen a tenth of their service were advanced to high positions. If the words of the House of Commons were true in which it conveyed to General Evans its thanks, what respect to that opinion was there shown at the Horse Guards when men in every way General Evans' inferiors were promoted over his head? Such conduct is calculated to raise questions as to the constitutional control of the army, and call up a parliamentary interference which it is neither wise nor safe that men in high places should provoke.

Another honour yet remained for the hero of Inkerman. The gallant soldiers who fought under him in Spain convened a meeting of their numbers resident in and around London. An address was voted, and a deputation of the war-worn veterans presented it to him at his house. The address and reply do not form a part of the history of this war, but we notice the fact of the devotion of these gallant fellows to their general as illustrative of the qualities of head and heart by which General Evans never failed to attach to himself all who came under his command. We trust that, having braved "the battle's havoc and the tempest's rage," the gallant soldier and good citizen

may be enabled to enjoy what the corresponding words of our motto so sweetly express—

"The calm close of valour's various day;"

and should the call "to arms" again in our day stir the hearts of men, may the veteran general be again able, with re-invigorated health, to lead his countrymen to victory in a position of higher command, and therefore more befitting his experience and his capacity.

This notice of General Evans has been carried down to the close of his active connection with the war, in order that an unbroken narrative of his services and honours might be given. When Sir de Lacy Evans resigned his command, there was a dearth of generals in the British army—Inkerman and sickness had sadly thinned their numbers. The general commanding the first division, his Royal Highness the Duke of Cambridge, was on board ship invalided; his second in command, Sir Colin Campbell, held the military government of Balaklava, and therefore could render no service in the trenches. The other brigadier of his royal highness's division had been wounded. The second division was not only deprived of its chief, Sir de Lacy Evans, but of Brigadier Adams, who received a mortal wound at Inkerman. The third division retained its generals, for although no man was more anxious, active, and vigilant than Sir Richard England, he seemed, like Sir Colin Campbell, to be endowed with great physical endurance. The fourth division lost all its generals on the fatal hill-side of Inkerman. The light division was deprived of its indomitable chief, Sir George Brown, he having been dangerously wounded in the late battle. The Earl of Cardigan, second in the cavalry command, remained an invalid on board ship. An accession of superior officers, men of tried resolution, sound health, and extensive experience, was as requisite to Lord Raglan as strong reinforcements of men; neither came in any adequate proportions until overwork and watching still further reduced the diminished and suffering army.

Although the tidings of the battle of Inkerman did not excite the same enthusiasm in England as the battle of the Alma did, it won for the English soldiers on the continent, and especially in France, still more admiration; and tended very much to strengthen the feeling of our ally, that the army of England, however numerically inferior, was not surpassed—the French press generously said not equalled—by the troops of that great military nation. The English government conferred on Lord Raglan the baton of a field-marshal, and a rule was made to confer commissions upon those non-commissioned officers who most distinguished themselves for skill and valour. This much—

required resolution was not promulgated until several weeks later.

Horse Guards, December 9.

The queen has been pleased to command that, as a mark of her majesty's recognition of the meritorious services of non-commissioned officers of the army under the command of Field-marshal Lord Raglan, in the recent brilliant operations in the Crimea, the field-marshal shall submit, through the general commanding-in-chief, the name of one sergeant of each regiment of cavalry, of the three battalions of the Foot Guards, and of every regiment of infantry of the line, to be promoted to a cornetcy or ensigncy, for her majesty's approval; and, with the view to render immediately available the services of these meritorious men, her majesty has directed that the field-marshal do appoint provisionally, and pending her majesty's pleasure, the sergeants so recommended to regiments in the army under his command; and her majesty has further been graciously pleased to signify her intention that, on the several recommendations receiving her majesty's approval, the commission shall in each case bear date the 5th of November, 1854.

The chief points in the royal warrant, dated the 4th of December, concerning annuities and gratuities to soldiers, are the following:—

Whereas, we deem it expedient to mark our sense of the distinguished, gallant, and good conduct of the army serving in the East, under the command of Field-marshal Lord Raglan, our will and pleasure is: that one sergeant in each regiment of cavalry and infantry, and of each battalion of the Foot Guards, and of the Rifle Brigade serving in the East, in the Crimea, or elsewhere, under the command of Field-marshal Lord Raglan, shall be selected by the commanding officer, and recommended to us for the grant of an annuity, not exceeding £20, provided that the aggregate of grants now made and to be made shall not exceed £4000 in any one year. The annuity so granted is to be at the disposal of such sergeant, although he may be still in our service. It is also our will and pleasure to extend the provisions of our royal warrant of the 13th of April, 1854, and with the special view of marking our sense of the distinguished service and gallant conduct in the field of our army now serving in the East, in the Crimea, or elsewhere, under the command of Field-marshal Lord Raglan, to order and direct that the commanding officer of each regiment of cavalry shall be allowed to recommend one sergeant, two corporals, and four privates; and the commanding officer of each regiment of infantry, and of each battalion of Foot Guards, and of the Rifle Brigade, shall be allowed to recommend one sergeant, four corporals, and ten privates, to receive a medal and a gratuity of—

For a sergeant	£15
For a corporal	10
For a private	5

The gratuity to be placed in the regimental savings-bank, there to remain in deposit at interest until his discharge from our service, and to be deemed to be his personal property, in conformity with the terms of our royal warrant of the 13th of April, 1854.

The tidings of the great storm, following so closely upon those of the great battle, convinced the government that aid must be speedily sent to Lord Raglan. It will scarcely be credited by readers not acquainted with the character of the Aberdeen government that the reinforcements resolved upon amounted to no more than 6500 men! It was generally believed that, but for the letters of Mr. Russell in the columns of the *Times*, even that miserably inadequate assistance would not have been sent forth. The first battalion of the Grenadier Guards, and the 34th, 62nd, 71st, 90th, and 97th regiments of the line received orders to

proceed to the Crimea, with various other detachments. Some of these troops were never sent, and all that were dispatched arrived too late in the season to do anything but share in the sufferings of their brothers in arms previously in the field. The apologists of the government excuse its tardiness in sending supplies of men and munitions after the united effects of Inkerman and the storm had so completely exhausted the army. The examinations conducted by the Sebastopol Committee threw light on these matters; Lord Hardinge, the commander-in-chief of the forces, gave the following evidence:—"Our peace establishment had been so very low indeed, that, after making the first effort, and sending out 25,000 men, we could do nothing more than send out young recruits. We made them pretty perfect in drill in a couple of months, but instead of sending out bone and muscle, they were, I may say, only gristle. Our peace establishment had been so low, that when the war broke out we were obliged to raise men as fast as we could; and the great difference between the army under the Duke of Wellington on his going to the Peninsula in 1808, and the army in the Crimea, is this: in 1808, we had for six or seven years previously a very large force of second battalions and of militia, to resist invasion. All those men, from twenty to twenty-five years of age, were in the highest state of discipline, and when we drew upon them, we knew we should get soldiers whom we could rely on. But when we came in November and December, in the face of the winter in the Crimea, to send out those raw recruits—and we had no others to send—it was impossible to expect them to resist hard work and the inclemency of the weather so well as other and more seasoned men."

The French reinforcements were dispatched with great order and alacrity—20,000 men augmented the French army; but however generous and sympathetic our allies were in every other respect, they were very unwilling to share the labour of the trenches with the British. They did their own part well; but the English were numerically unequal to the proportion of labour which they had undertaken, and the French were unwilling to assist them. Lord Raglan, either from over-anxiety for the pride and dignity of the British army, or expecting reinforcements as they might be required, undertook a proportion of the common toil which his numbers, in comparison with the French, by no means justified. His lordship knew as well as any man that supplies of men from home could not be relied upon to a very great extent; but as he was a personal and political favourite with the court and the government of the day, he relied much upon

his own influence in obtaining whatever he required. He knew well also that there were still regiments at home sufficient to afford substantial help. The specious evidence of Lord Hardinge before the Sebastopol Committee may appear to contravene this; but we had four battalions of household infantry, three regiments of household cavalry, several heavy and light cavalry regiments, and strong depots, and battalions of the line, which might have been promptly embarked for the seat of war, but were kept uselessly at home.

When the effects of the storm were at last obliterated, so far as the camp was concerned, the work was actively renewed in which the English soldier bore so patient and suffering a part. The trenches were enlarged, batteries were repaired and remounted, the approaches were pushed forward, and the toiling English worked on without respite, sickness and fatigue still their portion. To these the rigours of winter were now added—

“—chill November's surly blast
Made fields and forests bare.”

The Russians also toiled and also suffered. Through the haze of the Crimean November the opposing hosts regarded one another, as if each were afraid to strike, and yet longed for the decisive moment when battle terminates suspense.

A gentleman who followed the armies to Roumelia and Bulgaria, and wrote some of the most interesting letters which came thence—letters rivalling those of Mr. Russell or Mr. Woods, although these possess a wider fame—thus notices the state of things around the war-beaten city after the storm and through the month of November:—“If a traveller familiar with Sebastopol and its environs were to take his stand on one of the heights held by our outposts, and to look down upon it, knowing all that has occurred, undoubtedly one of the first impressions made would be that resulting from the little change effected in the appearance of the town and its fortifications, notwithstanding the number of shot, shell, and other destructive missiles discharged against it for more than a month past. The next thing that would attract his notice perhaps, would be the number of earthworks and batteries erected on the south side of the town and dockyards, and on the high points as far as Careening Bay, also on various prominent positions in the town itself, and again on the north side of the roadstead and heights above. But the principal forts remain unchanged, and apparently as perfect as ever. The great Fort St. Nicholas, seen in reverse, with its stone arcades, extending in long concave lines one story above another; the lofty, but comparatively narrow stone tower of Fort Paul, with its two wings, exhibit no change.

The rows of dockyard buildings, the storehouses, the loftier and more spacious buildings in the town itself, preserve their original outlines. Three buildings, from their elevation and structure, particularly attract the gaze in looking at the town. One of these, the loftiest, is crowned by a dome covered with bright lead or other shining metal; another has the appearance of a Gothic church with several pinnacles rising from its roof; the third has the form of a Grecian temple, and from its proportions, portico, and columns, appears to be a copy of the Parthenon. These seem to have been untouched; but the last-mentioned building exhibits, by its partly stripped roof, the effects of the late hurricane. The nearer buildings, consisting of private residences, public offices, or warehouses, show here and there an opening made by the entrance of a shot, but seldom exhibit any more extensive damage. To the left, the work of destruction is more manifest. Several lines of one-storied barracks, a considerable number of houses and other buildings—a few large, but generally of an inferior character—in their rear, are here in a state of ruin. The only works of a more imposing kind, which show the effect produced upon them by the guns of the besiegers are, on the right, the Round Tower, battered by the English; and on the left the Fifty-gun Fort, which terminated the south end of the loop-holed wall of the town, and which has been destroyed by the French. These are the only two stone works which are in a dilapidated condition. Of course, the forts on the north shore of the roadstead show no change, as they have not been touched, excepting Fort Constantine at the entrance; and from the distance, although it is said to have been severely shaken, and to be propped up within by timber, no alteration can be perceived. The heavy guns on its roof remain as before. The effects of the firing are manifest only in the immediate neighbourhood of those points against which the efforts of the besiegers, as well as of the besieged, have been concentrated—namely, the earthwork batteries which each antagonist has mutually raised in the course of the period which has elapsed since the 28th of September.”

The uncertainty of the information transmitted from the seat of war, and the irregular reception there of despatches, were vexing to the army, and to its friends at home. Remonstrances and petitions to the Post-office in St. Martin's-le-Grand, and to the government, were alike unavailing. In this respect our French friends contrasted very favourably with us: the regularity of their despatches, and the punctual receipt of letters by the soldiery deserved the highest eulogy.

The conduct of the French commander-in-

chief at this juncture was passing excellent. No commander ever showed more sympathy for his men. Attended by his intimate friend, Bosquet, he might be seen daily, almost hourly, about the camp or at Kamiesch personally superintending everything, and consulting his skilful general of division on every point which required deliberation. He visited the hospitals, and inquired individually at the beds of the soldiery as to their condition and requirements. He inspected the medicine chests, conferred with the medical staff, saw to the repair of ambulances, the better construction of huts, the supply of coffee, bread, and fresh vegetables. He went on board the transports, talked to the skippers, acquiring and giving information. It appeared as if he united in himself the functions of commissary, assistant surgeon, and lieutenant of engineers. Many of his excellent arrangements were attributed to General Bosquet, but the kind motive and the active disposition needed no prompting.

The English soldiery, still patient and unmurmuring, remarked the different conduct of the staff of their own army. Canrobert was a younger man than Lord Raglan, and better able to undergo this great amount of exertion; Bosquet was also a hale and vigorous man. Lord Raglan was really ill, and his habits were more contemplative and literary than such as the exigencies of the situation required. In early life, Lord Fitzroy Somerset was one of the most active officers in the army, and on the staff of his great chief, the Duke of Wellington, served in the vigorous performance of every duty; but for many years he had settled down in an easy chair in the Horse Guards, at the desk of the military secretary, and this sedentary life had obtained ascendancy over his habits; he was, besides, far advanced in years considering the requirements of his position. His staff were not active. General Esteourt, the adjutant-general, was, like his chief, one of the most gentlemanly and amiable of men, and he did his duty conscientiously and to the best of his power; but he was a man of little general capacity, and intellectually totally unequal to the magnitude of the undertaking. General Airey, the quartermaster-general, was a very active man, always bustling about, doing and undoing—and with so little skill that his department was the centre, if not the source, of most of the confusion that ruled in the camp, and excited at home so much indignation and shame. Every body gave General Airey credit for the best intentions, but he and his *alter ego*, Colonel Gordon (son of the premier) were so self-sufficient that the most experienced generals were not consulted, and their requests and remonstrances were frequently unheeded. The officers and men were dispirited and disquieted by these things,

although they evinced a fortitude the most unyielding.

The arrival of "the drafts" cheered the men, and those of the Guards brought out drums and fifes, which had a very inspiring effect on the soldiers as they encamped on the bleak plateau. "Cheer, boys, cheer," "Pop goes the Weasel," and "the British Grenadiers," were in great request; but the shivering soldiery after a time appeared to lose interest in these home-strains—so stern and all-exacting were their tasks and toils.

Our Ottoman ally sent forward his reinforcements, such as they were, well provided with *materiel*, although the Turkish troops already in the Crimea were utterly neglected and their condition deplorable. With the small reinforcements of Turks there arrived some very large and magnificent guns. These were brass cannon weighing 75 cwt. each, but which threw shot and shell nearly as heavy as our own of 95 cwt. As soon as these fine pieces of artillery were landed they were sent up to the batteries, and placed in important positions. What were termed the staff-corps arrived from England, but the advantages expected from this body were never realised.

Such was the state of the camps and siege when, on the 20th of November, a smart combat took place which redounded to the honour of the British infantry, and in which one of the most promising officers of the service lost his life.

In consequence of the reduction in numbers of the English army it was impossible to occupy various outposts in sufficient strength, and from some it was necessary to remove the detachments altogether. The broken ground beyond the British batteries furnished excellent cover for riflemen, and the English had placed there small parties who kept up an incessant and deadly fire upon the enemy. As these men were gradually drawn in, for the reason already given, the Russians, well knowing the reason of their withdrawal, advanced and took possession of every sheltered hollow and cover whence they might in turn annoy us. Opposite the English left attack, then under the cautious and skilful command of General England, there was a hollow place where the ground was rocky and uneven, and the surrounding rocks indented by caves of singular construction, formed by the decay of the softer portions, between the strata of which the rocks are composed. These caves afforded very convenient shelter for the occupants of the post, and the whole formation of the ground enabled them to sally out and take sure aim upon an advancing enemy with impunity. Besides these advantages, there were several broken limekilns and two ruined buildings, admirably adapted to protect the men, whether

actually engaged with the enemy or on bivouac. This place obtained the name of "the Ovens" among the English, from the likeness of the old limekilns to such useful culinary appendages. When the Russian riflemen ensconced themselves in this snug post, they began operations by a smart fire upon the extreme of the French right attack. On the night after the great storm, and on the 15th, the French suffered seriously from the sure aim of the sheltered enemy. Many of the men of their fatigue parties working in their second parallel were hit. It became necessary to dislodge the Russians from the position, and on the night of the 16th an attempt to do so was made by orders of the commandant of the French right attack. The French found to their surprise that the post was occupied by at least 300 men, and as not half that number had been sent to dislodge them, the Russians not only kept possession, but drove back our allies with severe loss.

Emboldened by success, and finding the value of the situation, the Russians doubled their garrison there, and turned their attention to the English left attack, picking off the gunners and the men of the working parties. Under these circumstances General England thought it necessary to attempt their dislodgement, and committed the arrangement of the attempt to his skilful brigadier, Sir John Campbell. Lord Raglan, in his despatch, thus calls the attention of the home government to the success which attended it:—

Before Sebastopol, Nov. 23, 1854.

MY LORD DUKE,—The Russian advanced post in front of our left attack having taken up a position which incommoded our troops in the trenches, and occasioned not a few casualties, and at the same time took in reverse the French troops working in their lines, a representation of which was made to me both by our own officers and by General Canrobert, a detachment of the 1st battalion Rifle Brigade, under Lieutenant Tryon, was directed, on the night of the 20th, to dislodge the enemy; and this service was performed most gallantly and effectively, but at some loss both in killed and wounded, and at the cost of the life of Lieutenant Tryon, who rendered himself conspicuous on the occasion, was considered a most promising officer, and held in the highest estimation by all.

The Russians attempted several times to re-establish themselves on the ground before daylight on the 21st, but they were instantly repulsed by Lieutenant Bouchier, the senior surviving officer of the party, and it now remains in our possession.

Brigadier-general Sir John Campbell speaks highly of the conduct of the detachment, and of Lieutenant Bouchier, and Lieutenant Cunningham, and he laments the death of Lieutenant Tryon, who so ably led them in the first instance.

This little exploit was so highly prized by General Canrobert, that he instantly published an "Ordre Général," announcing it to the French army, and combining, with a just tribute to the gallantry of the troops, the expression of his deep sympathy in the regret felt for the loss of a young officer of so much distinction.

RAGLAN.

His Grace the Duke of Newcastle, &c.

In this despatch of Lord Raglan's some things are overlooked. A small body of Rifles,

under the command of Lieutenant Tryon, is represented as having captured the post, and the same detachment, under Lieutenant Bouchier, as successfully defending it on the 21st. The facts were, that two companies of the 1st battalion of the Rifle Brigade, supported by four companies of the 68th regiment, were appointed to the undertaking. Lieutenant Tryon was the senior officer of the two Rifle companies, and as he was regarded as a first-rate officer for outpost duty, the four companies of the 68th were ordered to follow his directions. The whole of these troops remained in the second parallel of the British left attack until the hour which Sir John Campbell appointed for the enterprise to proceed. When that hour arrived, Tryon led his Rifles forward with profound silence and caution, creeping from crag to crag, and furtively advancing upon the foe. In this manœuvre the Rifles had greatly the advantage of the 68th, who made slower progress and some noise, which was ultimately heard by the Russian sentinels. The night was one of excessive rain and storm; such nights are seldom dark, a fact often overlooked by persons who describe the incidents of war, and by officers who have to direct the movements of a surprise: the night of the 20th of November was, however, dark, as rain accompanied the wind—and this favoured the more rapid progress of Tryon and his party. There was still some fifty yards distance from the hollow where the Russians were lying sheltered, and unsuspecting of the vicinity of any assailant. The Rifles were scattered, the men of the 68th advanced more compactly, and their tramp roused the vigilant ear of the sentinels, who, springing up, fired and fell back. The advance was discovered, the Russians were at their post in an instant, with rifles ready to give our troops a deadly reception if there were only light enough to take aim. The British, perceiving that the sooner among the enemy the less fatal the encounter, rushed forward as if by a common impulse. An irregular volley from the Ovens was the only resistance; its possessors fled before the bayonets of the English, not, however, until a number were victims to that destructive weapon. The captors found very valuable prizes, which they hastened to appropriate; there was a large supply of black bread, and nearly every man among the conquerors secured a flask of spirits and a blanket—booty most welcome.

According to Lord Raglan's despatch, the enemy next day attempted to regain the place; Mr. Woods declares that five minutes did not elapse before the renewed attack began. Both statements are incorrect, although the language of the despatch may seem to have literal accuracy, for the Ovens was captured before

midnight of the 20th; after midnight, and therefore on the 21st, the Russians returned to retake it. They came back in great force, but were met with a determined and successful resistance. In a popular memoir of Lieutenant Tryon, his men are represented as "firing destructive volleys into the head of the various Russian columns as they came on to the attack." This is mere hyperbole; a force of about 1200 men constituted the attacking party, whereas the defenders of the post barely numbered 400; these had, however, the advantage of position, and most gallantly used it: not a nook, or spot of cover which the ground afforded but was occupied by the Rifles, while the detachment of the 68th was judiciously drawn up so as to receive the enemy with bullet and bayonet as he came on. The rain too abated, and as the clouds drifted before the careering gale, the night brightened, enabling the British to take aim as the foe came within rifle range. As soon as our men opened fire their opponents fell fast. The fire was returned at great disadvantage. The Russian officers perceiving this, gallantly, sword in hand, endeavoured to lead their men at the charge; but they remembered Inkerman, and quailed before so early a repetition of a bayonet contest with the English. They turned and fled, leaving on the field 150 killed and wounded; at least twice that number of wounded were brought off the field. Before they retired, Lieutenant Tryon was killed; he was considered the ablest rifle officer in the service, and the best marksman. At Inkerman he fired 119 rounds from his own rifle, and was supposed to have destroyed more of the enemy than any twenty men in the English or French armies. At the Ovens he had brought down eleven Russians, and was raising his rifle to take aim at a Russian officer, when he received, by a chance shot, a bullet in the brain. This gallant officer was son of Thomas Tryon, Esq., of Bulwich Park, county of Northampton. Lieutenants Bouchier and Cunningham conducted the defence after Tryon fell; and both officers obtained and nobly merited the approbation of the army.

The spirited enterprise of the Ovens was the last which the English troops attempted before Sebastopol during the year 1854. The dreary winter fell upon them with renewed vigour, disabling the army from all active exertions. The privations of the English caused desertions; the men were seldom more than eight hours at a time off duty; and hunger, cold, and sickness, struck mortal blows around. The Russians, aware of this state of things by the increasing desertions, made frequent petty sorties, approaching the outposts and parallels, and often finding the English soldiers asleep at their posts, bayoneted them. Some-

times the men who were thus overpowered with slumber sank to wake no more, the cold depriving them of life.

The French, well housed, well fed, with numbers sufficient to do the labour of their own trenches, and those of the English also (in which, however, they did not in the least assist), continued to work their approaches, to strengthen their parapets, and to replace their worn guns in their batteries. Parties of Frenchmen might be seen daily, beyond their own parallel, gathering sticks for fuel, unmolested by the Russians, who only occasionally fired upon them. At night, however, the French and Russian Rifles had constant skirmishes on a small scale, by which neither side gained anything. The severity of the weather conquered the active disposition of all the belligerents, and the grim and stricken hosts confronted one another with surly and discontented mien.

Occasionally, however, some event of startling interest would animate the allied armies. Thus, on the 24th of November, a very brisk affair took place, between the Chasseurs de Vincennes and the Muscovite riflemen, in front of the Flagstaff Battery earthworks. While yet the rifle combat was maintained with fluctuating fortunes, the batteries of the town opened the most furious cannonade heard since the cessation of the bombardment. For seven hours the dark sky reflected the flashes of the artillery. The French suffered very little from this unexpected outburst from the enemy's batteries; and although the flame from so many pieces of ordnance threw light over the ground where the skirmishers fought, yet the noise of such a sustained roar of artillery enabled the French stealthily to push on, unheard, detachment after detachment in support of the Chasseurs, until at last a dash was made by these increased numbers. The Russian outposts were driven back with the bayonet under heavy loss. The Chasseurs still pressing forward, followed the enemy within his lines, entered the intrenchments, bayoneted gunners, spiked guns, and established themselves at last so firmly within the *enceinte*, that it was afterwards seriously discussed by the officers of both the allied armies whether, if this success had been followed up, the place might not have been successfully assaulted. There was, however, no preparation for such an event. The general-in-chief of the French army lacked enterprise, as well as that of the British; and no chances, which arose so frequently, of this nature were ever made available. In the condition the British troops were at this time, the conquest of Sebastopol might not have ensued, even if the French had entered in full force.

On this night the Russians showed some disposition to renew their attack upon the

Ovens, and some men were detached in support from the Green Hill Battery on our left, but returned. The French sent a strong detachment across the ravine, to assist in keeping the post—the preservation of which was as necessary to the security of the men in their right attack as to those in the British left.

Wearied, harassed, and sick, as were the English—although rain and storm scarcely intermitted, and the track from the camp to Balaklava was a vast puddle, through which the horses had to wade up to their sides—yet desperate efforts were made through the latter part of November to arm the English batteries afresh, and prepare them for a renewed bombardment. What our allies were able to effect on their side by numbers, the British performed by dint of indefatigable toil, under which some of them dropped down dead; and numbers sunk each day after their task was over, unable again to resume a degree of labour so unrelaxing and oppressive. Sixteen 32-pounders, from the armament of the *Britannia*, were landed on the 26th. Twenty-four other guns, of the same calibre, were landed from the armaments of other war-ships the same day; sixty tons weight of shot and shell were also landed; and efforts, successful but most onerous, were put forth to bring these and other large stores of material up to the trenches.

On the night of the 26th, another skirmish between the French and Russians enlivened the British left attack. The French surprised a mud fort at the Quarantine Battery, and drove out the Russian detachment there stationed; the latter, reinforced, sought to regain it; but the French continued to hold possession, after having suffered a loss of men altogether disproportioned to the value of the post, except so far as that every advantage produced a moral effect which tended to dishearten the enemy. The fire of the Russian Rifles was, on this occasion, more sure than the French had as yet experienced; and the men seemed to handle their weapons with increased confidence. They were unwilling to charge home with the bayonet, but approached the French very closely, taking deliberate and often fatal aim, as far as the little light afforded enabled them to do so. The increased confidence which the Russians showed in their fire-arms on this occasion arose from the fact that they had been recently armed with the Liege rifle,—an excellent although cheaply-constructed weapon, which the Belgian manufacturers, with the willing assistance of the Prussians—and it was reasonably credited of the Prussian government—supplied to our enemies. Belgium was deeply indebted to England and France for her independence, and was pledged by her constitution, and by the very terms of her political existence, to a faith-

ful neutrality; but both the people and government were faithless, and showed to Russia all the sympathy they dare avow. Prussia professed to be an ally, but acted as an enemy. The Prussian people declared very generally their desire to see the allies victors; but they supported their government in a double-dealing policy, and regarded their temporary commercial advantages, and individual interests, more than the cause of liberty, with which they professed to sympathise. The Russians had no difficulty in obtaining from Belgium, *vid* Prussia, excellent rifles, muskets, rifle-carbines, and pistols, with which they gradually displaced, to the disadvantage of the allies, the inferior arms previously used.

By the night of the 27th a fine new battery was erected by the English, to be manned by their dauntless tars, whose usefulness at the Sailors' Battery had been so severely and successfully tested during the recent bombardment. This battery was fitted to bear twenty-six guns of the largest calibre; it was thus described:—"It is a *flèche*. The right side of the *flèche* commands the Inkerman Road and battery; the left side sweeps the head of Inkerman Creek, and commands the shipping, which will now be driven down towards Dockyard Creek."

A Polish deserter came into the trenches in the dusk of the morning of the 27th, and related that the Grand-duke Michael had reviewed, on the 25th, 12,000 men in the city, and personally exhorted them to drive the heretics into the sea, intimating that they should soon have an opportunity for putting his exhortations into practice, as another attack would be made upon the flank and rear of the allies. The exhortations of the prince were followed by donations of money and a distribution of extra rations of food and spirits. When the prince retired, the priests dispersed themselves among the various battalions, repeating the exhortations, and in the name of the archbishop distributing additional donations of money, clothing, and raka. The men were much excited—their national and sectarian feelings were roused to fury; their tenacity in the night combats of the 25th and 26th were in a great measure to be ascribed to the enthusiasm thus enkindled. The Poles, who were listeners to these exhortations, were moved to anger—their religious and political sympathies being with the allies; still their disposition to desert was checked by the thoughts of the loved ones at home, whom they knew they never could see again if they did not remain in the Russian ranks.

The severity of the weather and the sufferings of the army—officers as well as men—now operated upon a class of camp-followers who acted as sutlers, servants, valets, chapmen, &c. These men were Maltese, Ionians, and Greeks, chiefly, mingled with Albanians and Rouma-

nians. They took every opportunity during the last week of November to leave—deserting the officers, to whom they had engaged themselves as servants, in their utmost need; and frequently manifesting the basest ingratitude to those who had fed them when themselves scantily supplied, and watched over and tended them in sickness. Many of these men were spies, and such was their greed of money and utter baseness, that they would have betrayed into the hands of the enemy the very men whose salt they had eaten, and who had succoured and saved them. During the closing weeks of November the dead bodies of wrecked seamen, the mutilated trunks of others, and sometimes a head or limb, were washed ashore along the coast of the Crimea, the strong winds which continued to prevail driving them in from the sea.

Several occurrences before the month of November expired, disgusted the English army with the official management, which had so much to do with its sufferings. The rain and wind which set in about the 8th of the month continued to its close. Before and after the great storm the gales were high and dangerous—after that deplorable event the cold continued to increase intensely, the rain often becoming sleet, and followed by occasional snow-storms. The trenches were frequently nearly filled with water; the road from Balaklava to the camp, and the various offshooting tracks, were almost impassable from the mud created by such incessant rains falling upon a soil peculiarly adapted to yield to it. Chill damp vapours hung every morning over the plateau, and hid the valley of the Tchernaya beneath a sea of mist. As the day advanced, the high winds swept these mists partially away, but generally a deluge of rain or sleet was shaken, as it were, from the wings of the wind, darkening the day. The men were drenched perpetually. Efforts to dry their clothes, when fuel was procurable, afforded only temporary respite from the chillness which pervaded their frames. Nothing at this dismal period was more valuable than firewood, yet vast quantities were drifting about the harbour of Balaklava, and along the adjoining shores, and no efforts were made to collect it. The wrecks of the 14th would have supplied the army with fuel for a space of time which would have been sufficient for saving many lives. The soldiers made repeated attempts to collect the wood thrown up upon the beach, but for so doing they were treated by the incapable and impracticable authorities as thieves. Any man caught *stealing* the drift timber became the victim of the provost-marshal's wrath. As soon, however, as fuel ran scarce at headquarters, the *Caradoc* was employed to fish up so much of what then remained as might supply the comforts of Lord Raglan and his

attendants. The young gentlemen, nephews and friends of his lordship, and the quartermaster-general's staff, did not like the cold and damp any more than the common soldiery; the latter were left to perish without any effort to procure what would have been life to them, nor were they even permitted to help themselves, but the navy was brought into requisition the moment the necessities or convenience of head-quarters required a supply. In this a contrast was presented to what took place in the French army, conferring as much credit upon the one as it reflected disgrace upon the other. The heartless contempt for our poor soldiers—as if being humbly born was a crime in the esteem of the men to whose care these brave fellows were committed—was an infamy which no qualities of excellence, personal or professional, on the part of those guilty of it, can ever redeem.

The distribution of green coffee had also much to do with the ill health and discomfort of the soldiers. They had no means of roasting the berries, no means of grinding them; requisitions and remonstrances to supply them with the roasted berry, or ground coffee, or the means of preparing it, were not even noticed. The men threw the berries away, and in many cases drank the water in which their ration pork was boiled—the pork being excessively fat and salt. During the last ten days of November neither sugar, coffee, nor tea, were given to the troops. Scurvy began to prevail among the men to a deplorable extent, yet no means were resorted to for procuring fresh food. Vegetables were landed to a considerable extent at first, but they were piled up in vast stacks at Balaklava; the persons in charge would not part with them without written authority from their superiors; the written documents could not be obtained at all, or only after a tedious interval. Contempt for the humble soldiers, and an indifference to their comfort and health, which were hardly disguised, prevailed where everything that was just, honourable, manly, patriotic, humane, and even grateful, should have prompted vigorous and thoughtful effort. Ultimately the stacks of vegetables rotted on the beach, in the sight of the scurvy-stricken and often hungry men; and these rotting masses were allowed to remain in that state, their smell horribly offensive, and adding to the prevailing sickness, because it was no one's business to remove them. When the nuisance became utterly unendurable some one assumed authority, and the vegetables were thrown into the sea.

The state of the men's clothing during the month of November was most wretched; few ever took off their clothes from the beginning of the bombardment. So ragged and tattered were they that it would have been difficult for them, had they taken them off, to get them on again.

The soldiers were covered with parasites; the camps and the trenches were literally alive with them. All this time bales of warm clothing were carried about from port to port on board the transports, or were stowed away in the tossing ships uselessly lying at Balaklava, or were piled up on shore, where they were cast, soaked with sea-water and rain, after the wreck of the *Prince*. On the last day of November, the *Ottawa*, which had stores of warm apparel on board, was ordered to land them, but from some inscrutable causes the soldiers profited little in the result. All the detail connected with the supply of an army was conducted as badly as it was possible for the like to be conducted—so far as it depended upon the management of head-quarters, and the order and efficiency of the departments at home.

The condition of the medical men was truly deplorable: their number was so small that their work was incessant, and they received neither aid nor sympathy from the military authorities; while the chiefs of their own profession were as gifted in official bungling as the officials of the more martial departments of the army. The medical men made requisitions for medicine, and for such comforts as would aid in the recovery of the sick, but in vain; neither by the chiefs of the navy or army were they treated with respect, nor their patients considered with humanity. When they applied for laudanum or opium, in cases of diarrhœa, they were supplied with epsom salts or cream of tartar; and in return to their requisitions for other important medicines, they received vast quantities of alum. Alum pills was the prescription for every complaint, because the doctors thought it necessary to humour the common soldiers, who put faith in medicine. Several of the more intelligent of the medical men, who were acquainted with the shores of the Bosphorus and Black Sea, urged upon the authorities the feasibility of obtaining fresh provisions from Trebizond, and other of the Asiatic ports, and also from Bulgaria and Roumelia; but no effort was made to do so. Offers to form contracts to supply the army with any amount of cattle, and large quantities of vegetables, were refused. Ships which ought to have been employed to carry these commodities were lying idle, and knocking against one another, in a filthy condition at Balaklava. *There was no head.* It was discovered long after, that much of the starvation, sickness, and misery, might have been mitigated—that supplies to any amount could be had at Trebizond; and contracts were offered, some of which were accepted; but even then the genius of mismanagement deprived the army of most of the benefits which would otherwise have been derived. Our regimental

officers, and the men of both army and navy, sustained the honour of the English name—so did our generals of division and brigade; but the staff of the army disgraced their country, and nearly ruined her cause. Nor were the officers of the navy exempt from blame: their neglect and mismanagement at Balaklava, and their ineffectual blockade of the Russian ports at this period, call for heavy censure. The disposition of the chief military and naval authorities to shift the blame upon the commissariat was unjust. The commissaries, from the humblest man in the department to their chief, were treated with contumely. There was no organised system of connection between the departments. The horses of the commissariat were employed to bring up shot and shell, and Mr. Filder was blamed for not bringing up his stores when his means of conveyance and carriage had been arbitrarily withdrawn from him. The necessities of the army were many, and the confusion in attempting to supply them, as well as the indifference which neglected to supply them, were alike signal. Head and heart were wanting where the government at home should have taken care to provide both.

The state of things at Balaklava, at the end of November, is thus described by one who proved himself a faithful witness; and the contrast between the disorder in the English navy there, and the order in the French navy at Kamiesch, is testified with painful accuracy:—"The gales of wind to which the fleet has been exposed are excessively strong and violent. Every night there is a storm for a few hours; every day there is a 'breeze of wind' and rain. Will it be credited that, with all our naval officers in Balaklava with nothing else to do—with our *embarras des richesses* of captains, commanders, and lieutenants—there is no more care taken for the vessels in Balaklava than if they were colliers in a gale off Newcastle? Ships come in and anchor where they like, do what they like, go out when they like, and are permitted to perform whatever vagaries they like, in accordance with the old rule of 'higgledy piggedly, rough and tumble,' combined with 'happy-go-lucky.' Now in Kamiesch Bay the vessels are about tenfold more numerous than those in Balaklava, yet the order and regularity which prevail in the French marine are in the most painful contrast to the confusion and disorganisation of our own transport and mercantile marine service. Captain Christie avers that our merchant captains wont attend to him. Captain Powell, of the *Vesuvius*, a most active and indefatigable officer, is beach-master, but he has no power of interference in such matters as I have alluded to, and there is no harbour police whatever."

Such was the state of affairs at the close of the first winter month in the Crimea. The men were fed on half rations of salt pork and hard biscuit; they lived in threadbare tents, which had done service in the war of the Spanish Peninsula. They walked, and to some extent slept, in mud; they were nearly destitute of clothing, wholly destitute of fuel, hard worked, sick, without medicine, and exposed to the attacks of a powerful and insidious foe, perfectly well acquainted with their condition. The Russians in the valley and on the Tchernaya heights were nearly as unhappily circumstanced as to material comforts, or the flank and rear of the allies would again have been attacked by overwhelming masses of troops.

The guns and heavy mortars landed on the 29th by the *Golden Fleece* could not be brought up to the batteries, nor could the other munitions of war ordered to the camp from Balaklava—the road was so utterly cut up and so overlaid with vast piles of mud. Along its course might be seen dead horses, broken carts and arabas, gun-carriages stuck fast, and relics of every description of camp material, left behind in despair. As part of this road lay under the fortified position of General Bosquet, whose men had little duty to perform except to keep a vigilant look-out towards the army of Liprandi, it is extraordinary that no assistance was afforded by him to repair it. Certainly intimations were frequently made that such assistance would be welcome, and would be regarded as most generous and humane; but no formal requisition was made from British head-quarters, which some attribute to national, some to personal pride: others alleged that the requisition was not made because it was known that it would have been refused. An invalid English officer, who was moved down to Balaklava at this time, describes what he suffered and what he saw in the following terms:—“I was fortunate to be able to get up my baskets and other articles from the *Colombo*; and my servant and pony arrived at a late hour, tired out from the dreadful state of the roads, for it was a day's work to go to Balaklava and back. I was in a wretched state of weakness, and did not see much chance of my health improving, since for many days I could not get any fresh meat from the hospital, and was obliged to live on biscuit and tea. While in this state R—— received a box from Mr. G——, of the *Vengeance*, in which were a loaf of bread for me and a bottle of wine. The bread was a fortnight old, and rather mouldy, but, barring the crust, it was a great luxury, and lasted me for some time. Every third day my servant was obliged to go away some distance for fuel, and to pick up small roots and chips of wood, as it was almost an impossibility to make fires of the green brushwood

which the soldiers used, in rainy weather. This took him some hours, and it generally ended in my losing my dinner altogether, and contenting myself with a cup of tea. At this period the men only remained in the trenches twelve hours at a time, which was a great relief to them, and I believe this course was first proposed by Lord W——. It was impossible to procure any sort of comfort for them at Balaklava. I lent my pony, and sent my pay-sergeant down frequently, but he was unable to procure any flannels, or woollen comforters, socks, or anything that might be useful. He bought some boots there, which fell to pieces the first time they were used in the mud, and this was a total loss to the poor fellows. The town was full of ‘sharks,’ but I think the prices in some instances were made exorbitant by the masters of transports selling things to the shops from their stores at frightful prices. It is to be regretted that some of the shopkeepers and robbers were not turned out of the place, for then we might have been able to obtain provisions at a price something like their value. M—— and I sent my pony to Balaklava for some potatoes and onions, if the servant could buy them; and he brought us a sackful, for which he paid nothing, having been allowed to help himself on some steamer, together with a number of soldiers. Difficulties arose at this time in the commissariat department. The store of pork and biscuit being exhausted, we were asked to allow our bāt ponies to go to head-quarters (about two miles) for biscuit, as the roads were in such a state that it was impossible for even an araba to move in them. It was now decided by the medical men that I ought to go to Balaklava for a few days to recover my health, and accordingly, on the 3rd, the principal medical officer of our division came to see me, and decided that I was to go thither and remain on board ship for a week or two. Consequently an application was drawn out, which had to be signed by six different people before I could obtain leave to go thither for a fortnight. The country was a perfect quagmire, and you could scarcely discover the road, except that it was in a little worse state than the ground through which it ran. I waited a day or two for an ambulance, and at last, on the 5th, when tired of waiting, I decided on riding down with my servant, and borrowed Colonel D——’s pony, my own being ill. My servant filled my saddle-bags with a few necessities, and I managed to get on the animal, and turned his head straight across the mud to Balaklava. . . . I felt very ill on the road, but my servant kept close to me, and every now and then I was obliged to make a halt and start afresh. The mud was fearful, and there were numbers of dead horses near the French camp, in every stage of decomposition. I even

saw two bullocks, which had fallen down in an araba, and not being able to rise from weakness and exhaustion, had been relieved by death. Many of the carcasses had been skinned, and the hides used for the roofs of huts; but very few appeared to have been buried. I met six artillery-horses drawing a limber-waggon, that could scarcely move their load, which was a truss of hay. It resembled more a Canada swamp than anything I had ever seen. On reaching the edge of the plateau, looking down on the valley of Balaklava, I could plainly see a large body of Russian cavalry occupying their old position, while the Cossacks were on the hill where formerly our redoubts stood. The worst part of the road now lay between us and Balaklava, and I met several bāt-horses and men plodding their way to camp. One cavalry officer remarked to me that they were fine roads to belong to the quartermaster-general and engineers."

The condition of inferior officers it will be seen was little better than that of the men. Invalid subalterns were almost as roughly treated as the privates. Those who were put on board ship for Scutari suffered indescribable hardships in many cases. The sick and wounded soldiers were often obliged to lie out on the deck, exposed to the pelting rain and cold high winds then prevalent. The officers were placed under cover in cabins and nooks, without furniture and without bed-covering. In one ship, where the officers and men were destitute of every comfort, there were bales of blankets which were carried back and forward over the Black Sea and through the Bosphorus. The officers in vain expostulated and requested some portions of those valuable commodities for themselves, and for their men. On board some of the transports there was no physician, or if an assistant surgeon were allowed to go, he had no medicines; no attendance of any sort was provided, nor were the crews, or even officers, always as kind as might be supposed from the reputed generosity of our tars. On many occasions, however, the sailors behaved with great humanity, and did everything men could do for their suffering countrymen. This was, however, chiefly the case on board the ships of war. The officers of her majesty's fleet were most considerate of their brothers in arms—often denying themselves every comfort to bestow it upon those who were for the voyage regarded by them as their guests. Nor was Jack slow to follow the example of his officers in such cases.

During this state of affairs with the English, the Russians, comparatively unmolested, prodigiously increased the strength of their defences. They succeeded in escarping the ground in front of all their batteries, and constructing a strong abattis in front of their lines, which

would cause great loss of life in the event of an assault, and render its success a greater difficulty. They raised earthworks on every salient point, and mounted them with the heaviest ordnance. Sunken batteries were made by them before all their redoubts, and before the Round Tower, and along the scarps of the slopes. The appearance of the allies on the Russian side at this time was thus described by an eye-witness:—"Riding along the heights over the French lines, from the telegraph to the lower road to Balaklava, one could see the Russians chafing their hands over the cooking fires, few and far between, rubbing down their horses, or engaged in collecting wood. Any one who has visited Selborne, and clambered up to the top of the Hanger, will have a very fair idea of the heights over the valley of Balaklava as it sweeps round towards Inkerman, always barring the height and magnitude of the trees, for which he must substitute dwarf oak and thick brushwood. From the angle of the plateau over the Tchernaya the heights are destitute of timber or brushwood, and descend to the valley in shelving slopes of bare rocks or gravel banks. The valley lies at the bottom, studded with a few giant tumuli, on which the redoubts which formed so marked a feature in the affair of the 25th of October are situated. It is about a mile and a-half across from the telegraph to the base of the heights at the other side of the valley, which rise in unequal plateaux, on one of which is Kamara, on another Tchorgoum, on another Baidar, till they lose their character of tablelands and become rugged mountain tops and towering Alpine peaks, which swell in the distance into the grand altitude of Tchatir Dagh. Along this base the Russian horse, which seems to number 6000 or 7000, are constantly moving about between the Tchernaya and the redoubts in their possession, but at times some of them disappear up the gorge of the Tchernaya, as was the case this morning. Possibly they go for provisions to the more open country behind the gorge. Their infantry, which does not appear to exceed 8000 or 9000 men, are stationed up in these mountain villages, or amid the plateaux which are covered with shrubs and bushes. Their artillery must be stationed in the villages."

The Russians closed the month by a heavy cannonade upon the French works, followed by one of their usual sorties, which the nature of the ground before the French works favoured much more than that before the British. Volley after volley of musketry rattled over the space which intervened between the hostile lines, but the issue was as usual—the retreat of the Russians, pursued by their active conquerors.

The chief object of attack on this occasion was the French advanced battery of ten guns,

which the Russians supposed, from its long silence, to have been worn out or disabled. A British officer, posted near the French position, thus describes the incident :—"It was a stormy dark night, with a very high wind and rain, when they attempted to destroy it. It was not much more than 110 yards from the Russian Flagstaff Battery, and had done great damage to it. An unusual noise was heard about midnight by the French picket. One of them immediately crept forward unobserved, and found a strong body of the enemy mustering inside their works. On his giving the alarm, 700 French sallied forth to meet them. The enemy, numbering about 3000, sent a volley of balls at them, without effect, when the French sent in a shower of Minié bullets, which caused them to waver, and the French then charging them, they fled in the greatest confusion, leaving behind them an officer and 250 men. The loss of the gallant little French band was nine officers and ninety men, killed and wounded. We could plainly hear the firing at night in our camp, but after listening a little time we used generally to say, 'It is only the French!' and turn over and go to sleep again—so frequent were the sorties and skirmishes in their quarter."

The English were encouraged on the closing day of November by the arrival of Captain Gibbs and a strong company of sappers and miners. The same night three German soldiers deserted from the Russian batteries, who confirmed the conjectures that Liprandi's army had been much reduced by cold and sickness, as well as the heavy losses inflicted by the allies. The gift of warm clothing was a welcome event for the 30th of November, but the distribution was incomplete and partial. The closing incident of the month was one which interested the army very much. Mr. Russell, who witnessed it, thus relates it :—"A very long reconnaissance of our lines was made to-day, at the distance of about 1000 yards, by no less a person than the Grand-duke Michael and a very large staff, among whom our knowing people said they could see Prince Menschikoff and General Liprandi. The grand-duke was recognisable by the profound respect paid to him by all; wherever he went hats were taken off and heads uncovered. He was also detected by the presence of a white dog, which always accompanies him. He is a fine stout young fellow enough, but he could not have seen much about Balaklava to put him in a good humour—for he is averred by the best telescopes to have looked mightily displeased. While making his inspection, the enormous telescope through which he gazed was propped on two piles of muskets and bayonets, and he made frequent references to a very large chart, which could be seen on a portable table. The

grand-duke, after closing his review of us, rode back up the hills towards Tcherngoum. Most of the Russian cavalry have disappeared from our rear, and the force in and over the valley seems greatly diminished."

The probable reason for the selection of the 30th of November for this grand reconnaissance by the prince and the whole staff of the Russian army was, that it is the day dedicated to the service of St. Nicholas, the patron saint of the then reigning emperor.

Before dismissing the history of November before Sebastopol, it is necessary to refer to the mismanagement of the cavalry and cavalry horses; the misfortunes attending which continued all through the winter, and exemplified the incompetency that prevailed among those entrusted with the direction of affairs, more than perhaps any other of the miserable transactions which filled the army with suffering and confusion, and the homes of England with sorrow and shame. When it was too late to repair these misfortunes, a royal commission was sent to the Crimea to inquire into their causes, and in 1856 a commission of general officers sat to investigate the report of that commission, or at all events to hear what the inculpated persons had to say in their defence. It would be a tedious task for our readers to be required to wade through the evidence *pro* and *con.*; nor would it be appropriate to the pages of a popular history to transfer to them the contents of voluminous blue-books. We shall, therefore, briefly depict here the realities of the case, as during the month of November they began to be developed. After the battle of Balaklava, it will be recollected the cavalry were moved from the valley before Balaklava to the plateau—a situation utterly unsuitable; where men and horses were exposed to the inclement blasts which swept over it; where there was not a blade of grass for the poor beasts to nibble; and where, in relation to their supplies, the men were most awkwardly placed. Subsequently they were moved nearer to the position at Inkerman, between the division of General Evans and the French corps of observation under Bosquet. This was a worse position, if possible, than their former one. They occupied it at the battle of Inkerman, in which they could render no service, from the nature of the ground. When the road to the camp became so cut up and clogged with mud that the greatest difficulty was experienced in bringing anything up from the harbour, the horses were badly fed; there was no grass, no hay, no corn allowed them, except about three pounds of barley per day, and a little barley straw. The horses of course lost condition, and were rapidly starving. All the while trusses of hay innumerable were floating in the harbour, or lying on the beach—no effort whatever being

made by the staff of the cavalry, or of the general army, by harbour-master, beach-master, or naval commandant, to save this vast quantity of fodder, and thereby save the horses. Corn and hay could have been procured from Asia and from the Bosphorus during the month of November, but no person seemed willing to incur the obligation. If, indeed, Mr. Commissary Filder could have carried up the hay at Balaklava on his back, the troopers would have doubtless fed their horses with it; or if Mr. Filder had had the command of the fleet, the direction of the transports, and money at will, he might have brought more provender from Asia Minor; but unless he was able to do everything, or to work miracles, the horses must starve. There was no foresight, no authority anywhere—or, at all events, if there were, no one made use of it. The authorities in the Crimea did not even take the trouble to write home in forming government of their urgent necessities, and their helplessness to do anything whatever to mitigate them, so as to give the country the chance of finding out some means of remedying the dreadful state of listlessness and impotency which prevailed in the camp. It will hardly be credited in England even now, that ships were constantly sent with despatches from Lord Raglan to Varna and Constantinople, whence forage for the horses, as well as lemons (so important when scurvy prevailed), potatoes, and other vegetables, could be obtained in any quantity, *and yet the vessels brought back nothing*, having no orders on the subject. Perhaps Samsoon and Sinope were the nearest points from which corn, cattle, and vegetables could be procured; and they were so near that it only required some one with understanding and forethought of a very ordinary degree to look to the matter, and plenty might have reigned in the camp. Beasts of burden, in any numbers, might have been obtained from the same market for the purposes of the quartermaster and commissary-generals.

While the cavalry were posted near Inkerman, Mr. Crookshank, the commissary officer attached to it, wrote to Lord Cardigan and his senior, Lord Lucan, warning them that the road from Balaklava would soon be altogether impassable. Lords Lucan and Cardigan, with Mr. Filder, forwarded to Lord Raglan the representations made by Mr. Crookshank to them, and requested the immediate removal of the cavalry to a more convenient place for obtaining food. Lord Raglan expressed his regret that he could not comply with their request, as it was the wish of General Canrobert that the cavalry should occupy their present position. His lordship regretted the facts stated, as to the impossibility of feeding the horses there, but could suggest no remedy!

A more extraordinary reply it is scarcely possible to conceive. Surely, General Canrobert could never desire the British cavalry to continue where they were, after representations were made that the horses could not be fed! Of what avail would be the troopers for the purposes of either commander if their horses were dead? It is plain that the statements of Mr. Crookshank, Mr. Filder, and the Earls of Cardigan and Lucan, were never placed before the French chief, for he was too provident and considerate of the comforts of his own army to have persisted in a request so irrational where his ally was concerned. But if the French commander were guilty of such obstinacy and folly, that could be no reason for the acquiescence of the British chief. Mr. Crookshank then went to the commanding officer of each regiment, suggesting that a certain number of horses each day should be sent down to bring up forage for the regiment to which they belonged. The commanding officers approved of the plan, as the only expedient to which they could resort. This was not, however, to be carried into effect. Lord Cardigan could not allow it without the approbation of Lord Lucan, and he, although well disposed to it, must have the authority of Lord Raglan, and his lordship would not authorise it; and so the troop horses began to languish, and at last to die, from cold and insufficient supplies. Still the cavalry were kept posted near the front, as if folly ruled at head-quarters. When many horses died, orders were sent to the generals commanding to send down detachments to carry up provender from Balaklava. But what Mr. Crookshank suggested and urged when it was practicable, was only authorised by head-quarters when impracticable. The horses had become so attenuated and exhausted that they were not able to walk through the mud seven miles, and return, laden with cut straw and barley, the same distance through the same difficulties. It was attempted, but most of the animals perished. Some got as far as Balaklava, and died in the streets; others received their burden, and fell with it in the slough, as they returned, never to rise again; and not a few dropped down dead under the exertion of getting half-way down from the camp.

On the 2nd of December the cavalry were ordered to their old quarters at Kadikoi, having first eaten their own pack-saddles and one another's tails. About 120 troopers, whose horses could not be removed, remained a few days until death relieved them of their charge. The others were led carefully down the track—a distance of four miles—and into the plain, the sick and hungry soldiers rendering their once spirited chargers what aid they could. Never did men exert themselves more than

the insulted and ill-used commissariat officers, whose labours were incessant to find food for both the men and horses of the division. It is certain that very inexperienced and careless young men were attached to this department, but generally, at this juncture, the class deserved the highest commendation.

The French horses were well fed and cared for; Kamiesch, the French place of support, was nearer to their lines; there were more men available to assist; the commissariat and transport services were under stringent regulations, and General Canrobert himself saw that all orders were executed. Had the French, however, with all these advantages, occupied Balaklava and the English lines, they must have undergone great suffering: their men were less hardy, patient, and enduring than ours.

Several officers of experience, and agents connected with the commissary service, urged the commencement of hutting; but while the French promptly adopted the plan, the English had no materials. The fleets could have supplied vast stores of canvas and tarpaulin, also of poles and planks. Constantinople may be called a city of carpenters, as the people live in wooden houses—thence workmen and wood might have been procured very cheaply; but the English authorities did nothing, and all the severities of a Crimean winter were allowed to penetrate the camp and decimate the army without any skill, foresight, or aptitude for such an emergency being put forth. Many of the men did their best to burrow in the earth, or build huts of mud, but they proved to be bad architects, and their material was but little adapted. In the *Morning Herald* a humorous description of some of these performances was given at the time:—"The French began to hut themselves in holes in the ground. They were not the kind of residences which a man would choose from taste, but they were just the sort which he would be glad to get if he had no choice between them and exposure in a tent. Our own men made a few abortive attempts to construct similar retreats. I saw one of these, bearing an uncomfortable resemblance to the most dilapidated variety of Irish pigsty. Its walls or rather mounds, were leaning out at total variance with each other, and its particularly heavy and misshapen 'top' looked as if its inmates would certainly require some strong protection against the roof itself. Yet outside this sat two good-humoured, hairy Irishmen, extolling the 'illigance' and 'nateness' of the mansion, and expressing astonishment that neither Raglan or 'Gineral Canrobber' gave up their comfortable houses for the delights of such a residence. The 'illigance' of the abode some might question, but its 'nateness,' when the puddle in the centre had

subsided, must have been beyond a doubt. Such as it was the men were pleased with it as with everything else. I never saw troops more contented, or enduring bitter hardships with more cheerfulness. They said they had seen the worst then—that they could not have more rain or more wind, and with such plain reasoning got over all their difficulties. In their *désagrémens* a battle with the enemy was never thought of, or, if anticipated, only as a rather enlivening and cheerful incident."

The sailors on shore erected habitations of a very peculiar sort, which, to all appearances, were very comfortable; but Jack, however at home in making all 'taut' on shipboard, was a novice in tent and hut building. "Rough timber shanties fastened together anyhow, and roofed with tarpaulin," constituted the refuge from the storm which our tars provided for themselves. Jack also had obtained some charcoal which a ship had brought over for some purpose or other from Sinope. At that place this material could be had in great abundance at a nominal price; and if the soldiers had been provided with good fuel rations of this commodity, many lives would have been saved, and genial warmth afforded to those who, although they survived the winter, languished long after in foreign hospitals or at home.

Rapidly through the month of November, the scrub and brushwood disappeared from the plateau and ravines—the men had rooted it all up for fuel; and as no attempt was made to provide any substitute, they were obliged to eat their pork raw, or confine themselves to half rations of biscuit. Early in that month the steamer *Sea Nymph* had brought a vast quantity of patent fuel from England, made up like the sods of turf used in Ireland, but this treasure was never distributed. When landed, it was piled in rows of low stacks in the courtyard of Lord Raglan's house at Balaklava, where it remained until the stacks were thrown about, and covered with filth and refuse of all kinds. In the spring of 1855, when the place was cleared out, the relics of the valuable cargo were discovered. The greater part had been stolen by sailors, camp suttlers, Tartars, &c. All around Lord Raglan's head-quarters on the plateau there were trees, but the soldiers were not allowed to take a single branch, although dying from wet and cold. This fact sank deep into the minds of many of the soldiers, who, notwithstanding their bravery, sense of duty, patience, and willingness to bear without a murmur any amount of hardship that was inevitable, could not but feel that their lives were set against the value of a few trees and vines, which made head-quarters look a little more picturesque. One poor fellow, a guardsman, exclaimed as he perished in his misery, "I die for an ungrateful country." Well might

he feel so when such scenes were witnessed, when such sufferings were endured.

The men were especially solicitous to obtain boots; they would give any sum of money, and even their greatcoats, for a pair of boots or shoes. Those with which they were supplied from home were often so badly made, and of such worthless material, that they fell to pieces after the first day's struggle against the tough mud on the plateau, especially on the road, which now became more impassable for man or horse than the plateau itself. Strange anecdotes were current in the camp of the exploits performed by the soldiery in their attempts to capture or kill a Russian for the sake of his shoes—the following will serve as a specimen:—"Yesterday, on returning from the quarries, in front of the fourth division, where I had been to get a good look at the besieged town, I met one of our riflemen and a Russian sharpshooter walking slowly together. As I came near I saw that the Russian was limping along in pain, resting his hands on the captor's shoulder, who, with his rifle under his arm and a pipe in his mouth, was walking easily and coolly along, evidently giving his wounded opponent some good advice, which I have no doubt was all the better relished for not being understood. I waited till they approached, and asked the

rifleman how he got his prisoner? 'Is it where did I get him, sir?' said he, with an accent of surprise, 'faith, I shot him with my own two hands.'—"Where did you shoot him?" I inquired.—"Where? I shot him down there of course," said he, pointing towards the trenches. 'He was down there behind a wall, sir, when I hit him with my last round in the knee; and I've got his pipe, sir, and I've got his bacca, sir, and all I wants now is his boots, and I'm leading him to the hospital, when I can take 'em off him comfortable.' Having said this much with a droll earnestness to which no words can do justice, he quietly resumed his way towards the rear, assisting and helping his poor wounded prisoner, who, during the whole time of our dialogue, had been bowing, cap in hand, from one to the other, as if to implore our mercy and forbearance."

Dreadful as were the scenes, depicted faithfully in the foregoing pages, those which occurred in the following month were still more harrowing to the feelings. The words pronounced by Lord John Russell long afterwards in his place in parliament, and which vibrated upon the heart of the nation, but too truly expressed the condition of affairs—"horrible and heartrending." A further account of these calamities is reserved for another chapter.

CHAPTER L.

SUBJECTS OF THE PREVIOUS CHAPTER CONTINUED.—CLOSE OF THE YEAR BEFORE SEBASTOPOL.

"We are but soldiers for the working day!
Our gayness and our gilt are all besmirch'd
With rainy marching in the painful field;
There's not a piece of feather in our host
(Good argument, I hope, we shall not fly),
And time has worn us into slovenry;—
But, by the mass! our hearts are in the trim."—SHAKSPEARE.

THE state of the troops became worse in every way as December advanced. The weather grew more intensely cold; perhaps no winter was ever known to be so severe in the Crimea as that of 1854-5. The old Tartars declared that, forty years before, they had been accustomed to mild winters; but that every year since, with rare exceptions, especially during the last twenty years, the cold had become progressively more intense. Snow fell during the latter part of the month; and the keen cutting north winds swept the bleak plateau, so as to make it doubtful if human life could possibly endure.

December was nearly half over, and many of the soldiers had perished of cold before the cargo of the *Ottova* was entirely apportioned—so miserably tardy was the distribution. The clothing was of the most flimsy texture, and so scanty that it was a burlesque

to call it apparel. Each soldier was supplied with one flannel guernsey shirt, one pair of gloves, two pair of socks, and one woollen comforter. The flannel shirt was such as persons who wear flannel next the skin at home put on after winter is over; these shirts were all worn out before the month expired. The socks were scarcely thicker than the shirts. The gloves were warm and substantial, but a single pair did not last longer than a fortnight, so incessant was the use of them. The comforter was a narrow strip of coloured woollen manufacture; the largest specimen of this absurd article of "winter clothing" for a campaign was not large enough to afford any warmth to a drum-boy. The men laughed at them, and threw them away. The winter clothing aggravated the sense of neglect under which the men laboured. Great as was their amazement at receiving such articles, it was greater

when they discovered that they were all to be paid for; and when the amount deducted from their pay became known, indignation was felt by every soldier in the camp, the price being so exorbitant. The officers shared in the indignation of the troops. Specimens of these useless articles were sent home, and were displayed on the Exchange at Liverpool to a vast crowd of merchants, amidst groans and cries of "shame."

Provisions were as inadequate in quantity, and as carelessly provided, during the month of December as in November. Scarcely any food which the men obtained but what was more or less spoiled; the mud and filth of the stores of Balaklava, or sea-water, having generally come in contact with it. Half and three-quarter rations were luxurious; often the men were a whole day without food. All this while the stores of Balaklava were crowded with provisions; they were stacked in the dirty streets, piled amidst the fetid collections of decaying and decayed matter on the beach, lying in confusion on board transports in the harbour, or sailing about on the Black Sea. In all the ports of that sea, and the neighbourhood of the Bosphorus, European and Asiatic, there were still provisions of every kind, and live stock in abundance, and there were ships enough idle to carry ten times the quantity required.

The state of the cavalry, men and horses, during November has been related; the horses had died off in great numbers, leaving comparatively little trouble in caring for the survivors during the more inclement month of December. The cavalry division, which had numbered 2000 men when the campaign commenced, and which only once (at the battle of Balaklava) suffered from the arms of the enemy, was now reduced to 200 available men. The division was therefore dissolved, and the few men and horses remaining were used in carrying biscuit up to the front. Each soldier led one horse, which he had to help along by methods which taxed his inventive faculties. So covered with sores, and so attenuated and feeble, were the poor animals, that it was with much labour to the dilapidated trooper it was brought up to the lines; 80 lbs. weight was a horse load, but the poor beasts often fell under the burden, and generally remained where they fell, until removed by the voracity of the wild dogs, or covered by mud or snow.

The applications of the commissariat agents to form depots of provisions nearer to the camp began to be seriously entertained at headquarters; but, as in the case of most other good resolutions there, it was too late. The state of the only road to the camp, and of the tracks sometimes used for foot-passengers and horses, was such as to render it next to impossible to

get any large loads of provision to the camp. Loose stones suitable for road-making were abundant, and the commissaries had suggested the collection and employment of them while the Turks were able to work. They were sufficiently numerous, and from the posts they occupied they could have been well spared. The representations of the commissaries were disregarded, and the matter was only taken up when the Turks were dying at the rate of 300 a day, and the whole Ottoman force struck with cold, hunger, typhus, cholera, and dysentery—so stricken with numerous and complicated disorders as no body of troops ever were before. The absolute necessity and practicability of making the road at an earlier period is thus put by the correspondent of a metropolitan morning paper:—"If any of our great geologists want to test the truth of their theories respecting the appearance of the primæval world, or are desirous of ascertaining what sort of view Noah might have had when he looked out of the Ark from Ararat, they cannot do better than come out here at once. The whole plateau on which stands 'the camp before Sebastopol'—the entire of the angle of land from Balaklava round to Cherson, and thence to the valley of Inkerman—is fitted at this moment for the reception and delectation of any number of ichthyosauri, sauri, and crocodiles—it is a vast black wilderness of mud, dotted with little lochs of foul water, and seamed by dirty-brownish and tawny-coloured streams running down to and along the ravines. On its surface everywhere are strewn the carcasses of horses and miserable animals torn by dogs and smothered in mud. Vultures sweep over the mounds in flocks; carrion crows and 'birds of prey obscene' hover over their prey, menace the hideous dogs who are feasting below, or sit in gloomy dyspepsia, with drooped head and drooping wing, on the remnants of their banquet. It is over this ground, gained at last by great toil, and exhaustion, and loss of life on the part of the starving beasts of burden, that man and horse have to struggle from Balaklava for some four or five miles with the hay and corn, the meat, the biscuit, the pork which form the subsistence of our army. Every day this toil must be undergone, for we are fed indeed by daily bread, and only get half rations of it. The painful reflection which ever occurs to one is, what necessity is there for all the suffering and privation created by this imperfect state of our communications? Why should not roads have been made when we sat down before the place? Their formation would have saved many lives, and have spared our men much sickness and pain. Had there been the least foresight—nay, had there existed among us the ordinary instincts of self-preservation—we would have set the Turks to work at once

while the weather was fine, and have constructed the roads which we are now trying to make under most disadvantageous conditions. The siege operations have been sometimes completely—sometimes partially—suspended, and the attack on Sebastopol has languished and declined. Neither guns nor ammunition could be brought up to the batteries.”

To add to all the other miseries of the wretched state of our men, symptoms of the re-appearance of cholera had broken out on the 28th of November: a few cases occurred in the camp that day, and men died in the trenches that night. The two following days there was no increase of the number of deaths, although each night the victims were augmented. On the 1st of December sixty men perished, and for the first week in December this was the average loss of life from that cause alone: afterwards the disease spread and became epidemic, in the Turkish quarters sweeping away the men by hundreds daily, a few hours often sufficing for the cold hand of the avenger to chill the tide of life in the victim's frame. There was no means of medical treatment, and so rapid and deadly was the stroke in almost every case, that it is doubtful whether any medical assistance could have availed.

The wretched condition of the Osmanlis tended to throw an air of despondency over the whole of the allied armies; they died off rapidly from hunger and disease. Immediately after the occupation of Balaklava, the Turkish commissariat disappeared, no one could say how, and the unfortunate soldiery were left to chance or charity. They partly supplied themselves by stealing, and when that became impossible from the vigilance and energy of the English commissaries, they betook themselves to begging; but, alas! the generous marines and soldiers of England could not spare much from half rations of innutritious food, and the Turks famished in numbers in the streets of Balaklava. It is possible that they would have all perished had they not eaten the dead horses. Strange as it may appear to English ears, such of them as resorted to this supply found it wholesome, and preserved their health better than those who, being in the service of the English commissariat, had tolerable rations of fat salt pork. The clothing of the Turkish soldiers was in such tatters that it would have been difficult to say with what garments, either as to form or colour, they had been originally apparelled.

Their medical officers were most humane, and in some cases, having received their education in London and Edinburgh, were men of reading and skill. The hospital assistants were strong athletic fellows, and as tender to their poor sick countrymen as even women could be. There were vast stores of Turkish medicines, but ill-assorted and ill-suited, and no proper hospital

accommodation. Death trod so rapidly in the progress of all the sanitary efforts made by the medicals, that the places which were used as hospitals became charnel-houses. The Turkish government allowed money sufficient to meet the exigencies of its Crimean army, but these sums were squandered by minions of the court and pashas, while Jews and Armenian bankers made a trade of buying up contracts which were never fulfilled.

The accounts given by Mr. Russell and other correspondents of the London press, and by officers and medical men, who witnessed the horrors of the Turkish camp and hospitals, are too voluminous even to condense—a volume larger than this History might be compiled from these letters and statements. There is one account extant which, however, surpasses all others for its fulness and brevity, and for the graphic fidelity with which it portrays those dismal and heart-harrowing scenes. Mr. Woods seems to have witnessed them under circumstances terribly advantageous for conceiving all that was awful in connection with them. He went to the chief physician in the Turkish service, an officer of superior parts and humane disposition, to make inquiries as to the true state of the men, for he could not believe the terrible reports current in the camp. This officer informed him that:—“The men were without clothes, without food, and without shelter,—literally left to die. He said the 110 drachms of biscuit granted by our commissariat was utterly insufficient to support the men under the duties they were expected to perform. They were brought in to him all day, and day after day, dying from exhaustion, and he had nothing to give them—not even a refuge where they could pass away quietly. We descended the hill towards a good-sized building—a new Greek church—the roof of which had not been quite finished, and which, with many houses, had been given up to the Turks for the use of their sick. As we came near it, two or three men were being carried in. The surgeon, pointing to them, said solemnly, ‘None of those poor fellows will come out alive. I have not saved a single man who has once entered that fatal building.’ I asked him, had he any medicines? and he replied, pointing to two large tents, covering trunks and boxes, that he had a considerable store of them. ‘But they are useless,’ he added; ‘the men are dying of hunger, and medicine is of no avail.’ His patients, when admitted, were too weak to masticate their small ration of bread, and they soon ceased to require his care. An acute kind of diarrhoea, somewhat similar to cholera, always terminated their sufferings. He said he had many times entreated our commissariat authorities to spare him a little meat of any kind, salt or fresh, with a little rum, for the use

of the hospital, but in vain; so he thought they had none to give.* I asked to be allowed to see his hospital, but he advised me strongly not to go inside, as the atmosphere of the place was almost poisonous. However, I pressed my request, and, with some reluctance, he advanced towards the door of the building, across which, as in Turkish houses, hung a piece of matting. He pulled this aside, and the sight that met my gaze rooted me to the ground, and made my heart sink within me. The building inside formed a square of about 100 feet, and every inch of the space was covered with Turks. Not a soul was in the place but the dead and dying. The deadly fœtid air which issued from this charnel-house made me involuntarily shrink back from the door with loathing, and I already repented my rash wish to enter. But the surgeon had gone in, and I followed. The sickening horrors that I saw would be repulsive to dwell upon; but the principal features, which surpassed all that the imaginations of Defoe or Boccaccio ever conceived, may be soon told. The building had once been used as a cholera hospital; and, before the Turks, the Russian wounded had been put there, and all died. Since the allies first took the place, the floor had never been cleaned, and it was now ankle-deep in filth of the most abominable description. The Turks lay *in* this without blankets, covering, bed, or bedding. The latest comers—those nearest the door—had a wan, pinched, mournful look, in which death was plainly written. They did not speak, but raised their eyes in mute appeal as we passed. Those further in, who had been inmates of the place some three or four days, were dying fast; many were dead, and lay rigid and almost unnoticed among the rest. Beyond small jars of rice-water here and there, there was no food or medicine of any description in the place. At the upper end of all, my blood crept to perceive that both the Turks that lay there, and the walls of the building, were completely covered with maggots, which crawled in all directions. While I was there, four men of the burying party entered, and began looking carefully among the prostrate forms. They had not long to search. Five corpses were carried out by the arms and legs, and laid upon the stones in front of the place, from whence another party bore them to their last home. Other incidents occurred, but of so harrowing and dreadful a nature that it would be impossible to mention them here. Dizzy and sick with what I had seen, I hurried into the open

air. The surgeon followed me, and, in reply to some of my exclamations of horror, said the place would yet, he feared, be worse before the winter was over. I promised to see him again, and obtain a detailed account of all the sufferings of his unfortunate countrymen, which he said he was most anxious to give me. But on the following day he was sent to Eupatoria, and I saw him no more, and, literally, had not the courage to visit the 'hospital' again."

The Turks pay particular attention to the burial of the dead; in other pages of this History this fact is recorded and exemplified; nothing, therefore, could be a stronger proof of the state of misery, helplessness, and despair to which our Turkish allies were reduced, than the neglect shown to the deceased and their place of sepulture. The author last quoted thus refers to what he observed on this head:—"One day, as I came down the slope of the hill from the old Genoese castle into Balaklava, I saw a numerous burying party of the Turks interring their dead comrades in little shallow troughs scraped on the hill-side. I went over towards the spot with my companion, who was a naval officer. A great many graves, such as they were, had already been filled, and others were being made. Thirty-seven corpses, some on their faces, some on their backs, all in their clothes, just as they had breathed their last, lay in ghastly rows upon the ground close by. As fast as some were buried, others were carried up by the legs and arms from the building at the foot of the hill, called the Turkish 'hospital.' By this time I was well used to horrid scenes, but such tokens of rapid mortality terrified me. While looking with painful feelings on the rows of dead, a Turkish officer approached and said, in very good English, 'This is a dreadful sight, is it not?—all these men were starved to death.' I was shocked to hear this thus told me, though I had before surmised it; and I entered into conversation upon the subject with the officer. He was a surgeon high in the service. He had been educated in England, taken his diplomas at Guy's, and knew well most of the leading medical men in London. He gave me a fearful narrative of the way in which the Turkish soldiers were abandoned by their government."

The distance from Constantinople to Balaklava is about 306 miles, so that the Turkish army was within easy distance of its proper source of supplies, and no enemy could cross the track of its transports; while every assistance in the way of carriage might have been rendered by the allies, if so disposed, or if the confusion regnant in maritime as well as military affairs allowed. It may be interesting to our readers to know the impressions produced upon an American by witnessing the condition of Balaklava, its harbour, and its neighbour-

* It need hardly be remarked how gladly, in spite of Mohammed, the Turkish soldier would have eaten salt pork and drunk rum if they had only been allowed the chance. At present, the majority of the Turks hold that the injunctions of the Koran against the use of wine or spirits do not apply to those exposed to privation or great fatigue.

hood at this time. Mr. R. C. McCormick, jun., of New York, ventured, like other military amateurs, upon a visit to the Crimea. He arrived early in December on board the *Medway*, and thus describes his arrival and what he witnessed:—"As soon as we had anchored, army and navy officers—men worth thousands of pounds—rushed on board, anxiously seeking an interview with the steward. One went away with a keg of butter, another took off a turkey, another made a prize of a head of cabbage; while another carried a basket of bread; and still another walked off with a live sheep! and seldom have I seen men better satisfied with their purchases. Many inquiries were made for long-legged waterproof boots, and Indian-rubber coats and leggings, and several of our passengers who had brought some of these articles on speculation, effected a speedy and profitable disposal of their stock. I remember that one officer 'from the front' was overwhelmed with delight at the opportunity of securing a pair of Indian-rubber boots at the moderate charge of seventeen dollars. It rained merrily as we entered the harbour, and indeed during the entire day, as well as the succeeding one. I thought that I had never seen such a doleful place. The ship having been fastened very near the shore, we could plainly see everything that was going on in the village. There was little to induce us to encounter the thick black mud through which we saw the well-drenched soldiers 'plodding their weary way.' But curious to find how matters appeared on a still closer inspection, a walk through the miserable streets was finally agreed upon. How shall I describe our first impressions? Confusion worse confounded stamped everything. Men, horses, waggons, and carts crowded the slimy beach, where all sorts of stores were carelessly scattered. The horses mere breathing skeletons; the men jaded and worn; not one in complete uniform, and every jacket and cap as tattered and forlorn as though it had been through all the wars of the last dozen centuries."

We will conclude our distressing detail of the sufferings to which the troops of all arms and all nations were subjected during the month of December by a narrative of his own experience and observations, from an English officer who fought at the Alma, occupied the post nearest to the enemy to which our infantry advanced at the battle of Balaklava, and who, although not engaged in the fierce strife of Inkerman, was usefully and dangerously employed in the trenches that day, and on many a day and night, from the landing in the Crimea to the 12th of December, fought or endured as duty imposed those obligations upon him. Invalided and ordered to Scutari, he was carried down to Balaklava, and thus writes concerning what befell him:—"I had

great difficulty in finding the principal medical officer, who happened to be out at the time. Dr. Lawson, however, gave me an order to go on board the *T*— transport, at that time receiving sick. She was lying close to the wharf, but it was some time before I could get put on board. On producing my certificate to the master, I was shown into a cabin without a vestige of any furniture of any kind, except a looking-glass, which was about the very last thing I then required. No bed or mattress was to be had at any price, so I told my servant to return to camp the following day and bring down my camp-bed. In the meantime, I begged the steward to make his way into a bale of government blankets in the hold, in which I slept that night, and a pretty hard time I had of it. Several invalids had been put on board that day, and one soldier was dead when he arrived on the stretcher! There was only one officer besides myself, Captain C—, 5th Dragoons, who was very ill. It would be impossible to describe the feelings I experienced the first night when I found I had something more than canvas between me and the firmament of heaven, and that I could bid defiance to the rain which was pattering on the deck. The following day my servant came down with my bed, and I got up for a few minutes to have it put in the berth, but I felt extremely ill after the exertions of the previous day. Our medical officer, Dr. D—, in charge of the ship, came on board and took up his quarters next to me. He had two assistants on board, S— and W—, but the former was removed to another ship shortly after his arrival. Nine poor fellows were put on board on the evening of the 6th of December, and had some arrow-root and port-wine given them, and were made comfortable for the night, when notice came that they had gone to the wrong ship. Accordingly they were turned out in the cold, and taken off to another vessel which was loading in the harbour. They had come down from camp that day. The master of the transport came in to see me, and told me that he wanted to get out of the harbour, that it was full of arms, legs, and pieces of human flesh, and his men and officers were dying of fever."

The first week of December resembled November in its dull and murky weather; the rain, however, was not so heavy nor incessant, and therefore by the 6th of the month the whole of the works of what was called the new attack were completed, but not armed. On other points old guns were displaced, and five guns of position, and three thirteen-inch mortars, were packed with the reserve artillery in the camp. On this day, just after midnight of the 5th, a stir as of a numerous concourse was heard down in the valley by the sentinels of Bosquet's corps. The alarm was given, and

the French stood to their arms awaiting the event. Lights were seen flashing to and fro, voices hoarsely giving orders rose through the stillness of the night, and the din of marching men fell upon the listener's ear. Communication was made to the English at Balaklava, who had heard nothing. The previous evening the Russian camp showed all its usual tokens of fixity, and there were even some signs of menace, as though a reconnaissance in force, or an attack, was intended on our positions in the rear. In the morning the English videttes observed that the Cossack patrol ordinarily in front of them was not there; and as the English advanced, they soon discovered that the camp was deserted. The French, who had been on the alert all night, moved down their cavalry and took possession of the abandoned camp. The Russians had departed, leaving "dummies" (mock cannon) where their guns of position had been posted; and their tents, which were neat and clean, and every way better fitted for a campaign than those of either the French or English, were in many instances left standing. There was no booty found, for such of the tents as were not removed, and the plank-building for stables, and other loose camp commodities, were set on fire before either the English or French pickets approached. That which principally arrested the attention of the allies was the number of graves. Many of them were accounted for by the battle of Balaklava; but in order to occupy so many homes of the dead, there must have been fearful mortality in the Russian camp. This cause probably influenced Liprandi in moving his men, for their hardships rivalled those of the English: all supplies, or nearly all, had to be brought down by way of the M'Kenzie heights, and the road was nearly as bad as the English mud track from Balaklava over the plateau. It was, however, reported in the allied camps that Liprandi, being informed that French forces had landed on the north side of Sebastopol, and alarmed by this false rumour, so generally circulated through all the camps of the belligerents, made what he intended to be a timely retreat.

When the night of the 6th closed over the trenches, the Russians pushed out strong forces of carbineers, armed with a new Belgian weapon, as serviceable as the Liege rifles. These men were reinforcements which had arrived, and they came on boldly, taking what deliberate aim the dim starlight permitted. They first, as usual, fell upon the French, and were repulsed with rapidity; they then with increased numbers advanced from the direction of the Ovens towards the English left attack; the Rifle Brigade gave them a reception which cost them many men, and they doggedly retired, carrying off their wounded and some of

their dead. On the night of the 7th a severe frost congealed the mud tracks on the plateau, and the pools of water in and around the trenches. The men suffered from the cold, especially in their hands and feet, but all hoped that by the frost setting in the road would be so hardened that provisions and munitions of war might be more easily brought up. On the morning of the 8th, the sun rose warmly and genially, rapidly thawing the congealed slush and pools, and leaving the mud tracks as impassable as ever. The night of the 8th there was a harder frost, which was thawed on the following day, and guns and mortars were brought to the lines. The spirits of the men revived, and hopes of soon re-opening the bombardment more effectually were entertained. This was the more opportune, as Lord Raglan had at last become alarmed at the insufficient supply of food, and found fault rather sternly with Mr. Filder, the chief commissary. The latter replied by referring his lordship to the memorial presented on the 12th November, requesting the commander-in-chief to allow depots to be made near the camp, which his lordship refused, although informed that, if not permitted, the troops could not be fed. It was his lordship's fate to resist every suggestion until it was no longer possible to act upon it, and then to order its execution, and censure those who could not execute it, and who had made the proposition itself when opportune and feasible. This occurred in reference to almost every department of the service.

The English papers containing Lord Raglan's despatch concerning the battle of Inkerman had now found their way to the camp through various sources. The Guards murmured long and loudly that due honour was not rendered to them. His lordship's despatch did not certainly convey a very good idea of the battle, but he had no intention to do the Guards an injustice, whom he always favoured when he could. The Guards fought at Inkerman in a manner calculated to exalt the dignity and honour of their country; but well as they behaved—and no troops could behave better—other corps equally distinguished themselves. The 41st and 55th, all General Evans' division, and portions of the light division, fought as gallantly as even the Guards. Mr. Woods and Mr. Russell gave too much countenance to these murmurs; no invidious distinctions were intended by Lord Raglan; and it is evident that so far as different corps were concerned, his despatch was written in an impartial spirit. He gave due credit to all, whether the fortune of war gave them a little more or less opportunity of being conspicuous. As Young says—

"Who does the best he can does well, acts nobly,
Angels can no more."

Lord Raglan's despatches were frequently found fault with during the winter for various reasons.

During the first three weeks of December reinforcements arrived very fast; 10,600 English, 5600 French, and 4800 Turks, landed in the Crimea; nearly all were afflicted with diarrhœa or dysentery soon after. Most of the evils which afflicted the army were concealed as much as possible from the home government. To this end the mails were delayed, and every obstacle possible thrown in the way of the correspondence of the army. The correspondents of the London press, who were treated with hospitality and kindness by the officers, and with the greatest respect by the men, were literally hated at head-quarters; because it was well known that the selfishness and mismanagement displayed there would be exposed to the English public, and possibly bring down punishment and disgrace upon all concerned, and upon the government at home, for conniving at these things, and sheltering the offenders. This was as foolish as it was unjust, and as criminal as the neglect, obstinacy, and ignorance that led to such a resort.

A supply of warm clothing for the officers was burnt off Constantinople, and a cargo of great-coats for the men was left lying in lighters in the harbour of Balaklava until, with leakage and rain, they nearly rotted; no one would take charge of them without orders—they dare not incur the responsibility; and at head-quarters there was no head large enough to comprehend such vast details, or direct any complicated arrangements.

A cargo of iron stoves and charcoal, about the middle of December, was regarded with great joy. The officers, however, had the exclusive advantage, and, as it turned out, the exclusive disadvantage; for, in consequence of the construction of these stoves, carbonic acid gas was generated in such quantities as seriously to injure the health of those who used them; and one officer, Captain Levington, R.A., was found dead in his tent.

Much annoyance was caused, during the most trying days of December, by the Zouaves. Their conduct to the commissariat, and to the fatigue parties bringing up provisions, was execrable. If an araba stuck in the mud, or an axle of a forage cart broke, the Zouaves who hung about rushed forward and plundered it, breaking open spirit casks, and taking not only the contents, but the casks and the araba itself to make firewood. Application had to be made to the French commander-in-chief to put guards along the line, to prevent practices so disgraceful to the French army. These Zouaves were not starved, like our men, and had no excuse for their predatory habits in

this instance; and when the condition of our soldiers is considered, the conduct of these allies was infamous. Had not the French chief taken precautions to check the marauders, collisions, perhaps involving a general quarrel between the soldiers of both armies, would undoubtedly have taken place. These Zouaves, however, often rendered friendly and well-timed assistance, in carrying up ammunition and carrying down the sick.

Perhaps the most mortifying thing which occurred to the soldiery during the latter part of December was the fact that, although government sent out huts, and the huts arrived safely, the men had not received them. They were on shipboard in Balaklava, or floating about in the harbour, or knocking about on the beach, or stolen by the Zouaves, or made firewood of by those who could lay hold on them, or turned into stabling for the officers' horses, or their planks huddled among the timber of the wrecks fished up from time to time to feed the glowing fires which diffused their comfort at head-quarters. No one at Balaklava would have anything to do with the huts; no orders were given—and of course nothing could be done without orders.

The army melted away, and no plans to save it originated with its chief or his quartermaster-general, or any one connected with them. Three thousand men were sick in camp at Christmas, and about 7000 men were sick on the Bosphorus. Every twenty-four hours 100 men were lost to the army, all of whom might have been saved, or nearly all, if a man like the Duke of Wellington had been at its head, or if any active and humane man, capable of organisation, had held authority in the British force. Never, in the world's history, was such utter helplessness seen, as in those who had the responsibility and control in the British army of the Crimea in the winter of 1854.

Great efforts were made in England to relieve the distresses of which the people became aware—not through the English authorities in the Crimea, or the government at home, but through the newspaper correspondents. The *Times* appealed to the British community with a terribly earnest eloquence, before which the whole tribe of jobbers and corrupt officials trembled. Mr. Gladstone, Mr. Sidney Herbert, the Duke of Newcastle, the Earl of Aberdeen, Sir James Graham, and their subordinates, resorted to every trick and artifice of words to hide the truth; and denials the most unqualified were given by those high authorities to the statements of the newspaper correspondents, which statements were all ultimately proved to be less than the truth. Never were the arts of evasion, sophistry, and political intrigue and trick, more shamelessly resorted to than by the government, and its minions

and advocates, to destroy the reputation, more especially of the *Times'* correspondent; whereas truth, stated with moderation and firmness, characterised all the communications of Mr. Russell, and of the other gentlemen who, like him, roused their country to the calamities entailed by an incompetent government at home, and an equally incompetent command abroad. A subscription opened at the *Times'* office swelled to a vast amount, and a gentleman every way worthy of the trust was sent from that office to act as the trustee of this treasure. At Scutari, and in the Crimea, the sums entrusted to him were the means of saving thousands of lives.

Through the instrumentality of "the *Times'* commissioner," as he was termed, even the officers in the Crimea were glad to replenish their exhausted apparel, and to obtain things essential to the continued endurance of December's rains, and sleet, and snow. One regiment was furnished by this judicious and talented man with warm clothing, without which the men must have perished—sent out as they were in the depth of winter from England unprovided with those necessities which were so obviously required for the service upon which they were sent. Things of all sorts were despatched from home by the government for the army; but wrong things were sent, or to the places where there was no one to use them; or they were placed on board ships in such confusion that there was no telling in what transport any commodity might possibly be. Summer clothing was actually sent out in winter, and good winter material arrived when the spring sun glared upon the Crimean heights. The comforts for invalids sent up from the Bosphorus in December by the *Times'* commissioner, were received by the medical officers with a burst of enthusiastic gratitude. Will it be believed that these benefactions were regarded by the authorities with the utmost jealousy, and the *Times* became the object of additional hatred and virulent abuse; not only in proportion as its eloquent articles roused the country to a sense of the indignity all this mismanagement entailed, but also in proportion as it, by timely succour, saved the lives of our poor neglected and condemned soldiery—condemned by those who held high command in the army, the reputation of which their valour redeemed!

There existed at this juncture an all-pervading sympathy in England for our heroic men. Fair hands worked cunningly devised comforters, and knit and wrought socks, hose, and gloves, of consoling substance. Our aristocracy thinned their parks of game to send rich Christmas presents to the brave men who fought England's battles on the shores of the stormy Euxine. Wine, porter, brandy, rum,

fruits, preserved meats, all conceivable luxuries, were sent in order to reach the camp before the 25th of December, and to cause the Christmas bivouac to be gladdened with old English cheer. What a communion of mind with the far-off brave filled the breasts of the people of England! How happy it made us all to think, as we enjoyed our Christmas fire and our Christmas fare as the short days of 1854 darkened over our comfortable and warm homes, that the men who bore arms for our honour were partakers of our festivities and our most cheering cup, that our banquet was shared by them, and that they drank cheerily a brave health to merry England under shelter of the well-planned hut we contrived for them, and by fires fed with the fuel we had so carefully prepared for their use! What a delusion and a mockery! The huts rotted in the sea, or blazed on Lord Raglan's hearth; the fuel concealed beneath slime, and mud, and filth, no one then knew where; and the fat bucks, and dainty meats, and delicious preserves, and cheering wines, and warm garments, were lying in the holds of ships, beneath piles of heavy shot and shell, or stowed carelessly away in Varna, Constantinople, or still farther off from those who so bitterly realised that "hope deferred maketh the heart sick." These things disgraced our country, but still deeper has the stain of disgrace sunk into the national name since the men of all other lands have learned that the authors of all this infamy enjoy impunity, and that honours decorate the unscarred breasts beneath which no sympathy for the brave, who suffered so manly, was ever shown. High up on the roll of infamy let the names of the men be found written who held posts for which they were not fit, although thousands of their best and bravest countrymen therefore perished, and who themselves neither partook of the Crimean sufferings, nor felt for those who unrepining died.

While all the privations were experienced which the foregoing pages record, Lord Raglan was seldom seen in the camp. There was no report of his being ill, and the men freely commented upon his seclusion. Applications for leave of absence from officers during the month of December were so numerous, that had the commander-in-chief granted them, the army would have been nearly without officers. The men deemed it unsoldierly to complain, unless when gross neglect showed an indifference to their fate where they had a right to expect care and interest. The way in which our great ally regarded the state of things in the English army may be seen from an article in the *Constitutionnel*:—"The first thing that would strike a spectator arriving at Sebastopol is the great contrast which exists between the

English and French armies. In the former are to be observed the reign of formality and the strict observance of rank and of social position. After the hour of combat there are no longer any relations between the officers and the privates. Whilst the French officers, always mingled with their men, constantly occupy themselves with the means of supplying their wants, the English officers remain inactive, if not indifferent; this is the affair of the government. On the other hand, they have the highest possible sense of honour and of their duty, and will perform the most heroic actions. The English soldiers are somewhat of the same stamp as their officers; they fight admirably, but keep bad watch, and are not very good for work. They require to have paid hands for this latter purpose. It is an army splendid in combat, but it is not made for undergoing sufferings. The organisation is bad, because it is incomplete, and because proper administrative services do not exist. It is shown that the French army, on the contrary, is essentially calculated to support suffering, and consequently war also—provided there be constant emotions to keep alive such excitable imaginations. A kind of familiarity exists in the relations of the officers with the men, and, on the part of the superior officers, a kind sympathy which supports and encourages. There is a sort of solidarity in all the degrees of rank in the French army; but what appears most striking in that army is the ready aptitude of the French officers which is so remarkable. Many of them, it is said, are deficient in education; but the presence of mind natural in the nation replaces it, by transforming itself on the spot into a practical instinct which renders them skilful in drawing the greatest possible advantages from the most different elements. It is owing to this that so many men are found, who, after two months' service, make good sub-officers, and in twelve months, efficient officers. It is remarked that the natural vanity of the French serves them in this respect. A wish to attract attention is the occasion of acts of valour, and jokes which cause laughter and support the mind. Each man wishes to outdo his comrades. There is the same rivalry in cooking their food as in firing their musket, or in giving proof of intelligence."

One of the chief causes of the deficient care of the wounded and sick in the early part of the war was the constitution of the ambulance corps, which consisted of Chelsea pensioners. These men had been already worn out in the service, and were utterly incapable of taking care of the ambulances, or even of themselves, far less of the sick men. Most of these poor pensioners perished at Gallipoli, Varna, and Scutari. But even this wretched ambulance

corps would have been some aid before Sebastopol had it been there.

Meanwhile the efforts at home to relieve the sick and wounded, and to send them every necessary, were sustained with wonderful generosity and patriotism. An occurrence at Portsmouth tended to increase those praiseworthy exertions, and at the same time to direct popular indignation against the mode in which public affairs were managed. The *Himalaya* brought home a great number of wounded soldiers. She entered Portsmouth and landed her freight of brave and suffering men upon the jetty. No one attended to them. Admirals, generals, officers of ordnance, dock and storekeepers, officers of every conceivable rank, and belonging to every existing branch of the service, were at hand, but not a soul among them all stirred to help our wounded braves. There the poor fellows stood or lay on the jetty—sympathy for them among the officials did not appear. The inhabitants at last collected omnibuses, which supplied the place of ambulances, and the sick soldiers were borne by the people to the hospitals. Seldom was the heart of the country more outraged than by this display of official callousness. The *Times* only expressed the public sentiment when it thus denounced the conduct of those in authority at Portsmouth:—"Everybody knows that Portsmouth swarms with officials, naval and military, and that if the queen had been landing from Osborne, instead of our helpless and crippled soldiers from the Crimea, there would not have been wanted one of the tail to swell the unmeaning pomp and idle ceremony. We should have had the admiral-superintendent, the port-admiral, the lieutenant-governor, and a host of other officials whose titles it is not worth now recording, as none of them could find time to attend to this ordinary duty of hospitality and humanity, or to see that the noble freight of the *Himalaya* was received with all honour, all gratitude, and all tenderness."

Some have apologised for the authorities by throwing the blame on the system; but if the men had been any better than the system, they would, in such cases, have shaken off its trammels. The dying words of Justice Talfour were verified by the incident, that the great defect of our social state in England is the want of sympathy. Another incident at Portsmouth soon showed that, bad as the system was, it might be made to work if those who directed it knew and felt their duty. Within a week after the disgraceful reception of the wounded from the *Himalaya*, the *Candia* landed 200 more wounded; then the naval and military authorities had made every preparation for their reception. The indignation of the public alarmed the authorities, and within a

week from the heartless reception of the one detachment of wounded, there was a suitable reception of the other. Portsmouth in these cases illustrates Balaklava. The neglect and distress in both places arose from the *spirit of the service*; the sudden activity at Portsmouth exemplifies what would have happened at Balaklava if the force of public opinion could have been timely brought to bear upon the lazy, or indifferent, or incompetent persons, upon whom the higher responsibility devolved.

While the people of England were exerting themselves in every possible way to augment the public treasures for the relief of the suffering, the heads of departments were putting forth remarkable statements of the prodigious exertions made by them to purchase, both on the Bosphorus and in the Crimea, the most ample supplies of comfort for the sick and wounded, as well as for the army in the field. A complete account of these supplies, or alleged supplies, would occupy too large a space for any history, however voluminous. The following must suffice as specimens of the details given to the press by these officials. Dr. Andrew Smith was chief of the medical staff of the army at home. After the battle of the Alma had brought to light the total want of preparation in the expeditionary army for the charge of the sick after an engagement, and public indignation ran high, the doctor wrote to the London morning journals, giving an account of the vast amount of stores sent out by him. Wine, sago, arrow-root, brandy, medicines of all sorts, were ranged in the long catalogue. There were sent out 250 medical officers, each provided with instruments and appliances of every known kind; 780 stretchers for carrying the wounded, and fifty ambulances for the same purpose, were also sent. The doctor urged the folly of private exertions, as the sick at Scutari and Balaklava had every necessary. He was especially eloquent in his dissuasives as to lint, old linen, &c., vast stores of which had, according to the doctor, already reached their destination. Afterwards, when "the Crimean commission" and "the Sebastopol committee" had made their investigations, it became known why all these things had not reached their destined ports, and why the useful commodities which had arrived out were not given to the men. Official routine, and the indifference and incompetency of those upon whom the chief responsibility devolved, accounted for all misfortunes. Dr. Smith was very minute in his particularization of all things provided by him; his description of the ambulances will illustrate this, and show the reader what a wide gulf existed between the theory of supply in the offices in London, and the actual facts where the wretched army withered away. Dr. Smith could have had

no certainty that these stores had ever left England,—so complicated were the departments and their distinctive duties,—and it was therefore a great error to interpose between the public and their benevolent purposes. He thus describes the ambulances:—"The slightly wounded are accommodated towards the front of the carriage, placed back to back, separated from each other by wooden partitions, and prevented from falling outwards by each compartment being provided with a chain covered with leather, to be passed across the chest when the seat is occupied, with a view as well to safety as support. The badly wounded, extended on elastic stretchers, six feet six inches long, and two feet wide, are placed behind, and, as already stated, in separate compartments, into or out of which the stretchers glide with facility, from their being provided with rollers. Each of the compartments is fitted with a ventilator from end to end, which can be closed or opened by the person lying on the stretcher. A waterproof roof, supported on wood hoops, covers the body of the carriage, and under it is a depository for firelocks, knapsacks, caps, accoutrements, &c. There is also under the seats for the slightly wounded men a large capacious locker, in which may be placed water-sacks—for barrels soon become useless, especially if exposed to weather and sun—bedding, and other articles, which the medical officers of the army may consider as likely to be useful; and under the hinder part of the waggon is a convenient box, in which medicines, instruments, &c., can be carried if required. At the back part of each vehicle there are two iron brackets, which fold down to support a stretcher, and so afford the means of forming a convenient table. This plan I from the first preferred to one which was strongly urged on me—namely, to form a table by placing a stretcher across two panniers." There were also waggons for the aid of the medical department:—"Each waggon is capable of carrying from the field, or from field-hospitals to hospitals in the rear, ten persons—namely, four badly and six slightly wounded men, each in a separate compartment. By this arrangement, every person will be insured against inconvenience or injury from his immediate neighbours, which would, did no partition exist, certainly prove most detrimental, especially to weakly and severely wounded men, who might have to be transported along an irregular, broken, or sloping road, or over a country where no roads exist." Other vehicles were also described, "intended for the carriage of bedding, stores, &c., to be used in field-hospitals; and, in the event of their not proving sufficient for the purpose, the waggons intended for the transport of sick and wounded are capable of being quickly

dismantled internally, and made available to supply the deficiency. They, like the others, are placed on springs, and, in case of necessity, can also be used for the carriage of sick and wounded."

Among the most remarkable efforts put forth at home to relieve the distresses occasioned by the mismanagement of the war, was what was called "the *Times*' Fund." We have already alluded *en passant* to the benefits conferred by "the *Times*' Commissioner" in the Crimea. It is desirable to put on record a more particular account of the endowments made through the editors of that journal. Although all editors are supposed to be shut up in the *sanctum* of their office, yet it is generally pretty well known in the literary world who they are. The editors of the *Times*, with all their mystery and their power, are no exception to this rule. These gentlemen are known to be men of honour and principle—fearing none, and dealing impartial justice to all. Accordingly, the public offered large contributions through the medium of the *Times*' office. Two separate amounts, of more than £10,000 each, were transmitted to the Crimea and Scutari. A gentleman named Macdonald, one of the *Times*' staff, was selected for the management of this fund, and he performed his embarrassing and dangerous task with judgment and assiduity. The originator of this fund was Sir Robert Peel, who, in a letter directed to the journal named, dated October the 12th, enclosed a check, and thus opened the list of subscriptions. In a few days a fourth of the whole amount was subscribed. The suggestion of Sir Robert Peel was to form a committee, but the money came in so fast, and the wants of the suffering brave were so urgent, that the *Times* adopted a more prompt mode of action. Sir Robert and the editor, Mr. Delane, were made joint trustees, and the three principal subscribers regularly audited the receipts and disbursements. The following extract from an article in the *Times*, published a week after the suggestion was first made, shows the spirit of the whole procedure:—"It was only on this very day last week that, in the course of our duty, we invited public attention to the necessities of our disabled soldiers at Scutari. We had certainly no idea at the time of becoming the bankers of the charitable public, or of undertaking the distribution of such funds as might be forthcoming; but so rapidly were contributions poured into our hands, and so indispensable did immediate action appear, that we accepted the trust which our own appeals had called into being, and now find ourselves engaged in the duty of applying directly for the benefit of our soldiers the gifts of their countrymen at home. During the

seven days which have elapsed since our first appeal on behalf of the sufferers, we have actually received for their use a sum considerably exceeding £5000—the whole of which amount has been subscribed for the single object of comforting the inmates of the British hospital in Turkey."

While the "single object" of the fund was defined as being for the comfort of "the inmates of the British hospital in Turkey," Mr. Macdonald, unlike the routine gentlemen of the different departments there and in the Crimea, diverged from the sole application of the funds in that way—giving aid in the Crimea, and even supplying some soldiers on their way to the seat of war with warm clothing, without which all would have suffered and many perished. When Mr. Macdonald waited upon the Duke of Newcastle, the Minister of War, and upon Dr. Andrew Smith, they both assured him that Scutari and Balaklava were supplied with every necessary. Mr. Macdonald knew well to the contrary: the *Times* employs those only upon whom it can rely, and its correspondents had given the clearest evidence of the malversation and stupidity which balked all the efforts of the well-intentioned at the seat of government at home.

As we reserve the state of things at Scutari for another chapter, we shall not follow Mr. Macdonald thither in our narrative at present, but notice his timely benefactions at Balaklava. He there found worthy coadjutors in Dr. M'Shane, of the *Caradoc*, and the Rev. Mr. Haywood, army-chaplain. These men had to battle against the opposition of the officials, who evidently had hints, if not orders, from the departments at home to impede all voluntary efforts to assuage the sufferings of the army. Preserved meats, vegetables, tea and sugar, arrow-root, wine, and brandy, to the amount of £2000 in value, were sent thither by Mr. Macdonald; and during the short time the supply lasted, it diffused comfort, gladness, and gratitude, among the men in front. All the power of the government was not, at the time, equal to the distribution of the tenth part of such a store of comforts. It may be at once gratifying and curious to our readers to see the description of the various articles required by the army, and supplied by the *Times*' Fund. The following was Mr. Macdonald's account of the expenditure of less than £12,000:—

Articles of Diet and Nutriment:—Tea, 20½ chests. Arrow-root, about 33 cwt. Sago, 14 cwt. 2 qrs. 14 lbs. Tapioca, 70 lbs. Sugar, 107½ cwt. 20 lbs. Preserved soups, meats, &c., 4024 canisters or about 80,000 portions. Preserved vegetables, about 80,000 portions. Port wine, 313½ dozen. Marsala, 2½ quarter-casks, and 3 dozen. Brandy, 70 dozen and 200 gallons. Fowls, 18 dozen. Calf-foot jelly, a large quantity. Bottled ale, 33 dozen. Jams, 74 dozen. Macaroni and vermicelli, 1½ cwt. Pearl-barley, 1 cwt. Tamarinds, 2 cwt. Lemons, 366 dozen.

Biscuits, 12 canisters. Butter, 2 kegs. Isinglas, 11 lbs. Gum-arabic, $5\frac{1}{2}$ lbs. Figs, 12 drums. Pepper, 15 packets. Mustard, 20 bottles. Vinegar, 20 bottles.

Articles of Clothing and Personal Use:—Cotton shirts, 713 $\frac{1}{2}$ dozen. Flannel, worsted, and woollen shirts, 932 $\frac{1}{2}$ dozen. Flannel drawers, 3053 pair. Socks and stockings, 10,542 pair. Night-caps, 311 dozen. Comforters, 492 $\frac{1}{2}$ dozen. Gloves, 377 dozen. Woollen sashes, 125 dozen. Slippers, 1865 pair. Quilted gowns, 365. Pocket-handkerchiefs, neck-ties, &c., 1100. Tartar stockings, 50. Tartar boots, 50. Flannel in pieces, 927 $\frac{1}{2}$ yards. Calico, for sheets and shirts, 1310 yards. Soap, 1840 lbs. Paper, 56 $\frac{1}{2}$ reams. Envelopes, 1200 packets. Ink, 144 bottles. Steel-pens, 30 boxes. Sealing-wax, 10 lbs. Wafers 20 boxes. Stationery, 1 box. Postage-stamps, £14 10s. Clay-pipes, 7044. Tobacco, 1347 lbs.

Articles Pertaining to Hospital Use:—Towels, 379 $\frac{1}{2}$ dozen. Quilts, 200. Mattresses, 75. Basins, 702. Bowls, 99. Blankets, 780. Bed-pans, 290. Close-stools, 20. Kitchen-stove, 1. Tin drinking-cups, 80. Tin pails, 30. Gamelles, 80. Knives and forks, 64 $\frac{1}{2}$ dozen. Spoons, 62 dozen. Corkscrews, 2. Tea-spoons, 10 dozen. Kettles, 6. Scrubbing-brushes, &c., 27 dozen. Dust-pans, 3. Sponges, 12. Chloride of lime, 27 lbs. Sacking to wash floors, 3 pieces. Shoe-brushes, 22 sets. Sadirons, 6 pair. Starch 3 cwt. and 33 $\frac{1}{2}$ lbs. Washing-tubs, 3. Hair-combs, 4 dozen. Wall-lamps, 100. Olive-oil, 3 cwt. Oiled-cloth, 130 yards. Carpet-mats, 20 pieces. Mosquito-muslin, 2 pieces. Marking-ink, 4 bottles. Cotton-tape, 3 pieces. Needles, 12 boxes. American-clocks, 12. Castor-oil, 2 $\frac{1}{2}$ cwt. Charcoal, 1 ton 15 $\frac{1}{2}$ cwt. Millboard, 150 sheets. Calico, for towelling, 4 pieces.

The distribution of the above included Scutari and Balaklava, and also benefactions made to the sick on board ships, from the battle of Inkerman to the end of the severer portion of winter.

Another spontaneous effort of the public to meet the dreadful state of affairs, was the formation of "The Crimean Army Fund." The object of this benevolent project was to send to Balaklava nourishment and warm clothing. An agent, acting under the direction of a committee, was to land the whole there. The sum collected exceeded £20,000, which was sent in to the committee within two months after the beginning of the subscription. The scheme adopted for distributing the money involved two separate modes of succour. One of these methods of relief was to give to the troops certain articles of necessity; the other was to establish a depot at Balaklava for the sale of useful articles at such a price as would prove a great boon to the troops. In consequence of the adoption of such a general plan, the committee advertised their willingness to receive goods as well as money. As soon as this became known, there was a generous rush in every part of the country to contribute something, and the strangest varieties of things were hurried up to London—the railways carrying without charge all packages for the Crimean Fund. The benevolence of the nation seemed to adopt for its motto "*Bis dat qui cito dat*," and, accordingly, in an incredibly short space of time, the depot was loaded with specimens of all things eatable or wearable, and with many things which the ingenuity of the committee could never have comprehended in its

suggestions. In the beginning of December, the *Fairy* yacht was placed at the disposal of the committee, to convey this heterogeneous but useful mass of commodities, and dispatched with a freight of tea, sugar, tobacco, wines, arrow-root, &c. A small steamer was afterwards chartered, and the Earl of Ellesmere lent his large yacht of 220 tons burden. Before Christmas the committee chartered the steamer *Pioneer* of 700 tons burden. The following was the published list of articles destined for this useful service:—blankets, shirts, flannel, hose, wash-leather waistcoats, leather for shoes, shoemaker's tools, needles, thread, buttons, tape, tobacco, preserved meats, portable soup, arrow-root, tea, chocolate, sugar, essence of coffee, pearl-barley, preserved vegetables and milk, salt, pepper, mustard, Cayenne-pepper, hams, tongues, bacon, cheese, ale, porter, wine, spirits, coffee-roasters, coffee-grinders, and patent fuel.

The severity of the weather, and various delays interposed after the vessels had entered the Dardanelles, prevented the arrival of these treasures so soon as was expected; and instead of Christmas and New Year's-day being enjoyed with English comforts in the camp, the season of home festivities was the period of hardest privation there. It was not until January asserted his cold and stern sovereignty in the Crimea, that the good things began to be distributed which were provided by the Crimean Fund. By the termination of winter, however, a report was made by the committee to the subscribers, in which it appeared that the following distributions were made:—6 $\frac{1}{2}$ tons of tobacco; 3000 lbs. of tea; 28 barrels of sugar; 85 cases of cheese; 30 casks of butter; 18 casks of herrings; 30 cases of bacon; 190 cases of Price's patent candles; 6 cwt. of chocolate; 165 dozen of port; 70 dozen of sherry; 160 dozen of brandy; 30 dozen of whisky. Together with large quantities of porter, ale, preserved meats, woollen goods, and sundries.

Independent of the foregoing media of relief, various others were formed by the zeal and ingenuity of particular donors—amateurs, sea-captains, gentlemen of the press, sailors, soldiers, nurses, doctors, all sorts of persons were invoked to become the bearers of gifts more or less welcome in the Crimea. Some of these donations never reached their destination, especially such as were committed to the care of the government. Gifts of food and nourishment were ingeniously contrived—such as soluble chocolate in cakes, ground coffee, potted venison, preserved soups and broths. Warm clothing was a favourite selection, and nothing was more useful—such as flannel shirts, thick cotton shirts, mitts, comforters, knit and wove hose, flannel vests and drawers, substantial

fustian jackets. Large presents of linen were sent to the officers, and cases of wine and brandy, porter and ale. A London tobacconist sent out cigars for their use to the value of £250. Commercial firms undertook to send packages, and the Screw Steam Navigation Company conveyed them free of charge. The benevolence of the country had taken many forms from the breaking out of the war—such as the “Central Association in Aid of the Wives and Families, Widows and Orphans, of Soldiers ordered to the East.” Before the end of December the funds contributed through this channel reached £100,000; and by that time 5000 women and 8000 children were receiving assistance—proving how large a portion of the brave men who fought, and who volunteered to fight for their country in that campaign, were men of domestic tastes, and bound to their country by bonds of love and virtue.

“The Patriotic Fund” was the largest source of aid which the country provided. In the year 1803 a “Patriotic Fund” was raised, under a like pressure, in a manner highly creditable to the country. £200,000 were then provided by the liberality of the people, and from some cause or other about £8000 of this money remained unappropriated, this formed the nucleus of the new fund of 1854. It was opened by royal proclamation on the 13th of October, and thirty commissioners were appointed for its custody and administration. The queen herself headed the list of subscribers, public bodies and individuals munificently followed, and the humblest classes of tradesmen gave a portion of their earnings. The provinces were more liberal in proportion than the metropolis, with the exception of Lancashire, which, although always first in acts of splendid liberality, was not so on this occasion—the city of Glasgow giving more than Manchester and Liverpool together, although much less wealthy than either. Edinburgh, in proportion to its population, surpassed even Glasgow in generosity, and all Scotland seemed moved with a fervour of patriotism and charity in this emergency. Nobly did the sons of Scotland dare for their country in the field, and nobly did the sons and daughters of Scotland at home sympathise with their chivalry and their sufferings. In Ireland also the appeal was responded to with generous emotion, nor was there a distant colony of England which did not hear the appeal, and answer it with feeling heart. In Gibraltar, Malta, the Ionian Isles, at the Cape, in the Mauritius, India, Australia, and in the islands, cities, and backwoods of the western hemisphere collections were made. From the gold-fields of Australia, and the pine-forests and prairies of western Canada, money was transmitted. The “Six Nations Indians” sent £100. British settlers, temporary or per-

manent, in every country contributed. The English excavators working on a Danish railway marched twenty miles on a Sunday appointed for the purpose, and deposited a dollar each for the British Patriotic Fund. A musical fête in the Crystal Palace, at which the band of the French Guides assisted, realised £3000. By the beginning of December the amount collected was £100,000, which during the month was trebled. It was trebled again in the month ensuing, and went on still increasing until it reached the enormous amount of a million and a half sterling. The mode in which this fund was distributed, and the spirit which actuated the commissioners, may be best judged from their report, made when all the hardships of the winter and spring were over, and relief had been extended with no parsimonious hand. In that report they express the willingness of the country to meet the largest demands upon its liberality, and the desire universally felt by the donors that the widows and orphans of the soldiery rather than of the officers should be relieved. There were, however, cases as much deserving the country’s consideration connected with officers as with the humblest soldiers who fought or sickened by their sides. It was remarkable that while so large a portion of those who fell, up to the end of the year 1854, were married men, and left wives and children, comparatively few of that class were numbered among the victims of 1855. The old soldiers were taken off during the former period, and their places were supplied by raw lads during the latter.

Numerous old institutions of a charitable nature, chiefly intended for widows or orphans of deceased soldiers, were revived during this period of excitement, and established on a more useful scale; and others sprung into existence—some metropolitan, others provincial—but none so local as to be exclusive or illiberal in their constitution.

The religious efforts to meet the wants of the army kept pace with those of a temporal nature. The “Religious Tract Society,” the “Society for the Propagation of the Gospel in Foreign Parts,” the “Soldiers’ Friend Society,” the “Society for sending Scripture Readers to the East,” a “Society for providing extra Chaplains for the Army,” &c., made vigorous exertions to send to the men the means of religious instruction, while receiving the sympathies and succours of temporal benefactors.

When the tidings of all these movements reached the Crimea, the men were much encouraged; the love of country, if it could have been increased in their gallant breasts, burned still more fervently, and to “do or die” (one of their common phrases) seemed if possible to be more their determination than ever. The state of mind in which the men were, was also

favourable to religious influences; and never, perhaps, did any men listen to the consolations of the Gospel with readier ear than the sick and wounded sent from the shores of the Crimea to the shores of the Bosphorus.

The generous attentions of the British public were necessary to sustain the loyalty of the soldiery to their generals, however unswerving it might have been to their country, as throughout December the impression that their chief officers had no concern in them grew rapidly. This cannot excite the surprise of any person who reads the report of her majesty's commissioners for inquiring into the causes of the disasters in the Crimea, or the commission for inquiring into the state of the hospitals at Scutari and Balaklava. Dr. Bruck, the surgeon of the Scots' Greys, was one of the witnesses examined by the latter commission, and he thus certifies as to the neglect of which the men were the subjects, on the part of those from whom they might have expected the most anxious care:—"With the French authorities I believe the greatest deference is paid to the medical department, and every assistance rendered them; nobody has presumed to say that this is the case in the British service; it is a notorious fact that the reverse holds good. When a man gets sick, he is handed over to the doctor, and, generally speaking, nobody but the doctor takes much interest in him. During the time I have been in the Crimea—that is, since the landing of the regiment in September last up to this date (January 23rd, 1855)—no general officer has visited my hospital, nor, to my knowledge, interested himself in any way about the sick. What is the cause of this apparent apathy it is impossible for me to conjecture; but this I maintain, and this I would earnestly beg to impress on the minds of the gentlemen whom I have now the honour to address, that unless general officers, or those high in command, do take an interest in their sick soldiers, or until they do lend a helping or a willing hand to their medical officers, it will not be possible for the duties of the medical department to be satisfactorily and efficiently carried on in the field."

The report of the former commission represents the loss of the cavalry as thirty-five men out of every hundred. Let it be remembered that they had no night-work in the trenches, and except at the battle of Balaklava were but little engaged with the enemy. They were not exposed to the endless cannonade or the nightly sortie, yet one-third of their number perished. Much as has been said against Lord Lucan in connection with the loss of men and horses, it is obvious that his representations to head-quarters were so frequent, and of such a nature, as to transfer much of the re-

sponsibility which it has been sought to fix upon him.

One of the worst arrangements connected with the sick and wounded was fixing the hospital at Scutari, hundreds of miles from the scene of action. Had the dismasted transports been turned into hospital-ships, many valuable lives would have been spared; but when the men were brought down to Balaklava, they were either left unsheltered for many hours—perhaps a day or night—on shore, or else hurried on board some ship about to sail, without any suitable accommodation for them. The very ill died in great numbers while the ships were tossing about on the Black Sea; many survived just long enough to be handed over to the authorities at Scutari a few days before death terminated their sufferings, the chief of which were experienced on board ship; *many cases recovered on the voyage*; a few days rest at Balaklava, on board a well-ventilated, clean, and convenient hospital-ship would have restored them. There were two such ships for the sailors and marines, and they admirably answered their purpose. The *Diamond* and *Pride of the Ocean* returned convalescent most of the men placed in the hospital berths fitted up on board. As this subject must recur again in our chapter on Scutari, we dismiss it for the present.

Such was the state of the troops, their privations, endurance, trials, and fortitude, during the month of November, and such were the efforts made at home to cheer and help them. At the end of the third week in the month the frost broke up, and for several days the whole country was again deluged with rain as in the dreary days of November: by some *mal à propos* arrangements, the removal of the sick to Balaklava was ordered on some of the most drenching of these dreary days, and the result was the return of every form of disease prevalent the previous month, and great increase of cholera.

Amidst all their privations the enemy kept the allies from seeking rest. They had not only to work hard in preparing for a renewed bombardment, but often to stand to their arms and resist the sallies of the ever-vigilant foe. It is a tribute to them, just as it is eloquent, paid by one who shared their perils and privations:—"Englishmen need never hesitate to speak of the winter campaign in the Crimea. Like the light cavalry charge at Balaklava, it was a bright though melancholy proof of what English soldiers will dare and endure. We may blush for the government, and blame some generals; but the soldiers at least were faithful to their trust, and in their long struggle with cold and hunger were never doubtful or dismayed. To the enemy they opposed courage; to the evils and mismanagement of their own

military system, endurance: encountering both they died, but died nobly, and doing their duty to the last."

On the 20th of December the Russians made a sortie in the neighbourhood of the Ovens, and penetrated up the ravine which separated the extreme right of the French from the extreme left of the British. It would appear that the worn-out troops which formed the picket had laid themselves down, trusting to the vigilance of the sentries, who were probably also overpowered with sleep—for the Russians quietly bayoneted them and fell upon the picket, some of whom they also put to death without firing a shot. The troops on duty consisted of a detachment of the 50th regiment, and while the enemy entered among them the command was given in French, which deceived the British officers. Major Möller, detecting the *ruse*, called upon his party to form, and charged the enemy with the bayonet, who, not expecting so daring an act from so small a body of men, fled from the work. The brave picket mounted the parapet, and opened fire upon the retreating enemy, who speedily rallied, and again assaulted the defence. The little band would have been inevitably overwhelmed but for a picket of the 34th, which hurried to their relief; the enemy was again repulsed, having lost about sixty men: they carried off two of their officers who were slain. The loss of the British was seventeen men bayoneted, eleven made prisoners, and as many wounded by musketry. Captain Franklyn and Lieutenant Clarke were among the prisoners, Major Möller among the slain. This excellent young officer was of the lineage of a respectable foreign family, which came originally from Flushing, but settled at Ham-burgh before leaving the Continent for England. Major Möller was third son of Charles Chausain Möller, Esq., of the 18th Hussars, a regiment which greatly distinguished itself in the Peninsula and at Waterloo, but which, with the 19th Lancers, was broken in Dublin a few years subsequent to the return of the British army of occupation from France after the fall of Napoleon. Major Möller had served with the relics of the 44th in India when that corps had suffered from the unfortunate affair at Cabul, but exchanged into the 50th, and had attained the rank of major only a few months before he bravely fell. He seems to have had a presentiment of his fall, for in a letter from Varna, written to a relative, he says:—"We sail in a few days for Sebastopol. It is hard to say, Farewell! but God's will be done. As we are not to meet again here, remember that we shall meet hereafter." The commanding officer of the 50th wrote home to inform the bereaved family of their loss in terms most flattering to the deceased:—

Before Sebastopol, Dec. 22, 1854.

"DEAR SIR,—It is with deep regret that I now perform the melancholy duty of communicating to you the intelligence of the death of Major Möller, which took place here this morning. He was on duty in the trenches on the night of the 20th inst., when the enemy made a sortie, and he received a mortal wound from a musket ball through the body. He fell close to me as he was gallantly cheering on the men. I enclose a letter from him which arrived to-day. I must beg you to break the sad news to Mrs. Möller, and, with my kindest regards, to assure her how sincerely I console with her for this sudden bereavement.

"I remain, dear sir, yours faithfully,

"R. W. WADDY,

"Lieutenant-colonel, 50th regiment."

It is remarkable that Lieutenant-general Möller, of the Russian service, is descended from the same family.

On the 26th the French lent the British 500 horses, a most valuable succour. The following terse summary of events is entered in the journal of Mr. Russell for the 27th:—"The 18th regiment (Royal Irish) arrived in the *Magdalena* to-day, all well. Their fur caps and new coats made them objects of great attraction to the tattered old campaigners on the beach. The Russians are very active getting up guns in every possible direction along our approaches. The French have also pushed a trench within 180 metres of St. Vladimir. Continual firing and skirmishing are going on at night in front of our lines and along the French works. The Turks continue 'to die like flies.' They literally are found dead on their posts where they have mounted guard." The night of the 28th was one of excessive rain. The Russians were not prevented by the deluge from pouring in shot and shell upon the French batteries, which suffered little. On the 29th, the French, of General Bosquet's corps, made a reconnaissance in force, supported by the 79th Highlanders, and four companies of the Rifle Brigade, sent out by Sir Colin Campbell to cover their right flank. The Russians withdrew sullenly, their cavalry fighting as they retired a brief battle with carbines. The French chasseurs found an admirable opportunity for charging, which they accomplished with great spirit, driving the Russian horse before them. Having compelled the corps of Liprandi to retreat beyond the village of Tchergoum towards his main body upon the M'Kenzie heights, the allies withdrew to their respective positions. The moral effect of this reconnaissance, which was beautifully executed, was advantageous to the allies. The troops now felt that their flank and rear were not liable to be perpetually menaced.

The general condition of our ally, and the views entertained by the French chief of the aspect of affairs, were thus presented in a despatch, dated the 22nd of December, addressed to the French minister of war:—

MONSIEUR LE MARÉCHAL,—The bad weather has continued, with rare and short intervals of improvement. We nevertheless continue, as much as possible, to encircle the place with our trenches, and all the siege operations become perfect and solid, notwithstanding the rainy season, which renders the transport very difficult.

The two armies mutually assist each other. I am indebted to the English army for the transport of nearly all the cavalry I have under my orders in the Crimea, and, on my part, I have placed at the disposal of Lord Raglan my mules to convey his sick to Balaklava, and teams to convey his ammunition. These exchanges contribute to keep up excellent relations and perfect cordiality between the two armies.

There scarcely passes a night without some points of our lines being attacked by sorties, which generally cost dear to the assailants. Yesterday, at two, A.M., the Russians, after having made a sortie on the third parallel of the English, who vigorously repulsed them, made also a demonstration upon the centre and left of our works. Received by a very brisk and well-directed fire, they withdrew before our soldiers, who pursued them at the point of the bayonet. The enemy left a great number of dead upon the ground.

To make the guard of our trenches more efficacious, I have organised a corps of volunteers, whose duty it is to keep the approaches of our works clear of the enemy at night. I expect good results from this institution, which completes that of the *frances-tireurs*, organised since the commencement of the siege, and who do duty by day in the trenches. They have already done much injury to the enemy.

As I have already informed you, our works extend actually to the bottom of the Quarantine Bay. The enemy's attention is drawn to the efforts we are making on that side, and his artillery sharply disputes the ground with us, where, as nearly everywhere, we are obliged to hollow out the rock; but our progress is not the less real, and we remain in possession.

I have informed you that the enemy had withdrawn his left and evacuated the portions of the valley of Balaklava where we formerly saw them in considerable numbers. I was desirous of ascertaining their exact position in that direction, and the day before yesterday I pushed forward a reconnaissance to the vicinity of the village of Tchorgoum, consisting of a brigade of cavalry, under the orders of General d'Alloville. They came upon some hundred riflemen behind the village of Kamara, and drove them back into the ravines. Detachments of cavalry, accompanied by their artillery and some battalions of infantry, appeared on the flanks of the reconnaissance, but did not attempt to interrupt its operations, which were happily accomplished. At the same time 1000 infantry, Scotch and Zouaves, left Balaklava, on the right of our position, and explored the heights which extend towards the valley of Baidar. They only met a post of Cossacks.

To resume, I am of opinion that on the left bank of the Tchernava there are only pickets of the enemy observing our positions from a distance. A movement has evidently taken place in the Russian army, caused probably by the landing of the Turkish troops, which continues at Eupatoria. I shall soon know the real state of the case.

Although the number of the sick has somewhat increased, in consequence of the perpetual wet in which we live, the sanitary condition of the army is satisfactory, and its moral condition perfect. If the troops have suffered much from the rain, it has not yet been cold: the snow, which for some time has covered the tops of the mountains inland, has not yet fallen upon the plain which we occupy, and the thermometer has not yet in a single instance been below zero (freezing point of Fahrenheit). These general conditions are rendered better by the care taken of our men, and, thanks to the wise foresight of the emperor and his government, the army enjoys relative comforts, which makes it gaily support the fatigues it

has to undergo. The number of sick in our military hospitals at Constantinople is 3794, of whom 1387 are wounded. I have established in the Crimea, near the Bay of Karatsch, a depot of convalescents, where the men who leave the army ambulances, and who only require rest, will regain their strength, and be enabled to return to their duty. This measure will diminish the number sent to Constantinople. His Imperial Highness Prince Napoleon, still retained at Constantinople by the malady which forced him to leave the Crimea, wished to rejoin us. I opposed his return, which might compromise the health of the prince.

I am, &c.,

CANROBERT, *General-in-chief.*

It will be seen in the above despatch that the French general refers to the Turks as landing in Eupatoria. When the Austrian occupation of the Dacian provinces at once secured them from an attack by Russia, and the Russians from pursuit by Omar Pasha, that chief gradually withdrew his armies to Varna and Shumla, leaving garrisons in the Danubian cities sufficient for their protection. It was determined that a considerable portion of this army should be transferred to the Crimea, and General Canrobert makes reference to the first of several detachments which landed at Eupatoria, in order to strengthen the garrison there against Russian reinforcements, which it was rumoured were to assemble in large numbers to assault the place, for its importance now began to be better appreciated by both sides. It was alleged that to no part of his menaced dominions did the Emperor Nicholas look with so much anxiety as to Eupatoria—that he considered it the key of the Crimea, and was resolved at all costs to dispossess the allies. His earnestness and alarm at this juncture were manifest. The report made to him by the grand dukes painfully affected him. If the rumour spread by prisoners and deserters in the allied camp was true concerning the conduct of these imperial personages after the battle of Inkerman, it is likely that they would convey to the Russian capital very discouraging representations of affairs. According to the story current in the camps, when their imperial highnesses saw the slaughter and defeat of their troops, they uttered the most passionate lamentations, and besought Prince Menschikoff to give up the struggle, and make the best terms he could. This the prince was described as promising, in order to quiet their apprehensions, and, leading them away from the scenes which had so affected them, quietly sent them home with despatches of pretended importance to their imperial sire. The czar speedily published a manifesto, which was read with sacerdotal pomp in the churches of Sebastopol, and was intended to raise the hopes and sustain the spirit of the discouraged troops. It was issued on the 14th of December, old style:—

By the grace of God, we, Nicholas I., Emperor and Autocrat of all the Russias, &c., make known:—

The causes of the war, which still lasts, are well understood by our beloved Russia. The country knows that

neither ambitious views, nor the desire of obtaining new advantages to which we had no right, were the motives for those acts and circumstances that have unexpectedly resulted in the existing struggle. We had solely in view the safeguard of the solemnly recognised immunities of the orthodox church, and of our co-religionists in the East. But certain governments, attributing to us interested and secret intentions that were far from our thoughts, have complicated the solution of the question, and have finished by forming a hostile alliance against Russia. After having proclaimed as their object the safety of the Ottoman Empire, they have waged open war against us, not in Turkey, but within the limits of our own realm, directing their blows on such points as were more or less accessible to them—in the Baltic, the White Sea, the Black Sea, in the Crimea, and even on the far distant coasts of the Pacific Ocean. Thanks to the Most High, both in our troops and in all classes of our subjects, they everywhere met with intrepid opponents, animated by their love for us and for their country; and, to our consolation in these troublous circumstances, amid the calamities inseparable from war, we are constantly witnessing brilliant examples and proofs of this feeling, as well as of the courage that it inspires. Such are the defeats more than once inflicted on the enemy's troops on the other side of the Caucasus, notwithstanding a great disparity of force. Such was the unequal contest sustained with success by the defenders of the coasts of Finland, of the convent of Solovetsky, and of the port of Petropaulovsky, in Kamschatka. Such, above all, is the heroic defence of Sebastopol, signalled by so many exploits of invincible courage and of indefatigable activity, as to be admired and done justice to by our enemies themselves.

Beholding, with humble gratitude towards God, the toils, the bravery, the self-denial of our forces both by land and sea, and also the general outburst of devotion that animates all ranks of the empire, we venture to recognise therein the pledge and augury of a happier future. Penetrated with our duty as a Christian, we cannot desire a prolonged effusion of blood; and certainly we shall not repulse any offers and conditions of peace that are compatible with the dignity of our empire and the interests of our well-beloved subjects. But another and not less sacred duty commands us, in this obstinate struggle, to keep ourselves prepared for efforts and sacrifices proportioned to the means of action directed against us.

Russians! my faithful children! you are accustomed to spare nothing when called by Providence to a great and holy work—neither your wealth, the fruit of long years of toil, nor your lives—nor your own blood, nor the blood of your children. The noble ardour that has inflamed your hearts from the first hour of the war will not be extinguished, happen what may; and your feelings are those also of your sovereign.

We all, monarch and subjects, if it be necessary—echoing the words of the Emperor Alexander in a year of like trial, "The sword in our hands and the cross in our hearts"—know how to face the ranks of our enemies for the defence of the most precious gifts of this world—the security and the honour of our country.

Given at Gatchina, the 14th of December, year of grace 1854, and 30th of our reign. NICHOLAS.

Having related the condition and prospects of the various forces engaged in the contest around Sebastopol, it is necessary to direct attention to the proceedings of the fleets. After the 17th of October, the sailors were of little service except on shore; they were exposed at sea to much hardships from the incessant rains, the cold, and the prevailing storms. Great was the disappointment which prevailed after the failure of the naval bombardment, and the brave tars longed for an opportunity to redeem the character of the navy. Admiral Dundas having disapproved of the expedition to the Crimea from the first, because of the inadequate means

at the disposal of the allies, the advanced period of the year, and the excessive sickness prevailing among both the naval and military forces, was supposed to repress all enterprise, and to be desirous rather to see his own vaticinations fulfilled. In these representations there was at this juncture, at all events, much injustice; and certainly the predictions of the admiral, as regarded the difficulties and sufferings of the expeditionary forces, were but too circumstantially fulfilled.

Early in December the fleets took up new positions around the south-west coast of the Crimea. Many of the British ships entered the harbours of Kamiesch and Karatsch, which were in the possession of the French. The *Agamemnon*, *Hannibal*, *Algeria*, *Napoleon*, *Jean Bart*, *Pomona*, *Nimanguet*, and several frigates blockaded Sebastopol. The *Vauban*, *Caton*, and bomb-vessel *Vautour*, were in Arrow Bay, the nearest position to Sebastopol. The *Montebello*, *Marengo*, *Alger*, and a number of frigates and smaller craft, were in the Bay of Kamiesch. The French raised fortifications along the coast from Arrow Bay to Cape Chersonese, a work the necessity of which did not appear. They erected beacons and lighthouses, not only for the shipping, but for the troops on shore.

The inaction of the British fleet gave much uneasiness at home, and excited much unreasonable comment. The government felt the influence of this, and on the 8th of December sent out directions to attack Odessa. Odessa, however, was not attacked; and it was afterwards learned that this was due to the influence of General Canrobert, acting under the direct orders of his emperor. The charge of the French fleet devolved not upon its admiral, but upon the general-in-chief of the army. Such orders could not at that time have been obeyed by the British admiral, the pick of whose crews were serving on shore.

FROM THE SECRETARY OF THE ADMIRALTY
TO VICE-ADMIRAL DUNDAS.

Admiralty, Dec. 8, 1854.

SIR,—I am commanded by my lords commissioners of the Admiralty to call your attention to their letter of the 13th of October last, No. 622, respecting an attack on the port of Odessa at any proper opportunity. Although this question has been postponed at the request of the generals commanding the allied forces on shore, my lords are of opinion it should be again taken into consideration, with a view to an effectual operation whenever circumstances will permit.

I am, &c.,

R. OSBORNE.

It was a curious coincidence that while the authorities at home were carrying on the deliberations which led to this letter from the Admiralty, the Russian navy was putting forth some symptoms of spirit, to the astonishment of the allies. On the 6th of December, two Russian ships sallied from Sebastopol, proving that a passage had been left between the sunken

ships, this had been universally disbelieved in the fleets. One of these steamers lingered close to the harbour, as if in reserve; the other, supposed to be the *Vladimir*, boldly issued forth, passed a French frigate which either did not recognise it, or supposed it to be British, and steaming round Fort Alexander, "brought to," and threw shot and shell into the French works near Quarantine Bay. The amazed admirals sent the *Valorous* and *Terrible* after her, but the Russian was as nimble and vigilant as bold, and escaped with her consort behind the lines of sunken ships.

On the 21st of December, Admiral Dundas gave up the command of the fleet and returned home. He was succeeded by Admiral Lyons. The latter, desirous to give his gallant predecessor a courteous farewell, ordered signals—in the hoisting of which occurred a ludicrous mistake. Admiral Dundas ran up a signal to Admiral Lyons to the effect, "May success attend you," to which the latter ordered the reply to be given, "May happiness await you." By some mistake the word *hanging* was substituted for *happiness*! Great was the amazement of the whole fleet as it read the parting signal from the *Agamemnon* to their late amiable chief, "May *hanging* await you!" What made this more unfortunate, and a source of the greater chagrin to Sir Edmund, was the state of feeling between the two admirals, which was notorious: the senior officer considering his junior as forward, somewhat saucy, and very intriguing; the junior representing his senior as "slow," and deficient in enterprise. Admiral Dundas took leave of the fleet in a manly address:—

*H.M.S. Britannia, in the Bosphorus,
Dec. 22, 1854.*

My term of service as commander-in-chief in the Mediterranean and Black Sea having drawn to a close, I am about to return to England, and give up the command of this fleet.

During the past year many trying circumstances have occurred—pestilence in its most aggravated form, action with the enemy against land defences such as ships hardly ever encountered, and a tempest of the most awful violence. In all those events the good conduct and gallantry of the fleet have been evinced and proved.

In taking an affectionate leave of the officers, seamen, and marines of the fleet, I can hereafter experience no higher gratification than the assurance that they preserve their high character for discipline, enterprise, and devotion to our sovereign and country.

J. W. D. DUNDAS,

Vice-admiral, Commander-in-chief.

*To the admirals, captains, commanders, officers,
seamen, and marines of the fleet in the Medi-
terranean, and Black Sea.*

When the British admiral was leaving, the yards of all the ships, French and English, were manned, and hearty cheers were given for the veteran sailor who had won the respect of the armies and navies of the allies, as well as of the men under his own command.

About the same time Admiral Hamelin returned to France, to receive promotion from his

government, and the command of the French fleet devolved upon Admiral Bruat—a bold, reckless sailor, stubborn in opinion, and reputed to have no love for the English nation, its people, or its policy. Admiral Hamelin appears to have issued no farewell, but Bruat, on assuming the command, thus referred to him in an order of the day:—"We are about to lose our worthy chief; his illustrious services have received their reward. After having called on me to second him, the emperor has called on me to replace him. Faithful to the traditions bequeathed to us by a glorious past, we shall continue to lend to our valiant army and to our brave allies that warm co-operation to which he has already rendered such flattering and cordial justice. On the day of combat, the same patriotic cry will still rally us round the flag of France."

Soon after Sir Edmund Lyons took the command of the English fleet, an opportunity was given him of softening the asperities which had hitherto throughout the war characterised the spirit and temper of the Russian commanders. He happened to have formed an acquaintance many years before with the Russian admiral, and he took occasion on his newly-acquired command to send that functionary a large English cheese, with his compliments, and good wishes for his health. The Russian sent in return a fat deer (how such a present could at that time be found in the neighbourhood of Sebastopol may well be a matter of surprise), and with the present a letter conveying the following delicate compliment:—"The Russian admiral remembers with pleasure the time of his acquaintance with Sir Edmund, and regrets not to have seen him for so long, except the other day, when he came in rather close with the *Agamemnon*."

The fleets were gradually reduced as the winter advanced, by the sailing vessels being ordered home, and the steamers remained as mere "tenders" for the armies. The naval brigade on shore was gradually augmented to a naval division, reducing the numbers who constituted the crews afloat. The sailors in the trenches and at Balaklava became increasingly conspicuous for their bravery, good-tempered submission to toil, and usefulness in bringing up stores: nothing came amiss to Jack—his strong hand, brave heart, and jolly temper were always the same.

The year 1854, so full of events to Europe and the world, at last closed in gloom and chillness over the beleaguering and beleaguered at Sebastopol. The Russians were stronger within the mysterious city than ever. Their fortifications had grown up under the fire of the allies, and increased to dimensions the most prodigious. The labour of a large army was devoted without respite to accomplish the

VICE ADMIRAL SIR J. W. D. DUNDAS, F. R. S.

from a Photograph sent April 1846.

stupendous work. The allies also grew in strength, notwithstanding the waste and wear incurred by weather, war, and pestilence. The French works were twice as strong as when the first bombardment commenced; and the English had, by dint of death-inflicting toil, prepared a terrible armament for their batteries. The British also began to feel acclimated, and to resist better the local diseases. Fresh meat arrived from the Bosphorus, and large stores of food and raiment were on their way from home. The general feeling of the armies was, that Sebastopol could only fall by a most bloody assault, and that must be made soon or never. The preparations showed, however, that the generals were preparing for a more tremendous battle of artillery than the world had ever before witnessed. Tokens, terrible and unmistakeable, were given that the Western powers were resolved to win the proud citadel, and that Russia had staked her strength and resources upon the struggle there. The progress and character of the siege hitherto was keenly reviewed at home, and various plans of fortifications and attack were discussed in the military journals and clubs, and in the senate. Lord Palmerston, in his place in the English House of Commons, referred to this state of feeling in the country, and to the actual facts of the case, in one of his happiest efforts. Within a short compass, his lordship places the state of affairs around Sebastopol in its real aspect, as presented at the close of 1854. His lordship thus spoke:—"With regard to fortifications, an honourable member has adverted to a system which has attracted much attention—that proposed by Mr. Ferguson. Everybody who has read, with the attention it merits, the pamphlet published by that gentleman on the defences of Portsmouth, must be aware that it contains a great deal of

matter well deserving of careful consideration; but it would be a mistake to draw a conclusion in favour of his system from what passed at the siege of Sebastopol. The operations at Sebastopol were very different from those of ordinary sieges. At Sebastopol there were two great armies confronting one another. One of those armies was lodged behind trenches and earthworks, from which it was the object of the other to dislodge them. But the first army had resources, both of men and ammunition, almost unparalleled in the history of war. As fast as their guns were dismounted others were substituted, and as fast as men were slain others were forthcoming to supply their places. We have been authoritatively assured that at the last bombardment the Russians lost, in killed and wounded, something like 1800 or 1900 men a-day. Fresh armaments, however, were always forthcoming from the other side of the harbour, and new supplies of men were continually brought up from the army in the rear. Operations such as these furnish no parallel for a limited fortification, where reinforcement and replenishment cannot take place. It is therefore a mistake to suppose that the earthwork system is invariably applicable to limited fortifications. I will not go into those details which those who are familiar with the subject must have attended to, but I believe it is admitted that earthwork will not stand perpendicularly like stone; it must have a slope of forty-five degrees, and these slopes can be ascended by an attacking force much more easily than perpendicular walls terminating in a ditch. However, the merits and advantages of this system are being very much considered, and no doubt the addition of earth in front of stone walls has been found to be a mode of considerably strengthening the stone revêtement of a fortification."

CHAPTER LI.

SCUTARI AND ITS HOSPITALS.—MISS NIGHTINGALE.

"A lazar-house it seem'd, wherein were laid
Numbers of all diseases'd, all maladies
Of ghastly spasm, or racking torture, qualms
Of heart-sick agony, all fevrous kinds,
Convulsions, epilepsies, fierce catarrhs."—MILTON. *Paradise Lost*.

WHEN war broke out between England and Russia in March, 1854, the hospital arrangements of the British army were in a very imperfect state. The chiefs of that department have generally but little influence at the Horse Guards, and, therefore, whatever the extravagance in other branches of the military service, economy rigid and parsimonious was applied in that direction. Not, indeed, that the medical and hospital service was free from jobbing any

more than any other connected with the army, but the provision for the efficiency of that department of the military administration was regarded with more indifference, because the officers belonging to it were seldom connected with the aristocracy. Immediately upon the declaration of war, instructions were sent out to Mr. Calvert, British consul in the Dardanelles, to select for recommendation such places as he deemed most eligible as localities for

hospitals. He recommended Abydos, Scutari, and other places. The army while at Varna suffered severely from the deficient number of surgeons connected with it; although young men of undoubted talent, energy, and courage, offered themselves in numbers for the service. During the prevalence of disease and death at Varna, an hospital was established at Scutari. It was only intended for those who might incur wounds in the campaign approaching, which was then expected to take place in Bulgaria. The arrangements devolved upon the Duke of Newcastle as minister of war, and Dr. Andrew Smith, chief of the medical department. Those gentlemen found their efforts embarrassed by the system of divided control, and they were not men of that resolution and clearness of judgment either to dare much on their own responsibility, or make any effective efforts to extricate their own from complication with other official departments. The army, therefore, continued to suffer, and each hospital at Scutari became a lazaret-house. When the Sebastopol inquiry, proposed by Mr. Roebuck, brought all the complications to light with which the medical department had to struggle, it was seen that while individuals were scarcely less to blame, the system of our army administration was confused and corrupt. A contemporaneous writer has, in a small compass, described the confusion and complication prevailing. "Dr. Smith's first instructions were from the Horse Guards, the commander-in-chief's office, to provide necessary medicines for an army destined to service in the East; but he had no control over the shipping of the hospital furniture and clothing for the sick, no bill of lading, no power of seeing that the articles were actually shipped off: this devolved upon the Board of Ordnance. Then, in relation to such medical comforts as wine, sago, arrow-root, &c., very important to an army in a season of cholera and dysentery, Dr. Smith had to apply to the commander-in-chief, who applied to the Board of Ordnance, which applied to the Board of Admiralty, which had been accustomed to supply such comforts; but neither the minister of war nor the medical director, whatever might be ascertained by voluntary inquiry, had any official knowledge whether these supplies were ever sent to the East."

Scutari, it will be recollected, is a part of the Turkish capital, but separated from the main portion of that city by the Bosphorus. The place selected for the hospital was the grand Turkish barracks—a series of buildings so vast that 6000 sick men could be accommodated there. It was not all appropriate for hospital purposes. One side of the square, and half of another side, were set apart as the English hospital, and these sections were large

enough to accommodate 3500 invalids. There was attached to the barracks a Turkish hospital for 700 men. It was not until after the battle of the Alma that the incompetency and confusion at Scutari became apparent. On the 23rd of September the first news arrived in the Turkish capital of the great victory. The French steamer *Orénoque* having arrived, bedecked with flags and streamers, a band playing on her deck, and her crew exulting loudly, the truth was known before any one landed to give the details. These were supplied the day following with dreadful distinctness. The *Andes* steamer was the bearer of 400 wounded British soldiers; she was soon followed by the *Vulcan* with 300, and by the *Simoom* with 300. Other ships rapidly succeeded, all carrying their freight of wounded and diseased. Numerous as were the sick conveyed from Varna, and from Old Fort, immediately after the landing, yet the energy and address of individuals surmounted the obstacles which existed, and the sick were tolerably cared for; but after the battle of the Alma the numbers of wounded which arrived baffled the skill and power of the managers of matters at Scutari, and there ensued scenes of confusion, horror, and death, such as no pen could describe.

It must not be supposed that the hospital accommodation which we have above described constituted all which existed on the Bosphorus for the navy and army of England. There was a naval hospital at Therapia, under the exclusive government of the authorities of the navy, which was clean, orderly, well provisioned, carefully attended by naval surgeons, and well supplied with every requisite for a hospital. It constituted at once a pleasing and painful contrast to the hospitals under military superintendence. There was much in the contrast to confirm the language of Mr. Bernal Osborne in the great parliamentary debate upon the conduct of the war, in which he boasted of the superiority of the department with which he was connected—the Admiralty—as entitled to the confidence of the house, and gave the following faithful but alarming picture of the administration of the army:—

"Will any man tell me that our military system, as existing at present, has tended to develop or bring forward military talent or genius? Look, sir, in the first instance, how the staff of the British army is composed. It is all very well for honourable gentlemen to come down and talk of consolidation of the Ordnance, the Horse Guards, and the commissariat under one head, and the substitution of one minister for another; I maintain, whatever may be the inherent vigour of that man, whatever may be his experience, a mere consolidation will not be sufficient; you must reconstruct your whole military system. The time has arrived

when you cannot expect an army, besides winning battles in the field, to go through the vicissitudes of a campaign under the present state of things. You must lay an unsparing hand on that building adjacent to these premises; you must see whether, in fact, you can find a modern Hercules to turn the Serpentine through the Horse Guards and all the ramifications of the War-office. Look at the constitution of the staff. In France, the staff is regarded as the head of the army, and officers only are placed on it who possess a knowledge of military science, and display fertility in expedients. In England, every one knows that it is not merit and capacity for which an officer is appointed to the staff, but interest and connection. Let any honourable gentleman move for a return of the officers employed on the staff in the Crimea, showing how many speak French, how many can trace a common military field-plan. I will venture to say not one-third can do it. I attack no individual, I attack the system. Why, if anything were to happen to Lord Raglan, will any gentleman tell me where we are to select a general for the chief command. It has been suggested to borrow one from the French army. How can you possibly have a succession of generals when the first thing you do is to debar any man who has any peculiar talent for command from entering your army unless he can lodge a large sum of money and purchase every step? The regulation price—and no man gets it for the regulation price—of the commission of a lieutenant-colonel of cavalry is £6175. I have known instances in which £15,000 have been so expended. The regulation price for the commission of a lieutenant-colonel of infantry is £4500. How is it possible, then, that any but a rich man can enter the army? . . . I say it is unfair to sacrifice a minister of war to the faults of your system, which this house has sanctioned and confirmed. If we are to have any reform in the British army, with a stern hand you must do away with the practice, and put the whole staff arrangements on a different footing. If you constitute another army on the same footing, I do not think it will do any better. It is not enough that they should win battles, they must go through campaigns; and we have seen the lamentable and disgraceful way in which this war has been conducted. I say, in this, I impute no inefficiency to the men: they are the victims of the system, and this house is to blame for having so long permitted it."

It is impossible to deny to this statement truth as irrefutable as its candour was striking; and in no respect was it more clearly shown to be so than in the hospital administration in the East. Therapia was situated twelve miles up the Bosphorus, and short as this distance was,

it was the cause of much inconvenience, for, however excellent the management there, some influence from the anarchy prevailing all around was felt. A curious and painful instance of this occurred when a number of marines and soldiers, wounded and invalids, were brought in one ship to Scutari: the marines were refused at that place because they were not soldiers, and they were sent on to Therapia, whence, not being sailors, they were sent back to Scutari, whence, after fatal delay, they were once more dispatched to Therapia, and received into the naval hospital as belonging properly to the navy. Before the year 1854 expired there existed for the army the "General Hospital," the "Barrack Hospital," and two floating hospitals. The General Hospital was situated near the cemetery, where burials were perpetually taking place—a most unwholesome and unseemly site for a house of recovery. It was a large building with a vast square court, after the manner of oriental houses. In this building each floor, or storey, had long corridors in which the beds of the patients were arranged. At intervals there were doors opening into apartments of considerable space, which were used as dispensaries, surgeries, and rooms for various medical purposes. In these apartments operations were generally performed. Some of these were, however, appropriated to sick and wounded officers. As many of the latter as possibly could took up quarters at the other side of the Bosphorus. The Barrack Hospital, less than a mile from the former, was like it in arrangement, but of far greater dimensions. The floating hospitals were at the Golden Horn, they consisted of an old Turkish hulk, and an English transport but little better fitted to accommodate invalids. There was besides these an hospital for Russian prisoners at Kulali, on the Bosphorus. The Convalescent Hospital was distant from all these, and received patients from each whose recovery was pronounced probable; this was at Abydos. Subsequently, and as the result of agitation in England, what was called the Civilian Hospital was established at Smyrna. The medical men attending here were in no way connected with the army, but the director was a military man. This hospital was beautifully and healthily situated, and the care and nursing of the poor soldiers much surpassed what was experienced in the other asylums. It was at Scutari that the great evils were prevalent, the great horrors enacted, and the indelible shame upon our country inflicted.

Every branch of the medical department of the army in the east worked badly, in spite of the courage, humanity, and skill of individual medical men—many of whom devoted superior talents and untiring industry, with the most self-sacrificing spirit, to mitigate the sufferings

of their countrymen. For the sake of order in our narrative, we shall attempt to describe the processes of sending the soldiers away, landing them, conducting them to the shelter allotted to them, and the treatment which they there received.

It might without exaggeration be said, that not one yard from the trenches before Sebastopol to the hospital or cemetery at Scutari was the poor soldier carried without an amount of suffering being inflicted upon him barbarous in the extreme, and which any previous preparation might have averted. Well might Mr. Russell write, that, even if the instinct of self-preservation had existed in the British army, these horrible evils might have been avoided, or at all events mitigated. A medical officer writing home from the camp thus describes the outset of the unfortunate candidate for the corridors of Scutari:—"I often look back at the misery and wretchedness I have witnessed in England in my attendance on the sick poor; but, on comparing these with my present everyday experience, their condition was Elysium itself; for when I tell you that the sick in this place have no other couch than the bare ground, itself saturated with wet, and a dripping canvas only between themselves and the clouds, you will perfectly comprehend that the veriest hovel would be a palace in comparison, so that it were provided with the ordinary defence of either mud or stone walls, and with thatch for its roof. We do all in our power to send away the sick from the camp on board ship as speedily as possible, yet—mark the difficulty—there are no means of transport, or rather, I should say, that the means we have at our disposal are totally inadequate to the emergency. It is true that our ambulances are on the ground, where they are likely to remain, for all their mules are either dead or useless, and the only means at our command is a Flanders' waggon, which goes to Balaklava daily for forage. Can you fancy a poor fellow, who may be struck down from disease of a most prostrating character, being either jolted along in a waggon without springs or covering, or placed across a horse for three hours, exposed to an atmosphere which may be many degrees below the freezing-point? Far better would it be to let the poor invalid remain, in even his comfortless tent, than to subject him to such torture."

When the men were placed on board, there were fresh trials awaiting them, such as we glanced at when referring to the state of things at Balaklava. Generally the men lay "between decks," without any bedding, and often without a blanket in the depth of winter. The number of medical men was utterly disproportioned, and often they were themselves the subjects of disease. Invalids attended invalids, or, as

frequently happened, the men were utterly unattended. The transports on board of which they were placed were not provisioned for the purpose of carrying the sick; there was plenty of salt pork and hard biscuit, but no such dietary supplies as sick and wounded men could use. In this condition the miserable sick and wounded lay, from five to twenty days, according to the weather and the sailing qualities of the ship, before they reached the landing-place at Scutari, or the hulks at Stamboul. Starvation ensued in some cases: the men literally died of cold, or from want of food, or they became so reduced that death became inevitable, even if no further horrors awaited them when they arrived at their destination. In several of these "sick transports" the poor fellows nearly perished from want of water, and on board one ship, the sufferings of the men from this cause were appalling—although there was water on board in sufficient quantities to meet their wants, but it could not be got at from the confusion which prevailed in the mode in which the cargo was stowed away. No accounts will ever be published of the horrors of this "middle passage," which can depict the full atrociousness of the facts.

It is undeniable that much want of system prevailed among the medical staff, but both in the Crimea and on board ship their efficiency was impeded by want of authority, and by the inextricable complication of their functions with those of the commissariat and the general staff of the army—so that the invalids arrived at Scutari in a state which the authorities there had no right to expect, and for which they were not, therefore, prepared. At Scutari, as well as in the Crimea, the same complications as to official routine and range of official control existed. Some things could not be done there without the sanction of the British ambassador, in Constantinople; others without the authority of Dr. Alexander Smith, in London; a third class of matters required the direction of Mr. Commissary Filder, who was at Balaklava; and a fourth must be referred to the staff of the army before Sebastopol. An officer cognisant of all this complication and consequent misrule has not exaggerated in the following statement concerning the clashing of departmental authorities, staff, commissariat, and medical:—"The various military departments in London were under the superintendence and control of the secretary for war, the secretary at war, the commander-in-chief, the master-general of ordnance, the Board of Ordnance, the Treasury, and the Admiralty. To these departments there was no acknowledged head, and on a variety of most important questions their jurisdictions clashed. The army in the field was commanded by Lord Raglan, then verging on his 68th year, his generals of division, with

one exception, having nearly attained that patriarchal age. The officers of the staff were without a chief, and had, with few exceptions, been selected from favour and affection—not from merit or ability. But five out of the ninety-seven appointed had taken a first-class at the senior school Sandhurst—an institution specially founded to prepare officers for the staff; and five out of six of Lord Raglan's personal staff had been chosen among his own relations. In truth, the only qualifications consisted in a short term of active service and good interest at head-quarters, no educational or other test being required. The commissariat was officered by civilians brought together from all parts of the world, without common understanding or mutual confidence. They had no efficient military organisation, and no opportunity of becoming acquainted with the army or ministering to its wants. In the medical department the surgeons and their assistants were men of great ability, and for the most part zealous in discharge of their duties; but, as there is no school of military surgery in Great Britain, many of them were practically unacquainted with that special branch of their profession, and were first introduced to gunshot wounds and sabre cuts on the heights of the Alma. No nursers were provided, and the medical orderlies were taken from the ranks, raw and untrained. The ambulance carts and waggons were so heavy as to be altogether unserviceable; even had they been fit, no horses were at hand to draw them. The ambulance corps consisted principally of worn-out pensioners, whose application to the bottle far exceeded that bestowed upon their duties; they were not only useless, but a positive curse. The commonest necessities for field-hospitals—bedding, medicines, and medical comforts—were wanting; and not a single operating-table was supplied to the army. At the permanent hospital of Scutari no sufficient preparations had been made, and the purveyor's department was composed of an old man of 70 and an inefficient staff."

When the transports freighted with sick and wounded arrived at Scutari, a new series of sufferings commenced, and an entirely new class of horrid scenes was presented. The first difficulty consisted in getting the invalids on shore. There was no proper jetty, no boats fitted up for the express landing of the sick. One ship arrived without any boats, having lent them for the disembarkation of troops in the Crimea. A long delay occurred before boats could be procured, although they are not scarce commodities in the Bosphorus; but it did not occur to any one to employ the Turkish boats which were in numbers lying idle by Stamboul. The invalids had been more than three weeks on this vessel before they were

landed at Scutari, and presented a ghastly and emaciated appearance, begging all description—so much had they suffered from pain, cold, and hunger; scarcely any food, and no covering having been provided for them. A few had light chaff beds *thrown over them* to keep them warm as they lay on the bare boards of the ship. The nearest hospital to the beach was the Barrack Hospital, which was a quarter of a mile distant from the landing-place. This, commonly called the pier, was a most unsuitable construction, not furnishing adequate room for a tenth of the business necessarily transacted upon it. The Rev. Sydney Osborne, who remained at Scutari during the autumn and winter, rendering what help he could, thus describes this miserable landing-place, where the wretched invalids were jostled through the crowd on their way from ship-board to hospital:—"I have seen the bodies of the dead, stores for the living, munitions of war, sick men staggering from weakness, wounded men helpless on stretchers, invalid orderlies waiting to act as bearers, oxen yoked in arabas, officials stiff in uniforms and authority, all in one dense crowd, on this narrow, inconvenient pier, exposed to drenching rain, and so bewildered by the utter confusion, natural and artificial, of the scene, that the transaction of any one duty was quite out of the question. Sometimes the wounded, when landed at the pier, were kept exposed to inclement weather until orderlies—themselves invalids in process of recovery—in sufficient number could be obtained to carry them on the stretchers up to the hospital."*

According to Mr. Osborne's account, the miseries of the invalids increased at every step. When they were free of "the pier," they were carried on stretchers exposed to the piercing cold or drenching rain to the nearest hospital, in most cases to be told that there was no room; they would then have to be jostled to the General Hospital, which was half a mile further; perhaps this also would be full, and the doleful procession would have to return; and then in all probability the invalid would be laid at the door of the Barrack Hospital, or in the corridor, where he would be in every one's way, and out of the *regular course* of attendance, until he could be ranged in one of the berths, and be comprehended in the routine plan, if plan it could be called, of medical administration. Many sunk into untimely death in the dark corridors and bare wards of both hospitals, if not unpitied, certainly unaided. Should the patient be so fortunate or unfortunate, it is hard to say which, as to obtain a berth in *any hos-*

* In the Rev. Mr. Osborne's book, entitled *Scutari and its Hospitals*, the reader will find a far more minute and circumstantial account of the disastrous state of things than can be given in a general work upon the war.

pital, his case was so utterly deplorable as to balk every effort to depict it. Little do the readers of this History know what relations of agony, disgust, hopelessness, loathsomeness, and death, published and unpublished, it has been necessary for the author of these pages to peruse, in order to give some clear but succinct account of these most mournful events. Hard must the heart be that can read even a transient record of them without deep feeling—the task of analysis and compilation, in order to present even the main features of the case before others, harrows the heart. Never since it pleased God to endow men with fortitude and resignation were these qualities more signally shown than in the gloomy and pestilential wards and corridors of the Scutari hospitals: by men and by women who attended the sufferers, not less than by the sufferers themselves, have these traits been exhibited. For ever branded with infamy must the country be which cannot estimate such virtues, and which has no tear to shed over the lost and tortured brave, who went down to death so gallantly for home and nationhood. If the exasperating history of confusion and misdirection connected with the sick and wounded in our Eastern campaign do not rouse the resolution of every English, Irish, and Scotchman to resist oligarchical and irresponsible government, then our boast of freedom will make us the mockery and byword of the earth.

Within the hospitals at Scutari confusion and misery prevailed in every department. The first thing needed by the patients was, of course, a place of repose—the only means of supplying which were the bare ground, or a sort of wooden divan which surrounded many of the wards, something resembling a guard-bed in a barrack-room, or rather the guard-house of an English barrack. More than 3000 men were lying on the bare ground in these hospitals, while bedsteads and other bed fittings were lying at Varna neglected. At last a steamer was sent to bring them, but she encountered another which had sprung a leak, and towed back the disabled bark; weeks rolled by before she was again dispatched on the same necessary errand. The next thing required by the patients was a suitable classification of their cases. Nothing could be more absurd than to place men in Crimean fever, or cholera, beside those who were suffering from overwork, or cold, or wounds; but all were huddled together, just as vacancies occurred for them, and as chance ruled. A wounded man might have within thirty inches (the space allowed) of him at one side a person with "Varna fever," and within the same distance on the other a victim of dysentery.

Means of cleanliness, one would suppose, would be provided as soon as the sufferer was stretched upon his hard resting-place; but

there were no vessels for water nor utensils of any kind; no soap, towels, or cloths, no hospital clothes; the men lay in their uniforms, stiff with gore, and covered with filth to a degree and of a kind which no one could write about; their persons covered with vermin, which crawled about the floors and walls of the dreadful den of dirt, pestilence, and death, to which they were consigned. Medical assistance would be expected by the invalid as soon as he found himself in a place of shelter, but many lay waiting for their turn until death anticipated the doctor, and many others until beyond the aid of any earthly intervention. The medical men toiled with an unwearied assiduity; never did men deserve better of their country. Their numbers were inadequate to the work, and they had no means of procuring what was necessary.

The government at home stoutly maintained that every necessary requisite for men in health or sickness had been sent out; but when the correspondents of the London press dispelled this illusion, and the *Prince* was lost, that disaster became the apology. The loss of the *Prince* deprived the army of a vast store of useful personal commodities, as well as munitions of war; but the following list of articles which constituted its cargo will show exactly how far its wreck could have influenced the destitution at Scutari:—

Cartridges, musket, Pn. '1851,' 2½ dms.....	1,000,000
Ditto smooth bore, 4½ dms.	750,000
Shot, round, 9-pounders	3,000
Ditto, case, gun, 9-pounders	400
Ditto, case, howitzer, 24-pounders	140
Shells, shrapnel, guns, 9-pounders	600
Ditto, shrapnel, howitzers, 24-pounders	800
Ditto, common, empty, 24-pounders	630
Carcases, fixed, 24-pounders	30
Cartridges, flannel, filled, guns, 9-pounders, 2½ lbs.	4,000
Ditto howitzers, 24-pounders, 2½ lbs.	1,600
Ditto bursters of sorts	2,090
Fuzes, boxers, common	700
Ditto shrapnel	1,540
Tubes, brass	1,680
Ditto, friction	5,040
Portfires	168
Match, slow, cwt.	3
FOR BATTERING-TRAIN RESERVE.	
Shot, hollow, 8 inch	600
Shells, common, empty, 8 inch	2,570
Carcases, fixed, 10 inch	40
Cartridges, flannel, filled, guns, 8 inch	3,960
Ditto filled, bursters of sorts	7,116
Ditto empty mortars, 5½ inch	1,000
Powder, L.G. lbs.	4,560
Fuzes, boxers, 5½ inch	2,800
Ditto, common, 10 inch	3,390
Ditto, common, 5½ inch	3,000
Match, lbs.	170
Portfires	230
Tubes, brass	2,500
Ditto, friction	6,000
CLOTHING.	
Frocks, woollen	53,000
Stockings, half worsted, pairs	33,000
Ditto half lambs'-wool, pairs	2,700
Drawers, half lambs'-wool, pairs	17,000
Blankets, single	16,100

Rugs, single	3,750
Palliasses, single	10,000
Cloaks, watch	2,500
Boots, ankles, pairs	12,880
Shoes, pairs	1,000

There was an attempt to maintain some system of hospital attendants, but the invalids were set to take care of the invalids, for the orderlies caught the infection produced in these great fever dens, and died off. The floors ultimately became covered with filth, the stench which exhaled from doors and apertures became insupportable to those who would otherwise have been visitors, and was intolerable to the brave men who did their best to alleviate the sufferings which filled these dismal charnel-houses.

While the patients were without beds, surgeons, attendants, nurses, medicines, cleanliness, clothes, and comforts of all sorts, hunger was added to their deprivations. Mr. Osborne bears unqualified testimony to this fact. Nor he alone, other faithful witnesses recorded it. *The wounded soldiers of England in many cases died of starvation in the hospitals provided for them by their country!* Such was the state of the wounded and diseased at the close of 1854, and to some extent during the remainder of the winter. Soon after the year closed, the number, including the camp, Balaklava, and the hospitals on the Bosphorus, was computed at 14,000. Yet the increase of surgeons was very small, and these indefatigable men, in spite of much hindrance and even tyranny from their superiors, worked on with a zeal and courage never to be sufficiently lauded. In a work entitled *Eastern Hospitals and English Nurses*, by a lady volunteer, a high testimony is borne to their exertions:—"Severe things have been said of the medical department of the army; and its members were, apparently, so despaired that their work was taken from them in some measure, and put into the hands of civilians. No doubt some of the heads of the department, who had grown old under the old system of military hospitals, and were unable to realise the necessity of a prompt and immediate change, were obstinate and hard-hearted. No doubt, among such a large body of men many young and careless ones, unfitted for the awfully responsible charge then placed in their hands were to be found; but in condemning such the merits of others should not be overlooked. Most ungrateful were it if the nurses should omit recording their experience of the much dreaded 'army surgeons.' So misrepresented had this class of men been that it was with far more fear of them than of the horrors of hospital life that the ladies entered the hospital. They were told to expect rebuffs, discouragements, and even insult. During a year's residence among them the writer and all her companions never experienced from an

army surgeon other than assistance, encouragement, and gentlemanly treatment, and from many of them the most cordial kindness."

When nurses were appointed (an event to be taken notice of in another page) they resorted to various expedients, to warm beef-tea and other nourishing drinks for the men, but the medical chiefs embarrassed this good work, and prevented the working surgeons from giving any encouragement. The lady writer already quoted denounces this conduct, and the chief author of it, in the following terms:—"It was very hard work after Dr. Cumming's order had been issued to pace the corridor and hear perhaps the low voice of a fever patient, 'Give me a drink for the love of God,' and have none to give—for water we dared not give to any; or to see the look of disappointment on the faces of those to whom we had been accustomed to give the beef-tea. The assistant-surgeons were very sorry, they said, for the alteration, but they had no power to help it—their duty was only to obey. On one occasion, an assistant-surgeon told us that Dr. Cumming had threatened to arrest him for having allowed a man too many extras on the diet roll. Amid all the confusion and distress of Scutari hospital, military discipline was never lost sight of, and an infringement of one of its smallest observances was worse than letting twenty men die from neglect." So severely did the working surgeons suffer that twenty-two of them were sick at one time.

The men were as destitute of spiritual as of temporal consolation, for a long time there were no chaplains; lay instructors were provided by the generosity of religious persons in England, but the authorities threw every obstacle in the way of their charitable labours.

No reliable returns were ever given of the numbers who perished from causes which might have been remedied. The *Morning Advertiser* thus noticed the proportions of wounded and diseased up to February, 1855:—"Among the causes of death we notice scurvy, debility, and rupture, which tell of the salted pork, extreme exposure, and excessive hard work. How many have perished by sword, bullet, and shell, we shall probably never know with accuracy. There are to be accounted for above 44,000. Of these it is not likely that 10,000 fell in the three engagements; but admit that 10,000 have perished in battle, in the trenches, and of wounds, there are 34,000 whose fate has been sealed in a more terrible manner in the tents, ships, and hospitals. According to the proportions furnished by the list of deaths, these poor men have probably perished in the manner below:—

Dysentery	9,860
Diarrhoea	9,180
Fever	4,760
Cold, rheumatism, cough, fatigue, exposure, half-rations, with hard work, &c.....	10,200

The conduct of the men under their unheard-of agonies was worthy of their heroism in the field: it was calm, resigned, and manly. The love of home was strongly manifested, but the desire to hear that their comrades won glory for their country seemed to predominate over every other interest. The Rev. Sydney Osborne depicts this feeling among the inmates of those sullen wards and corridors in this manner:—"Many of the soldiers read aloud remarkably well; I have seen a black-whiskered, fine-looking man, propped up in bed, chosen as a reader; having lost an arm, they had folded the paper for him, so that he could, holding it in one hand, get at the 'battle bit.' Cripples of all kinds crept up, and sat on and about the adjoining beds; as far as his voice could be heard (it was a loud Irish one), you might see men turned in their beds, trying to drink in every word; on he went, right through the whole; beginning in rather a monotone style, he soon warmed up, and as the men said, 'gave it out well.' Then there would be a hail from a distant bed—"I say, let us have it up here now," and some crippled patient would come scrambling down to beg the paper: a new reader would be found, and nearly the same scene again and again repeated. I heard a shrewd observation from one veteran, who, having read the battle in a 'daily,' then looked at a picture of it in a 'weekly.' 'The writing, sir, is more like a picture than the picture is like the battle. Why, sir, these painters seem to think all our horses are fit for brewers, and that gunpowder makes no smoke.'"

The medical men were solicitous to send on convalescents to Malta, Corfu, Gibraltar, or to England, in order to give more space to the sick, and to make sure of some more suitable accommodation for the constantly-arriving cargoes of wretched men from the Crimea; but the directors of the transport-service either feared to incur responsibility, or were themselves harassed by confused orders, so that they were unable to supply regular or suitable transport for such convalescents.

The causes of all these miseries have never been adequately traced. Mr. Sidney Herbert, the secretary-at-war, in a speech in the House of Commons, defied Mr. Roebuck and the committee of inquiry to discover who was to blame, and results showed that to some extent he was safe in uttering that defiance. Mr. Macdonald, the special commissioner of the *Times*, attributed the confusion in the hospitals to the want of organisation in the medical department; undefined relations between that and other departments; and the unfavourable position of the hospital on the Asiatic side of the Bosphorus. But there were other causes at least as operative as any of these: such as the want of system in the departments in London;

of mutual dependence and prompt correspondence among these departments; and of well-defined responsibility in connection with all the officials at home and abroad. The British ambassador at Constantinople, however burthened with diplomatic business, had many *employées* at his disposal, and influence enough with the Turkish government, to procure aid in the season of protracted and bitter distress. No efforts seem to have been made by him to check the ravages of disease, or afford any melioration of the miseries of those who languished so near his palace. It is utterly inconceivable how the representative of her majesty on the spot—a man of such personal consideration, and wielding so much political power—should allow all the anguish of these houses of suffering to go on unmitigated and unsoothed. If ever there was a work worthy of a humane and vigorous mind, that of healing the distractions and overmastering the confusion at Scutari was such. As the Rev. Sydney Osborne looked upon all this misery and neglect, he might well exclaim:—"O war, war, how dost thou in thy utter bitterness of trial curse our race! Sowing penalties and pains broadcast over our living soul, heaping up more of poverty on the very poor; deriding the widow in her bereavement, making her childless; casting on them who only in hope are wives pangs as bitter as those of widows; thou begettest orphans; in the very wantonness of thy cruelty seekest victims from every other class; reckless of all social distinction, levelling all to one condition—that of the heart-broken and desolate: men crown thy triumphs with laurel—the cypress of the cemetery, the yew of the village churchyard, these are the real emblems of thy accursed work."

When the state of the hospitals in the Bosphorus became known in England, the heart of the nation was appalled; deep commiseration for our brave men filled every heart; and suggestions for their relief multiplied and received publicity in every form. The authoress of *Our Camp in Turkey, and the Way to it*, had recommended the employment of the soldiers' wives as nurses—a plan which was never adopted, but which had more to recommend it than was recognised by the public. The military authorities in England set their faces against it, and it was given up. The Rev. Mr. Shepherd, Master of St. John's House, Westminster, where "a Protestant Sisterhood," formed for charitable purposes, resided, addressed a letter to the Bishop of London, offering on the part of these ladies their services as nurses. This idea met with the approbation of the government, and it was believed also of the queen. The Duke of Newcastle and Mr. Sidney Herbert made themselves its especial patrons, and Mrs. Herbert took an interest in

it which redounds to her honour, and claims on her behalf the gratitude of the country. Through her instrumentality, Miss Nightingale was introduced to this benevolent work, in order to take the superintendence of the lady nurses generally, and organise a system of operations. Numbers of excellent and accomplished women, in various ranks of life, and from every portion of the three kingdoms, offered their services; but of these only a few possessed the mental and physical qualifications, and the experience which was so essential to a task so trying in itself, and amidst scenes of mutilation, agony, and pestilence calculated to daunt the most daring spirit. To join the charge, or mount the breach, was nothing compared to the trial of faith and fortitude which Miss Nightingale and her gentle companions were prepared to undergo.

In consequence of the numerous offers made by ladies for this service, Mr. Sidney Herbert deemed it desirable to publish a letter explanatory of the duties required, and the impediments likely to be met with. "Many ladies," he said, "whose generous enthusiasm prompts them to offer their services as nurses, are little aware of the hardships they would have to encounter, and the horrors they would have to witness, which would try the firmest nerves. Were all accepted who offer, I fear we should have not only many inefficient nurses, but many hysterical patients, themselves requiring treatment instead of assisting others." This judicious caution did not check the generous ardour of the women of England, but induced more serious consideration as to their fitness for the work in individual cases. The ladies who were chosen out of the vast number of volunteers comprised six from St. John's House, Westminster; eight from Miss Sellon's House of Sisters, in Devonshire; ten Roman Catholic Sisters of Charity; and fourteen hospital nurses who had acquired much experience. These all departed for the East on the 23rd of October. Early in December, fifty-eight ladies, selected in a similar manner, followed the former detachment. The first thirty-eight were chosen by Miss Nightingale herself, and accompanied her. The ladies afterwards sent out were mainly selected through the kind and indefatigable exertions of Mrs. Sidney Herbert. Each of these received a certificate from the authorities at home, permitting her to undertake the work at Scutari, for which she had volunteered. The departure of all these excellent women was marked by demonstrations of respect more ardent and deferential than are usually offered to persons of the highest rank, and for the most eminent public services. They journeyed by way of France, and when they landed at Boulogne, the civic officers of that place prepared for them a most respectful

welcome. The fishwomen assembled to carry their luggage to the hotel, where they were hospitably and gratuitously entertained. Along the line of route to Marseilles the railway officials facilitated their journey in every possible way, and showed them all honour, as did the populace of town and country. At Marseilles they embarked on board the *Vectis* steamship, whose captain and crew treated them with the most profound reverence and respect, and with the most prompt alacrity served them on every occasion where their services could minister to their comfort. The ladies were accompanied (we write of the first detachment) by Mr. and Mrs. Bracebridge, whose presence and aid were of great value. When they arrived at Scutari, they set themselves *at once* to the performance of their arduous duties. A tower at one of the corners of the Barrack Hospital afforded them some accommodation. They were easily pleased in that respect; their mission was one of privation and self-denial, and they were equal to the work which they undertook; brave hearts beat beneath fair bosoms—as brave as beat beneath the manly breasts which were torn with ball and bayonet on the slippery slopes of bloody Inkerman. We must be indebted to Mr. Osborne for a description of that part of the building allotted to the nurses:—"Entering the door leading into the sisters' tower, you at once found yourself a spectator of a busy and most interesting scene. There is a large room, with two or three doors opening from it on one side; on the other, one door opening into an apartment in which many of the nurses and sisters slept, and had, I believe, their meals. In the centre was a large kitchen-table; bustling about this might be seen the high-priestess of the room, Mrs. C—; often as I have had occasion to pass through this room, I do not recollect ever finding her either absent from it or unoccupied. At this table she received the various matters from the kitchen and stores of the sisterhood, which attendant sisters or nurses were ever ready to take to the sick in any and every part of these gigantic hospitals. It was a curious scene, and a close study of it afforded a practical lesson in the working of true common-sense benevolence. . . . The floor on one side of the room was loaded with packages of all kinds, stores of things for the internal and external consumption of the patients; bales of shirts, socks, slippers, dressing-gowns, flannel; heaps of every sort of article likely to be of use in affording comfort and securing cleanliness. It gave one some idea of what such a room would be in a good hospital, if on some sudden alarm it had been made a place of refuge for articles snatched from its every store. In reality, it was one feature of a bold attempt upon the part of extraneous benevolence to supply the deficiencies of the various depart-

ments, which as a matter of course should have supplied all these things. In an adjoining room were held those councils over which Miss Nightingale so ably presided, at which were discussed the measures necessary to meet the daily varying exigencies of the hospitals. From hence were given the orders which regulated the female staff working under this most gifted head. This, too, was the office from which were sent those many letters to the government, to friends and supporters at home, telling such awful tales of the suffering of the sick and wounded, their utter want of so many necessities. Here might be seen the *Times'* almoner taking down in his note-book from day to day the list of things he was pressed to obtain, which might all with a little activity have been provided as easily by the authorities of the hospital."

The ladies of the first mission reached Scutari just twenty-four hours before the first arrivals of the wounded from Inkerman; so that their energy and fortitude were tested before they had time to make themselves acquainted with the prevailing routine, or with the localities in which they were to move. Nobly did they acquit themselves: they were as "ministering angels" sent from heaven. With the arrival of the ships loaded with wounded men commenced their duties and difficulties. Almost every conceivable obstacle was thrown in their way, often by the jealousy, as often by the bad temper of the superior officials. And frequently, when there was a disposition to co-operate with them, there was not the capacity. Doctors, purveyors, storekeepers, orderlies, inspectors, dispensers, and interpreters, were in the uttermost confusion amongst themselves, and they generally regarded these gentle missionaries as a new element of anarchy. Miss Nightingale and her devoted followers would probably have been driven away by the ill-will, jealousy, and impracticableness of these people, had it not been for the countenance which they received from various persons of influence who opportunely interposed on their behalf. The persevering kindness of Mr. and Mrs. Bracebridge has been already noticed. Mr. Macdonald, the *Times'* almoner, by his firmness and practical tact, was an invaluable auxiliary. Mr. Stafford; and the Rev. Mr. Osborne, were pillars of support. Lady Stratford de Redcliffe, wife of the British Ambassador, made up for her husband's coldness by her zeal and sympathy; and thus sustained, these ladies bore up against every trial, and wisely and gently combated and overcame every opposition.

It is here desirable to furnish some notice of the lady upon whom devolved the superintendence of the nurses, and the efficient conduct of the holy enterprise upon which they had en-

tered. The author of *Two Months in the Camp before Sebastopol** gives this brief, but for our purposes sufficient, account of her birth and previous habits:—"In the outer room we caught a momentary glimpse at the justly celebrated Miss Nightingale, the fair heroine of Scutari; an amiable and highly intelligent-looking lady, of some thirty summers, delicate in form and prepossessing in her appearance. Her energies were concentrated, for the instant, in the careful preparation of a dish of delectable food for an enfeebled patient—one of her hourly ministrations to the wan victims of relentless war, for whose relief she so readily and nobly sacrificed the comforts of her quiet happy English home. Miss Florence Nightingale is the youngest daughter and presumptive co-heiress of her father, William Shore Nightingale, Esq., of Lea Hurst, Derbyshire (England). She speaks the French, German, and Italian languages as fluently as her native tongue, and has enjoyed all the benefits of a complete education, as well as those of extensive travel, having ascended the Nile to its remotest cataract, and been very generally throughout the continental countries. Wealthy, and surrounded by the attractions of a most agreeable society, it was indeed a great sacrifice to remove to the pestilential halls of a crowded and confused hospital in a foreign land. History will proudly perpetuate the name and memory of one so faithful to the demands of suffering humanity, while the evergreen wreath of affection will insure glad thanksgivings for her glorious mission, even in the hearts of the latest generation. Her self-denial, her prompt disregard of the thousand inconsistencies and absurdities of official assumption; her skilful foresight, and masterly planning; her readiness to take the responsibility of doing anything and everything necessary to promote the comfort of her unfortunate fellow-beings, at all hazards of offending the hardened hearts of those around her; her general activity and untiring perseverance, prove her to be amply possessed of the ability necessary to confront the demands of every emergency. Until her providential interposition, the hospitals had been without the commonest preparation for the reception and care of thousands of sick and wounded, pouring in from the suffering camp."

The following notice of her birth-place, by Dr. Spencer T. Hall, will interest the reader. The doctor describes certain rural scenery in Northamptonshire;—"But in the whole of the lovely view, never seemed a spot more fair or attractive than the old and many-gabled rural seat of Lea Hurst, henceforth classic for ever—the English home of Florence Nightingale,

* The reader must not confound this work with another, already quoted, entitled *A Month in the Camp*, &c.

THE MOTHERS IN THE HOUSE

whose name, like Grace Darling's, now quickens the beat of millions of hearts. Some people are born with a genius for nursing and solacing, as much as others are with a genius for music, or dancing, or poetry; and Miss Nightingale may be regarded as the archetype of her order. Her spirit first showed itself in an interest for the sick poor in the hamlets around Lea Hurst, but at length found a sphere requiring more attention and energy in continental hospitals, and afterwards in London, where she took the office of matron to a retreat for decayed gentlewomen. And now she is gone to tend and to heal the wounds of the sufferers by the siege of Sebastopol. What a contrast to the quiet pastoral retirement of this vale of Holloway, with its fireside memories and its rural delights! They who love not war must still sorrow deeply over the fate of its victims; and to such even now, amid all the din of arms, the beautiful and beneficent name of Florence Nightingale cometh sweetly as 'flute-notes in a storm.' And in after ages, when humanity mourns—as mourn it will—over the blotches and scars which battle and fire shall have left on the face of this else fair world, like a stream of sunlight through the cloud with which the present strife will shade the historic page of civilisation, will shine down upon it brighter and brighter, the memory of the heroic maiden of Lea Hurst, till all nations shall have learnt to 'do justly, love mercy, and walk humbly before God,' and covetousness, war, and tyranny shall be no more."

Collating the letters of Mr. Bracebridge; the letters, lectures, and book of the Hon. and Rev. Sydney Godolphin Osborne; the speeches and letters of Mr. Stafford, who sat by the bedsides of the patients, reading for them the letters of their friends, and acting as letter-writer general on their behalf; and the letters of Mr. Macdonald, the agent and almoner of the *Times'* Fund,—one may arrive at a correct view of the self-imposed duties and extraordinary impediments which Miss Nightingale had to encounter. She had to tend, or see tended, thousands of sick men; the commissariat, purveying, and hospital staffs, were utterly insufficient in number to perform the work expected of them, and neither the government at home, nor its representative to the Porte, made efforts to supply the deficiency; the stores actually sent out were put away in various places without order, and no person knew, except by accident, where to find anything; the authorities were jealous of all civil interference, which they regarded as a reflection upon themselves; the hospital scenes were such as to be hardly endurable by experienced surgeons; and pestilence, under the name of the "Scutari fever," raged throughout the two barracks; yet this admirable lady, and the

great majority of her assistants, bore up against all these accumulated evils, and endured to the end. Some, borne down by sickness and toil, were obliged to return. One of their benevolent coadjutors, a gentleman of unimpeachable veracity, describes them as showing throughout the most unswerving fortitude, and faith in the divine Protector. Of Miss Nightingale he says:—"I was with her when various surgical operations were performed, and she was *more than equal* to the trial. She has an utter disregard to contagion; I have known her spend hours over men dying of cholera or fever."

Through the aid of Mr. Macdonald she often obtained useful articles from the stores, which otherwise would have remained useless there. This was a work of contest requiring no mean perseverance, and was often successfully resisted by the officials, who seemed to think their chief duties were to receive the articles into store and keep them there. A portion of the *Times'* Fund was placed at her disposal for the purpose of a soup-kitchen, and this was the means of saving many lives. The work of ensuring cleanliness was perhaps the severest which Miss Nightingale had undertaken. When the year 1854 closed, the Turkish laundry attached to the hospitals was occupied as a *depot for chopped straw*, to be sent to Commissary-general Filder to feed the cavalry and artillery horses in the Crimea! A building had to be especially rented for the purposes of a laundry, through the intervention of Mr. Macdonald and this indomitable lady, *the rent to be paid by the Times' Fund!*

When Mr. Macdonald was about to return to England, having accomplished his mission, he thus wrote concerning Miss Nightingale:—"Wherever there is disease in its most dangerous form, and the hand of the spoiler distressingly nigh, there is this incomparable woman sure to be seen; her benignant presence is an influence for good comfort, even amid the struggles of expiring nature. She is a 'ministering angel,' without any exaggeration, in these hospitals; and as her slender form glides quietly along each corridor every poor fellow's face softens with gratitude at the sight of her. When all the medical officers have retired for the night, and silence and darkness have settled down upon those miles of prostrate sick, she may be observed alone, with a little lamp in her hand, making her solitary rounds. The popular instinct was not mistaken which, when she set out from England on her mission of mercy, hailed her as a heroine; I trust that she may not earn her title to a higher though sadder appellation. No one who has observed her fragile figure and delicate health can avoid misgivings lest these should fail. With the heart of a true woman, and the manners of a

lady, accomplished and refined beyond most of her sex, she combines a surprising calmness of judgment and promptitude and decision of character."

Happily the fears of Mr. Macdonald were not realised, and Florence Nightingale still lives—an honour to her country, an ornament to her sex, a grace to humanity—now when the hospitals of Scutari are closed, its cemetery has received the last martyred soldier of England, the clarion of war is silent, victory distributes laurels to the brave, and the fair hand of peace scatters blessings upon all. If Florence Nightingale be not rewarded, it is because her country has no honours worthy of her; her virtues and her services have so far surpassed the value of any gifts or honours the nation has to bestow, that we can only render the tribute of a deep gratitude, and treasure her name as the brightest in the annals of our nation's glory.

If the brow of Miss Nightingale wear no coronet, it is not because her queen was unmindful of her deserts, either while toiling by the pallet of wretchedness, or when her task of misery had terminated. While yet the tale of suffering at Scutari filled the ears and hearts of the nation, those about the court did their best to prevent the Queen of England from knowing the state of her poor brave fellows, who bore all things for her honour and their country's renown. Her majesty learned, indeed, the progress of events on the battle-field as the official despatches gave a general outline, or the letters of court favourites to court favourites gave more detailed accounts; but it was not deemed courtly to vex the royal ear by tidings of her sick soldiers sinking into despair and miserable death through the perversion of the very means she expected were put forth for their preservation. Her majesty's heart yearned to learn something of their fate, for notwithstanding the efforts to conceal from her the mismanagement of her officers, and the disgrace which had accumulated upon her government, some rumours found access to the royal mind, and her majesty sent the following to her secretary-at-war:—

Windsor Castle, Dec. 6, 1854.

WOULD you tell Mrs. Herbert that I begged she would let me see frequently the accounts she receives from Miss Nightingale or Mrs. Bracebridge, as I hear no details of the wounded, though I see so many from officers, &c., about the battle-field, and, naturally, the former must interest me more than any one?

Let Mrs. Herbert also know that I wish Miss Nightingale and the ladies would tell these poor, noble, wounded, and sick men that no one takes a warmer interest, or feels more for their sufferings, or admires their courage and heroism more than their queen. Day and night she thinks of her beloved troops. So does the Prince.

Beg Mrs. Herbert to communicate these my words to those ladies, as I know that our sympathy is much valued by these noble fellows.

VICTORIA.

The newspapers containing copies of this letter arrived in Scutari before the end of the year, and it was a source of consolation to the nurses and of joy and triumph to the men. It is no exaggeration to say that a vast amount of benefit to the sick resulted from that letter. It stimulated all about the hospitals upon whose care, zeal, and vigilance, depended the sick man's human hopes; and it diffused a spirit of resignation and cheerfulness along the terrible corridors of the hospitals. The men felt a pride and comfort that their queen thought of them; and many a wish was expressed that they might recover, in order to serve her majesty once more where the hissing shell sped its flight, or the glistening bayonet presented its point.

It is needless to pursue here an inquiry into all the causes of the suffering which her majesty only gradually learned. In spite of complicated offices and selfish officialism, the *main cause* was the crotchety and conceited self-sufficiency of certain members of the cabinet, and the incompetency for the task which they had assumed of that portion of it which insisted upon the exclusive conduct of the war. An officer of "fifty foughten fields" pointed out to the author the following extract from a military periodical of great reputation as solving the whole enigma:—"The origin of all our misfortunes was the want of provision, in the outset, for actual operations in the field. It is idle to say that this circumstance could not be felt nearly a year afterwards, for every one knows, from incontrovertible testimony, that it had hardly been remedied at the close of the siege. War was commenced without any expectation that it would be seriously prosecuted; and, in the first instance, it was even thought that the army would not proceed further than Malta. On this account no attempt was made by the authorities at home to render the force available for active service, and the same policy and the same supineness prevailed when the expedition was sent forward to Constantinople. We had so many men, and so many bayonets, but nothing more; no efficient artillery train, no augmented commissariat, no adequate medical and hospital staff, and, worse than all, no transport. It was still believed that the troops would not be called upon to fight, and on this belief the British government continued to act, shutting their eyes to every incident which foretold the future. But the Russians, who had employed a century in making ready for this contest, were not to be frightened by shadows. Goliath had buckled on his armour, and come out to fight; his attitude was unmistakable, and the military world looked wondering on, while the British government still made no preparation. Meanwhile the troops began to feel the effects of the climate;

the cholera appeared; the medical staff, few in number, and overwhelmed by the multitude of patients, were literally worked to death, and many valuable officers were swept off by the plague."

The various remedies put forth by the people of England, and by the government under the pressure of public opinion, began to tell about Christmas. Up to that time a series of unfortunate events tried the patience and hope of the indefatigable ladies upon whom the responsibility might now be said to devolve—for the people at home lost all confidence in the officials, and transferred it to those true-hearted missionaries of their own choice. One of the principal tokens of amendment appeared in the change of feeling and opinion among the working surgeons, who, ceasing to regard their gentle coadjutors as intruders, gradually, as we have elsewhere shown, welcomed their co-operation, and at last consulted them on all occasions where the comfort and help of the invalids were concerned. But in spite of an improved spirit among the doctors, and the aid from home, one misfortune trod closely upon the heels of another, mocking every effort materially to lessen the aggregate misery and death. We have already shown that numerous detachments of wounded were brought from Inkerman the day after the arrival of Miss Nightingale, and her fellow-helpsers who accompanied her on the voyage out. Soon after Inkerman the great storm ravaged sea and shore, and Therapia and Scutari received new accessions of wounded, bruised, and sick men. The cholera re-appeared at Sebastopol only a fortnight after the storm spent its fury on those stricken heights. The deluging rains of November caused fever, ague, rheumatism, and chest complaints, to such a degree that few hale men remained among the English who still battled for the capture of the strong city. The changes in December from warmth to cold, from rain to frost, from tempest to moist and foggy calm, contributed still very much to the sick-lists. All this while the men were overworked, and skirmishes and contests repeatedly occurred. No wonder that Miss Nightingale's arrangements, with all that Mr. Macdonald, Mr. Osborne, Mr. and Mrs. Bracebridge, and Mr. Stafford could do, were unequal to meet the appalling increase of the victims of mismanagement, incompetency, and severity of climate, before Sebastopol. The number of ladies sent out was too small compared with the awful requirements. The "Lady Volunteer," in her interesting book, says:—"How small has been the number of women sent to the military hospitals of Scutari, Kulali, and Balaklava: 142 in all, and of these only fifty-five were volunteers—twenty-seven ladies, twenty-eight Sisters of Mercy; and of these

only seventeen ladies and twenty Sisters were on the spot at one time; while in the French and Sardinian services there have been hundreds of *Sœurs de la Charité*."

Accordingly, although affairs mended much about Christmas, the intensity of the frost of January, 1855, gave a new impulse to the sickness, and the youths who arrived as recruits formed speedy candidates for the ambulance or "the stretcher." Other hospitals were founded or resorted to as temporary auxiliaries to the principal ones, but still all efforts proved inadequate to the strain upon them which accumulating miseries caused. Mr. Bracebridge, writing at the end of December, while acknowledging thankfully to the benefactors of England the melioration produced, predicted doleful things, and his sorrowful vaticinations were but too faithfully realised. As January, 1855, opened, most things at the hospitals were on a better footing; but the mass of human misery had increased, was increasing, and threatened to grow to proportions baffling all attempts at mitigation, unless the government at home put forth its might, or the ambassador at Constantinople, *who had full powers*, bestirred himself. At the end of January, there were 5000 sick men at the camp, most of them waiting for transmission to Scutari. The General Hospital at Scutari, and the Barrack Hospital, were crammed with patients to the very doors, and the stench tainted the atmosphere around both. Seven other hospitals were created on different parts of the Turkish coasts. Near the Barrack Hospital were good cavalry stables, fitted up in the manner usual with the Turks, who take great care of their cavalry. One hundred and eighty beds were arranged there, and it was a more fortunate allotment for the poor sick or wounded men than the adjoining hospital, to which it was auxiliary. Near the general hospital is the spring palace of the sultan, this was fitted up as a *convalescent* hospital with 500 beds. Alas! many who entered it as "convalescent" were doomed to the cemetery. Another convalescent hospital was furnished at Abydos with 400 beds. Here most of the men were really convalescents—the air of the Dardanelles seemed very salutary to those sent thither from the Bosphorus. The hospital for Russian prisoners at Kulali, on the Bosphorus, was appropriated by the English—for the Russian prisoners, having generally the good fortune to be under the care of the French, were not subjected to the pestilence, filth, and neglect from which the English suffered. The Russians at Kulali afterwards occupied the arsenal at Stamboul. The Convalescent Hospital at Smyrna was under civil management, and was very successfully conducted. Here also benevolent women were occupied in restoring the languid sick. One of

these excellent ladies gave the author much useful information concerning this and the other hospitals, and afforded him an insight into the principle of management such as enables him to express with greater confidence the opinions and statements these pages contain. The hospital at Smyrna was beautifully situated; its site was picturesque, and its neighbourhood salubrious. The climate favoured recovery, being one of the most delightful in the world. The supplies were ample, fruit and wines were easily procurable, and generous hands on the spot supplied luxuries and comforts. The lady nurses were treated with respect and the tenderest consideration by all who came near them, and the gratitude of the poor soldiers repaid the generous care bestowed upon them. There existed among the men a perfect horror of going back to the Crimea; they were willing to fight the enemies of their country, and to fall in its service, but their confidence in the capacity of their chiefs was gone; and while they looked forward to battle with the enthusiasm of British soldiers, they regarded with despair the prospect of neglect and hardship which would be to a great extent unnecessarily entailed upon them. Most of the men would have preferred to be laid in the burying-ground at Smyrna to going back to the Crimea, unless with the prospect of meeting a soldier's death in combat with the foe.

One of the devices adopted to increase the hospital accommodation on the Bosphorus was ingenious, but did not conduce to the health of the place. The open square of the Barrack Hospital was filled with a structure which accommodated 1000 patients. This additional hospital space did not check the progress of death—on the contrary, fever and dysentery were more rife than before. Many who entered these receptacles of the sick, with wounds not necessarily mortal, *died of being in the hospital*, catching "the Scutari fever," or being carried off with diarrhoea or dysentery. By the end of January not less than 6000 men were invalided on the Bosphorus, exclusive of the sick and wounded at Malta, the Dardanelles, Smyrna, and the many thousands almost untended in the Crimea.

All through this unhappy winter the nurses experienced impediments from some of the officials; but that which most of all invoked the indignation and censure of the country, and every human heart, was the mode devised for preventing the voluntary gifts of the people of England, through Miss Nightingale, from reaching those for whom they were intended. The packages arriving for her were placed under lock and key by the authorities, and nothing could be procured without a series of requisitions, which so consumed time that the benefit

was lost to the invalid, or his case escaped notice altogether. It was in vain that Miss Nightingale protested—in vain did the influential persons whose countenance and aid were so valuable to her rebuke and implore; the benefactions of England were locked up by the governing hands lest their authority should not be appreciated, and that it might ultimately appear these things were not wanted, but had been provided by the purveyor, or commissary, or chief medical, or some one else whom it was supposed was the proper medium through which it should come. The authoress of *Eastern Hospitals* thus states this fact, and accounts for it. The recital is truly horrible: it seems a libel upon human nature even to suppose such wickedness and hardness of heart, but it is certain from other evidence that this good nurse is a true witness:—

"The want of clean linen was bitterly felt at that time at Scutari. How it was issued from the stores was a mystery no one could ever unravel. If things were sent to be washed, they never returned, and there was not the slightest order or regularity in the issue of linen, either sheets or shirts. Towels and pocket-handkerchiefs were both considered unnecessary luxuries for the soldiers, and could be obtained only from Miss Nightingale's free-gift store, and, generally speaking, only from them could flannel shirts be had. Orderlies thought nothing of taking off a soiled flannel from a man, and giving him a clean cotton in exchange. Confusion, indeed, so prevailed in all quarters at that unhappy time, that though quantities of things were sent to Scutari, but few ever reached the sufferers for whom they were destined. Every ship that came in brought to Miss Nightingale large packages of every imaginable article of wearing apparel; great numbers of bales of old linen and lint also arrived, and these last were quite useless, as both were amply supplied from the medical stores of the hospital. The packages were unpacked and put into Miss Nightingale's free-gift store, which was a large shed outside the hospital. It was impossible for Miss Nightingale, with her numerous and arduous avocations, to find time even to look at them; no one had the regular charge of them; nurses and sometimes ladies, when they had time, went to assist at the endless task of putting them to rights. There was another store inside the hospital, which was under the charge of the Superioress of the Sisters of Mercy; this store was kept in beautiful order, but was quite full. From neither of these stores of Miss Nightingale could anything be procured but on the same plan as the diets, *i.e.* a doctor's requisition signed and countersigned. It was even more impossible to get these than the others for diets, from a feeling among the surgeons that clothing

for the men ought to have come from government stores, and not liking fully to acknowledge the gross neglect of the purveying department. So we only saw how miserably the men were off, and were obliged to leave them so. It was a common thing to find men with sheets and shirts unchanged for weeks. I have opened the collar of a patient's shirt, and found it literally lined with vermin. It was common to find men covered with sores from lying in one position on the hard straw beds and coarse sheets, and there were no pillows to put under them. Pillows were unknown to the government stores, and we could not get requisitions for them from Miss Nightingale's free-gift store."

When the writer of the foregoing paragraph complains in the following gentle terms, her patience of temper, as much as her patience of toil, commends itself to our admiration:—"As we passed the corridors, we asked ourselves if it was not a terrible dream. When we woke in the morning, our hearts sank down at the thought of the woe we must witness that day. At night we lay down wearied beyond expression; but not so much from physical fatigue, though that was great, as from the sickness of heart from living amidst that mass of hopeless suffering. On all sides prevailed the utmost confusion—whose fault it was I cannot tell—clear heads have tried to discover in vain; probably the blame should have been shared by all the departments of the hospital." Referring to their patience of toil, it would be difficult to give the reader any adequate idea of their round of daily and nightly duties. They had to do everything for themselves, as well as for the patients—there were few else to serve either. The authoress of *English Nurses* says:—"Our life was a laborious one; we had to sweep our own room, make our beds, wash up our dishes, &c., and fetch our meals from the kitchen below. We went to our wards at nine, returned at two, went again at three (unless we went out for a walk, which we had permission to do at this hour), returned at half-past five to tea, then to the wards again till half-past nine, and often again for an hour to our special cases. . . . We suffered greatly from want of proper food. Our diet consisted of the coarse sour bread of the country, tea without milk, butter so rancid we could not touch it, and very bad meat and porter; and at night a glass of wine or brandy. It was an effort even to those in health to sit down to our meals; we forced the food down as a duty, but some of the ladies became so weak and ill they really could not touch it."

There are a few things in English military history which more exemplifies the character of the English soldier than the way in which they conducted themselves when sick upon the

shores of the Bosphorus. A subaltern officer, writing to his wife, describes them as at once manly and resigned, bearing every privation with unrepeating fortitude, and maintaining a soldierly dignity even when carried helpless and maimed from the pier to the ward or corridor of the wretched asylum prepared for them. The writer of *Eastern Hospitals and English Nurses* thus eulogises their uniform delicacy of behaviour to the nurses:—"Our life was a regular routine of work and rest (except on occasions of extraordinary pressure) following each other in order; but whether in the strain of overwork or the steady fulfilment of our arduous duty, there was one bright ray ever shed over it, one thing that made labour light and sweet, and this was the respect, affection, and gratitude of the men. No words can tell it rightly, for it was unbounded, and as long as we stayed among them it never changed. Familiar as our presence became to them, though we were in and out of the wards day and night, they never forgot the respect due to our sex and position. Standing by those in bitter agony, when the force of old habits is great, or by those in the glow of returning health, or walking up the wards among orderlies and sergeants, never did a word which could offend a woman's ear fall upon ours. Even in the barrack-yard, passing by the guard-room or entrances where stood groups of soldiers smoking and idling, the moment we approached all coarseness was hushed; and this lasted not a week or a month, but the whole of my twelvemonth's residence, and my experience is also that of all my companions. It was astonishing the influence gained by the ladies and sisters over the orderlies. Without their superintendence they were an idle, useless set of men, callous to the sufferings of those around them, not trying to learn their business, which was of course new to them, and regardless of carrying out the doctor's orders when they could do so without getting into disgrace; but under the sisters and ladies they became most orderly and attentive."

Among the many strange tasks undertaken by the ladies was that of sharing the honour, with Mr. Augustus Stafford, in writing letters for the men. The letters of the soldiers—at least, when written by themselves or entirely under their dictation, without any of the modifying or mollifying influence of womanly sweetness—strikingly exhibited the strangely-blended roughness and affection of the English soldier. The writer* last quoted gives the following specimen:—"Writing their

* Much discussion was carried on in England as to the propriety of employing ladies in such a service. Although pertinent to the subject of this chapter, notice of the discussion is not essential to this History, but the question is so important in itself that our readers will desire to know what the experience acquired by the ladies themselves

letters home for them was most amusing; very often they had not a word to say, but trusted entirely to the lady. 'What shall I say?' we began with.—'Just anything at all you like, miss—just the same as you write your own letters home. You knows how to make up a letter better than I do!'—'But how shall I begin?'—'My dear Thomas.' The lady writes on, hoping dear Thomas is well, and informing him of the illness and whereabouts of his friend. Then she inquires what relation the said 'dear Thomas' is to him. 'Oh, he's just my father, miss!' She suggests the propriety of addressing him by his usual title. 'Oh, never mind, miss, it's all the same—it will do very well!' One of the men received a letter from his wife, entreating him in the most broken-hearted words to allow her to come out and nurse him—that she was utterly miserable, could not sleep at night thinking of what he was enduring, and so on. The poor man very likely felt more than he cared to express, but he chose to treat it with apparent indifference and almost amusement. 'That's just the way women talks—they're always

awanting to do impossibilities. They fancies they can do anything! Oh, yes, they fancies it fast enough, but then you see, they can't, so what's the good of it? I should like to see her come out here, indeed! A pretty place for a woman by herself, and I shouldn't be able to see after her. She's much better at home, and I'll write and tell her once for all that it's impossible and no good whatever talking about it no more.' Fortunately for the poor wife's feelings his arm was too stiff to write that day, as he evidently intended to send her a severe reproof for her folly, rather forgetting in his wisdom the deep affection and anxiety contained in her earnest pleading to come and nurse him. As the post went out next day he rather reluctantly accepted the sister's proposal to write in his stead, and she, of course, took care to soften the refusal as much as possible, and poor Mrs. — was very likely rather surprised at the unusual affectionate letter she received from her husband by that mail; and we must hope it in some little measure compensated for her disappointment, though, doubtless, a few stern lines merely granting her request would have been far preferable."

led them to feel and think about it. The following will satisfy this curiosity:—"Attention has been drawn towards the class of women whose task it is to nurse the sick of England. These pages will in some degree show how unfitted they are for that responsible office. For though a military hospital was the worst imaginable position in which to place them, yet those who were unable to resist its temptations are certainly unfitted for their present occupation. Regarding the ladies who went out various opinions have been entertained. Perhaps in this case their own view of their position may be the best, as they learnt their knowledge by experience, and most of them agreed that though in the great emergency that had called them forth their efforts had been blessed to the relief of much suffering, the system was based on no permanent footing. To raise the occupation of a nurse to a higher standard, to form a body who will both nurse in our home hospitals as well as be ready to attend the sick in the army and navy, other means are required. There are two reasons which may be alleged against the permanent employment of ladies. For the arduous duties of an hospital (especially in a foreign country) long training is required ere the health can endure them. The neglect of this precaution will cause a waste of many valuable lives, while the amount of good for which they will be sacrificed will be but small. Again, experience is necessary for the attainment of skill in nursing, and it is therefore necessary nurses should be changed as seldom as possible. But this is simply unavoidable when they are ladies possessing home-ties and duties which they are only enabled temporarily to relinquish. Of course there are exceptions to this as well as all other objections which may be raised against the plan, but I speak not of small or isolated efforts, I speak of a supply to the present great deficiency of nurses for the poor of England. But, I repeat, it is not for military hospitals alone that we want better nurses. War, it is hoped, has almost passed, and its trials and troubles too; but as long as this world continues suffering will go on, and will prevail to its greatest extent among the poor; and shall England, who proudly boasts her superiority in science, government, and wealth, above other nations, be behindhand in alleviating the bitter sufferings of her own children?" The value of this lady's testimony is the more important when it is remembered that she, with another lady and a hired nurse, had the care of 1500 sick and wounded! This in a hospital prepared for 1700 patients, but in which there were about 3500.

The conduct and usefulness of the lady nurses is the more important when the fact is recollected that the *hired* nurses were unwilling to do anything for which they were not paid, and were sometimes insubordinate, often difficult to manage. The voluntary services of these ladies will be estimated in proportion as this latter fact is known. "It was like the revival of the olden times, when women were almost exclusively the nurses and physicians of the sick warriors, to witness the departure of ladies, nurtured in our somewhat effeminate civilisation, to the hardships and miseries of a camp."

About the middle of January, Colonel Hamley was sent to the Bosphorus on duty; he visited the hospitals at a juncture more favourable than at any time previous, and soon after his departure matters fell back very much; he thus writes as to what he saw:—"Entering any of the corridors, or wards, the same scene presented itself. The occupants of some of the beds sat strongly up, eating heartily their soup and meat; others, emaciated to skeletons, more like corpses than living beings, except for the large, hollow, anxious eyes, lay back on their pillows, or tried with difficulty to swallow the spoonful of arrow-root or sago offered to them by the attendants. There seemed no doubtful class—all were broadly marked either for life or death. The patients appeared comfortable—had good beds and plenty of bed-clothes; and the temperature of the chambers was, as before said, regulated to a very pleasant warmth. At some beds a woman, the wife of the patient, sat chatting with him; beside others stood the

somewhat ghostly appearance of a Catholic Sister of Charity, upright, rigid, veiled, and draped in black; the veil projecting far beyond her face, threw it, as well as the white linen folded across her bosom, into deep shadow. The thinness of some of the forms propped up against their pillows, their chests exposed by the open shirts, was absolutely frightful; the bony hands wandered vaguely about the hair and sunken temples, and the eyes were fixed on vacancy. Some lay already in the shadow of death, their eyes reverted, showing only the whites beneath the drooping lids; and others had passed this last stage, and waited only for the grave. At the end of a corridor in a tower are quarters once held by General Sir George Brown, but now occupied by gentler tenants. There dwelt the sisterhood that had come from England to tend the sick—the Rebeccas to the Ivanhoes of the Crimea. That quarter of the building threw a softening and romantic tinge over the rest; in its neighbourhood pain and misery seemed less forlorn. The corridor opened on a kitchen where some good sisters were preparing soup, sago, and wine, and other comforting compounds. Doorways opening from the kitchen were screened by long folds of black cloth or tapestry, behind which dwelt the lady sisters; and high up the wall of the kitchen were windows, across which flitted nun-like forms, heard presently to descend the stairs to our level. It was while one of two or three who accompanied me, a man of sedate and respectable aspect, such as might without presumption engage the attention of a Sister of Charity, extracted from a motherly, benevolent lady some statistical details of the sisterhood, that the chief of them herself, Miss Nightingale, lifted the piece of tapestry before her door for a parting visitor, stood for a moment revealed. During that short interval the statistics of the motherly lady were unheeded. We steadily regarded the chief as she bid her visitor adieu; then the tapestry fell and she vanished. There were eight Protestant ladies, and a rather larger number of Catholic sisters, in all, with their attendants, who officiated as nurses, there were about forty in the sisterhood. In the great kitchen, close by their quarter, rice-pudding, manufactured on a grand scale, was transferred, smoking, by an enormous ladle to the destined platters; beef-tea and mutton-broth were being cooked in large cauldrons, such as the witches danced around; and flocks of poultry were simmering into boiled fowls or chicking broth. There are three English hospitals besides this; one at a little distance, a large red brick building, was originally built and used for the purpose by the Turks; it is the most comfortable and best suited to the object of all; another is known as the Kiosk or Palace Hospital; and the third is

at Kulali, a place some miles up the Bosphorus, on the Scutari side, where there is a large barrack, which was occupied by the English cavalry and artillery before the army left for Varna. All these buildings were clean, cheerful, airy, and comfortable. They contained in all, at the time of my first visit, 4700 sick, increased to 5000 at the end of January, and from first to last they received 30,000; some came back to the Crimea, where, in many cases, they relapsed into sickness and died; some went to England, and some to their final resting-place."

Colonel Hamley certainly does not dwell on the most painful features of Scutari life, while he had an opportunity of witnessing them. There is a manifest desire to paint things *couleur de rose*. It is difficult to reconcile some of his statements with others which we have recorded from the Hon. and Rev. S. G. Osborne, Mr. Macdonald, Mr. Bracebridge, and the authoress of *Eastern Hospitals and English Nurses*. For this reason we have quoted his narrative in this place, that the reader may form an impartial judgment from testimony of every kind which could be suitably furnished. Lieutenant Peard, whose narrative we have frequently quoted, arrived at Scutari invalided three weeks earlier than the visit of Colonel Hamley. This difference in the time of their visit will to some extent account for the difference in the *tone* of the testimony. Lieutenant Peard was too ill to see much of the men in the corridors—he was in one of the best wards, but he hourly heard of what was going on. Things became very much better and very much worse after Lieutenant Peard left; and in the former stage of affairs Colonel Hamley landed in the Bosphorus. By the end of January and beginning of February the accumulation of numbers in the hospitals set all system and all zeal alike at defiance—the men could not then be sufficiently attended to by thrice the number of nurses and surgeons. Lieutenant Peard thus describes his voyage to the Bosphorus, and what he saw there:—"We arrived at Scutari in the afternoon of the 20th, after a voyage of eight days, during which we had lost thirty men. Our invalids, as may be imagined, were rejoiced to get there, and expected to go on shore immediately; but the crowded state of the hospital prevented their being landed for some little time. They had, however, received many medical comforts on the voyage, in the shape of arrow-root, sago, mutton broth, port wine, &c., which their kind and attentive doctors ordered for them. One poor fellow died immediately after his dinner, about which he had been quarrelling, and, I suppose, had over-exerted himself. Many of the poor men were in the most filthy state, and the medical men came up from the decks looking wan and ill. The worst of the blan-

kets had, however, been destroyed, and replaced by others, and additional ones had been issued at D——'s request; in fact, every care and attention was taken of the sick, but the ship was totally unfit for the duty assigned to it. The galley was not large enough for the cooking of two separate diets at the same time. Invalid ships should be fitted with cribs and partitions on the deck for the worst cases; and the sick should always be conveyed in steamers, or be towed down."

Mr. Peard makes the following acknowledgment of the services afforded to officers as well as men by the *Times*' Fund:—"I was ordered before a medical board on the 29th, when it was determined that I was to proceed to England for the recovery of my health. On the 30th Major Sharpe was buried in the military burying-ground at Scutari, and his remains were followed to the grave by all his brother officers who were well enough to attend. Forty men were buried this day in one grave, and sixty the day before.—My dinner during my stay at Scutari was always supplied from the *Times*' kitchen. I could get soups, jellies, and blanchmange, as well as anything I required to be cooked. How happy were we to be able to procure such luxuries! I cannot be too thankful or speak too highly of this generous institution. Nothing could have been better organised and arranged; and all who derived benefit from it will feel grateful to those who contributed so generously towards the fund, as well as to the newspaper which evoked the sympathies of the public. My illness prevented my going into the wards and rooms, and visiting the sick, and I was obliged to remain patiently in my very comfortable quarters. I heard great praises of Miss Nightingale. Her kindness and thoughtfulness cheered the poor sufferers in the hospital."

Probably the most correct solution of any apparent contradictions in the representations made by different officers of the condition and treatment of the sick is, that in the latter end of December and throughout January, better food, warm drinks, clean shirts, and bedding, were distributed *as fast as the number of hands engaged could distribute them*; so that in some portions of the corridors plenty and comfort would prevail, while the miseries of others had not as yet been either mitigated or touched.

The transmission of the maimed and wounded who became convalescent, but who were unfit to be sent again to the Crimea, was an important and often ill-managed duty on the part of the authorities at the Bosphorus. An instance of what these men sometimes suffered, and would have had in all cases to endure, if left to the tender mercies of government arrangements, occurred at the end of November. Two hundred convalescents were

on ship-board, and about to sail for England. The weather was intensely cold, as it always is at that season in the Bosphorus, but was especially so in the winter of 1854. None of these men were perfectly recovered: all were delicate, and still needed nursing; many were too ill to be with propriety sent away at all, if by doing so the chance of saving their lives was not greater than by allowing them to stay at Scutari. Yet the accommodation provided for them was a long wooden trough, in which each lay like a corpse placed in an open coffin—a single blanket by way of bed and bedding was given to every man! In forming some notion of the callousness of persons in authority, it must be remembered that the government declared in the most public manner that the British ambassador had a *carte blanche* as to any expenses to be incurred for the comfort and convalescence of the invalids. Mr. Macdonald opportunely discovered the condition of these poor fellows, and the *Times*' Fund was, as in many other cases, brought into most merciful requisition.

One of the most painful and pitiful things connected with Scutari was the frequent and irreverent interments. The Turks looked upon the matter-of-course burials of the English with perfect horror. Their reverence for the dead has been more than once noticed in this History; and often would they look on in mute astonishment at the English burial scenes in the cemetery at Scutari. The unseemly pit, the coffinless corpse, the hasty and noisy sepulture, the lightness of behaviour which immediately after the interment marked the conduct of the lookers on, utterly shocked the grave and dignified Osmanli. No description which we have seen of these burials presents so graphic a picture as that of Colonel Hamley: there is a terrible reality in his description, which makes one shudder over so inappropriate a close to the career of men so nobly brave:—"On the edge of the bank of the Sea of Marmora, a few hundred yards to the left of the mouth of the Bosphorus, is a level space of green sward, used by the English, from the time of their arrival in Turkey, as a burying-ground. The placid sea, the distant isles, the Cape of Broussa on the left, and Seraglio Point on the right, make up a lovely view from the melancholy spot. At the southern extremity of the ground are single graves, neatly defined and turfed, where those who died while the army halted here in the spring are laid. But the press of mortality no longer admitted of such decent burial. To those accustomed to see the departed treated with reverence, and attended solemnly to their last habitation, there was something horribly repulsive in wholesale interment, while the dead far outnumbered those who stood around the grave. A pit often ten feet deep, and

fourteen square, received every afternoon those who had died during the last twenty-four hours. A rickety araba, drawn by two oxen, was the hearse which conveyed them from the neighbouring hospital to the place of sepulture. In the yard of the hospital is a small dismal house without windows, for its tenants no longer need the light. Thither those who have died in this and in neighbouring hospitals are brought on stretchers, and packed like sacks in a granary, till the araba comes for them, sewed each in a blanket with sufficient tightness to leave a caricature mummy-like resemblance of humanity. A score of bodies are laid on the vehicle, and travel slowly, dangling and jostling as they go, to the mouth of the yawning pit, where the party who dug it await the *cortège*. There is no time for ceremony; each poor corpse, huddled and doubled up limply in case of recent death, or stiff and statue-like where it has been longer cold, is handed down nameless, unknown, and void of all the dignity of death, to its appointed station in the crowd. One row being laid, the next comes, and the feet of all those who deposit them necessarily trample on the forms below, leaving muddy footprints on the blanket shrouds. Sixty-one (about the daily and average number at the time) were buried together on the day I visited the spot. Noticing one corpse in which the lower part of the outline seemed remarkably thin, I remarked to the corporal in charge that that deceased must have been long ill to be so wasted, but he pointed out to me that one limb had been amputated. A clergyman waited until all were deposited to read the funeral service. Close by another pit was being dug for the requirements of next day; and we had seen in the hospital many of those unmistakeably destined to fill it. Altogether the scene reminded one of Defoe's accounts of the burials in London during the prevalence of the Great Plague. I have mentioned elsewhere the trenches dug in a battle-field, but these were dug in rows, and the men lie like soldiers, with an awe and glory on their bloodstained uniforms and upturned faces, which no pall or coffin could bestow. Death is deprived of his sanctity, majesty, and mystery, and retains only those elements which constitute the grotesque. Officers are buried singly in groves, with a head-stone or board to mark the place."

The state of the French hospitals on the Bosphorus formed a remarkable contrast to that of the English. Colonel Hamley endeavours to throw discredit upon this well-attested fact. He, however, found the French hospital in its usual condition, and everything was there systematically managed. In the English hospitals the patient well-served to-day could not therefore calculate upon being well-served to-

morrow; in the French regularity and order reigned. Whatever advantages Colonel Hamley recognised in their condition when he visited them, had been in existence months before, whereas the English hospitals were nearly destitute of everything until after the arrival of Miss Nightingale; and it was *long after* her arrival before any sufficient supplies were transmitted, or, at all events, distributed from the government stores, and before she could calculate upon even her own stores being at her own disposal. While a few nurses struggled against the accumulated miseries of Scutari, an adequate number of Sisters of Mercy ministered to the necessities of the occupants in the corridors of Pera. A comparison of the hospital sites was also to the disadvantage of the English. It was not candid of Colonel Hamley to express his surprise that the deaths at Pera were fewer proportionably than on the English side of the Bosphorus, on the ground that he saw no difference between the discipline of the establishments, the nutrition of the food, the character of the attendance, the situation of the sick, or, indeed, anything except the classification of diseases, which he erroneously asserts was at first carried out in the English hospitals, until the overwhelming numbers of the patients rendered it impossible. The greater number to be attended the more necessary such classification, which, if attempted at all, the attempt was utterly abortive from the first, and Colonel Hamley ought to have made himself acquainted with that fact before standing sponsor for the English hospital service.

"Wishing to see the French hospital in Pera, I applied to M. Lévy, the inspector-general, who very kindly gave me a note to M. Morgue, the principal medical officer, in which he prayed him to receive some other Englishmen and myself, '*avec la courtoisie que méritent si bien nos dignes alliés.*' The building, standing on a high point of ground above the new palace of the sultan, and conspicuous from the Bosphorus, was originally intended as a school of medicine. It is very large, newer and fresher, and the wards and apartments loftier than those of our hospitals. At the door was a covered cart, with a cross in front, filled with coffins, and drawn by oxen. In the first room we entered, besides some French officers, there were a Russian captain and two subalterns, wounded at Inkerman, playing at some game like draughts. In the next room, a very spacious one, with a painted ceiling, and windows opening to the floor looking on the Bosphorus, were five or six French officers, apparently very comfortable. The corridors, like those of our hospitals, were filled with patients; in the wards, the beds on each side were raised on a platform above the floor; there was a very

thick palliasse under each man; across the rail at the head of the bed was a shelf with his medicine bottles, and on a card at the foot was a description of his case. The surgeon who accompanied us round pointed out a remarkable case, that of a man who had received a bullet in the head, which, entering on one side, had gone out near the opposite ear, passing close to the lobe of the brain; he was sensible, apparently suffering but little pain, and would, the surgeon thought, live. Opposite him was another with his skull fractured by a sabre-cut from a Russian officer; the surgeon, removing the dressing with tweezers, tapped them audibly, without pain to the man, on the bare skull bone, which was cleft for about an inch, and surrounded by a gaping wound in the scalp. The poor fellow whined dolefully as the instrument-case was unfolded, but the surgeon reassured him, saying he was only going to move the dressing: he told us afterwards he thought it would be necessary to trepan him. Sisters of Charity, with the freshest of complexions and the snowiest of caps moved to and fro among the beds; one of them was an Irish-woman from Meath, who had left Ireland, as she told us, five years before to join the sisterhood. One corridor was filled with convalescent Russians in their uniforms of gray or blue, surmounted, in many instances, by a French cap; they stood up respectfully and grinned approval when the good doctor patronised them by a tap on the back or a pull of the ear. The chief distinction between this hospital and ours seemed to be that here the patients were classified according to the nature of their ailments; one ward was filled with cases of frost-bites, another of wounds, another of fever—a plan tried at first in our hospitals, but broken in upon by the throng of sick arriving. It is probable that the worst cases are kept apart in the French hospitals, as none of the men we saw seemed in extremity, and it is certain that '*nos dignes alliés*' like to exhibit on all occasions the best side of their management. The doctor said the deaths averaged seven or eight a-day out of fourteen hundred—about half the proportion of those in our hospitals; a variation somewhat puzzling, since there seems nothing in the difference of accommodation, care, nourishment, or treatment, sufficient to account for it."

The testimony of the Hon. and Rev. Mr. Osborne may be set against the depreciating tone of Colonel Hamley:—"The French are certainly a most wonderful people, at home, anywhere; I found it difficult to believe that the order, quiet, regularity of service, and perfect machinery of this hospital, could be the growth of but a few months, and that too in a foreign land. One element was obvious throughout—system; every one seemed to have

his own particular sphere of duty, and quietly to set about it; nothing seemed left to chance, a certain importance being given to even the smallest matter of detail. Passing with the chief officer from bed to bed, I heard his orders as to diet and treatment for the day given most distinctly: they were noted down on the spot by an official in attendance for the purpose. The surgeons in uniform, with their trained orderlies in proper costume, went systematically to their work; the trays with the dressing apparatus were well contrived and admirably furnished; the Sisters of Charity had each her post and its well-defined duties, and went about them coolly, and with a skill the evident result of perfect training. . . . The dispensary, with its adjoining laboratory, its abundant stock of medical *matériel*, and its well-considered arrangements, showed at once the skilful adaptation of proper means to attain the end desired, so characteristic of the French. The baker's department, the kitchens, the large bathing-room, with its many capacious baths—each, in its own way, was all that could be desired. I saw the meals for the patients in course of preparation; it was far more like the cooking for an hotel than for an hospital. They have established so well-considered a system, affecting the supplies each day from every department of the various things required, as prescribed by the medical authorities, that all work with the order of a well-regulated machine; the dispenser, the cook, the baker, had evidently no time to be idle for a moment; there was ample evidence of the demand made upon their separate resources, but there was no hurry or confusion."

Dr. Lévy, referred to by Colonel Hamley in the narrative of this visit, was the chief of the medical staff of the French army in the East; a report of his, written at the end of October, and directed to the minister of war at Paris, proves that the plan of management and the working out of that plan in detail were infinitely superior to those of the British. The following extract from Dr. Lévy's report will be sufficient to prove this as it regards the hospital arrangements in the Crimea, as Mr. Osborne's statement establishes it in reference to the Bosphorus:—"The divisionary field-hospitals are well installed, well provided, and well attended. Everybody concurs in praising the good that they do. That of the headquarters has assumed a useful development; composed of a group of tents and a wooden erection for 115 patients, it offers, like that of the divisions, but upon a large scale, conditions of comfort and regularity which one is almost astonished to find at so short a distance from a besieged town. A field-hospital hospital has been established at Cherson, on the shore, to shelter and give attention to the sick and wounded up

to the time of their embarkation. I visited it yesterday, and found only two serious cases—namely, an intermittent fever and a case of cholera, of mean intensity. The trench-ambulance is formed by turns by two assistant-surgeons of each divisionary field-hospital, and two assistant-surgeons of the head-quarters; they are directed by the different chiefs of the field-hospitals, who have solicited the honour in turns of this more exposed post, which has been granted by the general-in-chief on my application. The camps are spacious, provisions are abundant, bread and fresh meat are distributed at least one day in three, and these provisions are all of good quality. The wine is beyond contradiction the best that can be procured. The moral state of the army is perfect. The earnest solicitude of the general-in-chief for the comfort of the soldiers, the administrative vigilance which has collected so promptly provisions for a period of at least three months, and the intelligent activity of the surgeons, combat with efficacy the injurious influence of an advanced period of the year and a special state of war." Independent of the hospitals at Cherson, in the Crimea, and at Pera, on the Bosphorus, Dr. Lévy established others at Varna, Gallipoli, Nogara, Adrianople, and the Piræus.

Perhaps the opinion of an American gentleman may be regarded as more impartial than either English officers, anxious to make their own military system appear to the greatest advantage; or English gentlemen, whose independent and philanthropic spirit might influence their judgment to write severe things when they beheld the helpless and the deserving treated injudiciously or neglected. The gentleman whom we quote visited the hospitals on both sides of the Bosphorus at the same time, the end of December and beginning of January, in company with the Rev. Dr. Dwight, the distinguished American missionary, and several other American gentlemen, who were on terms of cordial intimacy with the English, and who were well known as belonging to that class of American citizens who regard England as the mother-country, and Englishmen as brethren. The writer gives his impressions as those of his party. He thus sums up his opinion of affairs on the English side:—"Until her (Miss Nightingale's) providential interposition, the hospitals had been without the commonest preparation for the reception and care of the thousands of sick and wounded pouring in from the suffering camp. The authorities evinced a blindness to duty utterly incomprehensible, and even more astounding than that exhibited in the conduct of affairs in the Crimea. A recital of a tithe of the disgusting evidences of cruel neglect, noticeable in every section of the premises, would shock

the sensibilities of the reader to a degree surpassing that of any imaginary horrors ever pictured to his mind."

The following is his description of what he saw in the French hospital at Pera:—"The bedding looked soft, warm, and clean; and the atmosphere of every room was both mild and pure, the ventilation being very carefully looked after. Each patient had his number posted upon the head of his couch; and a large card, fastened in the same position, announced his name, regiment, disease, date of hospital entry, age, religious preference, &c. At the head and foot of each bedstead, a narrow shelf resting upon the top of the posts, contained the plates, cups, spoons, medicines, and other necessaries for the use of its occupant. Nothing could be more conveniently arranged. The blankets were so fastened as to entirely protect the lower end of the bed, so that the patient could by no means suffer from the current of air often felt from the slipping to and fro of the cover. The floors were scrupulously clean; and an air of quiet ease and comfort reigned as triumphantly as in any hospital that I remember to have seen either in London or New York."

The writer then notices the care and skill of the physicians, the arrangements for culinary purposes, and the admirable supply of nutritious diets; the order and discipline of the porters, orderlies, and nurses; and the air of quiet and arrangement which pervaded every department. He finally sums up his estimate of the condition of things at Pera, &c., in the following manner:—"I need hardly say that we united in acknowledging the chief of the French military hospitals in the East one of the most complete establishments of its kind that we had ever visited. Its rapid organisation and admirable management reflected the highest credit upon its able and intelligent directors, the French government, and the French character. There appeared to be neither a lack nor superabundance of system, but, as though guided by a single powerful hand, everything progressed regularly and in order. How widely different was the state of affairs in the English army hospitals at the same date! It was said that the French hospitals, some ten in all, contained no less than 15,000 patients. They were all well cared for, and deaths were not nearly so numerous as in the English establishments."

Such is a faithful representation of the state of the sick and wounded in the Crimea, and on the shores of the Bosphorus, the Sea of Marmora, and the Dardanelles. The remedies provided, their failure, and their success, are also presented to the reader on the best available authorities. Had the government at home dispatched some one adapted to the under-

taking, with full powers of control, and authorised to purchase and dispense all necessaries—some competent person who could direct and overrule all the clashing departments, and act in the name of the government, or had the ambassador, who was invested with very great and extensive powers, used them as he might have done and ought to have done,

the “defects of the system”—the excuse which has been pressed before the public by the apologists of the government, *usque ad nauseam*—could not have operated so as to consign thousands of the bravest men in the empire, or in the world, to premature and unworthy graves, and to inflict torture indescribable upon many thousands more.

CHAPTER LII.

BRIEF REVIEW OF THE CRIMEAN CAMPAIGN OF 1854.

“*Constable*. If the English had any apprehension, they would run away.

“*Rambures*. That island of England breeds very valiant creatures; their mastiffs are of unmatched courage.

“*Orleans*. Foolish curs! that run winking into the mouth of a Russian bear, and have their heads crushed like rotten apples.

“*Constable*. Just, just; and the men do sympathise with the mastiffs, in robustious and fierce coming on. Give them great meals of beef, and iron and steel, they will eat like wolves, and fight like devils.”—SHAKESPEARE. *Henry V.*

IN reviewing the course of events of the campaign, from the sailing of the expedition from Varna until the year closed over the camp before Sebastopol, many reflections are suggested which are painful to every English patriot and humane man; and many causes for national triumph are afforded. Certainly a review of the incidents of that campaign ought to have furnished our statesmen and legislators with sufficient light as to the working of our military institutions, and to have enabled the ministry to prosecute the war, in the second year of its course, with far more intelligence and vigour.

In relating the state of the army before its embarkation from Varna, we described its sufferings, and the neglect which it experienced from the heads of departments. We scarcely bore sufficiently heavy upon the supreme authorities—a remark of Mr. Woods’ will illustrate this: in referring to Mr. Commissary Strickland, who was sent out to the neighbourhood of Varna before the troops were dispatched thither, he says:—“Every suggestion which this officer’s long experience enabled him to make upon the best method of meeting the requirements of the troops was systematically disregarded.” The same authority informs us that Varna and Devno were selected for the sites of encampments, in despite of every remonstrance from merchants and persons of experience, who unanimously represented it as “one of the very worst spots which could possibly have been chosen—the whole country round being unhealthy, but Devno the very worst part of all.” He describes the amount of tea sent out as 8,000 lbs., which lasted a few days; and 80,000 lbs. of raw coffee in store could not be sent up to the camp, there being neither waggons nor arabas. The means of conveyance for the hospital tents and hospital

stores were two bullock waggons. The medicine chest was as curiously furnished, and as scantily, as the heads of the chief officers of the army. For each thousand men, the distribution was four bottles of brandy, four of wine, six pounds of arrow-root, and a few of the most necessary drugs and surgical instruments!

In our narrative we did not do sufficient justice to the generosity of individual officers and physicians; the following faithful testimony will supply that omission:—“In some regiments, the officers gave up their own small stocks of wine for the use of the sick and dying; others again contributed candles for the hospital marquee, in order that the men might not lie there without a light, and die in the dark like dogs. Regimental surgeons, speaking of this time, have told me over and over again, that they attributed the loss of many men entirely to the want of proper medicines and medical comforts. Of the latter there was absolutely none of any kind or description whatsoever. Assistant-surgeons and surgeons used to ride into Varna, and, hiring boats, pass the whole day in endeavouring to procure a little arrow-root, sago, or port wine from the vessels of war, or the transports anchored in the bay. The principal medical officer of one division informed me that he had spent out of his own pay upwards of £30 in providing poultry and other little delicacies for his patients. This is only one instance within my own knowledge; but I have not the least doubt but that there were many others of a similar kind. Sir George Brown, who knew the poverty of his division in respect of hospital comforts, made a private present of six dozen of port, and six dozen of sherry for the use of the sick. In fact, but for the exertions of medical and other officers at this period, the mortality among

the English troops would have been very much greater than it was."

When the landing in the Crimea was effected, and the troops, having gained the victory of the Alma, sat down before Sebastopol, the destitution of the army was, as we have already shown, unparalleled. Among the efforts to mitigate these circumstances, the *Times'* Fund, and the judicious administration of it by Mr. Macdonald, have been noticed. One mode of relieving the mass of suffering, not mentioned in previous chapters, has been thus named and acknowledged by Mr. Woods:—"Mr. Macdonald also established a little tea-house at Balaklava, where the sick sent down from camp and waiting to be embarked were given beef-tea, soup, arrow-root, brandy and water, tea, and whatever their exhausted condition required. It would be difficult, if not impossible, to name any charitable institution which, at such a trifling outlay, has ever relieved as great an amount of misery and suffering as this little tea-house at Balaklava. It would be impossible to enumerate here all the services which Mr. Macdonald rendered to our suffering army, which were not only beneficial at the moment, but which resulted in some most important improvements being introduced, especially with regard to the rations issued to the troops."

Some circumstances connected with the battle of the Alma have been mentioned by Sir Edward Colebrooke, which throw light upon portions of that memorable action. Sir Edward gives it as the opinion of many eminent officers, that in that battle the light division was left too long unsupported by the Duke of Cambridge's division (the 1st). The 2nd division (Sir de Lacy Evans'), which had a still more formidable task, if possible, to perform than even the light division, through the skill, forethought, and gallantry of Sir Richard England, received the most valuable support from all the guns of his division. When the light, under Sir George Brown, was in the crisis of its peril, the Duke of Cambridge led up his division, which, as has been shown in our relation of the battle, was opposed by a most formidable battery, from which the Guards suffered dreadfully in their advance, and which they ultimately stormed, under his royal highness in person. The Highland Brigade, under Sir Colin Campbell, suffered little, and were the last troops engaged; this is noticed by Sir Edward in the following manner:—"Called on Sir C. Campbell, and talked over the Alma. 'How was it,' I asked, 'that the Russian battery which played on his brigade caused such little loss?'—"They had," he thought, 'the range of the river, but as he advanced they took up a new position a little further back, and their fire was then very wide.' His men advanced very rapidly, his object being

to gain the flank of the Russian battery, which was doing so much execution against the first and light divisions. The fire of our men was very deadly, and they loaded as they advanced—that which, he said, every charge by the bayonet usually ends in. He thought this mode of firing ought to be more attended to, and form part of the ordinary exercise of troops. I asked if he thought the Russians retired in much disorder? 'Not very great,' he said; 'those bodies which had come into conflict with us were in great confusion, but there were columns who were not engaged, and helped to cover the retreat, without which their heavy guns could not have been brought off. Indeed, if the country had not been as hard as a formed road, they must have fallen into our hands. The heavy metal of the Russian guns rendered our artillery unable to compete with them effectively during the attack; hence the heavy loss we incurred.'"

When our army performed the celebrated flank march, and appeared before south Sebastopol, divided opinions arose as to whether it might not be taken by storm. Sir George Cathcart energetically recommended an immediate assault; Lord Raglan and Sir J. Burgoyne opposed it. The latter, in an able paper in a military periodical, strongly urged the danger, and even futility, of any such attempt, and represents General Cathcart as the only officer of note in either fleet or army who took that view. It is certain that Sir de Lacy Evans and Admiral Dundas coincided in this respect with General Burgoyne; but Sir Edward Colebrooke, who was on board Admiral Lyons' ship, the *Agamemnon*, represents that admiral as saying in an off-hand way, that he did not see why we should not walk into it. The following arguments, by General Burgoyne, will throw additional light upon the subject to that which has already appeared in our pages. "We are decidedly of opinion that the generals in command would have acted most rashly had they made such an attempt, that the prospect of success was small, and that a failure would have been fatal. It would be foreign to our purpose to go into the question of the propriety of a more rapid advance from the Alma, or whether a due regard for the sick and wounded, and the difficulties of provisioning and of transport, were a sufficient justification for the delay of four or five days that intervened before the allies reached the ground in the immediate front of Sebastopol. We are to take up the circumstances as they then were, the question being why the place was not assaulted when the army did come before it. The allied armies then consisted of about 50,000 men. The Russians could not have had less than an equal number of infantry (every report gave larger numbers) including their seamen, who are notoriously, in the

Russian service, thoroughly practised as soldiers, and, being moreover good gunners, were particularly valuable in a defensive position. They had also a very superior force of cavalry, a very large proportion of field-artillery admirably horsed, a thorough knowledge of the country, and were masters of all its resources; in all which the allies, recently disembarked, were necessarily very deficient. The first object of Prince Menschikoff, after the battle of the Alma, must have been the security of Sebastopol, with its fine fleet and valuable and extensive arsenals. Accordingly he made a hasty retreat on that place to forward arrangements for its defence. Had the allies followed in the most rapid manner consistent with order, and found the great body of the Russian army in the place, what would have been the consequence? It must be borne in mind that, even in that case, there would have been no longer the confusion of a routed army, but ample time for re-forming the different regiments and corps; they would have occupied the strong position as above described (on the north was one equally strong and of a narrower front), and have been unattackable. To have attempted to shut them up there was utterly impossible. The line to have occupied would not have been less than from fifteen to twenty miles in extent, separated by the deep valley of the Tchernaya, against any part of which position the enemy might have concentrated an attack with nearly their whole force. Thus the communication with the interior would have been fully open to him on the north or south, and he could equally have divided his forces whenever he pleased. Prince Menschikoff's arrangements, however, were completed before we made our appearance, and a portion of his army was moved to the interior. The allies, in their forward movement, came upon their baggage at M'Kenzie's Farm, and reconnoitred their force, which appeared to be about 15,000 men. This, and the vast importance of retaining Sebastopol till reinforcements could be received, leave little doubt but that an ample garrison would be left in the place, and could not be estimated at less than from 25,000 to 30,000 men. These would be posted along the very strong positions round the place, on which, even at that early period, some heavy guns were mounted, and with a great available power of field-artillery to command the bare open country in the front, and some slight earthen parapets for cover, in addition to the defensible towers, walls, and buildings, with your backs to the sea, and an enemy's force at hand of a description not to be despised, to have made such an attempt would have been a most unjustifiable act of extreme rashness, and have compromised the safety of the whole army. On the other hand, we had a fine battering-

train at hand, with which we might hope to make an effective impression, and, at all events, without the desperate risk of the other course. And what are the arguments on the other side? First, a reputed vague expression by one who, it must be admitted, was a very able man and a good soldier, that such an attack might have been made, but, as far as we can learn, without any reasons being given founded on any good knowledge of the circumstances or much consideration; and it is somewhat remarkable that this very officer had himself served with the Russians, and, though he did his duty most gallantly against them, had an enthusiastic admiration of their military qualities or organisation, and who had constantly in his mouth, in reply to the least disparaging remark, 'Do not despise your enemy, sir; I know the Russians well, and they are not to be taken liberties with,' &c. Secondly, the report from deserters that the place was very unprovided with artificial defences when the allies appeared before it, that the troops were discouraged by the results of the Alma, and expected that it would be carried by assault. Such are the kind of reports that are almost always given by deserters, but in this case in a great degree true. The same men, however, estimated the number of the garrison far higher than has been above stated, no doubt in good faith, although probably much exaggerated. It proves, however, sufficiently, that it must have been very large. The opinions, besides, are those of the common soldiers, and those of the peculiarly ignorant class of the Russian soldier. That they may have entertained an unfavourable impression of their situation may very likely have been the case, but we have every reason to think—nay, to be assured—that they were not disheartened so as to admit of acts of extreme rashness to be undertaken against them. Certainly, no troops bear being beaten like the Russians. After every defeat—Alma, Inkerman, Tchernaya, &c.—they rise again with a noble infatuation, and every succeeding action has been fought by them with as much spirit, discipline, and energy as its predecessor. Thirdly, we have in favour of this measure the opinions of many 'gentlemen of England who live at home at ease,' that nothing great would be done in war if you look too narrowly at the consequences of failure—which may be granted; that it would have been a magnificent acquisition to have obtained Sebastopol—which may be also granted; but that it ought therefore to have been attempted is denied. That great acts have been performed by energetic generals and admirals which inferior characters would not have attempted—granted, on the understanding that there was always some reason in their actions. But then comes the deduction from these *data*, that they are a

justification for the most desperate proceedings, and that nothing is impossible to a great man; which is utter nonsense. There is not a man quoted as a hero, whose actions are to be followed, but has shrunk from attempts like the one here proposed."

In our narrative of the naval attack of the 17th of October, we have given, perhaps, the fullest account on record of that action. The question of ships *versus* stone fortifications was discussed in that portion of our pages. General Sir John Burgoyne has recorded his opinion on that subject, as upon other questions connected with the attack and defence of fortified places. As the especial object of this chapter is to review the outline of events already narrated, and complete the account by additional information, and by adducing additional authorities, it will be desirable to place before the reader Sir John Burgoyne's opinion on the capacity of fleets to attack sea-defences of exposed masonry:—"Although the masonry in fortifications should be well covered from distant cannonading, there are many occasions where this property must be dispensed with, or may be so with propriety, and the cases are chiefly in sea-batteries. A very small island, or rock, or point of land of very confined space, may be in a very influential position for opposing the approach of an enemy's ship, yet may barely be of sufficient size to hold a tower, large or small, upon it. The guns, however, may be multiplied by applying several tiers of them on a high building; and such constructions, although defective, and to be avoided if possible, with all their systematic evils have often a most powerful effect. It is quite a mistake to suppose that they can be readily destroyed or silenced by the most powerful shipping. First, unless the ships are very close (say within 200 yards) their fire will be weak, without precision, and ineffective. No other conclusion is to be drawn from the deliberate practice at a target, for in this case they will be in action, and surrounded by the opaque atmosphere created by the smoke. The inaccuracies will be still greater if the ship-guns require precise but varying degrees of elevation. The gunners from the tower, on the contrary, have other and far better guides for their fire—the masts, for instance, and all the advantage of the ricochet. Secondly, every shot (some of them, perhaps, redhot) and every shell that hit the ship must do great mischief. Any one may cause her utter destruction, while a very large proportion of those which hit the tower will occasion no damage whatever. Thirdly, the ship, in its approach to take the very near station necessary to produce effect, will have to sustain a damaging fire, which it is then peculiarly unable to return; and even although there may be ample depth of water, the fire

and the smoke will themselves be great impediments to venturing into such close proximity to the shore. Fourthly, the breaching of a substantial wall, even six or seven feet thick, requires a very great deal of close and precise battering, and therefore the ships must be engaged several hours in this disadvantageous contest to effect the purpose. Thus against shipping the exposure of the masonry may be admitted to be of little consequence. Nor is it to be held as a positive fact that earthworks do not suffer from being battered. Earthen parapets, for instance, are utterly destroyed in sieges by the fire of shells, and so levelled as to afford comparatively no cover at all. But there are many other instances besides sea-batteries where exposed masonry walls are admissible—indeed, often essential. Thus it sometimes occurs that all that is required from a fortified post is security against a *coup de main*, as in cases where circumstances will not admit of the action of artillery against them. Likewise where the object of the work is attained if the enemy is forced, perhaps with much difficulty, to bring up guns to the spot, or in the case of the gorges of outworks, which it is expedient should be exposed to your own artillery, simple masonry walls are preferable to earthworks."

It is certain that too much was expected from the navy. Persons at home talked as if our ships had only to go in and batter down whatever opposed them. At Sebastopol this was not possible—the shoal was a great obstacle, the position of the forts was another; when close in our ships came under a raking cross-fire, the most terrible and destructive. The new plan of throwing shells horizontally from land batteries gives them a new advantage over ships. It was reported after the naval bombardment that Admiral Dundas was for lashing the line-of-battle ships to steamers, and to keep them moving about before the batteries. Sir Edward Colebrooke collected on the spot, immediately after the failure of the fleets, the opinion of naval and military engineer officers, and they were generally of opinion that such a plan would not answer, and that in fact Sebastopol was impregnable as to any attack from the sea.

It is to be doubted, therefore, whether the Baron de Bazancourt* is correct, whatever his opportunities of gaining good opinions, when he affirms that, "If the Russians, after the battle of the Alma, had not had that supreme inspiration which led them to sacrifice a part of their vessels in order to close the entrance to Sebastopol, without doubt, after receiving

* The Crimean Expedition, to the Capture of Sebastopol. Chronicles of the War in the East from its Commencement to the Signing of the Treaty of Peace. By the Baron de Bazancourt, charged with a Mission to the Crimea by the French Government.

the first fire, the fleet would have been able to pass through the channels, and to force the entrance to the harbour."

These circumstances tended to lower the navy both in England and on the Continent most unjustly. It had in no respect deteriorated; never were the tars of England, officers or men, more eager for glory or for duty. In the bombardment they were dauntless, desperate as was the encounter, and on shore they were the bravest of the brave. A gentleman whose profession, if not exactly a peaceable one, does not combat with the weapons of military warfare—a member of the Temple—thus wrote of our sailors from before Sebastopol, shortly after the failure of the naval attack:—"In the trenches their animal spirits showed themselves in the most exuberant daring. Captain Lushington, I heard the other day, told some of them who had worked for several hours at the Seaman's Battery, that they might 'now go and have a lark.' They instantly jumped on the parapets to have it *there!* At that battery, indeed, it is with the greatest difficulty that they are restrained from exposing themselves in this way every moment, as nothing will content them but watching the course of the balls as they fire them! There is but one martial duty with which they cannot be trusted, and that is to guard the casks of ration-rum—the spirit invariably vanishes under their care. *A propos* of this little foible, somebody suggested, in reply to a remark on the difficulties of penetrating into Sebastopol, 'Only put up a grog-shop on the other side, and the sailors will find their way through!'"

The same writer does only justice to the spirit of the navy, and the naval spirit of the nation, when the sight of the little midshipmen, fresh from the battle, drew from him the remarks:—"What a softening, inexpressible grace is lent to a man-of-war by the middies! It is particularly striking after living in a camp exclusively composed of mature men. The army has nothing corresponding to these pretty little fellows, who, with their rosy cheeks, resemble their mammas much more than they do the heroes they are one day to be. To meet them too, in the midst of stern work; and with the knowledge that it was but the other day that the poor boys were ducking their curly heads, and laughing, amidst shot and shell; possibly, with about the same sense of adventure as if it had been a game at snow-balls! Never dream of degeneracy in a land where mothers thus devote their offspring. Talk of Sparta—of Rome! England alone rocks her children on the wave, and war is the 'wolf' which suckles them."

Among the incidents before the besieged city, our narrative records the battle of the

Lesser Inkerman as the most complete and creditable act of the war, so far as good generalship is concerned. Sir Edward Colebrooke confirms this. In his journal, under date of October 28th, written in the camp, he observes:—"Heard particulars of the repulse of the Russian attack on the 26th, which was most decisive. The enemy came with great force against our right, but their dense columns encountered so hot a fire that they were driven back in great confusion. Prisoners said that Menschikoff harangued them, telling them the English guns were carried the previous day, and they had only to move forward now to drive us all into the sea."

In a work entitled *Journal of Adventures in the Crimea*,* by G. Cavendish Taylor, Esq., late of the 95th regiment, an excellent summary of this action is given. Mr. Taylor only arrived the day before, but saw the battle on the 26th. He says, in his concluding remarks on the Little Inkerman,—“It was a complete victory on our part, inflicting great damage on the enemy, with but small loss to ourselves—exactly the reverse of Balaklava. All who saw it say that it was the best and prettiest action of the campaign, and the only one in which any *generalship* was shown. It deserves a clasp at least as much as the battle of Balaklava; but it is thought nothing of—not even named or known in England, because the ‘butcher’s bill’ was light. Had our losses been heavy, it would have been brought into notice.”

The accounts given in the chapters which record the battle of Inkerman, and the service in the trenches, contain but a brief notice of the services of the third division (Lieutenant-general Sir Richard England’s), which, being situated on the extreme left of the British position, nearest the French, was not exposed to the attacks from the Russian army in the field. It was from this division that the Ovens was supplied with defenders, and there was always great vigilance required to prevent the Russians stealing up through the ravine which separated the British and French positions. An officer of rank, whose services with the division were anxious and unremitting, in correspondence with the author, wrote a letter, the following extract from which shows how that division served and suffered. It was, however, kept well in hand by its gallant and experienced chief, and was enabled, therefore, to perform its onerous duties with advantage to the country and honour to itself:—"On the 5th of November, the general’s attention was attracted by sharp musketry, three or

* Veteran officers, who served in the campaign, and fought in both the actions at Inkerman, have pronounced to the author of these pages a high opinion of Mr. Taylor’s work.

four miles to the right, near the heights which overlook the ruins of Inkerman, and after providing for the security of his own front, where 1200 men of the third division were already in the advanced trenches, he took the Royals and the 50th, with some guns, to aid in repelling what soon appeared to be a serious attack, and with these troops joined the left of the light division. On this occasion these battalions lost forty men. Meantime the siege duties, vigilantly superintended, never ceased; and half the army was soon in hospital, or sent sick to Scutari. The cannonade kept even those who were seeking a moment's rest on the alert. But the incessant labour of the troops was not the less demanded to dig trenches and to defend them against the nightly efforts of our active enemy. Alarms were constant to drive back sorties, and officers were frequently on horseback during the night, to communicate orders. No service on which troops were ever employed could have produced more suffering. We held the advanced posts essentially with such few numbers that double vigilance alone saved them; and had the Russians known our weakness at points of importance, they would have overwhelmed us with ease. The French army disliked our ill-made trenches too much to accept any proposals for occupying them for us. In short, the third division, equally with the whole army, suffered from hardships, while it also was called upon for incessant skirmishes, and to repel nightly sorties of frequent recurrence."

In our account of the French expeditionary army, we did not furnish a detailed statement of the staff. The following, by the Baron de Bazancourt, supplies that omission. Our readers cannot fail to be impressed with the perfect organisation which this document implies. The names here recorded are interesting; many of them occurring in the important deeds transacted in the war, and recorded in this History.

COMPOSITION OF THE ARMY OF THE EAST.

Commander-in-chief:—MARSHAL DE SAINT-ARNAUD.

Aides-de-camp and Orderly Officers of the Commander-in-Chief:—Colonel Trochu, Aide-de-camp; Lieutenant-colonel de Wauvert de Genlis, Commandant-de-Place, Aide-de-camp; Captain Boyer, Aide-de-camp; Commandant Reille, Orderly Officer; Commandant Henry, Orderly Officer; Commandant Gramont, Duke de Lesparre, Orderly Officer; Commandant de Villers, Orderly Officer; Commandant Appert, Orderly Officer; Captain de Cugnac, Orderly Officer; Captain de Puysegur, Orderly Officer.

GENERAL STAFF.

Chief of the General Staff:—De Martimprey, General of Brigade.

Deputy Chief of the General Staff:—Jarras, Lieutenant-colonel.

Commander of the Artillery:—Lebœuf, Colonel.

Commander of the Engineers:—Tripiet, Colonel.

Military Intendant:—Blanchot, Military Intendant.

Provost Marshal:—Guisse, Major of Gendarmerie.

Chief Almoner:—The Abbé Parabère.

Staff Officers, attached to the General Staff:—Renson, Major; Osmont, Major; D'Orléans, Captain; De la Hitte, Captain; De Rambaud, Captain.

Officers of Artillery, attached to the General Staff:—Malherbe, Major, Brigade-major; De Vassart, Second Captain, Deputy to the Commandant; Moulin, Second Captain, Deputy to the Commandant; Lafon, Second Captain, Deputy to the Brigade-major.

Officers of Engineers, attached to the General Staff:—De Chappedelaine, Lieutenant-colonel, Deputy to the Commandant; Dubois-Fresnay, Major, Brigade-major; Sarlat, Captain, Deputy to the Brigade-major; Schmitz, Captain, Deputy to the Commandant; Prévost, Captain, Deputy to the Commandant.

Functionaries of the Intendance, attached to the General Staff:—Blanc de Moline, Deputy-intendant of the 1st Class; Viguier, Deputy-intendant of the 2nd Class; Lucas de Missy, Deputy-intendant of the 2nd Class; Le Creur, Deputy-intendant of the 2nd class; De Séganville, Deputy-intendant of the 2nd class; Gayard, Adjutant of the 1st Class; Leblanc, Adjutant of the 2nd Class.

Political and Topographical Service:—Desaint, Lieutenant-colonel, Chief of the Service; Davout, Major; Davenet, Captain; Perrotin, Captain.

In a former chapter notice was taken of the dispatch of a Turkish army to Eupatoria under Omar Pasha. Omar did not land at Eupatoria until the month of February, but throughout December and January his troops were dispatched from Varna, Burgas, Baltschick, and some from Constantinople. The proceedings of the redoubtable Turkish general in directing this expedition, and the character of his more active coadjutors, will find a suitable place in this chapter. At no period of Omar's previous career did he find so little opposition from the high Turkish party, but he was, nevertheless, still opposed. No one disputed his fitness for the command of that army; but attempts were made to surround his person with spies—men who would report all his actions and expressed opinions to the party at Constantinople opposed to him, and the more liberal section of the sultan's advisers. The wary chief indefatigably exerted himself to thwart these intrigues, but he did not entirely succeed in preventing the incapable and mercenary favourites of the court or the ministry from being appointed to important commissions in his army. He had, however, several officers of tried skill and courage upon whom he could rely in the hour of trial. The first division was commanded by Mehemet Ferik Pasha, its brigadiers being Terfik Pasha and Behram Pasha, better known to Englishmen by his English name and military title of Colonel Cannon. All these officers had seen service in the Danubian campaign, and Cannon was an officer of well-tried experience and courage. Salil Pasha commanded the second infantry division; he had the reputation of a good infantry officer. Ismail Pasha (not the Ismail Pasha who fought in the Asiatic campaign) commanded the third division; he also acquired reputation on the Danube. The cavalry were commanded by Halil Pasha, in whom the army had confidence. These divisions constituted, with their proper

accompaniments of artillery, engineers, sappers and miners, and staff, the first grand detachment of Omar's army. It was a fine body of troops; the men were picked for their superior appearance, good discipline, or experience in the Danubian campaigns. Some hundreds of the sultan's guard joined the ranks of these corps. Colonel Dieu was appointed French commissioner, and Colonel Symonds English commissioner to this army, each with the rank of brigadier. Omar evinced his usual skill and care. He understood well the impotence of the English at Varna and Devno, from their deficient transport and commissariat services. Even with the supplies of arabas, oxen, and labour, which he in various ways afforded them, while he occupied Shumla with the head-quarters of the Turkish army of Bulgaria, they were helpless, unless to send out the Earl of Cardigan on a "wild goose chase" after the Russians, whom he could hardly have expected to find, and which only issued in hardship to the men, and the loss of a large number of excellent horses. Omar determined, therefore, to secure for himself all necessary materials. The troops took a month's provision with them. At Varna and Baltschick he accumulated immense stores of biscuit, flour, preserved meats, butter, &c., and live stock. A flour mill, a bakery, and a slaughter-house, each on a large scale, were erected at Varna. The general knew what Bulgaria could provide; he had fought for and saved that province, taking care of his troops when garrisoned in it. Stores of wood and charcoal, and warm clothing, were found by him for the winter exigencies of his troops. An immense number of buffaloes, to serve as beasts of burden, were collected by him, but these animals did not thrive in the Crimea so well as either oxen or horses. Among his first distributions to the soldiers about to embark were fur-lined coats, with hoods which might be worn attached or otherwise, and which sheltered the head and neck from the bitter and biting northern blasts which sweep over the Crimea, and which are felt keenly at Eupatoria. The difficulties of this expedition were enormous,—proving how onerous an undertaking it is to bear large armies by sea to a hostile territory. It required two months for the Turkish navy to effect what the navies of the Western powers effected in about as many days.

Before these troops were embarked for their destination, the Russians had formed a large cavalry camp about ten miles from Eupatoria, making, as has been already shown, frequent razzias upon the Tartar flocks in the neighbourhood, and attacks upon the garrison. When

Liprandi moved from the Tchernaya, a large portion of his troops menaced Eupatoria. So slowly did Omar's army arrive, that had the Russians promptly attacked the place in force, there is no knowing what might have been the results. Independent, however, of the Turkish reinforcements, the number of English and French sailors and marines was increased, and the *Henri IV.*, wrecked on the 14th of November, was "beached," and its guns made to command one of the approaches to the place most effectually. The other wrecked ships were also, in various ways, made to minister to the strength of the defence, their guns covering the ordnance armaments. In this state were matters at Eupatoria when the warlike operations of 1854 ended.

Looking upon all the events of the campaign, there was little to cheer the English people but the indomitable bravery of their troops. Good generals, and good regimental officers there were in the Crimea, but the chief command was vacillating and feeble, and this was the main source of evil. When the year closed, Lord Raglan was scarcely ever seen by the troops, and his person was probably unknown to the newer arrivals. No doubt his desire to serve the army to the utmost of his physical capacity was as strong as that of other officers; but his health was bad when he took the command—anxiety, and the murmurs of the English public, produced still more unfavourable effects upon it. He was physically unable to go about among the troops, or to see personally to any of the details of their supplies: yet this is essential to the authority of a commander-in-chief, the efficiency of the staff, and the perfection of an army. Such was the opinion of the great Napoleon, frequently expressed by him, and his great rival entertained the same view.

Shakspeare exhibits this important military truth, in the pages of his *Henry V.*, in a way strikingly appropriate to what was required, but not found, before Sebastopol:—

"O now, who will behold

The royal captain of this ruin'd band,
Walking from watch to watch, from tent to tent;
Let him cry—Praise and glory on his head:
For forth he goes, and visits all his host;
Bids them good morrow, with a modest smile,
And calls them—Brothers, friends, and countrymen.
Upon his royal face there is no note
How dread an army hath surrounded him;
Nor doth he dedicate one jot of colour
Unto the weary and all-watched night;
But freshly looks, and overbears attaint,
With cheerful semblance and sweet majesty;
That every wretch, pining and pale before,
Beholding him, plucks comfort from his looks;
A largesse universal, like the sun,
His liberal eye doth give to every one,
'Thawing cold fear."

CHAPTER LIII.

CLOSE OF OPERATIONS IN THE BALTIC (1854).—RETURN OF THE FLEET.—DISCUSSIONS BETWEEN SIR CHARLES NAPIER, THE ADMIRAL COMMANDING, THE ADMIRALTY, AND SIR JAMES GRAHAM, FIRST LORD OF THE ADMIRALTY.

"Where is the Briton's home?
Where the free step can roam,
Where the free sun can glow,
Where a free air can blow,
Where a free ship can bear
Hope and strength everywhere."—SIR EDWARD BULWER LYTTON.

In the twenty-sixth chapter, the operations of the Baltic fleet were related to the month of October. Admiral Plumridge's squadron, after having remained at Nargen for seven weeks, returned home. Admiral Chads' squadron had been at, and in the vicinity of, Led Sound for nine weeks. Symptoms of terminating the naval campaign were evident, the ships by degrees departing for England. Most of the returning ships stopped at Kiel, where, by the end of the third week in October, a large fleet was assembled. The Danes and Holsteiners received the English well, but reflected, as much as courtesy allowed, upon the disproportionate effects produced by so large a fleet. They reminded our officers and men of what Nelson effected at Copenhagen, with only a division of the fleet sent out against it, and our brave tars felt humiliated by the recital. The people of England were indignant at the little that was accomplished, and as they had implicit confidence in the admiral, their wrath was vented against the Admiralty. As the government had fallen under much obloquy, they were solicitous to wipe out the stain of a do-nothing policy, and the Admiralty directed letters to Sir Charles which irritated and offended the gallant old chief; communications in return were less respectful to "the lords" than they deemed consistent with the public service; hence rose a bitter controversy upon the return of the admiral, which led to much newspaper discussion and parliamentary debate. The merits of the contest involve the facts which are essential to a narrative of the conduct of the fleet, and therefore shall be briefly stated. Early in the expedition, the Admiralty, and more especially the first lord, urged upon the admiral the necessity of the greatest caution, as, in their opinion, ships were no match for stone walls. The despatches of the Admiralty, and the letters of the first lord were to this effect, until news of the fall of Sebastopol reached England in October, when, excited by the intelligence, their lordships urged the most active and enterprising course upon the admiral, at a period of the year when the weather was necessarily uncertain, and generally severe. The admiral could not, and would not, carry out such instructions, well knowing their execution to be impossible; and the ministry sought, there-

fore, to transfer the responsibility of the management of the expedition from their own shoulders upon his. The daring spirit of the valiant old chief feared admiralities as little as enemies, and ultimately published the correspondence, and permitted the country to obtain a closer glance into the intrigues which exist in that department of the administration of public affairs.

So early as the 1st of May, the first lord thus addressed the admiral:—"I by no means contemplate an attack on Sweaborg or Cronstadt. I have a great respect for stone walls, and have no fancy for running even screw line-of-battle ships against them. Because the public here may be impatient, you must not be rash; because they, at a distance from danger, are foolhardy, you must not risk the loss of a fleet in an impossible enterprise. I believe both Sweaborg and Cronstadt to be all but impregnable from the sea, Sweaborg more especially; and none but a very large army could co-operate by land efficiently, in the presence of such a force as Russia could readily concentrate for the immediate defence of the approaches to her capital."

In the month of July, when it was announced to Sir Charles that a French military force would afford him its assistance, the Admiralty expressed its hope of great advantage from such an auxiliary, but renewed its cautions:—"Bomarsund will be clearly within your reach. Sweaborg, if it were possible, would be a noble prize; but on no account be led into any desperate attempts; and above all things avoid the least risk of the Russian fleet slipping out of the Gulf of Finland when your back was turned."

The letters of Sir James Graham, the first lord of the Admiralty, and the official despatches of "the board," were often irreconcilable; and the admiral, unable to comply with both, was puzzled and vexed, and in his usual brusque manner expressed what he felt. His opinion as to the feasibility of attacking Sweaborg or Cronstadt was very distinctly communicated by him in his despatch of the 29th of August:—"If you attack the islands with an overwhelming force of gun and mortar-boats, backed by the fleet and steamers, I believe you would destroy it; but it would be a work of

time. I do not think our present force would do it, and the season is much too far advanced to attempt it."

After the fall of Bomarsund, and the reconnaissance of Sweaborg and Cronstadt, consultations were held among the allied admirals and generals as to the possibility, with the forces under their disposal, of conquering these places. General Baraguay d'Hilliers, in command of the French army, gave an unhesitating opinion that it was possible. His chief of the engineering-staff, General Niel, was even more strongly in favour of that view. The celebrated engineer officer, General Jones, who commanded the English, concurred in these views. The military officers generally were of opinion that the fleet alone could accomplish the destruction of the fortifications. The allied admirals combated these opinions. The French Admiral Deschènes, and his second in command, gave their opinions coolly, that the fleets could not destroy either Sweaborg or Cronstadt without the assistance of the troops, and it was doubtful if, even then, much impression could be made upon these stupendous fortresses. Admirals Napier, Chads, Plumridge, and in fact all the officers in the British navy whose opinion was deemed of importance, declared these strongholds impregnable to the forces then opposed to them. Sir Charles Napier communicated his opinion to the editor of the *Times* in the following terms:—"I send you a chart of Sweaborg and Helsingfors, and a plan of their fortifications, showing the adjacent islands and sunken rocks. Show them to any naval officer, young or old (and you must know many), and ask him if it is possible in winter to place buoys and beacons on those rocks and shoals; to conduct a fleet alongside the batteries of Sweaborg, having neither gun-boats nor mortar-boats to cover the approach of the vessels and boats; to place the buoys on the sunken rocks, all of which are within range of the enemy's batteries. It will require several days for this operation, and they will be under fire night and day. The Russians themselves could not navigate these seas without beacons, and they are all removed. During the time the process of buoying is going on, the fleet must lie at anchor among the outer rocks. Imagine to yourself, sir, a south-west gale coming on (and in the winter without warning), and judge what would become of your fleet and gun and mortar-boats. A great number of the former would be driven on the rocks, and the latter would either be swamped or obliged to take refuge in the enemy's harbour."

On the 29th of August, Sir James Graham ordered Sir Charles to send home his sailing ships; subsequently the Admiralty censured him for doing so. The first lord sent out an order, and the Admiralty censures the officer

for obedience to the order of their own first lord, who is the responsible adviser of the crown in connection with naval affairs! On the 25th of September, the admiral was very explicit in his communications to the Admiralty lords. He showed that gun-boats, and other craft of light draft, but heavily armed, were essential to attack such extensive fortifications, resting on the strongest masonry and solid rock; and that, at such a season of the year, the enterprise would be most perilous. As the English people became angry, however, their lordships became impatient, and letters were written to the admiral urging him to attack and destroy something—evidently to redeem their own administrative reputation, and to make a fair show of official life before parliament. The principal actors in this line of conduct were the first lord, Sir James Graham, and the first naval lord, Admiral Berkeley. Admiral Dundas, who commanded the Baltic fleet in 1855, was a lord of the Admiralty, and joined in these proceedings; but when in command himself, he took care to avoid attempting anything which he joined others in censuring Sir Charles for not performing; for, although he attacked Sweaborg, he did so with appliances denied to Sir Charles. As a specimen of the letters addressed to Admiral Napier in October, the following communication from Sir James Graham will show the *animus* of the government:—"War is not conducted without risks and dangers; prudence consists in weighing them, and firmness in encountering them; and nothing great by sea or land can be achieved without considerable peril." This is a curious exemplification of the mode in which a thorough ministerial and government hack will say and unsay, as his interests or policy may lead. The following letter, of the 10th of October, in reply to an official communication from the secretary of the Admiralty, written on the 4th of October, will in a short compass declare the opinions of all the admirals which in previous despatches Sir Charles had presented to "the board."

Duke of Wellington, Nargen, Oct. 10, 1854.

SIR,—Before I received your letter of the 4th of October, I had written the accompanying letter, No. 558, giving my reasons for withdrawing from this anchorage; and, notwithstanding their lordships' letter of the 4th instant, I still think it my duty to persist in my intention. I have already given my reasons for withdrawing the sailing ships, and I thought I was following up Sir James Graham's wishes. Neither this anchorage or Baro Sound are fit for a fleet in the winter. My letter will clearly point out my reasons. Their lordships will see that we are losing anchors and cables every day, and we shall soon be losing ships.

Their lordships ask me, if I think Sweaborg can be laid in ruins, why I do not attack it? I reply, that before the ships should go alongside the batteries, my plan was to have it bombarded with mortars, shells, and rockets, from the islands and gun-boats, for a day or two, Lancaster guns, &c., and then, when well bombarded, the ships should go alongside and finish the work. The want

of means is one obstacle—the weather the next—why I do not attack it. Their lordships tell me to choose my day. There has not been a day since I have been here that it was possible to attack Sweaborg. It requires many days. The channels are studded with sunken rocks; they must be all sounded and buoyed, and if it came on to blow, the fleet would inevitably be lost, and I should be unworthy of the command I hold if I risked it. It would be a long operation. Their lordships have not the most distant idea of the dangers. Whether the Russian fleet in Cronstadt would venture out, if we were disabled, I know not, but the Sweaborg fleet would. I have never altered my opinion, that Sweaborg must be first attacked by mortars, shells, and gun-boats, &c.; but I never would have advised them to be sent here at this season. My second reconnaissance was never intended to open a new view—the view I first took, and the last, were the same. Their lordships say, the final decision must rest with me, and if the attack be desperate, it must on no account be undertaken. I look upon it that no man in his senses would undertake to attack Sweaborg at this season of the year; and even in a fine season I doubt much the success, without the means I have pointed out. A telegraphic message has stopped the French admiral's return to the Gulf, which I am glad of. His presence would be useless; and I have directed Admiral Plumridge not to come here, for the same reason.

When a council of war, composed of five admirals, viz.:—Vice-admiral Parseval and myself, and Rear-admirals Pennaud, Chads, and Seymour, and in which a sixth (Rear-admiral Martin) concurred, had given their opinion that neither our resources nor the season would permit an attack on Sweaborg, I should have thought that both their lordships and the public would have been satisfied; and I beg further to tell their lordships, that there is not an admiral in the British service that would have ventured to attack such a fortress at this season of the year; and as their lordships have so frequently returned to this question, it leads me to believe that, notwithstanding the praises that they have heaped upon me for my conduct in the Baltic, and judging from the altered tone of their letters, I have reason to think I have lost the confidence of their lordships. If that is the case, I shall be perfectly ready to resign my command; but, as long as I hold it, I will do what I think is best for the good of her majesty's service, and for the safety of the fleet I command, which I think is greatly endangered by our present position, and we are risking our ships for no adequate purpose.

I have the honour to be, &c.

CHARLES NAPIER, *Vice-admiral.*

To the Secretary of the Admiralty.

All the views expressed by the writer of the foregoing letter were acted upon by the admiral who, in 1855, succeeded him in the command; but the Admiralty did not even place at that officer's disposal, the means which Sir Charles pointed out as essential to success. He had, however, such means to some extent; but so badly constructed were the gun and mortar vessels that they were to a considerable degree unserviceable, so that when Sweaborg was ultimately bombarded, the result was incomplete. A statement of these facts, anticipatory of a future chapter, is necessary to explain several of the allusions and remarks in the following letter of Sir Charles. We know, from the gallant admiral himself, that he is anxious to bury the past in oblivion, so far as personal injustice is concerned; but his desire for the good of the service and of the country compelled him to vindicate his command, and expose the time-serving and trimming at the Admiralty, from which he suffered.

"SIR,—I have shown that I did not attack Sweaborg for two reasons:—1st, because I had not proper means; and 2nd, because it was a dangerous season of the year. Admiral Dundas has shown that, after forty-five hours' bombardment the batteries were little injured, and, with all his gun and mortar-boats, he never contemplated an attack by his fleet in the month of August. Is it, then, just to blame me for not attacking Sweaborg, without either gun or mortar-boats, in the month of October, and with only sixteen sail of the line? I shall now show how the Admiralty perverted my letter. The date of their lordships' letter to me was the 4th of October, the day they received the news of the fall of Sebastopol. On the 9th of October they heard Sebastopol *had not fallen*, and before they received my reply the order for the return of the French fleet and Admiral Plumridge's squadron to the Gulf of Finland was countermanded, and the attack of Sweaborg given up. The Admiralty may explain this, and also why they picked a quarrel with me.

"Admiral Berkeley said he had run an honest race with me for the command of the Baltic fleet; and perhaps he was inclined to start again; as Sir James Graham, after setting the public against me, and sucking my brains, wanted my place for some one else. My complaint against the Admiralty is, that they deliberately perverted my letter of the 25th of September, and I shall now prove it, and even the *Times* will not be able to deny it. This is an unusual course I admit; but my reputation is dearer to me than my commission, which they can take if they like. They well-nigh ruined my peace of mind before I left the Baltic, and it was all I could do to bear up against it. Their letter was dated the 4th of October, and I received it on the 10th, together with one from Admiral Berkeley, and one from the editor of the *Times*, while at anchor at Nargen. The three together came like a clap of thunder; a feather would have knocked down a stronger man.

"My observations on the letter will show that their lordships changed the whole meaning of it, which, to an officer on whom they had heaped so much praise, was heart-breaking and insulting; and I will venture to say that there is no precedent for it at the Admiralty. I shall take the letter, and dissect it paragraph by paragraph.

LETTER.

Their lordships observed that my second reconnaissance of Sweaborg gave rise to more pressing and serious considerations.

REPLY.

My first reconnaissance and my second were nearly the same. The first was made on the 12th of June, and sent home on the 13th of July, *not the 12th of June*, as I stated. It was Admiral Chads I sent home at that date with my observations.

LETTER.

You desire us not for a moment to suppose that Sweaborg cannot be attacked, and you proceed to point out in detail the precise mode in which the operation ought to be conducted, according to your judgment, on a careful review of all the difficulties and dangers.

You express your opinion, that if your plan of attack by the ships were adopted, you are quite certain the fortress would be laid in ruins, and most probably an entrance opened to the ships.

What then are the obstacles to the immediate attempt? If the diminution of your force be one, we have reason to believe the French fleet has been ordered to rejoin you off Sweaborg, and, by telegraph, we have directed Admiral Plumridge to hold himself in readiness to return to the Gulf of Finland, if he hear from you that the presence and assistance of his squadron are required.

You intimate an opinion that the uncertainty of the weather at this advanced season of the year is an objection to the attack; you may choose your day and your opportunity, as some risk must always attend every great operation.

You anticipate an attack by the Russian fleet, if many of your ships be crippled or destroyed. We are always reminded that the Russians are most unwilling to navigate the Gulf of Finland in line-of-battle ships when autumn has commenced, and Cronstadt is always blocked up by ice fourteen days before Sweaborg is closed. The attack, therefore, on Sweaborg might be

REPLY.

I pointed out two modes of attack—one with ships alone, the success of which would be very doubtful and many ships would be lost, and this was not a proper season; another with ships, gun-boats, rockets, Lancaster guns, 13-inch mortars on the islands, and a vast supply of shot, shells, and rockets, in addition to the ships. This mode I thought certain. This is perversion the first.

I expressed no such opinion: quite the contrary. I said, whether this attack would succeed or not it is impossible to say. That we must calculate on ships being set on fire by red-hot shot and shells, of which they would have abundance; and, whether successful or not, it is evident the ships would be in no condition to meet the Russian fleet afterwards; and, if the attack was made at this season of the year, when you cannot depend on the weather for two hours together, I do not know how many would be lost.

The want of the appliances I pointed out to ensure success. Had Admiral Plumridge and the French squadron rejoined, with a month's provisions he was ordered to take in, it would have been nearly expended before he joined, and he could have done no good in the end of October—the period their lordships thought most favourable for attack, but which I thought the most unfavourable.

Most certainly it is an objection, and a vital one.

Choose my day, indeed! there were not two days the whole time I lay at Nargen, that I could have attacked such a fortress as Sweaborg, even had I had the means to destroy it: it would have required a week. As for risk, I never cared a straw about that in my life, when there was the least chance of success.

Whoever wrote this ought not to be trusted with the management of the British fleet. Had I been such an idiot as to have attended to it, I should have most inevitably lost the British fleet. It is not correct that Cronstadt is blocked up fourteen days before Sweaborg. It is open that time: but blocking up is quite another thing. One night in the latter end of October,

LETTER.

made towards the latter end of October, with least danger of attack from the Cronstadt portion of the Russian fleet.

Recent events in the Black Sea will not encourage the Russians to attempt any enterprise of more than usual hazard and daring at this precise moment.

It is true that additional boats, having Lancaster guns, and mortar-vessels, have not been sent to the Baltic, since we were led to believe that Cronstadt and Sweaborg were unassailable by naval means alone.

Your second reconnaissance of Sweaborg opens a new view, and the presence or absence of a few guns of an improved construction, or even of mortar-vessels, cannot make the whole difference between a possible or impossible attack.

This order is founded on your own last report.

The final decision must rest entirely with yourself. If the attack on Sweaborg, in present circumstances, be desperate, it must on no account be undertaken by you; if, calculating the ordinary chances of war, and on a full consideration of the strength of the enemy's fortress and fleets, you shall still be of opinion that Sweaborg can be laid in ruins, it will be your duty, with the concurrence of the French admiral, not to omit the opportunity.

"I have now stated my case fairly, and the public must judge whether I am right or wrong. I shall merely add, that the whole of the summer I was cautioned to beware of granite walls by Sir James Graham, and the moment the winter commenced, I was goaded to attack them. Had the Emperor of Russia been first lord of the Admiralty, he would just have written me such letters.

"I remain, sir, your obedient servant,

"CHARLES NAPIER."

"Merchistoun, August 28, 1855."

REPLY.

with an easterly wind, would freeze at Sweaborg. What would have been said had the fleet been caught in the ice? We shall see whether Admiral Dundas will be ordered to choose a day and opportunity at the end of October to assemble his fleet, and make an attack on Sweaborg, now the magazines are blown up, and dockyards burnt.

Recent events in the Black Sea were a miserable deception; more recent events showed that the British fleet was nearly destroyed. And, had that been known at the Admiralty, Sir James Graham's cautions to me would have been repeated, instead of his goading language.

I never led you to believe anything of the sort, but quite the contrary; and I doubt whether Sir James Graham ever submitted my letter to the Board. It was sent to him on the 18th of July, and Admiral Chad's on the 14th of June.

Admiral Dundas seems to think very different; for, even with the forty-five vessels he had, and mortars on the island, he did not think fit to bring up his fleet, which proves that the absence of gun and mortar-vessels just made the difference between the possible and impossible attack.

No such thing.

Such is substantially the controversy between Sir Charles Napier and the government, involving the feasibility of an attack upon Sweaborg or Cronstadt. As Sir Charles Napier said in another publication, the French and British army sent out to Aland was too large to be employed in attacking small and detached places, and too small to be entrusted with the capture of Helsingfors or Cronstadt. The reconnaissance of the military leaders issued, as we have seen, in an opinion adverse to that of the admirals; those officers, with the commanders of the fleet, examined also carefully the Finnish coast. They found Abo exactly in the condition described by Captain Scott, recorded in a former chapter—defended by powerful land batteries, which could not be approached by ships of the line or frigates, while gun-boats moved about ready to attack any ship which met with the slightest misfortune in the attempt. When the reconnoitring steamer passed round Hango Head, the officers discovered that the fortifications which previously existed there had been pulled down, the Russians calculating upon the likelihood that the allies would capture or destroy them. These fortifications consisted of Fort Gustavam, a very formidable defence; with two lesser works, called Fort Meyerfeld and Fort Gustaf Adolf. The troops and the country people were set to work immediately before the appearance of the British, and in a very short time demolished all these fortifications. From Abo, the allied chiefs advanced to Sweaborg, which was attentively and anxiously surveyed from the nearest distance that the steamer could approach, the result of their review we have already stated. The reconnaissance of Cronstadt issued also in a decision unfavourable to an attack. It was reported that a portion of the imperial family were there at the time of both Sir Charles Napier's reconnaissances, which occurred within a short time of each other. Many stories connected with this circumstance were current soon afterwards, the principal one of which has been already related. A letter from the Gulf of Finland gave some details in connection with this subject which were deserving of credit:—"After having passed in review the 12,000 men of the imperial guard sent to reinforce the garrison, the emperor ordered a representation of a defence on the part of the forts Constantine, Alexander, Peter I., and Cronstadt, which command the entrance of the pass. They fired for an hour, but did not, it appears, give much satisfaction to the Grand Duke Constantine, who is considered a good judge of such matters. The emperor afterwards visited three screw steamers, the *Csar*, the *Constantine*, and the *Viborg*, which are now being completed, but whose machinery, ordered in England, is still wanting.

He then went to see a new apparatus for obstructing the passage into the port, and which was invented by an American engineer, consisting of a square wooden framework filled with enormous stones, and presenting sharp stakes sticking out and coming to nearly the level of the water. It is said that the immersion of these machines is a difficult matter, and that they do not answer. The emperor seemed out of spirits during his visit to Cronstadt. That circumstance did not tend to remove the disquietude of the population; and the next day great terror was excited by the fact of the general and the colonel charged with the direction of the artillery, as well as the colonel of engineers, being sent off to the Caucasus, to serve in the army in their grades, but at the bottom of the list for each. Every person has been forbidden to quit Cronstadt for fear of augmenting the public disquietude."

At this juncture the excitement of the people of Sweden, Norway, and Finland, was very great; and if the allies had had an army on the Finnish coast, or could they have entered into a treaty offensive and defensive with the united dominions of Sweden and Norway, it would have enabled them to have struck a blow which the czar would have felt to the pedestal of his throne; or if it were too late in the year to effect anything in 1854, matters might have been set in order against the spring of 1855, when hostilities could have been resumed under auspices more favourable—Russia must have succumbed to such a coalition. The Swedish and Norwegian press contained most able speculations upon the prospects of the war with Russia, especially the *Aftonbladet*. Another journal, the *Gotheborge Handels og Sjöfarts Tidning*, contained a series of articles on the subject of an immediate alliance of Sweden with the Western powers, and the fruits which would be borne. The following is a specimen, and the reasoning is apparently sound; it is at all events specious, and deserved the serious attention of all the countries concerned:—"Supposing that a Swedish army of 20,000 or 25,000 men marched into Finland, it could only be opposed by a lesser force, the Russians being obliged to leave at least 10,000 men at Sweaborg, and detach several corps along the coast, threatened as it is by the allied fleets. Could the result be doubtful, when it is remembered that the Swedes have hitherto always beaten a superior enemy, and that in the case they would be supported by the Western powers? And, as to the Finns themselves, could even the most incarnate Russian maintain that we had to fear any resistance from them? We have proved, that although the Swedish sympathies of the Finns may be

cooled, they nevertheless have not turned towards Russia; but that, on the contrary, the whole thinking part of the nation looks with mistrust to that side, in respect to the future as well as the present. We believe that those sympathies would be awakened if a Swedish army, preceded by proclamations commemorating our old connections, our common remembrances and hopes, entered Finland. Many a warrior from 1808-9 is still alive who willingly would support his old comrades; others have bequeathed their Russian hatred, and their fondness for the Swedish standard, to their sons. The hope of a new era—the loathing of being subject to a power inferior in spiritual culture to every other European nation, and to Finland itself—the ties of blood which still exist between Swedes and Finns—the commercial advantages of a union with Sweden—all this would procure us open or hidden allies in every corner of Finland. A people's sense of independence may be lulled asleep; it can never be destroyed. The Finns are well aware that united to Sweden they obey law, and not arbitrary power, and that their sons will not be sent away to Siberia without previous sentence. Supported by a friendly population in the country, by a powerful fleet on the coasts, which would scatter the forces and the attention of the enemy, the Swedish army, inflamed by the enthusiasm of a just cause, by the ardent desire of avenging at last the former treachery and violence of Russia, would before long chase them from every corner of Finland, and once more dictate peace. As to the defence of Finland, when conquered, it ought to be mentioned that this country, which at the beginning of the century had a standing army of 12,400 men, would now be able to put forth an army of 25,000 men; that Sweden, which needs not at present, as in 1808, to be afraid of an attack on the part of its neighbour, might easily send forth a similar quantity of troops to Finland; and, finally, that nothing could hinder us from entertaining in time of peace a proportionally larger army there than at home, on account of that province being the only one subject to foreign invasion. A famous man, and an excellent authority in those matters, Charles XIV., says, in a letter to Napoleon, 'Sweden possesses the elements of a great force; its inhabitants are naturally warlike.' Its constitution admits of the formation of an army of 150,000 men, and its male population affords the means of so doing. However, our foreign policy is marked with the stamp of weakness, dulness, and impotence, as if we could not lift our arm without looking out for a protector. Is this worthy of a nation which more than once has carried the destiny

of Europe on her sword's point? But it is not only for power and glory, not only for revenge and redress, that we look to Finland; it is our own safety, our existence, we seek there. This time Russia has misreckoned. This time Russia shall not conquer Turkey. But from this fruitless attempt she will learn that the way to Constantinople goes across Sweden. Therefore, to prevent Russia, or to be prevented by her, that is the question. If by a diversion in Finland we facilitate the approach of the allied fleets to St. Petersburg, Russia perhaps never more will threaten the liberty of the world. If not—if we let this occasion of reconquering of Finland escape us—Russia will not allow a new one to present itself to us. Laid open to her plundering hosts, degraded in the eyes of Europe by our faint-heartedness, Sweden, the glorious country of Charles and Gustavus, will cease to be a branch of the great European family, and become a nameless portion of the crowd of slaves which creep around the throne of the Autocrat."

Finally, as to the discussion of what was possible at Sweaborg or Cronstadt, the following remarks of Sir Charles Napier seem indisputably conclusive. The speech was delivered before the electors of Southwark, and after the failure of Admiral Dundas at Sweaborg, in 1855, to do more than silence the fortifications, burn some ships and sheds, and blow up some magazines, leaving Sweaborg unoccupied and Helsingfors untouched:—"There were possibly many officers in the navy who, if they had been in his position, might have done a great deal more than he had; but he did what he thought was right. He had performed what he believed to be within the range of possibility, and as much as he had thought that British seamen were capable of accomplishing. At the same time, he boldly stated that there was not one man or officer in that fleet who would not have given him three cheers, if he had offered to take them under the walls of Sweaborg and Cronstadt. Every one knew that we were engaged in a war which he had almost called 'a disastrous war,' seeing the immense amount of life and treasure which had been sacrificed in it; but it was not to be supposed that we were, therefore, not to prosecute it with vigour. Until recently he could not say that the government had carried on this war as it ought to have been carried on. It had not been carried on in the Baltic as it should have been. He did not blame his successor, Admiral Dundas, in the smallest degree, because he had done his best with the means at his disposal; but he blamed the Admiralty of the day, who had planned the campaign in the Baltic. They had sent an insufficient quantity of gun-boats and mortars,

MERLIN & FIREFLY STRUCK BY INFERNAL MACHINES.

and instead of assembling the fleet in front of Sweaborg, they—greatest fault of all—allowed it to be scattered about over the whole of the Baltic. He spoke advisedly when he said that if the mortar-boats had not failed—some splitting up and others bursting—and if there had been 100 there instead of 15 or 16, supported by the fleet, we might have destroyed Sweaborg entirely. Had such been the case, he was satisfied Sweaborg would have been destroyed after two days' bombardment. For whatever had gone amiss, therefore, in the Baltic he did not blame the admiral, but the plan; up to a certain point the government had acted in an imbecile manner. There was no excuse this year. The government had been warned in June, 1854, that Sweaborg could not be taken in two days, and yet, with Sebastopol staring them in the face, after eleven months' siege, and upwards of 1000 guns and mortars blazing away at it, one might have expected a little more patience and reason from them."

While the British fleet was cruising about the strongholds of the czar, a new instrument of sea defence was adopted by the latter. One of the officers of the *Merlin* wrote the following unpublished account of what that vessel experienced from this novel instrument for injuring ships, and which has been generally denominated an "infernal machine." On board his ship was the justly celebrated painter of marine scenes, Mr. Carmichael, an engraving of whose picture, "taking Soundings under the Batteries of Cronstadt," embellishes this work.

One P.M.

"H.M.S. *Merlin*, with Admiral Penaud and several French and English officers on board, left the anchorage to take a survey of Cronstadt, first from the north and afterwards from the south-west; the *Merlin* was accompanied by the French steam corvette —, and H.M.S. *Dragon* and *Firefly*. Unfortunately it was very hazy, and we had not so good a view of the north side as we could wish, but one point was decided, that they have thirteen steam gun-boats, having but one mast or signal pole; their length appears to be about 200 feet, and their breadth about thirty feet; they are very low shallow-looking vessels, and appear to have four large guns, but from the haze and the distance it could not be ascertained for certain.

"After taking a good view of the place we proceeded towards the lighthouse. About three o'clock—the ship going at the rate of five knots an hour—we received a very heavy shock, which made the ship's masts shake like 'coach whips;' the engines were immediately stopped, but the ship still kept her way through the water, which convinced every one that it was

the explosion of an 'infernal machine' under our bottom. The watch below, who were perhaps nearly all asleep at the time, frightened by the shock, came rushing up the fore-ladder—some without caps, others without frocks, &c.; the quick way in which they came from below can only be known to those who witnessed it, and others who have seen the activity of an English sailor. Orders were then given to reverse the engines, when we received another shock greater than the first, several shot were shaken out of the racks, and rolled about the deck. At this time the *Firefly* was coming up astern, and, in order to prevent her from getting into danger, all hands abaft set to work waving their caps in the most frantic manner: Captain Sullivan even lost his band while waving his cap to her. The open pendant was shown, when the *Firefly* put her helm to port, and then stopped, coming up along side of us the star-board side. She was not long before she got a taste of it herself, the explosion was distinctly heard by every one on board of us, although no smoke was to be seen. After taking cross bearings of the place we steamed quickly out, and then went round to the south-west, as was first intended we should. The *Firefly* left us to rejoin the admiral. Being under sailing orders, and hearing that there was a grand smash in the engineers' mess-room, I went down to have a look at it, when I found that everything in the shape of crockery was broken—all the racks, shutters, in fact, the bulkhead itself was blown down; the scene will be better explained to you by a sketch taken on the spot by a Mr. Carmichael, who was on board. I then went down in the lower store-room, where a tank with eight cwt. of tallow had been moved four feet from its original place by the explosion, which was near about that spot, for the ship's side was slightly bulged in, and a wooden girder was broken. Altogether we had a very narrow escape, but after all was over it was quite laughable to see the different places that had suffered."

While the fleet lay at Nargen, a number of seamen arrived who had been prisoners. It will be recollected by our readers, that when the attack on Gamla Karleby was made, the *Vulture's* boat was captured and taken on shore. She had run foul of a sunken vessel, and was therefore not in a condition to resist. The treatment which these men reported as having received from the Russians was such as to leave a very favourable impression of their captors. The wounded were especially cared for in the hospital at Gamla Karleby; the other prisoners were sent to Helsingfors. The inhabitants of Gamla Karleby seemed to vie with one another in kindness; for it was to

these patriotic Finns, rather than to the Russian authorities, that the invalids were indebted for the good things which they received. Of these there was abundance and variety: bread, butter, cakes, baked in the fashion of the country—beautiful seed cake, which the Finnish housekeepers are particularly expert in preparing—beef, rice, vegetables, especially potatoes—tea, sugar, coffee, were afforded to them. Before the inhabitants supplied them with cakes they had only dark rye bread, to which Englishmen have a strong objection. General Wendt, the commandant of the place, in the most generous manner, had meanwhile bread baked for them at his own expense. Nor did his generosity stay there—wine, which is expensive in Finland, was sent to their wards, and to the mess-table of such as were able to attend it, with fruits, and what the men prized more than all, pipes and tobacco. Upon their recovery they were “rigged out” with a new suit of excellent blue cloth; new shoes and woollen socks, and a cloth cap, were also given them. Several of the men died, and these received decent and honourable sepulture. A Finnish Protestant clergyman officiated at their grave: they were not thrown into a common pit, as the English were at Scutari by their own government, but placed in a decent coffin, and attended to the grave by the convalescents of their own countrymen, and by the principal inhabitants. After some time these pleasant quarters were changed, the English steamer *Leopard* made hostile demonstrations, and in consequence the prisoners were sent seventy miles inland to Imola. There they were obliged to wear an hospital dress, and to partake of the soldiers’ rations. Permission was given them to converse with the peasantry, whom they found courteous and hospitable in the extreme—a fine, manly, generous-hearted set of men, and the women modest and maidenly, or matronly, as beseemed them; the general population were represented by the liberated prisoners as exceedingly religious and moral. On the 21st of September they were sent in light spring-carts to Abo, and there put on board a small steamer and sent to Led Sund, where they were delivered up to the British authorities, who sent them on to Nargen.

A glance at the condition of Finland, and the character of the Finns, has been given in a previous chapter when touching upon the operations of this naval campaign. The excellent conduct of the Finns to our poor captured seamen will increase the reader’s interest in the people and their country. The following statistics connected with Finland may be relied upon:—“The internal trade of Finland is of very little consequence; however, the

new Saima Canal, finished in 1844, has facilitated the communications at home. The foreign trade is considerable. The most important export articles are timber (planks and boards), potash, tar, cattle, butter, meat, tallow, and fish; the exports amount to 3,000,000 silver roubles yearly. The official language of the land is Swedish. The Lutheran evangelical religion is the predominant creed, confessed by at least 1,500,000 of the inhabitants; the rest belong chiefly to the Greek Church. Politically speaking, the Finns may be divided into three classes:—1. The old Swedish Finns, regretful of the former union to Sweden, and wishing it back. They are not numerous, but among them may be found some very influential men. This party has its ramifications, supported by family alliances, all over Sweden. 2. The Russian Finns, fond of belonging to a powerful empire, and grateful for past and present imperial favours. They belong chiefly to the nobility and to the higher class of public functionaries, but are neither numerous nor powerful, inasmuch as they are not rooted in the national soil. 3. Last, not least, the Finnish Finns. Although cherishing the civilisation which they have received from Sweden, being fond of their Swedish recollections, and, on the whole, animated by a friendly feeling towards the Swedes, they nevertheless do not desire a political union with Sweden; still less do they aspire to being Russians. They want to be Finns, and nothing else. The large bulk of the nation, from the professor to the peasant, belongs to this party. The population of Finland, according to the census of 1852, amounted to 1,636,915 inhabitants. Finland is a most uneven country, with a great variety of mountains and valleys, and nearly devoid of plains, with exception only of the coast of Osterbotten (Wasa-land). For the most part, the west coast of Finland is flat, though rather rocky and craggy near the Qvarkeu, the narrowest part of the Gulf of Bothnia; and the peculiar kind of shoals and shallows which are successively heaped up by the sea cause a great deal of inconvenience in the harbours. The climate of Finland is harsh and cold, the winter long and severe. The principal livelihood of the Finns, especially in the south-western parts of the country, is agriculture. The potato production amounts to 1,500,000 tons yearly, and Finnish hemp, flax, and tar, are sufficiently well known in England. Even tobacco is cultivated in different places. Gardening is in a poorer state, on account of the climate. The forests are extensive and considerable; the most important species of trees are birch and pine. The meadows and pastures, although left to themselves, without any care or inspection, are

excellent, and afford sufficient food to the horses, cattle, sheep, goats, and reindeer of Finland, which, when compared, for instance, with those of Norway, are not, on the whole, inferior to them either in quality or quantity. The manufactures are not numerous. In 1851, 148 factories occupied 3364 persons, and gave a brutto-revenue of 1,295,621 silver roubles. The cotton mills and the glass manufactures are the most important. It is just to state that the Russian government has, in this respect, most liberally supported every useful undertaking in Finland."

In consequence of a peremptory despatch from home, the commander-in-chief of the fleet sent the greater part of his remaining ships to Kiel, on their way to England. The *Duke of Wellington*, *St. Jean d'Acre*, *James Watt*, *Princess Royal*, *Blenheim*, *Hogue*, *Edinburgh*, *Royal George*, *Nile*, *Cæsar*, *Majestic*, and *Cressy*, weighed anchor on the 19th of October, but, in consequence of bad weather, it was not until the 28th that they had all reached the rendezvous. At the same time the blockade of the Gulf of Bothnia was raised; that of the Gulf of Finland was maintained by a squadron of steamers, consisting of the *Euryalus*, *Arrogant*, *Impérieuse*, *Magicienne*, *Desperate*, *Basilisk*, *Bulldog*, and *Dragon*, under Captain Watson. During November little could be effected, nor was the blockade very strictly maintained. At the close of that month there was at the anchorage of Kiel a formidable fleet, notwithstanding that so many ships had returned home; there were thirteen ships, carrying 1100 guns, and containing 10,000 men. The steam squadron cruised about the Finland Gulf, impeded by mists, fogs, high winds, and at last the formation of ice. In the first week of December, Captain Watson abandoned the blockade in consequence of the ice. Most of the larger ships at Kiel steered for the Sound, preparatory to their return home, and by the close of the month the whole fleet was in English harbours. On the last day of the year, the *Duke of Wellington*, *James Watt*, *Hogue*, *Blenheim*, *Impérieuse*, *Arrogant*, *Penelope*, and *Locust*, arrived at Portsmouth, where Sir Charles himself landed on the 18th, and met a most generous and popular reception from the townsmen and the tars. The other ships arrived rapidly in various ports. At Devonport, the *St. Jean d'Acre*, *Princess Royal*, *Nile*, *Cæsar*, and *Euryalus*; at Leith, the *Edinburgh*, *Cruiser*, *Arden*, and *Magicienne*; Woolwich, the *Odin*; Sheerness, the *Cressy*, *Majestic*, *Royal George*, and *Amphion*; Hull, the *Desperate* and *Conflict*; North Shields, the *Bulldog*; Coventry, the *Dragon*, *Rosamond*, *Basilisk*, and *Vulture*; Harwich, the *Driver*. Soon after the blockade was abandoned as imprac-

ticable, seven Russian ships left Sweaborg for Cronstadt! This circumstance became known at home, and deepened the public discontent. In November the Russians reoccupied the Åland Isles, and immediately opened the postal communication between Åland, Stockholm, and the cities of Finland. Merchandise was imported from Sweden to Åland, and the Finland shores, notwithstanding the ice which rendered Captain Watson's services unavailing. At Revel a very active trade was driven after the hostile ships left the neighbourhood: scarcely had the latter disappeared when the vigilant traders of Revel commenced operations. At Riga similar vigilance and activity were crowned with a like reward. So bold were the inhabitants of the latter place, that they entertained projects for raising the ships which they had sunk across the harbour as an impediment to the entrance of the allied cruisers, and which, like the same *ruse* at Sebastopol, was successful. The Russian fleet at Cronstadt issued forth in the expectation that some lagging enemy would fall into their hands, but they only obtained damage from ice and storm, and some of the ships narrowly escaped wreck. As soon as all naval operations terminated in the Baltic, and there was nothing to be apprehended from the powerful armaments which had hovered about the great fortresses, the Russians set about increasing their defences with their usual industry and vigour. Roads were repaired and constructed, to enable the government to transport heavy material of war from St. Petersburg, and facilitate the communications between the different places of defence. The peasantry and citizens were everywhere laid under forced contribution of time and labour, and all that had money were obliged to supply it. Conferences were held at Helsingfors, Cronstadt, and St. Petersburg, in reference to the general defence of the Baltic shores. The defences at St. Petersburg were strengthened, as were those at Cronstadt, Helsingfors, Åbo, Revel, and Riga, in a lesser degree. Nearly everything that could be done for Sweaborg had been before accomplished, but the new works erected at Helsingfors, and the reparation of the Sweaborg batteries, added some new features of power to this twofold bulwark of the czar's power. Reviewing the campaign as a whole, the allies had considerably the advantage. Bomarsund, so dangerous to Sweden, was destroyed; the commerce of the Russian coasts had been cut off for the whole season, except the very early weeks of spring and the month of November, while the allied ships came home from a dangerous sea unhurt. A considerable number of Russian prisoners—including a general officer—had been made, and the prestige of Russia

among the Baltic nations impaired. Her fleets had skulked away from the presence of her rivals and enemies; and the idea of her naval superiority in the Baltic, of which she had boasted so long and so loudly, perished. Had the gun-boats of Sweden and Norway been at the service of the allies, Russia would have received injury incalculable. The alliance of the united kingdom of Sweden and Norway with the Western powers, had it depended upon the people, would have been promptly effected; but it was supposed that the timidity of the court prevented so happy a result to the negotiations set on foot. The following brief notice of the Swedish king may here be appropriate:—"The present royal family of Sweden is the youngest in Europe. It dates from 1809, when the weak and vacillating Gustavus IV. was compelled to abdicate, and the Diet exercised its old constitutional right of election, by excluding his children from the succession, and appointing the crown to his uncle Charles, with remainder to Charles John Bernadotte, a marshal in the French army, who was thereupon declared crown-prince. Napoleon gave his consent, though not very willingly, to this arrangement; and Bernadotte ever afterwards studied the interest of his new country and subjects as his chief duty. Charles XIII., the last reigning prince of the house of Vasa, died in 1818, his family having ruled the destinies of Sweden during nearly three centuries; and Bernadotte, under the title of Charles XIV., succeeded, amidst general acclamations and rejoicing, to the throne, which he worthily filled during the remainder of his life. He died March 8, 1844, when he was succeeded by his son, Joseph Francis Oscar I., who now reigns. His present majesty was born in July 1799, and married in 1823, Josephine Maximilienne Eugénie, daughter of the then, and sister of the present, Duke of Leuchtenburg. The Duke of Leuchtenburg is husband of the Grand Duchess Mary of Russia, sister of the present emperor."

On the return of Sir Charles he was put

upon half-pay, and the feud so long maintained afterwards between him and the government broke forth publicly. Sir Charles considered himself ignominiously dismissed from his command without trial; the Admiralty and the government maintained that he was not dismissed at all, but, as the command had terminated, he was placed on half-pay. The government declared that they did not intend to censure the gallant admiral, nor to express any disapprobation of his professional services; but they admitted that they preferred not employing him because of his arrogance and insubordination. The public, however, sided with the admiral; and, evidently acting in deference to public opinion, and with the desire to appease the wrath of the irate sailor, the government summoned him to court to receive the distinction of the Bath, conferred on so many others for less renowned actions than those of Sir Charles. The indomitable tar would not accept any honour, even from his queen, which came through the hands of a government that refused to do him justice. Meanwhile, public honours were heaped upon him by the people. The City invited him to dine; the country voted him addresses of confidence, and which might also be called condolence. The people admired the bold spirit with which he defied an unpopular government, and therefore, as much as from any conviction of the justice of his cause, expressed their sympathy and afforded their support. Finally, the electors of Southwark sent him to parliament, where he confronted his antagonist, Sir James Graham. In that debate the old warrior was not at home quite so much as on the quarter-deck, and, although no one doubted that he had right on his side, the crafty and expert special pleading of Sir James Graham made the worse cause so far appear the better, that the House of Commons dismissed the subject in a summary way, giving little satisfaction to the admiral's complaints of injustice.

Thus ended the naval affairs of the Baltic in 1854, and the events at home in 1855, which arose in connection with them.

CHAPTER LIV.

DIPLOMACY.

"What has been gained by the hearts' blood of the soldiers, those scribblers will lose cowardly and infamously."—BLUCHER'S *Letter to the King of Prussia*, February, 1814.

In the twenty-first and twenty-second chapters the diplomacy of the Western governments—in reference to the position of Germany, and more especially Austria, to the war, and the particular relations of Austria to the Porte—was noticed at considerable length. The Austrians continued through the

remainder of the year to occupy the provinces, and to trample upon the liberties of the inhabitants. The condition of the latter was worse under Austrian than under Russian rule. The cry of the oppressed passed over those unhappy countries to all the capitals and governments of Europe. The agents of England thoroughly

sympathised with the inhabitants; those of France felt, or pretended for political purposes to feel, a thorough sympathy with Austria. The game played by the latter power was deceitful throughout. She had been in complicity with Russia for a partition of the Turkish empire. The success of the Ottoman arms on the Danube, and the determination of the Western powers to protect the integrity of Turkey, necessarily modified the policy of Austria, and she then sought to possess the disputed territory herself, under the pretext of protecting the provinces against the return of the expelled Russians. The aim of Austria was a permanent possession; her pretence a temporary occupation in the interest of Turkey and the allies. As soon as she garrisoned the provinces, she assumed the part of "the strong man armed," and dictated in everything, subverting all law and liberty. England was very unwilling to permit this, but an influence was exercised over the cabinet, and over the imperial government of France, which has never been sufficiently accounted for, but which was attributed very generally, both in England and on the Continent, to the German influence in the English court. Others attributed it to the papal influence at the French court, at least, in part. The disingenuous policy of Austria was, at all events, apparent to the whole world, justifying the language of the *Church of England Quarterly*:—"Of the complicity of Austria, in the contemplated partition of the sultan's European dominions, we think that among our readers there can be but one opinion; that this has been modified since the commencement of the present contest there is no doubt; but that the merest selfish fears have caused that modification, and not any inclination towards the cause of justice, must be manifest to all who have studied the conduct of the Austrian government in their relations with the Ottoman empire, up to, and even since, the occupation of the principalities."

The attempts of the Western powers to draw Austria and Prussia into the alliance against Russia were most persistent all through the year 1854. The efforts of Prussia were to serve Russia under pretence of a decided neutrality. The policy of Austria was to serve Russia at the expense of the Western powers, if possible; to ally herself with Prussia for the mutual protection of the territory of either power, in case any overt act in favour of the czar should cause the allies to attack the ultra-German provinces of the Austrian empire; but, at all events, to possess herself of the Moldo-Wallachian provinces of Turkey, and, without risk, reap the advantage of successful war. The allied governments must have seen through this policy, and have determined to outwit the cabinet of Vienna, and to play with that

government as it presumed to play with them; but a large and influential section of the members of the Western governments believed in Austria, and sympathised with her despotic principles of government, hence the vacillation in the conduct and tone of the French and English cabinets, which excited so much surprise in Europe. To set forth all the cabals, intrigues, and negotiations, which filled up the time, and occupied the ingenuity, of the diplomatists and their agents, would neither interest our readers nor comport with the character of this History; we therefore suppress much which we know, and exhibit only the main features of those transactions.

When, after the Christmas recess, the British parliament reassembled, Lord John Russell gave the following condensed outline of the diplomatic proceedings which characterised "the fall" (as Americans call it) of 1854:—"At the end of November, the Russian government, through their minister at Vienna, declared their acceptance of what are called the 'four points.' On the 2nd of December, a treaty was signed by France, England, and Austria; and on the 28th of December, a meeting was held by the ministers of France, England, and Austria, at Vienna, with Prince Gortschakoff, the minister of Russia. At that meeting the French minister read, on the part of his own government and of the governments of England and Austria, the interpretation which those three powers put on the four points, and which should be considered as the basis of negotiation. I will mention only that with respect to the third point, it was proposed in that interpretation to put an end to the preponderance of Russia in the Black Sea. Prince Gortschakoff stated that he would not agree to the proposed interpretation of the four points, but that he would request further instructions from his government. Ten days afterwards he informed Count Buol that he had received those instructions, and on the 7th or 8th of January, another meeting was held at the office of the Austrian minister for foreign affairs, and at that meeting Prince Gortschakoff read a memorandum which he said he had received, and which contained the views of his government. It was replied by Count Buol, Lord Westmoreland, and Baron de Bourqueney, that they had no authority to receive any such memorandum, and that they must require, as the basis of negotiations, the consent of the Russian plenipotentiary to the interpretation of which he had already received information. The Russian plenipotentiary then withdrew the memorandum he had read, and declared the acceptance, on the part of his government, of the communicated interpretation as the basis of negotiations."

This brief summary of the barren negotia-

tions of the last months of 1854 is very expressive. Austria was the difficulty. Had she been true, the war would have ended when the eagles of Russia took their flight across the Pruth. Had the Western powers dared Austria to do her worst, it is questionable whether she would have ventured to raise a sword against them; and if she had, all Italy would have risen, Hungary would have started to arms, and perhaps Poland also might have given more trouble to its garrisons,—although we are amongst those who think that Poland could have done little if anything to effect a diversion in favour of the Western powers. Kossuth, in one of his masterly political harangues, put the conduct of Austria, and of England to Austria, in a light striking and, to a great extent, true. In a former page we combated, in many respects, the views of that noble-hearted man, as to what ought to be and could be the policy of England in respect to “the nationalities.” The Hungarian chief does not know enough of the elements of English society, and of English opinion, to dictate a policy to the British people in the tone and terms which some of his most eloquent speeches assumed. Austria, however, and her aims were familiar to the earnest and gifted Magyar; and his opinion on every subject connected with our policy to her, or hers to us and to Europe, must have great weight. In the following extracts from the orator, he overlooks the impossibility of England forming a line of policy towards Austria separate from that adopted by France; nor could she, independent of her imperial ally, direct the mode of conducting the war. Notwithstanding these objections to the opinions and spirit of M. Kossuth, the following passages from his orations are singularly pertinent to the diplomatic phases of the events of the closing months of 1854, and to the military events, so far as their character depended upon the diplomacy:—

“England has bent her mind on bringing Austria over to herself; she has sacrificed to this one aim everything—numerous millions spent in vain; the life-blood of the flower of England spilt in vain; principles, political reputation, the liberal character of the war, and the very issue of the war—everything. And has your government gained Austria? Has it gained that Austria to whom it has sacrificed everything—that Austria of whom the *Times* acknowledges, you ‘are fighting her battles more than your own?’ What a proud sneering there was in official quarters when I, months ago, told the good people of England that they believe they pay and bleed for freedom, when in reality they are made to pay and fight for Austria. Now the truth comes out at last. Well, has your government

gained Austria? . . . Go and read the well-founded lamentations in the organs—even the ministerial organs—of publicity about the treacherous attitude and the overbearing insolence of that Austria which your government persisted in courting with so much submission, and which in return facilitates the enterprises of Russia, insults your allies, and counteracts your combinations. It is not only that you have not gained over Austria, but you have the Turks arrested in the midst of their victorious course; and the fruit of their heroic struggle, poor Wallachia, played over into the treacherous hands of despotic Austria. There is the Turkish army paralysed on the one hand, and there is on the other hand the czar made and left free to throw overpowering numbers upon the flank and rear of your gallant ranks in the Crimea. There you have the spirits of the Turkish army, high-flowing as they were by the victories at Silistria and Giurgevo, now depressed; there you have the spirits of the Russian army, depressed as they were, now restored. And, oh! I could tell you what it is to neglect the moment of spirited excitement in a victorious army, and what it is to give time to a demoralised enemy to resume its spirits and to take breath. One such moment’s neglect in a war, and it is not battles, but empires that may be lost by it. . . . The *Times* says:—‘No human foresight could have anticipated the extraordinary position in which England finds herself.’ Extraordinary! Why, what is there extraordinary in the inexorable logic of concatenation between cause and effect? Is it extraordinary that Sebastopol is found to be an entrenched camp with a numerous army in it? Is it extraordinary that the czar is pouring whole fresh armies to its defence? The czar has been left perfectly free, and with ample time afforded to do it; nay, in fact, he has been invited to do it by the Turco-Austrian treaty, negotiated under England’s auspices. The extraordinary in the matter is not that he has sent reinforcements to Sebastopol, but that he has not sent double the number, and a month earlier. . . . To have a radical cure you must penetrate to the seat of the evil. The real source of all your difficulties is Austria. Every child knows this. *Either England fears Austria too much, or loves her more than she ought.* This is the evil. Don’t fear Austria, throw her overboard, and you are safe; if not, not. . . . Shift the theatre of the war; insist peremptorily on Austria’s evacuating the principalities, and on siding with or against you; advise the sultan to grant independence to the Roumains, and arm them; enlist the Polish emigration—not in Turkey, but here; mind where the weak point of Russia is, and strike there. And wherever a government is playing false to you, call on the

nations it oppresses. These are your radical remedies; but remember that while in matters of internal progress you may say, by-and-by we shall come to that, in a war everything depends on moments. Opportunity lost is a campaign lost—may be even more. Poland is your surest remedy even to-day, but how much surer and easier would it have been six months ago? I do not speak from even patriotic egotism. This war—such as it is—and it may be carried on, or arranged, in the worst possible manner—is manifestly an indication of retributive justice, slow, but sure in its decrees.”

Having in previous pages of this History combated the opinions of Mazzini as well as Kossuth, as to the duty of England in this crisis, and proved how impracticable were the measures recommended by that patriot, we have pleasure in placing before our readers the following eloquent passage from his pen, on the subject of a British alliance with Austria against the czar; it is addressed to the people of England:—“Will your government ever spontaneously adopt a change of policy? Never. The men who had not one word to say in the name of England’s honour when the czar in 1848-9 invaded the principalities and crushed Hungary, because his object was then to check liberty and national movements—the men who plotted with Louis Napoleon for restoring the Pope ‘under an improved form of government’ at Rome—the men who can, during sixteen months, exhaust every form of servile complacency towards such a power as Austria, and, scorned, do not dare a threatening word—can ally themselves with despotic usurpers—they never will say to a nation, Rise! Their policy lies between the despatch of the 23rd of March, 1853, in which Lord Clarendon declares that her majesty’s government is anxious to avert the risk of any advantage being given to the European revolutionists, and the speeches of Lord Palmerston, branding the liberty of Poland as a dream, the future rising of Hungary as an untoward lamentable event. They may break their pledge with Sicily; they will never break that which binds them to continental absolutism. But that you, English citizens, who worship freedom and revere morality—you who have no pledge except to England’s honour and safety—you who all to a man waved your hats at Poland’s glorious rising, and proclaimed its overthrow a crime—you whose brothers and sons are *dying*, the victims of a wrong policy, in the Crimea, whilst in Podolia and Lithuania they could *conquer*—that you, the free and able, by a single resolute act of will, by a sudden energetic collective manifestation to compel, can sit quietly witnessing the slow, useless work of destruction, and trust your fates to men who, thanks to

their policy and to Austria, are besieging, after nine months of operations, an outer work, is more than I can explain to myself or others. Every man who has a son, a brother, or a friend in the East, ought to walk with a map of the Crimea on his breast, and a flag with the name of Poland inscribed upon his shoulder, from place to place, from park to park, from cottage to cottage, and preach and explain, until hundreds of thousands should peacefully but sternly signify their will. ‘Change of policy. Down with Austria. Let Poland’s rising be helped.’ And then you ought to kneel and thank God most humbly for having placed the easy accomplishment of a great act of justice on the very path which leads to English safety and success. But Austria! Prussia! Leave Prussia to her own people; Austria to Hungary and to ourselves. As sure as Austria will never fire a single gun for you against Russia, not a single Austrian gun will be fired against you while we live. The question of the nationalities is amounting to a general war. What of that? Will not the nationalities fight their own battles? Only those battles will be yours too. With Poland, Hungary, and Italy up, the czar cannot dream of marching to Constantinople. Out of the road I point, depend upon it there is no decisive victory nor honourable peace possible for you. In a letter which I addressed to the chairman of the Society of the Friends of Italy, on the 2nd of March, I said, ‘Your policy is absolutely wrong and immoral, therefore you cannot and will not conquer.’ I maintain my ground. War is for me the greatest of crimes, whenever it is not waged for the benefit of mankind, for the sake of a great truth to enthrone, or of a great lie to entomb. Yours is not such a war. It shrinks from the proclaiming of a principle. It equally aims at curtailing despotic encroachments from the north, and strengthening despotism in the centre of Europe. It declares that Turkey has a right to independence, whilst its policy and tactics are calculated so as to prevent any other country from asserting itself independent. I believe in God and in a providential scheme, and consequently, I do not believe in triumph crowning a war grounded on expediency, temporary self-interest, and antagonism to European rights and liberties. Czarism is a principle—the principle of unbounded authority; it is only a principle—that of universal liberty—that can conquer it.”

However correct the general character of the above remarks, and however improved the tone and tenor of this address, or of these extracts from it, as compared with some others written by the same able hand, it is obviously a misrepresentation of the aims of either the English government or people, to describe

the war on their part as intended to curb the despotic principle in one direction of Europe, and to strengthen it in another. The object of the war was to check the aggrandisement of a colossal military power, whose continued aggression endangered the independence of the world. It was "expedient" to check it, "self-interest" prompted the attempt; but in this case neither what was expedient nor interested contravened principle. The aim of the war was righteous, whether the character of the alliances formed were politic or otherwise. On the latter point M. Mazzini's opinions are entitled to weight.

That the real feeling of the German governments, great and small, was not favourable to the Western powers at this juncture, might be easily gathered from their press,—in which apprehension of revolutionary outbreaks under the auspices of the Western governments, or of the popular feeling of the Western nations, independent of their governments, was constantly expressed. Those journals professed at the same time to see no real ground of alarm at the progress of Russian aggression, or if some fears on that score were to be entertained, they were dissipated by the certainty of Russian aid against revolutions.

In a letter from Berlin the aspect of the war from a German point of view was thus expressed by a correspondent, during the negotiations for peace described by Lord John Russell in the extract from his speech in parliament already quoted:—"The fall of Sebastopol, it is alleged, may be an event of high importance for the allies, but it by no means affects Germany, and does not impose on it the obligation of abandoning its neutrality. Germany believes it advantageous to its interest to still maintain the attitude it has assumed with relation to the belligerents. Why should it be modified? With what object and for what benefit? It does not feel the necessity nor understand the utility of such a change. This manner of viewing things may not be popular on the other side of the Rhine, but it would be unjust to pretend that it is not the expression of our own will, the consequence of a determination freely and maturely adopted. When we are accused of being under the pressure of Russia, of being, as it were, her feudatory, the accusation is unjust, and is contradicted by facts. Let us go back to the origin of the conflict, and ask what was it that Russia demanded at that period? She proposed to us to contract with her an alliance of neutrality, with the object of repressing by arms any commencement of hostilities, whoever might be the promoter of them. In that manner the difference would remain exclusively limited to Russia and the Ottoman Porte, and, as the former had taken possession of the

Danubian principalities before any declaration of war, occupying them as a material pledge, the consequence would be that the moment the Western powers prepared to expel the Russians from them, Germany, according to such a treaty, would be forced to intervene, and against the allies. Such a plan would have been of the greatest advantage to Russia. Yet Germany, that is described as devoted body and soul to that power, positively refused to accede to such a proposition of alliance."

Without a clear understanding of the tone of public feeling in Germany, it is impossible to comprehend the policy pursued by the German powers, or the shifts of diplomacy resorted to by those of the West. In a very brief space the reader may find a fair description of the feeling of people and armies, from Berlin to Vienna, by perusing *Twelve Chapters on the Struggle of the Age*, by Carl Prettag, Ph.D., late Professor of Philosophy in the University of Rostock. The following extract will justify this reference:—"Wherever we look into the present struggle on the Continent, society is divided into two camps of political principles and national sympathies. The princes, the nobility, and a very small portion of the people whose present interests are connected with the former two, as in Germany (especially the clergy, Protestant as well as Catholic), are on the side of Russia; all the other classes, as far as they have any opinion at all, are body and soul on the side of the Western powers. It is unnecessary to mention, that to the latter belong especially the commercial classes, and, above all, the young generation of intelligent mechanics; but also amongst the *Beamte* (government *employés*) in Germany, by far the largest number may be considered to belong to the national and liberal party. The proud Prussian *Beamte* perceives with indignation the humiliating and anti-national policy to which his country is condemned, in a struggle in which that civilisation is at stake, of which he considers himself one of the foremost representatives. As far as regards the armies, there is a decided difference between the Romanic nations and the Germanic. Whilst the armies of Spain, Portugal, Italy, have often been the first defenders of liberty, their generals have first raised the standard of constitution, as at present in Spain; the armies in the Germanic states are so attached to the person of the monarch, that they are but a too willing tool of his despotic plans and policy. The reason is, that these armies are entirely in the hands of the nobility, and that the privates are animated by such an '*esprit de corps*,' that as long as they wear the king's jacket, they consider themselves in opposition to the people, and are estranged to their interests. Espe-

cially is this the case in Austria and Prussia. Less to be depended on are the soldiers of the smaller states, in which the '*esprit de corps*,' created generally by glorious recollections of past services to prince and country, are more or less wanting. It is not too much to say, that without Prussia and Austria, the princes of the smaller states would not be able to maintain their petty thrones for one day. The revolutions of Baden, Saxony, and Hesse-Cassel, have given sufficient proof of it. The fear of the Prussians, who are considered as the policemen of Germany, alone retains for these princes a power which they so often employ against their protector."

To meet the complications of the crisis, it required on the part of England and France ministers and negotiators of the most profound experience and the highest genius. Unfortunately such were not employed. The perpetual changes of government in France since 1830 prevented that country from consolidating her diplomatic corps, and choosing only on account of their fitness the best men; regard to party rather than to capacity was constrained in reference to the choice both of generals and diplomatists in the service of Napoleon III. So torn was the country by parties—republican and red republican, democratic and monarchical, Bourbonist and Buonapartist, Reichstadtist and Orleanist—that it was extremely difficult to find men of great capacity, military or diplomatic, very ready to serve under the last adventure of government, and under which the war was conducted. In Great Britain there was talent of every order; but without aristocratic influence or connection it could not be made available for the country's service. To let down in the least degree the prestige or power of the aristocracy, either ministerial or military, was considered in the higher circles as tantamount to the ruin of the country. The greatness and glory of England, apart from the ascendancy and glory of the titled classes, was an idea that passed the comprehension of those who then ruled her destinies. It was truly written at the time—"At present all the first-rate diplomatic posts are held by peers. At Paris, at Berlin, at Brussels, at Vienna, at Madrid, there are peers; at the Hague and at Naples our two representatives are men who, by the natural course of descent, will inherit peerages."

An able writer in the British *Quarterly* thus severely and justly criticises the condition of our diplomacy, and the capacity of the diplomatists usually employed in the British service:—"The most wanton and impolitic neglect of British interest has been too often felt by British merchants and manufacturers in foreign states. British ministers and consuls are too often ignorant of their duty, and

of the first principles of trade, and are sometimes disposed to treat with supercilious contempt men, their superiors in every mental and moral qualification, who call on them for redress. Till the diplomacy of the country is entirely remodelled, these grave errors must continue to be exemplified. Diplomacy must be thrown as open to every aspirant as it was in the days of Cromwell in England, or in the days of Napoleon in France, when Bignon, Maret, Caulaincourt, Duroc, Reinhardt, Champagny, De Pradt, and others, rose from humble station, by the force of their talents alone, to be ministers and ambassadors. Our eldest daughter, America, has shown us a fine example in this respect. In America, men of learning, sense, and talent, considerable lawyers, or public writers or professors, not lean-witted lordlings, are chosen for the different missions. Franklin, Jefferson, Adams, Pinkney, Rufus King, Pickens, Randolph, Morris, Everett, Rush, Wheaton, Maclean, Clay, Gallatin, Washington Irving, Hughes, Waddy Thompson, and N. P. Willis, have all been either well-read lawyers or professors, public writers, or men of letters. We should like to have pointed out to us the negotiation in which Brother Jonathan has been outwitted. It were time that the bar of England should be had recourse to, and be allowed to furnish the same quota of able men which it furnished in the days of Cromwell. Within the last twenty years, it was necessary to send men especially out to do the work of ignorant or inefficient ambassadors, as the late Mr. Villiers, brother of Lord Clarendon, the late Sir Henry Parnell, Dr. Bowring, Mr. M'Gregor, Mr. Porter, Mr. Fetherstonhaugh, and even an ex-proctor in the person of Mr. Rothery. This cannot be any longer permitted. In the most despotic states, the diplomatic career is more open than in England, as may be proved by the examples of Spain, Portugal, Turkey, and Russia."

The necessity to England of patient, vigilant, well-informed diplomatists, irrespective of their social rank at home, or of their connection with any particular branch of politics, was rendered the more necessary by the artful and disingenuous character of all Russian negotiations. Lord Palmerston did not in the least exaggerate when he declared in parliament that "the Russian government, by its various agents and by itself, exhausted every modification of untruth, beginning with concealment and equivocation, and ending with assertions of positive falsehood." Lord John Russell, in speaking of that government, said, "that to its unprincipled and unjust aggression, it added what he could not designate as otherwise than fraudulent, in the manner in which it pursued its policy."

In consequence of the character of the Russian government, and of even its highest diplomatic functionaries here drawn, peace often appeared at hand when it was in reality no nearer than when the war broke out. It was one of the peculiarities of the contest that the hope of peace never seemed to be abandoned: Russia amused the governments and peoples of Western Europe and Germany by overtures for the restoration of tranquillity, made by way of Vienna and Berlin, or by appearing to accept overtures there originated; while her real object was only to gain time, and wear out the patience of the allies or interrupt their harmony. In the last chapter which treated of diplomatic considerations and details, Austria and Russia were represented as maintaining a correspondence concerning the evacuation by the latter of the Moldo-Wallachian provinces. The language of Austria on that occasion was firm, and Russia, while assuming the language of fearlessness, deprecated in the tone of an injured friend and ally the sympathy shown by Austria to the allies, and the separate treaty with Turkey as to the Austrian occupation of the provinces. On the 8th of August, the English, French, and Austrian plenipotentiaries signed a *declaratory note* as to the minimum of conditions upon which peace might be conceded. It was as follows:—

THAT the relations of the Sublime Porte with the imperial court of Russia cannot be re-established on solid and durable bases:

1. If the protectorate hitherto exercised by the imperial court of Russia over the principalities of Wallachia, Moldavia, and Servia, be not discontinued for the future; and if the privileges accorded by the sultans to those provinces, dependent on their empire, be not placed under the collective guarantee of the powers, in virtue of an arrangement to be concluded with the Sublime Porte, and the stipulations of which should at the same time regulate all questions of detail.

2. If the navigation of the Danube at its mouths be not freed from all obstacle, and made subject to the application of the principles established by the acts of the congress of Vienna.

3. If the treaty of the 13th July, 1841, be not revised in concert by all the high contracting parties in the interest of the balance of power in Europe.

4. If Russia do not cease to claim the right of exercising an official protectorate over the subjects of the Sublime Porte, to whatever rite they may belong, and if France, Austria, Great Britain, Prussia, and Russia do not mutually assist each other in obtaining from the original action of the Ottoman government the confirmation and the observance of the religious privileges of the different christian communities, and in turning to account, for the common interest of their co-religionists, the generous intentions manifested by his majesty the sultan, without any prejudice resulting therefrom to his dignity and the independence of his crown.

The cabinet of Vienna communicated this declaration to that of St. Petersburg, with an expository note reserving the right of the allies to make further demands, if the course of events should make them necessary. The reply of the czar's minister was as follows:—

AUSTRIA, in recommending these conditions, has added that the Western powers have still reserved the right to make others, which renders it perfectly useless to submit them to a detailed examination. Besides, even if they should not be changed, their acceptance would lead it to be supposed that Russia is reduced by war to the last degree of exhaustion. Although the emperor has adhered to the principles enunciated in the protocol of Vienna, he cannot enlarge the meaning of it as much as others have done, because the immense sacrifices which Russia has made in the interests of Austria and Prussia would remain without any compensation. In the place of finding in those concessions a motive for redeeming those obligations, Austria has drawn closer its alliance with the enemies of Russia.

Consequently, the emperor infinitely regrets that he has not been able to accept the last overtures made by Austria. He considers that he has made every concession compatible with the honour of Russia; and, as he has not withdrawn any of these advantages, it only remains for him to do the same as his enemies—that is, to try the eventualities of war, in order to arrive at some solid basis of negotiations for peace.

The emperor has directed his general-in-chief to re-pass the Pruth with his troops from strategic motives, and Russia will keep herself on the defensive within her frontiers, until more equitable conditions are offered to her. The emperor, on his side, will avoid increasing the complications of the war, but he will repel with the greatest energy all attacks against him, from whatever quarter they may proceed.

After this missive Austria strengthened her forces in every direction, until her army became one of the largest in the world, rivaling that of any of the belligerent states,—and too formidable, taken in connection with her position in the provinces, for either side not to respect her neutrality, and not to entertain some apprehensions as to the policy she might pursue. Seventy thousand troops were posted in the German provinces; nearly 120,000, under Radetzky, in Austrian Italy; 30,000 in the Danubian provinces, then under occupation; 60,000 in Hungary and Transylvania; 80,000 in Galicia and Bukovina; 60,000 in the district around Cracow; nearly 100,000 under Jellachich in the military frontier districts; and 12,000 in the federal fortresses of Germany. This attitude of the great southern German state alarmed its rival, the great northern German power, which immediately put all its diplomatic artifices into force to induce Austria to recognise two great principles in her future relations with Russia during the war. One of these was, that Austria should close the principalities against either the Turks or the Western powers, so as to prevent Russia being attacked by either in that direction. To this proposal the Austrian cabinet replied in a despatch dated the 30th September, that such a resolution would be incompatible with the treaties already entered into by that cabinet with the governments of the Sublime Porte, the French emperor, and her Britannic majesty. The other principle of procedure to which Prussia, as the advocate of Russia, sought to bind Austria was, that the latter should in no case declare war against the czar unless attacked by him. To this

Count Buol, in the name of his master, replied:—"It is evident that we cannot wait in order to obtain peace, which is a necessity for us, from the efforts and combats of others; nor can we bind ourselves to support for an unlimited lapse of time the difficult sacrifices which such a passive attitude must entail on us."

On the 6th of November the Russian chancellor addressed an important despatch to the Russian minister at the court of Berlin, professing a willingness to negotiate—the real object of which was to neutralise the action of the German powers.

St. Petersburg, Oct. 25th (Nov. 6th.)

M. LE BARON.—The information which we receive from every side proves to us that, at the present moment, the German governments are pretty nearly all pre-occupied with one and the same apprehension,—that of seeing a rupture, occasioned by the Eastern affair, break out between the two great powers of Germany, which may endanger the peace of their common country, and the existence even of the Germanic confederation. Faithful to the policy which he has pursued from the commencement of this deplorable complication, and desirous of circumscribing the disastrous consequences within the narrowest possible limits, the emperor, our august master, wishes in the present conjuncture, and as far as in him lies, to preserve Germany from the scourge with which she would be threatened in such an event. Consequently you are authorised, M. le Baron, to declare to the Prussian cabinet that the emperor is disposed to take part in any negotiations which may have for their object the re-establishment of peace, and for which the four undermentioned propositions may serve as a point of departure.

These propositions are as follows :—

1. A common guarantee by the five powers of the religious and civil rights of the Christian population of the Ottoman empire, without distinction of worship.

2. A protectorate of the principalities, exercised in common by the five powers, on the same conditions as our treaties with the Porte have stipulated in their favour.

3. The revision of the treaty of 1841. Russia will not oppose its abolition, if the sultan, the principal party interested, consents to it.

4. The free navigation of the Danube, which exists of right, and which Russia has never had any intention of interrupting.

This determination is founded, not unreasonably, on the supposition that the Western powers will faithfully fulfil the engagement which they have contracted in the face of Europe, to assure the future of the Christian population of the Ottoman empire—that their religious and civil rights shall be placed henceforth under the guarantee of all the powers, and that so the principal object which Russia has had in view in the present war shall be attained. If the sentiments which have dictated to his majesty the present declaration are appreciated in Germany, as we have a right to suppose they will be, we think we may indulge in the hope that the confederation, united on the same ground, and entirely reassured as to the German interests engaged in this quarrel, will profit by its unanimity to throw its weight into the balance of Europe in favour of a peace, for which Austria and Prussia have spontaneously presented to us, in the four points, a basis which would satisfy them completely.

If, on the contrary, there is any wish to make use of the union—maintained once more by the care of Russia—to put forth new conditions incompatible in substance as well as in form with his dignity, the emperor does not doubt but that the states of the confederation will reject all such pretensions, from whatever side they may come, as contrary to the sentiments of good faith with which they are animated, as well as to the true interests of Germany. It is a neutrality maintained with firm-

ness and perseverance, such as has been proclaimed since the origin of this contest, that the emperor thinks he has a right, in all justice, to demand from her, in return for the deference with which he has received the wishes which have been addressed to him in her name.

Accept, &c.,

DE NESSELRODE.

On the very same day that this despatch was sent to the Russian ambassador at the Prussian court, the czar addressed a letter to Count Perowski, minister of the appanage, betraying his real feelings to be a desire for vengeful war. This was published in the newspapers of the empire, and was therefore obviously intended to produce a warlike effect upon the people, and to stimulate their invidious nationality and religious bigotry :—

GRÄF LEO ALEXÉVITCH.—In full view of the dangers that threaten our beloved fatherland from the intentions of the enemy, our heart is refreshed by the zealous striving of all ranks to contribute to the defence of the Russian soil. In compliance with the wish of our imperial family, we have permitted it to raise a regiment of sharpshooters from among the peasants of the appanage domains. The orthodox Russian people has from time immemorial gained a glorious celebrity by its attachment to the faith, its devotion to the emperor, and its love to fatherland. In this, through your agency, summoning our appanage peasants to the defence of Holy Russia, we offer them the opportunity, like our valiant troops, to vindicate the ancient Russian courage. We intrust it to you to organise the regiment of sharpshooters, and are convinced that the task will be executed with the desired success.—We remain, your well inclined,

NIKOLAUS.

Thus the autumn wore on in fruitless negotiations among the powers, until, on the 2nd of December, Austria and the Western powers entered into a treaty of a more definitive character, of which the following were the Articles :—

ART. I.—The High Contracting Parties refer to the declarations contained in the Protocols of the 9th of April and 23rd of May of the present year, and in the Notes exchanged on the 8th of August last; and as they reserved to themselves the right of proposing, according to circumstances, such conditions as they might judge necessary for the general interests of Europe, they engage mutually and reciprocally not to enter into any arrangement with the Imperial Court of Russia without having first deliberated thereupon in common.

ART. II.—His Majesty the Emperor of Austria having, in virtue of the Treaty concluded on the 14th of June last with the Sublime Porte, caused the Principalities of Moldavia and Wallachia to be occupied by his troops, he engages to defend the frontier of the said Principalities against any return of the Russian forces; the Austrian troops shall for this purpose occupy the positions necessary for guaranteeing those Principalities against any attack. Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, and His Majesty the Emperor of the French, having likewise concluded with the Sublime Porte on the 12th of March a Treaty which authorises them to direct their forces upon every part of the Ottoman Empire, the above mentioned occupation shall not interfere with the free movement of the Anglo-French or Ottoman troops upon these same territories against the military forces or the territory of Russia. There shall be formed at Vienna between the Plenipotentiaries of Austria, France, and Great Britain, a commission to which Turkey shall be invited to send a Plenipotentiary, and which shall be charged with examining and regulating every question relating either to the exceptional and provisional state in which the said Principalities are now placed, or to the free passage of the different armies across their territory.

ART. III.—In case hostilities should break out between Austria and Russia, Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, His Majesty the Emperor of Austria, and His Majesty the Emperor of the French, mutually promise to each other their offensive and defensive alliance in the present war, and will for that purpose employ, according to the requirements of the war, military and naval forces, the number, description, and destination whereof shall, if occasion should arise, be determined by subsequent arrangements.

ART. IV.—In the case contemplated by the preceding Article, the High Contracting Parties reciprocally engage not to entertain any overture or proposition on the part of the Imperial Court of Russia, having for its object the cessation of hostilities, without having come to an understanding thereupon between themselves.

ART. V.—In case the re-establishment of general peace, upon the bases indicated in Article I., should not be assured in the course of the present year, Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, His Majesty the Emperor of Austria, and His Majesty the Emperor of the French, will deliberate without delay upon effectual means for obtaining the object of their alliance.

ART. VI.—Great Britain, Austria, and France will jointly communicate the present Treaty to the Court of Prussia, and will with satisfaction receive its accession thereto, in case it should promise its co-operation for the accomplishment of the common object.

The treaty of the 2nd of December was the source of much discussion on the Continent and in England. The general feeling in continental Europe was, that Austria had at last pledged herself, and that the spring of 1855 would see her in the field. The more knowing politicians smiled at these anticipations, and foretold that Austria would never draw a sword in favour of the allies. In England some hopes of active assistance from Austria were entertained, but the great majority of men still doubted her fidelity. These doubts were confirmed by the speech of Lord John Russell in the House of Commons, delivered soon after the treaty was signed, and before any new symptoms of vacillation were exhibited on the part of that dextrous and faithless power. The speech of Lord John Russell was, perhaps, the most remarkable ever delivered in the English parliament as to the intentions of an ally, when the treaty signed by that ally had been only just completed:—"The position of Austria with regard to this country had been adverted to. He had never been satisfied that Austria had pursued that course which her duty to Europe ought to have induced her to take. But a cautious power like Austria was not likely to forget that her danger from a war with Russia was greater than that of England or France, neither of which powers had any reason to apprehend an invasion of its own territory. The Emperor of Russia had kept up an immense army upon a peace establishment, and after one or two victories upon the frontier, the road to Vienna would be open to him. It was not until Austria had increased her military force, and made other necessary military preparations, that she took the first step in concert with the allies. Austria had now advanced a step further than

she had gone before, but she had not even yet gone the length of saying, that if before the end of the year peace were not made with Russia, she would be a belligerent. She had only gone this length—that if she should be at war with Russia, a treaty offensive and defensive should, *ipso facto*, exist between Austria, England, and France. She had likewise agreed, that before the end of the year she would take into further consideration what steps she would be prepared to take with respect to terms of peace with Russia. Now, he understood the meaning of that article—certainly not containing anything very precise in itself—to be, that if England and France propose conditions of peace, which should be in conformity with the four bases, and that Russia should refuse to assent to them in a treaty of peace, then Austria would no longer hesitate, but be part of the alliance defensive and offensive. He did not wish to overstate the engagement in any way, and he quite agreed that Austria might still, at the last moment, say, 'those terms of yours, those four bases, explained in a way I did not expect, would reduce Russia too much, and diminish too greatly her weight in Europe; and she can never be expected to agree to them.' Such might be the language of Austria, without any breach of faith, and she would then be released from the alliance; but his belief and expectation were, that she did concur in those bases which were necessary for the security of Turkey; and if Russia did not consent to a treaty of peace founded on those bases, then, in the next campaign, the forces of Austria would be joined with those of England and of France."

The popular view on the Continent and in England of the treaty with Austria and its probable effects was very ably expressed by a German *literateur* and politician, the author of *Poland the nearest way to Russia*, in the following letter:—"It would be a great mistake to expect a more speedy termination of the war, by means of the Austrian offensive and defensive alliance with the Western powers. 'If Russia does not accept the four preliminary conditions, Austria will make war.' Can Russia accept the four preliminary conditions? It is impossible. They imply the destruction of the power of Russia in the Black Sea; they consequently imply the reduction of Sebastopol, which, since the battle of Inkerman, has become equal to a regular campaign against the combined forces of the Russian empire. Will the Russian empire be considered, at St. Petersburg, to be in danger from an Austrian attack, so that it must hasten to deliver up Sebastopol, the Crimea, Georgia, and Bessarabia? For, with Bessarabia and the Danube in the possession of

* This letter forms no part of the work referred to.

Russia, one of the four conditions, the free navigation of the Danube, cannot be obtained. Can we then imagine that Russia will give up all those possessions without a most desperate contest? Certainly not. It would be cowardice and suicide to do so. It would be cowardice to fear Austrian aggression, while it is stipulated in every Austrian treaty, and not omitted in the present defensive and offensive alliance, that Austria shall merely form the rearguard of Omar Pasha, and consequently abstain from aggression, that it shall send troops to Varna, and not, where Russia is vulnerable, to Warsaw or to Odessa. And it would be suicide, if a power, like Russia, which is nothing but a military power, should consent to give up her finest provinces, and her dearest-bought conquests, without a desperate exertion of all her strength. Russia cannot and will not accept the four conditions in the course of this month; and Austria will be obliged to go to war next month. No doubt about that. What we have next to consider is, how far is Austria probably in earnest? She will go to war. We must admit that by this treaty she has made a very serious step in advance; and still to assert that this alliance is no alliance at all, and the war no war, but only a sham fight, would be a mistake. The same question arose about Louis Napoleon, when the French alliance was entered upon. We must infer that he earnestly wishes to reduce the power of Russia, although he does not wish to abolish the tyrannical Russian principle by introducing that of self-government anywhere in Europe. Is not Austria now quite in the same position? She saw the necessity of reducing Russia, not because she felt ashamed of her subservient position,—oh, no; but because she was aware that France and England could not yield, that Russia had not the slightest disposition to do so, and, consequently, France and England were obliged to make Germany move either with or without her governments. Thus, she had to take a resolution; and we must admit that she has chosen the safest course open to her. She takes the sword out of the people's hands, she will help to fight Russia; and although she does not wish to abolish the Russian system of rule and European tyranny, she wishes to force Russia to submission, and to act herself the part of the chief of the despots, by the grace of God, in that quarter of the world. The Austrian dynasty is again, as at the time of the Pragmatic sanction, very anxious to have as many guarantees as possible for the integrity of the Austrian dominions. First, Prussia and Germany were called upon, now the turn of the Western powers has come. One of the articles of the new treaty pledges France and England 'to maintain the integ-

rity of the Austrian empire after the present war.' The integrity of Austria! Say the integrity of the dominions of the evil spirit,—it is the same expression, it is the same sacrilegious pledge. This business will soon become the same work as that of the old anti-revolutionary wars. We pledge ourselves to maintain every despotism in Europe 'in its integrity,' even that of Russia, except in a part of the globe where the alteration of the system is of no consequence—in Asia and in the Crimea. But as to the war, has the help of Germany been obtained by the participation of Austria in the war? We must answer—Decidedly not! As Sebastopol was the wrong end of Russia to be attacked, so Austria is the wrong point for moving Germany. A decided move of Germany against Russia would destroy German despotism, and of course the Hapsburgs also. Now, as it is evident that Russia cannot be reduced without a serious European popular movement against her, she being the very keystone of the vault of continental tyranny, what will the Austrian alliance with us be to Russia? Let us speak the plain truth. After Louis Napoleon, who was the first, Austria will be the second guarantee to Russia, that this war shall not be allowed to take a popular turn—'that it shall not be conducted for the benefit of liberty and national independence;' and if it was difficult to resort to proper means with our first ally, it has become impossible to do so with the second we have now upon our hands. So long as Louis Napoleon and Aberdeen were the only obstacles of the popular turn of war, every German, French, Italian, Hungarian, Swede, Dane, and Pole, had a chance to be freed. He knew that a necessity might arise, by Austrian and Prussian desertion forcing England and France to a war of principles; and although neither Napoleon, nor Aberdeen, nor even Palmerston—represented a liberal principle, it was nevertheless a fact, that England as well as France were representatives of the revolution, in a very degenerate shape, it is true, yet both governments being the result of popular elections, they represented the liberal parties. They, after all, would not have objected to a popular movement in Germany, Poland, and Hungary; they might have desired it, in order to remove the German obstacle out of their way, and fairly to get at Russia where she is most vulnerable, namely, in Poland. Now, with the Austrian alliance all those nations have lost their chance. No longer can they feel the slightest interest in the victories of a force, guided, or at least, partially guided, by the black and yellow flag of Austria—the flag of death and pestilence, of tyranny, of the gallows in Hungary and Vienna, of the scaffolds in Italy, of the com-

mon enemy of every free German. Public opinion in Europe, I am sorry to say, will, from the date of this alliance of Western Europe with the Hapsburgs, no longer look upon Russia as the only enemy of freedom, but as if she were some avalanche about to slip from the top of a snow mountain, which, by its heavy fall, may crush the most inveterate and obstinate enemy of protestantism, of liberalism, of science, and honesty—Austria—and also bring about, by a fearful disaster, a change of governments in England and France, by which both these nations might be rescued from their present degradation. All interest whatever for the war has gone; no other feeling will remain in the hearts of the French, the German, and other oppressed millions, but the hope that the mischievous policy of the three governments, allied for the purpose of saving Austrian misrule, may rouse the indignation of their subjects, and create a new era of freedom and republicanism. The steam is up, but all the safety valves are screwed down, that of hope included, which, in ordinary misfortune, is left to the most miserable of all as a consolation. Thus the hope of millions becomes despair! The war about Sebastopol, about the Crimea, about Georgia, about the mouths of the Danube, will go on, but it will be a war of tyrants against tyrants, for a guarantee of tyranny is a tyrant himself; a war it will be, the curse of which is not to be forgotten for the noble end of the struggle. On the contrary, every country which sees the allied armies approach, discovers amongst them the Austrian hangman, and the men of the 4th of December, 1851. By this treaty of alliance with Austria, the Western powers have lost their character, and stand on equal barbarian ground with Russia. But they are far from being on equal terms with her. Russia has the advantage of a principle, which excited her masses to the hottest degree of fanaticism. In war this is a great advantage. Every war is a popular business. The fighting masses must have a higher inducement than mere obedience to the command to risk their lives; and, generally speaking in war, that party is the loser which is forsaken by public opinion, and that one the winner, which is backed by the spirit of the age and the enthusiasm of the nation. The nations may be induced, by superstitious and false motives, to sympathise with the one or the other of the fighting parties. Their enthusiasm may be fanaticism; but they will not seriously support any war in which they do not find their dearest interests involved. Russia has succeeded in giving a religious colour to the war before Austria stepped in. Now she will proclaim, although she does not believe a word of it, that the soil of holy

Russia is in danger, and that the struggle of 1812 has to recommence. But the English, and the French—can they still dare to speak, side by side with the Croats and hangmen of Arad, of saving civilisation from the inroads of barbarism? We have lost our character, and if before this treaty, on account of the Buonapartist alliance, we *did not dare* to show our flag of freedom, since the Austrian alliance we have *none* to show. The commonwealth is in danger. When it was so in Rome, the senate used to say, '*Consules videant ne quid respublica detrimenti capiat!*' Can our parliament say so? Have not our consuls brought this calamity down upon us? Louis Napoleon wished for such a solidarity of governments against the interest of the nation. Has not Lord Palmerston at Paris brought those sinister negotiations to a speedy termination? What then, in the name of justice, has the parliament to say? And who represents the wishes of the nation to see the war carried on quite in an opposite spirit? As yet we are at a loss to answer the question. And if we are not in a temper to despair neither of this nation, nor of France and Germany, we can only say, that we feel perfectly convinced our view of the case will be the general feeling of all the three leading nations, and this feeling will gather a thunderstorm in Europe compared to which that of 1848 will be nothing but child's play. The governments are blind—'*Que leurs destinées s'accomplissent.*'"

Although the above letter illustrates so well the feeling of the ultra-liberal party at home and abroad, in reference to the diplomacy of the Western powers, and especially in connection with the Austrian treaty of the 2nd December, yet in several respects it does injustice to the motives of the English cabinet, and was not in harmony with the views of a large number of the most liberal, enlightened, and active minds in England. The British government had certainly no intention of strengthening the dynasty of Louis Napoleon by entering into an alliance with him to conduct this war. Whatever dynasty governed France—Buonaparte, Bourbon, or Republic—it would have been forced into the struggle when Prince Menschikoff assumed the tone of insolent dictation which brought matters to an issue with the Porte. Whatever might have been the form of government in France, England must have consulted its will before going to war on a question raised by France; and even if the aggression of Prince Menschikoff had been perpetrated upon Turkey without any pretence of an occasion given by France, England must have consulted the policy of the French government in any step she took to defend the integrity of the Turkish empire. The question

with England, so far as France was concerned, was not whether she might have a more acceptable ally, or whether with such an ally she must leave untouched and unnamed various topics of European interest pending the alliance; but whether she could co-operate with that great and powerful nation, and its acknowledged ruler, to any and to what extent, for a common object—the preservation of Turkey from the dictation of Russia, a dictation injurious to France, perilous to England. Had England rejected the assistance of so powerful an ally, ready to concur with her in the one great object of the war, she would have proved herself unaccountably impracticable. Whether popular liberty on the Continent would probably be promoted or retarded by the war, and by the alliances England was constrained to form, were hardly subjects open at all to her consideration in the emergency. She had to deal with existing potentates, with the various states they governed and which they represented, and to accept or reject their alliance and aid in repelling the aggression.

In dealing with Austria, England proceeded in the same spirit as when dealing with France, and in no way pledged herself to preserve to Austria, for all time to come, the territory included within her empire. The writer last quoted, however, only too faithfully depicts the perfidy of that power, and the undesirableness of having her for an ally, except as the alternative of having her for an enemy, may be plainly inferred from what he so eloquently urges. The writer was in error in predicting that the treaty of the 2nd of December would commit Austria to a war with Russia; the speech of Lord John Russell was prescient on that point—the warning he gave was well timed and well put. Austria did not join her arms to those of the allies, but, lingering on the verge of war, feared to throw her glove into the arena; the kasir rested upon his sheathed sword, while France and England fought and bled for the policy to which he was in justice and honour equally connected.

On the 14th (26th) of December, the Emperor Nicholas published a manifesto, which might be considered as his answer to the treaty of the 2nd of December, given through his own people. The object was to prepare them for fresh struggles, by exasperating afresh their invidious orthodoxy; and yet, by pious professions of the love of peace, to act upon the German courts and public, and retain the sympathy of the one, and moderate the dissatisfaction of the other. We quote only so much of the manifesto as shows the czar's policy—the rest is empty boasting of victories that were never achieved.

The causes of the war, which still lasts, are well understood by our beloved Russia. The country knows that neither ambitious views, nor the desire of obtaining new advantages to which we had no right, were the motives for those acts and circumstances that have unexpectedly resulted in the existing struggle. We had solely in view the safeguard of the solemnly recognised immunities of the Orthodox Church, and of our co-religionists in the East. But certain governments, attributing to us interested and secret intentions that were far from our thoughts, have complicated the solution of the question, and have finished by forming a hostile alliance against Russia. After having proclaimed as their object the safety of the Ottoman empire, they have waged open war against us, not in Turkey, but within the limits of our own realm, directing their blows on such points as were more or less accessible to them—in the Baltic, the White Sea, the Black Sea, in the Crimea, and even on the far-distant coasts of the Pacific Ocean. Thanks to the Most High, both in our troops, and in all classes of our subjects, they everywhere meet with intrepid opponents, animated by their love for us and for their country; and, to our consolation in these troublous circumstances, amid the calamities inseparable from war, we are constantly witnessing brilliant examples and proofs of this feeling, as well as of the courage that it inspires. Penetrated with our duty as a Christian, we cannot desire a prolonged effusion of blood, and certainly we shall not repulse any offers and conditions of peace that are compatible with the dignity of our empire, and the interests of our well-beloved subjects. But another and not less sacred duty commands us, in this obstinate struggle, to keep ourselves prepared for efforts and sacrifices proportioned to the means of action directed against us.

Russians! my faithful children! you are accustomed to spare nothing when called by Providence to a great and holy work—neither your wealth, the fruit of long years of toil, nor your lives—not your own blood, nor the blood of your children. The noble ardour that has inflamed your hearts from the first hour of the war will not be extinguished, happen what may; and your feelings are those also of your sovereign. We all, monarch and subjects, if it be necessary,—echoing the words of the Emperor Alexander in a year of like trial, “the sword in our hands and the cross in our hearts,”—know how to face the ranks of our enemies for the defence of the most precious gifts of this world—the security and honour of our country.

The last diplomatic act of the allies, during 1854, was to prepare a memorandum signed by the plenipotentiaries of Austria, France, and Great Britain, and to present it to Prince Gortschakoff, the minister of Russia at Vienna. Accordingly, on the 28th of December, it was handed to the prince. The object of this document was to define the sense in which the allies interpreted the four points which were the bases of the treaty of the 2nd of December. The memorandum is as follows:—

In order to determine the sense which their governments attach to each of the principles contained in the four articles, and reserving to themselves, moreover, as they have always done, the power to put forward such special conditions as may appear to them required, beyond the four guarantees, by the general interests of Europe, to prevent the recurrence of the late complications, the representatives of Austria, France, and Great Britain, declare:—

1. That their governments, concurring in the opinion that it was necessary to abolish the exclusive protectorate exercised by Russia over Moldavia, Wallachia, and Servia, and henceforward to place under the collective guarantee of the Five Powers the privileges accorded by the sultans to the principalities dependencies of their empire, have considered and do consider that none of the stipulations of the ancient treaties of Russia with the Porte, relative

to the said provinces, should be revived at the peace, and that the arrangements to be concluded on the subject of them should be ultimately combined, so as to give full and entire effect to the rights of the suzerain power, to those of the three principalities, and to the general interests of Europe.

2. To give to the freedom of navigation of the Danube all the development of which it is susceptible, it would be desirable that the course of the Lower Danube, beginning from the point where it becomes common to the two river-bordering states, should be withdrawn from the territorial jurisdiction existing in virtue of the third article of the treaty of Adrianople. In every case, the free navigation of the Danube could not be secured if it be not placed under the control of a syndicate authority, invested with powers necessary to destroy the obstructions existing at the mouths of that river, or which may hereafter be formed there.

3. The revision of the treaty of July 13, 1841, must have for its object to connect the existence of the Ottoman empire more completely with the European equilibrium, and to put an end to the preponderance of Russia in the Black Sea. As to the arrangements to be taken in this respect, they depend too directly on the events of the war, for it to be possible at present to determine the bases: it is sufficient to point out the principle.

4. Russia, in renouncing the pretension to take under an official protectorate the Christian subjects of the sultan of the oriental ritual, equally renounces, as a natural consequence, the revival of any of the articles of her former treaties, and especially of the treaty of Koutchouk-Kainardji, the erroneous interpretation of which has been the principal cause of the present war. In affording their mutual co-operation to obtain from the initiative of the Ottoman government the confirmation and the observance of the religious privileges of the different Christian communities, without distinction of sect, and conjointly turning to account, in the interest of the said communities, the generous intentions manifested in respect to them by his majesty the sultan, they will take the greatest care to preserve from all attack the dignity of his highness and the independence of his crown.

This memorandum might have shown plainly to the czar and his government that the allies were no longer to be trifled with; yet it did not extinguish his hopes of distracting their counsels, and detaching Austria from them. His agents were set to work everywhere with renewed activity, and their eloquence was felt, not only in Berlin and Vienna, but also in Paris and London. Certain female politicians in the metropolis of France were supposed to exercise a powerful influence there. There were three parties in England extremely open to any argument in favour of the czar. The free-trade party was one; they were influenced by the desire to see commerce unimpeded by the exactions and obstacles of war. The peace party proper (as distinguished from the free-trade party) was another; their policy seems to have been to make the czar appear as frank and amiable as possible, in order to disarm public prejudice, and smooth the way of peace: by this party he was represented as a greatly aggrieved man, to whom the sultan had been faithless, the French government provoking and unjust, and the English government deceitful—having first connived at his errors, and encouraged him, and then at the last hour, when he could not have expected the like, his friendship was exchanged for that of the French emperor, who was the party really in the

wrong. The third party was the purely aristocratic, and sympathised with the czar as "the first gentleman in Europe," and the friend and patron of gentility and aristocratic *prestige*. Earl Grey was the chief representative of this section; he, however, advocated the czar and his policy as much from personal disappointment at seeing himself shunned by the coalition ministry, and from a certain idiosyncrasy which leads him to have a crotchet of his own, with which to annoy ministries, whether he be himself "in" or "out." He made the memorandum a subject of eloquent invective in the House of Lords, when, some months later, the diplomacy of the government connected with the Vienna negotiations came under the review of that house. By an extract from his speech the reader will sufficiently see how the class, of whose views his lordship was the exponent, regarded the four points as interpreted and made more definite by the memorandum handed to Prince Gortschakoff:—

"The original dispute which led to the war has been decided entirely in your favour, but you declared, as you were entitled to do, that having been compelled to engage in war, you would no longer be satisfied with the terms which you would have been content to accept before the commencement of hostilities, and would endeavour to obtain security for the future by requiring additional concessions. Accordingly the powers deliberated together, and agreed upon certain arrangements to be proposed to Russia as the groundwork of negotiations for peace. In the first instance, Russia rejected the proposal thus made to her, but ultimately agreed to accept it, and the recent conferences at Vienna were held for the purpose of ascertaining whether Russia and the allied powers could agree on the means of carrying into effect the four heads of an arrangement (known as 'the four points'), which had been communicated to the former on the 28th of December last. When the conferences opened, the two first heads of the proposed arrangement were easily settled. Russia consented to abandon the claim she had under former treaties to protect the Danubian principalities, and that they should in future continue subject to the Porte, but enjoy an independent and national administration under the guarantee of the European powers. This was a concession of no trifling importance on the part of Russia, which you did not think of asking at the beginning of the war, but which I willingly admit to have been now very properly demanded, as tending materially to diminish the danger of future wars. Russia, upon this point, seems to have met the allies as fairly as possible, and to have agreed to an arrangement with which no fault can be found. The same may be said of the second

point, by which the freedom of the navigation of the Danube was satisfactorily provided for. The third head of the proposal was that which it was always felt would lead to the greatest difficulty. The memorandum, delivered to Prince Gortschakoff on the 28th of December, 1854, stated, as the third point insisted upon by the allies, that 'The revision of the Treaty of July 13th, 1841, must have for its object to connect the existence of the Ottoman empire more completely with the European equilibrium, and to put an end to the preponderance of Russia in the Black Sea.' This was a demand of which nothing was heard till some months after the declaration of war. The first allusion I can trace to the necessity of obtaining anything of the kind, is in certain speeches delivered in the House of Commons on the occasion of a vote of credit being asked for the war, on the 24th of July last. Upon the first part of this point no serious difficulty arose, and an article was agreed upon declaring that the high contracting parties, 'engage themselves severally to respect the independence and territorial integrity of the Ottoman empire, guarantee together the strict observance of this engagement, and will in consequence consider every act or event which should be of a nature to infringe on it as a question of European interest;' to which a second article was added, providing 'that if a misunderstanding should arise between the Porte and one of the contracting parties, these two states, before having recourse to the employment of force, should place the other powers in a position to anticipate this extreme course by pacific means.' On these two articles, which were intended to carry into effect the first part of the third point, no difficulty whatever arose, except with regard to a reservation made by the Russian plenipotentiaries, that they were not to be considered, by agreeing to them, as engaging their government to take up arms for Turkey, whenever she might be attacked in any part of her dominions. The other powers recorded their regret at this reserve, but I must say I think without sufficient reason. Russia did not object to bind herself in the strictest manner to respect the independence and territorial integrity of Turkey, and also to abstain from using force in any misunderstanding she may hereafter have with the Porte, without giving to the other powers of Europe a previous opportunity of endeavouring to settle the dispute by pacific means; nor did she object to the other parties binding themselves to defend Turkey by arms from any attack, if they thought proper to do so; she only declined to contract a similar engagement herself, saying with unanswerable force, that the blood of Russia belongs to Russia, and ought to be shed only for Russian interests. The Russian pleni-

potentiaries, in my opinion, exercised in this a wise discretion, which I wish that our own had imitated. Unlimited engagements to defend other countries by arms, in all cases that may arise, and, therefore, in circumstances which cannot be foreseen, are, in my opinion, always imprudent and dangerous. But it is more especially so to enter into such an engagement in behalf of the Turkish empire, composed as it is of such ill-joined and heterogeneous materials, and menaced by such dangers from without and from within, that its ultimate dissolution is a matter of certainty, and a question only of time. Hence I consider the qualification attached by the Russian plenipotentiaries to their guarantee of the Ottoman empire to have been, not only reasonable, but called for by the most ordinary prudence. It is, I hope, most improbable, but it is certainly possible, that at some future time the English government may direct an attack from India on the remote eastern extremity of the Ottoman empire, and it is quite as possible that France may invade Tunis from Algeria—Russia most justly objected to being bound in such a case to make war with either of these powerful nations; and I own it gives me far more confidence in the sincerity of her plenipotentiaries, to find them thus guarding their assent to what was proposed to them, than if they had agreed, with what would have been a suspicious readiness, to all that was suggested."

After the 2nd of December, the Western powers made renewed exertions in support of the attempts of Austria to gain over Prussia to their cause. Many doubted whether she really desired to succeed in her apparently warm efforts for that object. It was alleged that she wished to keep Prussia back from jealousy of that power, while the necessity of having her support against Russia, on the plea of the inviolability of German territory, caused a show of eagerness in her negotiations for the junction of Prussia with the other powers. Very many were of opinion that the two German powers were in collusion to deceive those of the West; that each had chosen a part with the consent of the other, and was playing it out. The Western cabinets acted as if they believed Austria to be sincere, and desired really to overcome the *vis inertiae* of her northern confederate and rival. All efforts to win or frighten Frederick William only increased his truculency and time-serving. The more he was pressed, the more he vacillated; and the more loudly his people called for a line of policy worthy of the past glory and present position of Prussia, the more marked was the oscillation of the prince between the friendship of Russia, and the necessity of conciliating Russia's powerful foes. The Prus-

sians did not, however, show that zeal for the cause of national independence which Western Europe expected from so highly civilised and enlightened a people. A highly gifted young Prussian officer, and a gentleman of rank, while travelling with the author of these pages from Paris to Boulogne, made this remark:—"Russia will one day swallow up my country; at no distant period Prussia will be a province of the czar, unless the power of the great despot be checked, and I fear it is now too late for that." This remark indicates very fairly the tone of the class to which the speaker belonged. The youth of Prussia have been educated in the idea of the invincibility of Russia. To defer the day when Prussia shall become a province of her empire, is all for which they see any room to hope. The masses of the Prussian people abhor the autocrat, and would defy and manfully resist his power, if called to arms by a prince in whom they had confidence. The despondent feeling among the patriots of Prussia, no doubt acted upon any expression of public opinion there in reference to the temporising policy of Frederick William, subduing the pulse of the national heart.

Another motive for the coldness of Prussia to the cause of the allies, lay in the interests of the commercial classes—Prussia profited by the war. The blockade of the Russian ports enabled Prussian merchants to import the commodities consumed in Russia, and Russian produce was exported even to England from Prussian ports. The arrangement, recognised for the occasion by England and France, that "free ships make free goods," subserved the purposes of the Prussian government, and the interests of Prussian merchants. At last the attention of the English people was fixed upon this state of things, and they made such representations to their government as compelled the latter to address itself in strong terms to the court of Berlin. His Prussian majesty manifested considerable apprehension at these remonstrances, for he knew that if Prussia

ceased to be the medium of a profitable trade between Russia and the neutral nations, and Russia and even England, one motive for desiring peace would be withdrawn from his people, and his pro-Russian policy would become more difficult. Still nothing followed the almost menacing communications of the British government, except that the Prussian government and the traders became more cautious; the commerce still went on in the old channels. Perhaps England and France would have been more rigorous in the blockade, and more stringent generally in their relations to the commerce carried on with Russia by neutral states, had it not been for the government of the United States of America, the tone and temper of which were arrogant and almost hostile to the allies. That government made the occasion available to advocate the mooted point of free ships making free goods, as a fixed and permanent international law, and sought to draw the other neutral nations into treaties upon the subject, with the apparent design of thwarting the Western powers. The feeling of the American people was, however, generous and friendly, and the victories of the allies were hailed with almost as much enthusiasm in the cities of the United States as in Great Britain and Ireland.

Thus terminated the diplomacy of 1854; the opinions at home and abroad, and of all classes concerning it, are faithfully depicted in this chapter. The pen did nothing or next to nothing for peace—the bullet and the bayonet had still their work to perform: the red hand of war, more powerful and more terrible, was yet to be shaken over the nations, and the bolts of his fury to be yet more abundantly scattered. Fresh deeds of heroism, and new endurance, were to characterise the soldiers of England, ere the last laurel-leaf they should pluck might be enwreathed with the olive of peace. That leaf was at last torn from the standards of the proud empire, but, alas! how stained with woman's tears, and the hearts' blood of the brave!

CHAPTER LV.

CLOSE OF THE ASIATIC CAMPAIGN IN 1854.—ARRIVAL THERE OF THE BRITISH COMMISSIONER, COLONEL WILLIAMS, AND OTHER BRITISH OFFICERS: OPPOSITION TO HIM BY THE PASHAS.—UNFORTUNATE CONSEQUENCE OF THE INDIFFERENCE SHOWN BY LORD STRATFORD DE REDCLIFFE TO COLONEL WILLIAMS AND HIS MISSION.

Fluellen. "If the enemy is an ass, and a fool, and a prating coxcomb, is it meet, think you, that we should also, look you! be an ass, and a fool, and a prating coxcomb?"—SHAKSPEARE. *Henry V.*

THE epithets employed by the immortal dramatist in the passage selected as a motto for this chapter are applicable, without any exaggeration, to most of the leading officers in both the Russian and Turkish armies of Asia.

There were splendid exceptions in the Russian army. Mouravieff, subsequently, and Bebutoff, and others, during the autumn of 1853 and the year 1854, displayed undoubted talent, if not of the highest order; but the great ma-

majority of the Russian officers showed little military skill, and often acted in their professional capacity very foolishly. The Turkish pashas were, as we showed in a previous chapter,* ignorant, incompetent, corrupt, and cowardly. The Russian chiefs gained repeated victories over them—not by good generalship or any remarkable competency for command, but by sheer audacity,—counting always upon the cowardice, venality, or stupidity of the pashas, as affording them so many chances of victory that it might be always relied upon. The Russian officers, also, invariably displayed great professional pride, leading their men with dauntless intrepidity, and exposing themselves to danger with a prodigality of chivalry which did them immortal honour. Several of the Turkish pashas and beys actually hid among the baggage, in the last disastrous battle from which their deserted troops fled in the presence of an inferior foe.

The attention of the Western governments was called to the melancholy prospects of Asia Minor by the reports of battle after battle lost by the Turks, and of the incredible imbecility and dishonesty of the whole tribe of pashas, except such foreigners as bore the title, and at most one or two native bearers of that rank. The French seem to have contented themselves with sending 30,000 old flint-lock muskets to Schamyl, when it was too late in the season for them to be of any use to him for that campaign; nor did our allies even supply the aid of skilful French officers in place of those who fell in action, died of disease, returned home in ill-health, or were murdered by the Kurds and Lazi, who were alike ready to assassinate allies or enemies, if an opportunity for plunder was thereby afforded. The murder of Captain Belliot, who fell by the hands of certain banditti in Lazistan—although two pashas and many inferior authorities were in league with the murderers, and afterwards connived at their escape—did not rouse the French government to any proper exertion to correct a state of things by which the administration of Turkish affairs in Asia was cursed, and the influence and interests of the allies discredited and impeded.

The English government seems not to have regarded the emergency with a sufficient conception of its seriousness; and when at last it was awakened from its torpor, the appointment of Colonel Williams as “commissioner” without Turkish rank, or any authority or control, civil or military, was the extent of their effort. The British consuls had very little influence, arising from the miserable defectiveness in every respect of the English consular system. The French consular system being based on sounder principles, and more carefully worked

out, gave the French consuls in the cities of Kars, Trebizond, and Erzerum, more considerable power, and this seems to have been the only medium by which the pashas were acted upon for any good. Kurschid Pasha (the Irish officer, named Guyon, or, more properly, Gahan) was recalled to Constantinople, and put on half-pay, the native pashas having made common cause against him; and when Colonel Williams received his appointment, demoralisation and ruin hung over the armies of the sultan in Asia. The reader may conceive the sort of persons upon whom the government of the sultan's provinces, and the command of his armies, devolved, by the following sketch of a pasha met in a steamer from the Bosphorus to Samsoon by Dr. Sandwith, while on his way to act as chief of the medical staff to the newly-appointed British commissioner:—“We are honoured with the company of no less a man than Topji Pasha, who is proceeding to his post of governor of Khurjivat. It is a curious study that of a pasha, and if you have not the *entrée* of his *yoli* on the Bosphorus, a steamer is not a bad place of observation, since he makes himself quite at home on board. In spite of the crowded state of the deck, he has got a little space railed off near the rudder, and here he is seated on a chair enjoying his *kef*, the *dolce far niente*, the great occupation of his life since he has been a pasha. About seven of his attendants stand before him with their hands folded. They preserve a grave and serious air, gazing anxiously into that placid face, and they have been standing there for the last two hours. The pasha varies the monotony of the voyage by smoking, eating raw cucumbers, and fingering his beads. A Turk, even a pasha, is never absolutely unoccupied; some such employments as the above are always had recourse to, for I believe he never thinks. His numerous servants watch every movement of his eye. What can it mean; and whence the origin of this strange adoration of their master? We have nothing like it in the West; but from time immemorial it seems to have obtained in Eastern manners. It must have been deeply imprinted into the mind of the nation when each pasha had the power of life and death; and when at a nod the head of an offending servant was rolled into the dust. The pasha makes a languid remark; a servant answers, touching his forehead in token of profound respect. The pasha pushes a stool with his foot, and his attendants spring forward to remove it. The pasha feels for his snuff-box; a quick-fingered slave has found it for him ere his fingers closed on it. At last the pasha is tired of sitting on deck, so he makes a move, heaving a sigh at the exertion. Two of his men rush forward to support him on each side, two or three go before, pushing the *profanum*

* Chap. xxv., p. 293.

vulgus out of the way, and two or three follow, bearing his pipe, pocket-handkerchief, snuff-box, &c. He is conducted to the cabin, and, a soft cushiony seat being prepared, he settles himself down again, and his attendants take their places as before. It is a mistake to suppose the above individual is a specimen of a Turk. I would not wrong the Osmanli by quoting the modern Byzantine as a type of his race. To see the real Turk, we must turn to some of those deck passengers, and there you will see, wrapped up in the striped Anatolian cloak, several stout, short, brawny figures, with large but intelligent and honest features. These are either the aboriginal and nomad Turkomans, or the later emigration of the Osmanli. The pasha we have described, and his attendants, have nothing in common with these; their bodies are weak and ill-formed, their faces pale and inexpressive. They have, in short, the bodily forms, without the intelligent expression, of those individuals whose lives are spent in crowded cities. From this class of people, slaves of various races, and the lazy scum of the capital, the infancy and youth of whom are passed in crime and debasing servitude, is the race of pashas in a great measure recruited."

Unless endowed with an especial genius for inactivity, caprice, and stupidity, it is scarcely conceivable how the pashas in Asia could have failed to drive the Russians beyond the Caucasus. The numbers of the latter were greatly inferior; they were not commanded by men of extraordinary talent; their reinforcements arrived wan, wearied, and unfit for active service, after the long marches from Moscow, over so many arid and dreary steppes, exposed to every privation; the garrisons were located amidst either an indifferent or hostile population; Schamyl hung upon the flank and rear of Georgia, threatening repeatedly its very capital, and inflicting direful losses upon his enemies; the British had scattered the Russian garrisons on the Mingrelian coast, and the allied fleets commanded the shores of the Black Sea, in 1854, from Taman to the Bosphorus; yet did this ill-circumstanced enemy gain over these pashas five distinct battles in seven months, besides many combats. The cause of defeat did not rest with the Turkish soldiery, who only required to be well led, generally, to fight with spirit. "You fought well to day," said the British commissioner, after one of the contests in 1855, to a sort of Chasseurs de Vincennes, several corps of which the commissioner had organised: "We have always fought the same way, but were never commanded before," was the reply. It is to be admitted that when demoralised from any cause, the soldiery of Asia were not always true to the bravest and best commanders. On one occasion,

Guyon was deserted in the very crisis of the field by 4000 Turkish cavalry, whose organisation classed them with regulars, not with Bashi-bazouks. But, generally, the Turkish soldier fought well when bravely led, and when he had learned by experience confidence in his commander. Mr. Duncan, who travelled about with the head-quarters of the Turkish army in 1854, bears this testimony:—"By the introduction of a strict discipline; by an equitable system of promotion, and under the command of brave and honourable officers, the Turkish army could be raised to a point of excellence *second to no European force*. The sobriety of the men, their simple wants, unfailing patience, and power of resisting fatigue, offer the most splendid materials for creating an irresistible infantry. The men are both intelligent and courageous. A commander in whom they possessed confidence they would follow without hesitation or regret. And this confidence is facile to obtain: a few kind words, a display of interest in his welfare, and honesty of purpose, suffice to gain the poor Turk's heart for ever. The Turkish artillery is excellent, even in its present state, but is susceptible of great improvement. In the management of this arm the Turkish soldiers show great aptitude; and the pride of the men in their batteries, and the affection they display for their respective guns, is admirable. The causes that have largely contributed to weigh down the existing virtuous elements in the Ottoman army, are the corruption and incapacity that prevail among its higher ranks, and the disgraceful ignorance which distinguishes its subaltern officers. The Turkish private soldier, if well directed, is capable of great deeds, but the corps of officers and non-commissioned officers are alike inefficient and unsusceptible of improvement. Promotion by merit alone is unheard of in the Ottoman service. The subaltern ranks are filled by the personal slaves or domestics of the pashas; and such commissions are often the wages of disgrace. Promotion to the superior ranks is obtainable only by bribery or intrigue; the grade of colonel or pasha is purchased by the highest bidder; who subsequently recovers the sum he has disbursed by defrauding his regiment, or robbing the government. The simplest military rules are ignored by the officers, who are often withdrawn from a civil appointment to occupy a high military position."

Earl Granville, in his place in the House of Peers, after the conclusion of the war, pronounced this eulogy on the Turkish soldier:—"I have already observed that there are reasons why I should refrain from adverting to the conduct of the Turkish government; but no such considerations of delicacy need prevent me from expressing what I believe to be the

unanimous opinion of your lordships in regard to the behaviour of the Turkish soldiers, than whom no troops have evinced in a higher degree the military virtues of courage, patience, sobriety, and frugality. A striking evidence of this was seen in the fact that in the midst of famine these brave men guarded the provisions of the army under the enemy's fire, and rather than touch the food intrusted to their charge, preferred to die of hunger at their posts."

When Colonel Williams arrived at Kars, he found every obstacle to the reorganisation of the army which could by any ingenuity be conceived, or which the worst experience of Turkish pashas and their troops could lead him to expect. Before reaching Kars, he had made a close inquiry into the government of the provinces in Asia Minor generally, and the command and supplies of the army. At Trebizond and Erzerum he alarmed the pashas by these inquiries, who communicated their apprehensions to the muschir (field-marshal or captain-general) at Kars. The vile herd at once set about bribing him to silence, judging of him by themselves. Finding him to be incorruptible, they disputed his commission in order to gain time, and postpone the hour of his effective interposition. That hardly sufficed even for a very short time. They then denied his authority to interfere, alleging that, although it was competent to the Queen of England, as the sultan's ally, to send a commissioner to the head-quarters of his army, and to offer his opinion, or report it to his ambassador at Constantinople, or his government at home, he had no right to exercise any authority, or presume to call to account the high functionaries of the empire. He held no Turkish rank, and ought not to interfere, and must not be allowed to do so. This reasoning was unfortunately correct. Colonel Williams had no authority from the sultan, no rank in the civil or military administration of the imperial service; he was only a spectator, holding, indeed, a distinguished rank in his own service, and entitled to advise, but in any other way his interference might be regarded as impertinent, and an indignity to the sultan's officers. The pashas, taking this high ground obstinately, although with trepidation, Colonel Williams was impotent for good, or nearly so. He trusted to the power of his government and the influence of its ambassador to the Porte to rectify his position, and to invest his mission with power for usefulness; the pashas trusted to intrigue and corruption in the Divan, and sent agents to Constantinople to defame him, as they had defamed Guyon; and as the British ambassador was well known in the capital to be jealous of both Guyon and Williams, the pashas and their abettors in the vicinity of the sultan's

court were emboldened. Meanwhile, Colonel Williams, with no higher rank than that of a British brigadier (the usual one in his position to an allied army), instituted searching examination everywhere. He ascertained the muster-roll of regiments, and finding that all the corps were inferior in number actually to the roll, while the pashas were drawing pay for the dead men, he demanded an account of the surplus, which was refused with indignation; and he had no resource than to communicate to the British ambassador at Constantinople stated intelligence of the evils prevalent, the wrongs perpetrated, the speculations proved, and the obstacles thrown in the way of all attempts on his part to correct such things. The pashas more and more hated him, and were scarcely restrained from assassinating him—fear only deterred them. The common soldiers adored him, and in spite of every precaution on the part of the corrupt officers and civil officials, information privately, and often openly, was given to him of the misdeeds of those upon whom the responsibility of the ruin of the army rested.

While he was thus busy in a hopeless struggle to correct abuses, and the pashas only intent to get rid of him, that they might starve the troops and appropriate their pay, the Russians were making vast exertions for a new campaign, and laying up stores of every requisite for the winter about to ensue. The Russian generals at Tiflis, Gori, Gumri, and Bayazid, were well informed of all that was going on. Russian deserters renounced Christianity, adopted Islamism, and even obtained rank in consequence in the sultan's army, that they might have the more extensive opportunity to act as spies.

To understand clearly the scope of Brigadier-general Williams' original instructions, it is necessary that the reader should peruse the despatch of the Earl of Clarendon, conferring upon him the appointment. This was written August 2, 1854, while Colonel Williams was in the sultan's European dominions, where he was engaged in various services from the breaking out of the war:*

"You will communicate to me, for the information of her majesty's government, all matters of political interest which may come under your observation, and you will keep me fully informed of the operations in which the Turkish army is engaged. You will also be at liberty to correspond with her majesty's mission at the court of Persia, when it may appear to you that the interests of the service on which you are engaged may be promoted by your doing so.

* Reference is made to this circumstance in Chap. XXXII., p. 396.

"You will furnish Lord Raglan with copies of all despatches which you may have occasion to write to this office, or to any of her majesty's diplomatic or consular agents; and you will send your despatches for this office under flying seal to her majesty's ambassador at Constantinople.

"You will furnish her majesty's ambassador with any information which his excellency may specially require of you, but with regard to any representations which you may think it expedient should be made to the Porte, you will, unless otherwise instructed by Lord Raglan, apply to his lordship on the subject, in order that, if he should concur in your opinion, he may himself request her majesty's ambassador to bring the matter before the Porte."

Various delays prevented Brigadier-general Williams from reaching Erzerum until the 14th of September. There he found the troops many months in arrears of pay, and had his worst suspicions confirmed. He knew the Turkish officials well, and was able at once to discover the track of their corrupt courses. The clothing of the soldiery was in rags, their rations miserable, the hospitals scenes of empiricism and neglect. Everything was radically wrong. Immediately upon arriving at Erzerum, the commissioner reported himself to the British Foreign-office as having entered upon the sphere of his labours, and gave his lordship the first glimpse of the condition and prospects of the Turkish army, in the following terms:—

"The troops in this garrison consist of two battalions of Anatolia rediff, one battalion mustering 350, the other 260 men. They are fifteen and seventeen months in arrears of pay. There are also detachments amounting to 350 men of different regiments of the army of Kars; they are seventeen, eighteen, and nineteen months in arrears of pay. The staff of the army at present here are four months in arrears. In hospital there are 1190, principally wounded. Of artillery there is a Bimbashi and 100 men. They are in the castle for the purpose of firing salutes. All these troops got one month's pay just before the last Bairam. Your lordship will see by the arrears of pay, as above stated, how utterly destitute these poor soldiers must be of all those little necessities which can alone preserve contentment and a good spirit in an army; and I most sincerely hope that, through your lordship's influence, steps may be taken to rectify this evil ere these troops arrive in their respective cantonments at the commencement of a long and most rigorous winter."

Colonel Williams had no money committed to his trust, and no *matériel*; he had not even a supply of arms of improved manufacture,

although the army of Kars were armed with many old Turkish pieces, and French muskets of inferior make, flint-locks, and detonators: there were no Miniés. Doctor Sandwith, already referred to, thus reported the state of the hospitals and medical stores:—

"A physician attached to this army told me that, having prescribed carbonate of iron, he was told by the apothecary that there was none left, but there was plenty of carbonate of ammonia; and what is worse, I learned that any carbonate or sulphate was substituted for any other, either to save trouble, or because none of the medicine ordered was to be found. I am told that ample sums are provided at Constantinople for the drug department, but the supplies on their way gradually diminish, until little is left at Kars to be turned into money by the Turkish *employés*. The depots at Erzerum are filled with large quantities of dried herbs, such as rose leaves, poppy heads, &c., the valuable medicines having disappeared; boxes also of old fashioned *specula vagina*, obstetric instruments out of date, and other drugs on the market, are sent to the camp at Kars. After the late defeat of this army, a rich harvest was made by the apothecaries and doctors, who turned into money their medicines and instruments, and reported them to have been captured by the Russians. A regular system of embezzlement is pursued, from the highest to the lowest; and as charges could be brought and proved by any man against his superior, anything like discipline or subordination in this department is out of the question, and the efficiency of the Turkish soldier suffers in consequence."

The suggestions of Colonel Williams and the doctor, and the apprehensions entertained at their approach, led to the adoption of remedial measures. Colonel Williams makes the following report of the hospitals at Kars soon after his arrival:—

"It is with pleasure that I acquaint your lordship with the result of my inspection, which embraced the four caravanserais and buildings appropriated to the reception of the sick and wounded, amounting, at the present moment, to 500 men; the beds were comfortable, the rooms as clean as the nature of the buildings would admit of, the kitchens and offices in better order than I had been led to expect; the patients were well cared for in all those points on which a military officer can be supposed competent to offer an opinion. On my return to the muschir I mentioned to his excellency the suggestion of Dr. Sandwith, which was, to construct fireplaces in each building, to create, by means of the draught caused by these fires, a more thorough ventilation. His excellency

promised to give orders to that effect. The picture which I have thus drawn of the hospitals of Kars is indeed a pleasing contrast to that which presented itself to the miserable inmates of the same buildings during last winter, when, owing to the want of medicines, bedding, food, fuel, and light, nearly 12,000 perished in them—their bodies, even before death released them from their agonies, presenting spectacles too loathsome to describe.”

The medical treatment was, however, not improved, as the remarks of Dr. Sandwith reveal:—

“I asked where the medicines were. I found that a great proportion of the patients were without remedies; others had tin bottles by their bedsides containing their potions. The apothecary who accompanied me was unable to say what these metallic bottles contained, but on tasting the fluid therein it was invariably found to be some infusion or decoction of harmless and useless herbs, such as marsh-mallow, bitter-sweet, and the like. All the severe surgical cases had been removed, others were already convalescent or dead, so that I was unable to ascertain by personal inspection the kind of dressings used. Many of the patients I saw were in various stages of typhus, dysentery, pneumonia, &c., and certainly required more energetic treatment than appeared to be in vogue. I was unable to obtain a sight of any statistical account of the diseases under treatment, but the above-mentioned appeared to me to be the most frequent.

“Separating myself from Colonel Williams and his party, who were inspecting what was directed to be shown, I prevailed on one of the medical men to conduct me to the pharmacy. We dived into a dark filthy passage, ascended a ladder, and came into three small mud rooms, which were shown to me as the central pharmacy. A short inspection of this at once explained to me the want of medicines in the hospital. A few large bottles and vases were labelled with about twenty specimens of drugs, but those labelled for medicines of any value I found empty; the others contained preparations such as *aqua styptica*, and tinctures, the use of which has been long discarded by modern medicine. There were also infusions of marsh-mallow, extracts of bitter-sweet, and sundry equally inefficacious drugs. The whole place was filthy and disorderly, and seemed more like the wreck of a plundered pharmacy than the depot from which the sick of an army are supplied.”

The above description is terribly graphic and strictly true. Dr. Sandwith painfully felt the want of authority in his department, although his personal influence enabled him to apply the hand of reform at once. He had,

however, no skilful and active coadjutors, and no funds; as it was with his chief, so with himself—all depended on his own skill and courage.

On the 23rd, the commissioner pushed on for Kars. As soon as he arrived, he pursued the same sifting system there as at Erzerum, and with the like results. His report, so early as September 26th, presents a frightful exhibition of the condition of the army of Kars, justifying the strong language of Lord Clarendon in the British House of Peers, when he denounced the pashas as “robbers:”—

“I regret to inform your lordship that the troops composing this army are so much in arrear of pay as to induce me to believe that money sent from the capital for the purpose of settling, even in part, with these unfortunate soldiers, has been embezzled either at Erzerum, or on the spot here. The troops are twenty-two, eighteen, and fifteen months in arrears of pay; their patience, under so glaring an injustice, is truly praiseworthy.

“I have further to beg for your lordship’s intercession in the case of the unfortunate soldiers maimed and wounded in the former and recent battles on this frontier, and who are now reduced to beg their bread. An imperial firman that these men be pensioned, and that three months in advance be paid to them, would have a most beneficial effect during the next campaign.”

In three days after, the commissioner again reports to the foreign secretary, and in the same terse style conveys the state of affairs in these matters, which were then of most pressing importance:—

“The guns and their carriages were in an efficient state, and the horses, considering the season of the year and the difficulty of procuring forage, were in tolerable working condition, although these animals have been cheated out of at least a third of their corn by the malpractices of the commander-in-chief and his generals of division; the accounts of the army showing four okes a day for each horse, whilst the animals have only received from two and a half to three.”

The facts revealed in the foregoing extract are truly infamous. The next day the colonel reported upon the state of the cavalry. Such of our readers as know anything of military details will understand the labour and difficulty of these inspections when the colonel had every official opposed to him. The quality of industry in the man is strikingly prominent:—

“I have this day [September 28, 1854] inspected the cavalry of this army. I enclose an extract from the ‘morning state’ presented by

these pashas to the muschir on the parade this morning after the inspection, which sets forth that there were four regiments, containing 2222 men, and 2212 horses; whereas the files were counted whilst filing past by Lieutenant Teesdale and M. de Nettancourt, and their numbers were found to amount to 1568, whilst I have positive information, since the review was over, that there were six regiments."

Shortly after the foregoing report, the colonel had an interview with the muschir on the subject of the numerical strength of the army, which the muschir had represented to the colonel and to his own government at Constantinople to be greatly superior in numbers, as well as condition, to what it really was. The object of these misrepresentations was to draw the pay for a larger force, the surplus money being appropriated by the muschir and his pashas. The true state of the case is thus put by the British commissioner in a letter dated October 2:—

"Zarif Mustafa Pasha, the muschir, assured me the day before yesterday that there were 1500 under arms; but I learn from authority which I can depend on that their real effective does not amount to more than 800 men. I have, therefore, given to your lordship a statement of the numbers of the army supposed to have been composed of nearly 40,000 men. I will sum up the regular army as follows:—Of cavalry, 1568, and 2212 horses. Of artillery, 1822, of which 450 belong to other corps, leaving a total of artillery of 1372, and 1962 horses. Of infantry, 14,600 bayonets; forming altogether 17,990 men, and 4174 horses of regulars and 800 irregulars."

At a subsequent period, when the neglect of the commissioner by the British ambassador at Constantinople excited the indignation of the foreign secretary, his excellency excused himself by hinting, and ultimately expressing doubts, whether the commissioner had not exceeded his commission by the pertinacious and minute inquiries which he made into every department of the Turkish army. If our readers compare the labours of Colonel Williams, as expressed in the above despatches, with the instructions which he received from Lord Raglan, under whose direction he was placed, they will see, that no such imputation, coming even from Lord Stratford de Redcliffe, deserves respect:—

GENERAL LORD RAGLAN TO COLONEL
WILLIAMS.

Varna, Aug. 20, 1854.

SIR,—Her majesty's government having been pleased to nominate you commissioner at the head-quarters of the Turkish army in Asia, and to act in that capacity in communication with me and under my orders, I have the honour to request that, in obedience to their commands,

you will lose no time in proceeding to Kars, and assuming the duties confided to your discharge.

You will, however, in the first instance, take advantage of your being at Constantinople, for the purpose of obtaining the necessary equipment, to solicit her majesty's ambassador to get from the Turkish government introductions to the authorities with whom you will have to communicate in the accomplishment of the objects of your mission.

You will also seek to obtain from his excellency the advice which his great local experience, his knowledge of public men in this country, and his unrivalled power of discrimination, enable him to give better than any other man.

The instructions of the secretary of state are ample, and would render unnecessary that I should add anything thereto, were it not that the variety of accounts that have been given of the muschir's army obliges me to impress upon you the expediency of trusting to no reports you may receive, but of endeavouring to ascertain by close personal observation its actual composition, the numbers each arm can bring into the field, distinguishing the regulars from the irregulars, the state of the arms in possession of the troops, whether cavalry or infantry, the quantity of musket ammunition (rounds per man) in the hands of the men and in reserve, the number of pieces of artillery and their calibre, how horsed, and with what number of rounds per gun, and how carried; whether the infantry or cavalry are formed into brigades and divisions, and under general officers, or whether there is no formation beyond that of a regiment or battalion; whether the troops are regularly supplied with provisions and the horses with forage; and, lastly, whether the army is paid, and to what period.

You will also make it your business to discover whether the officers exercising commands of importance are efficient, and whether they support each other, or are occupied in intriguing to supplant those with whom they are associated.

You will make all these inquiries free from any spirit of party, or bias in favour of or prejudice against any individual, and you will attend especially to the judicious injunction of the Earl of Clarendon, to establish and maintain the most friendly relations with the French officer whom I have reason to hope Marshal St. Arnaud will attach to that army for the exercise of, the same functions as those entrusted to you.

You will correspond with me by every opportunity, and you will take care to send your despatches to the secretary of state under flying seal to Viscount Stratford, and to keep his excellency informed upon all military as well as political matters.

I have, &c.,
RAGLAN.

As a specimen of the way in which Colonel Williams communicated to the pashas the defects of inferior officers, the following letter will suffice. It is directed to the governor-general of Trebizond:—

COLONEL WILLIAMS TO HAFIZ PASHA.

Baybuz, Sept. 10, 1854.

EXCELLENCY,—The two guides whom your excellency sent reached me at Chiarrar, and have accompanied the caravan as far as this station. They have conducted themselves with great propriety, and I have to thank you for this mark of attention.

When I had the honour of conversing with your excellency at Trebizond on the affairs of the army at Kars, you fully coincided with my views with respect to the late disasters near that city—viz., that it was entirely owing to the want of conduct on the part of the superior officers. It is not only on the field of battle that ill-conduct leads to defeat; but the remissness of officers in charge of artillery, ammunition, and stores on their way to the army in the field equally conduces to fatal results. I have now to bring to your excellency's notice the bad conduct of the officer, whoever he may be, that has charge of the siege-train which you informed me marched a certain number of hours a-day towards Erzerum. I had not got more than two hours from Trebizond when I

passed two of the valuable guns planted in the middle of the road, and, on inquiring of a peasant who stood at his door, found that they had been abandoned. At a short distance from these guns, I passed a load of sponges and rammers, apparently enough for the whole siege-train of thirty-two guns. These were thrown together loosely on the cart, and were already much warped and injured by the sun and rain. They ought to have been packed in bundles and covered with matting.

I enter into these details with your excellency to show the utter neglect of the officer of artillery who sent forward these stores, and I take the liberty of strongly recommending you to dispatch the colonel of artillery whom I met at Trebizond to superintend the forwarding of this ordnance; obliging him to render you a daily report of their progress, and thus assuring their passage across the mountains before the snow falls. I have sent this despatch open for Mr. Stevens to read to your excellency; and I should fail in my duty if I did not send copies of it to her majesty's ambassador at the Porte, to Lord Clarendon, and to Lord Raglan, commander-in-chief of the English army. I beg to add that twenty of the guns have passed Bayburt, and that no less than twelve remain in the position I have described.

I have, &c.,

W. F. WILLIAMS.

It appears almost fabulous that such ignorance and misconduct should take place in any army, or, taking place, be suffered to pass with impunity; but such was the management of the Turkish forces when the commissioner first went among them. It will be seen from the foregoing despatch that Colonel Williams was extremely uneasy lest winter should set in before any proper provision was made for the troops at Kars. This uneasiness increased as the autumn wore away, and early in October the urgency of his tone is apparent. The following is addressed to Mr. Brant, the British consul at Erzerum, through whose influence he hoped to make an impression upon the pasha. It discloses already the dreadful prospects for the army of Kars:—

Camp near Kars, Oct. 4, 1854.

SIR,—Having had occasion this morning to bring to the notice of the muschir the state of the cavalry horses, which, from being for a considerable time on half-rations of barley, are unfit for service, I begged that three instead of two oaks might be issued to them. His excellency informed me that he had only six days' provision of this grain in store, and that his acquiescence in my request would reduce the number of days' subsistence to four; that in all other departments of the commissariat they were equally deficient; in fine, he admitted that this remnant of an army was living from hand to mouth, and in the event of the rains setting in, it would be reduced to extreme want and bitter suffering.

The army's debts here and at Erzerum are already 10,000 purses, and the arrears of pay amount to 25,000 purses; the troops were paid a half-month's arrear on the 1st inst.—that is, each man received a 10-piastre note, which he cannot change to buy tobacco or any other little necessary; specie is, therefore, necessary to its very existence. The musteshar is absent at Erzerum, and there is a lamentable remissness in forwarding supplies; may I, therefore, request of you to wait on Ismail Pasha, the governor-general, and read this despatch to his excellency, begging him, at the same time, to rectify these defects, and aid the common cause in which the three allied empires are engaged. His good intentions must be seconded by the most active assistance, or even greater misfortune than has already befallen this army will soon be exhibited when the winter obliges us to break up, and leave 10,000 unprovided for in this garrison, where typhus fever already prevails not only in the hospitals, but among

the inhabitants, in whose houses I am obliged to search for winter quarters for the sultan's troops, and which I hope to effect in a few days. You were witness to my efforts in this respect at Erzerum, and you can therefore conceive the difficulties which present themselves in this wretched and twice pillaged town.

I beg you to have the goodness to send a copy of this despatch, together with the answer of his excellency the governor-general to the Earl of Clarendon, to her majesty's ambassador, and to General Lord Raglan.

I have, &c.,

W. F. WILLIAMS.

Mr. Brant used every exertion to bring the refractory but dissimulating pasha to a sense of his duty, but in vain. The object of his excellency was to get rid of both consul and commissioner, and to preserve for himself and all minor pashas the immunities of pillage, peculation, and oppression.

COLONEL WILLIAMS TO THE EARL OF CLARENDON.

(Received Nov. 7.)

(Extract.)

Camp near Kars, Oct. 10, 1854.

After the despatch of my last messenger I waited on the muschir, and offered his excellency the following advice:—

1. Seeing that severe frosts now occur at night, which especially affect the invalids, and that we have before us the certainty of winter, which may at any day overtake us, I strongly recommended a selection of the weak and sickly men from all the corps, as also the most attenuated of the cavalry horses, in order that they might march leisurely towards Erzerum, which arrangement would in nowise lessen the real effective of the army, and at the same time enable the men to reach their winter quarters with less chance of crowding the hospitals after their arrival. Mustafa Pasha at first insisted that all his men were able to march to Erzerum in four days. I replied that in all armies infirm and weak men were to be found. The muschir then said that he would order the selection of the sickly and weak from each regiment. I have just heard from the ferik pashas that no such orders have been given.

2. I told the pasha that, in superintending the drills of the army, I found the infantry uninstructed in loading even with blank cartridges; that many of the regiments had not the opportunity of one day's file-firing given to them; and I begged him (now that it could be done without even the fear of scarcity of powder, which fear he had expressed when I first spoke to him on this vital point) to carry my wishes into effect.

3. I have repeatedly begged him to send into the neighbouring forests to cut wood and haul it into Kars before the terrible winter of these regions sets in.

4. I have not ceased for the last ten days to importune the muschir to cause the houses intended for the safety of the sultan's troops to be cleared out and cleaned for my inspection.

5. I have inquired in vain for the result of any arrangement made by the Vali of Kars for the supply of mutton for the force about to be left in Kars, and I can find no reason for supposing that great privation will not be felt on that head. The sheep ought to have been purchased before this eleventh hour, and placed in villages within reach of this garrison during the storms and intense cold of an Armenian winter.

6. Medicines and wine for the sick have also occupied my attention. His excellency Zarif Mustafa Pasha tells me that a supply of medicine has already arrived at Erzerum; but I have just complaints to offer to your lordship even on the diet of these hospitals. Dr. Sandwith brought me, two days ago, a loaf of black dough, full of all sorts of impurities, and quite unfit for a human being. This was taken from a sick man. I enclosed it to the muschir, who said it had been sent to the hospital as food for the attendants, and not for the sick.

7. I have just heard of the intention of the muschir to divide those regiments which will remain after the

garrison of Kars is completed, into detachments, to be stationed at Ardahan, Kaghisman, and Childir; thus reducing the garrison of Erzerum to a force quite insufficient to prevent its insult and capture by the enemy, operating by Bayazid in early spring. I shall immediately protest against this arrangement.

8. I shall again endeavour to bring the muschir to reason on all points connected with this despatch; if I fail, I am prepared to adopt that course which the urgency of our affairs demands at my hands.

The day after the colonel wrote the last despatch he found it to be his duty again to address the English foreign secretary on the conduct of the unaccountable muschir:—

COLONEL WILLIAMS TO THE EARL OF CLARENDON.

(Received Nov. 7.)

(Extract.) *Camp near Kars, Oct. 11, 1854.*

HEARING this morning that the muschir was in consultation with his two feriks, I sent and begged to be allowed to speak with them. I was consequently invited to Zarif Mustafa Pasha's tent. I began by recapitulating my requests to have quarters prepared for the troops who are to remain here. On this point I received the usual excuses and vague answers. I then touched on the preparations to be made for the march of the division intended as the winter garrison of Erzerum. Zarif Mustafa Pasha answered with a smile that did not convey respect, "that he knew how to manage and quarter his troops." I felt that the moment had arrived when I must act with firmness, or lose all my influence, which has thus far wrung from the muschir daily drill for the army, and procured wholesome food for the hitherto half-starved and fever-stricken soldiers, who have expressed to General Guyon their gratitude for this amelioration of their condition. I therefore drew from my pocket the draught of my despatch of yesterday's date, and caused each paragraph to be translated to the astonished muschir and his feriks. The tone of his excellency changed in a moment, but as no promise was given I took my leave. I had scarcely reached my tent when Mr. Zohrab, the interpreter and secretary, was recalled, and a promise sent to me that he would attend to every suggestion which I should in future make for his consideration.

At a later hour of the morning I was called to hear the muschir give his orders for the preparation of the houses intended for the troops in Kars, and also directions for the conduct of this local governor with regard to the supply of wood, grain, and sheep. His reply was that any supplies can be had with money, but that such is the extent of debts already contracted by this army that nothing but cash would induce the producer to come forward in the market. I have, therefore, addressed a letter to the defender of the army at Erzerum, under cover to Mr. Brant, requesting him to read it to that functionary, and to forward a copy of it, together with his reply, to your lordship.

I have this moment heard of the arrival of a courier in camp from Erzerum, bringing 500 purses (£2500), but, as on former occasions, it proves to be paper money. This sum, however, has been handed over to the governor of Kars, to insure the immediate supply of wood, meat, and grain.

I heard this morning that the muschir was about to quit the army; and, as he had thrown out a hint to that effect while conversing with me yesterday, I waited on him this morning, and advised him to contradict such reports, as his excellency well knew that Kars was his post till the army had been placed in safe winter quarters, in the details of which he will take my advice.

The Russian camp is now on the Arpa-tchai River, two hours above Gumri. It has lost a good deal of ammunition by accidental or wilful explosion; and I got the pasha's promise this morning to have our tumbrils so divided and guarded as to prevent any serious loss by the acts of spies or treacherous friends in this camp.

P.S.—After writing this despatch I have been able to see the muster-roll about to be forwarded by the muschir

to Constantinople. The total number stands 27,538 effective of all arms; whereas, as I have already hinted in my former reports, if this army were called upon to stand to its arms this evening, 14,000 effective men would be all that could respond to that call.

The firmness of the commissioner brought forth suitable fruits. The pashas, somewhat intimidated, placed the two regiments of Ariabastan infantry under suitable cover. They had been encamped upon the plains in pitiable plight—for the nights during October are bitterly cold in that part of Armenia. The streams and canals, which might be made a source of health to Kars, were so loaded with decomposing substances during the whole autumn as to breed fever extensively. The commissioner's remonstrances led to the cleaning of these currents, until the water ran fresh and clear. The drainage of the city had been in an abominable state, and was probably the most active generator of typhus among the many existing in Kars. The perseverance of Colonel Williams was here also successful; and these foul reservoirs of every filth known to an Asiatic city were at last cleansed. When the soldiers were at breakfast or dinner the commissioner visited them, and inspected their food, which he generally found to be both bad and deficient in quantity. The colonels were sent for; the bread broken and tasted in their presence; the meat and other food examined, and its deteriorated quality exposed: these officers, at last, dreading such encounters with the commissioner in the presence of their men, humiliating as it must have been to them, improved the diet, until for a time the commissioner had no cause for complaint. This was the state of affairs up to the middle of November. The exertions of the commissioner the reader must perceive to have been herculean. Kitchens, hospitals, camps, drains, barracks, regimental messes, drills, stores, magazines, treasury—everything connected with the army had his attention. His chief difficulty consisted in his having no rank in the Turkish army. Rank under the sultan was necessary in order to satisfy the prejudices of the soldiery, and to silence the objections of the pashas. Early intimation of the necessity was made to the British ambassador at Constantinople, both by the commissioner himself and by the British foreign minister. The ambassador took no means to effect this object; and the intrigues of the Asiatic pashas were powerful enough with the Porte to prevent the extension of this favour, unless the ambassador's determination to obtain it was unquestionable. The pashas, however, had their instruments not only busy with the Divan, but with the embassy; and Lord Stratford himself, jealous and suspicious, lent a ready ear to whatever tended to depreciate the commissioner.

Up to the middle of November, Colonel Williams' numerous despatches to the embassy at Constantinople remained unanswered. Not a letter—not a line—was sent thence to cheer the overburthened commissioner. No courier or messenger, no indirect communication through consul, secretary, pasha, or any one else, reached Colonel Williams from Lord Stratford, to whom he was taught to look for advice in every difficulty, and influence in every emergency. In vain did despatch succeed despatch from Erzerum and Kars to Constantinople. The British ambassador there might as well have been dead, for any advantage Colonel Williams derived from his presence and power. No man living had so much influence with the sultan as his lordship; and it is not conceivable that had he exerted himself as he ought to have done, Colonel Williams would have remained so long without Turkish rank. The irritable and jealous ambassador had no pretext given for either anger or jealousy by Colonel Williams, the tone of whose despatches is most deferential. As soon as he was fairly in the harness of his government, he submitted to the guiding hand of my lord at the Bosphorus. We find the following proof of this fact:—

COLONEL WILLIAMS TO LORD STRATFORD DE REDCLIFFE.

Pera, Aug. 23, 1854.

MY LORD,—I have the honour to enclose for your lordship's information a despatch which I have this moment received from General Lord Raglan, and in doing so I beg to solicit from your excellency the assistance and advice which are so necessary, and indeed indispensable, to the fulfilment of my mission.

My baggage has not yet arrived from England, but the *Medway* steamer is hourly expected. In the meantime I am occupied with my tents and other arrangements for my departure on the 31st inst., when I understand an Austrian steamer goes to Trebizond.

I have, &c.,
WILLIAMS.

Lord de Redcliffe seems to have taken matters very easy from the first. On the 9th of September he wrote home to the English ministry. The following extract shows that he thought matters would be kept cool and quiet by the frosts and snows of an Armenian winter, and that no person need be in any great hurry:—

THE Turkish government declares its intention of keeping the army at Kars on the defensive. The retirement of the Russians and the approach of winter are in themselves sufficient securities that no forward movement will be attempted.

The dead season, should war continue, will afford time for deliberation on the whole of this matter, and the reports of Colonel Williams may be expected to assist her majesty's government in coming to a decision as to what may best be done in order to make the next campaign in Asia more successful than the last.

The English foreign minister, however, was in earnest; and he wished the ambassador of her Britannic majesty, and the minister of the

sultan, also to be in earnest; for immediately on receipt of the despatch from Lord de Redcliffe, from which the above extract is made, he thus addresses his excellency:—

THE EARL OF CLARENDON TO LORD STRATFORD DE REDCLIFFE.)

(Extract.) *Foreign Office, Sept. 22, 1854.*

HER majesty's government trust that Ismail Pasha, the newly-appointed general, may, unlike his predecessor, have been selected on account of his capacity, and they request that he may receive instructions to defer to the advice of Colonel Williams, who is thoroughly acquainted with the people and the country, and who ought to have a high Turkish rank given to him in order to insure respect for his authority.

The British excellency was not, however, to be moved by even so urgent a despatch. Lord Clarendon had taken, without intending it, the most effectual way of checking the ambassador's advocacy of the commissioner's authority and his country's interests. The English minister for foreign affairs had chosen an active man, of great intelligence, well-known military talent, and extensive acquaintance with oriental affairs. He was not a mere creature of the British embassy, therefore he was not to be encouraged by the great man reigning in such puissance there. Lord Clarendon also reminds the ambassador of Colonel Williams' capacity and oriental experience,—a very unpalatable thing to the man who supposed that he alone was capable of giving an opinion on oriental affairs. Lord Clarendon had no suspicion of this sort, although had he condescended to read *Household Words* or the *Roving Englishman*, he might, notwithstanding his high position and great talent, have received light on this matter.

After Lord Clarendon had received the despatches of Colonel Williams, already before the reader, he was greatly astonished at the inactivity of the ambassador, and addressed to him a despatch, in which he politely hints that it was quite time the minister should bestir himself:—

Foreign Office, Nov. 9, 1854.

MY LORD,—Your excellency will have learnt from the correspondence of Colonel Williams the peculations and frauds on the part of the muschir and his immediate chiefs, which have been attended with such disastrous consequences as regards the efficiency of the Turkish army at Kars.

I have now to instruct your excellency to demand of the Porte the punishment of Zarif Pasha, and his two feriks, Kerim Pasha and Veli Pasha, by whom these frauds and deceptions have been carried on, if the Porte means to attempt the restoration of discipline in the unfortunate army at Kars.

I am, &c.,
CLARENDON.

While this correspondence was proceeding a change of "muschirs" took place in the Asiatic army. The new muschir was only intended as a provisional commander by the authorities at Constantinople. He, however, resolved to carry matters with a high hand, his predecessor having given him dark accounts of how dangerous a man Colonel Williams was to all

pashas sufficiently enlightened to look after their own interests. The new commander-in-chief was named and entitled Shukri Pasha. He appears to have entered upon his office in a fierce state of hostility to the English representative. He had the impolicy to betray his state of mind while on his way to his pashalic through Erzerum, and the active and vigilant consul there discerned the bias of the pasha, and at once wrote to Colonel Williams. His letter gives an amusing picture of the pashas altogether:—

CONSUL BRANT TO COLONEL WILLIAMS.

Erzerum, Nov. 2, 1854.

I LEARNED that in an evening meeting you were spoken of, and your interference. Shukri Pasha said it would not be allowed; that the authorities were not under your orders, and would resist interference on your part. Then Zarif Pasha chimed in, and did his best to Shukri Pasha against you. Zarif Pasha said that you were a mere *muralai*, without any proper authority; came to Kars, assumed the direction of everything, impeded the proper march of affairs, and produced nothing but confusion. Shukri Pasha, more excited, replied, that an officer in Roumelia had acted pretty much as you did, but the Turkish authorities soon got rid of him, and that this would be the result of your mission.

Zarif Pasha left Kars (the 25th of October) before his successor arrived. Colonel Williams seized the occasion to influence the hopes and fears of the muschir's *locum tenens*, one Kerim Pasha, and succeeded in persuading Kerim to assemble all the colonels, and lecture them on their idleness, speculation, drunkenness, neglect of their military duties, &c. &c. Kerim even went so far as to assure the commissioner, in the presence of all these superior officers, that whatever happened, speculation and intoxication should be put down. Accordingly reform had some chance in the short interval elapsing between the retirement of Zarif and the arrival of Shukri. Steps were taken to increase the stores of provisions, hospital arrangements of a beneficial kind were effected; billets of wood for fuel were brought in from the woods; corn and other provender were laid up for the horses of the artillery and the draught animals, for the cavalry was nearly extinct—it fared even worse if possible than the British cavalry in the Crimea. The fortifications on the heights above Kars, devised and commenced by the skilful and enterprising Guyon, were completed, the men working with eagerness and perseverance, willing to do anything to please the good English commissioner.

We have no fear that our readers will weary amidst the intrigues and intricacies which the deeds and misdeeds of the pashas present, for the transactions of the period are more like a chapter in oriental romance than in sober history. One is obliged to pause in wonder over some of Colonel Williams' accounts of the persons with whom he had to do, the way in which they acted towards him and their conduct in

the great events in which they were engaged, however grotesque or wicked they may alternately appear to be in the reader's esteem. It is difficult to peruse so grave a story without amazement at the infinite absurdity of these commanders of armies—muschirs, feriks, pashas, beys, and whatever else the sultan in his misguided counsels was so unfortunate as to make them.

When Williams, on the 10th of November, deemed it desirable to leave for Erzerum, he committed his trust at Kars to his worthy aide-de-camp, Lieutenant Teesdale. The Earl Granville, long after the events of which we write, passed a glowing eulogy on the merits of this officer, observing, that so young was he, and so boyish in appearance, that it seemed impossible he could have sustained such onerous and serious duties with such satisfaction to his chief, his government, and his country. But his instance only proves what Williams himself illustrates, that England is not deficient in wise and talented men to serve her and promote her greatness, her glory, and her beneficent influence among the nations, if she only insist that public servants shall be chosen for their capacity to serve, and not because they are the parasites of other men, who, by rank without merit, have occupied a name and place and power in the nation.

On the 17th of November, Colonel Williams being then at Erzerum, wrote to Lord Clarendon respecting matters at Kars, chiefly upon the testimony of his reliable young friend and coadjutor, Teesdale:—

“Lieutenant Teesdale further states that Shukri Pasha had arrived at Kars, and had received him with cold civility, but letting him plainly see that his presence was not desired. I also met that ferik on the snowy mountains lying between Kars and Erzerum. His reception of me was in all respects similar, and, although such conduct was irritating, my thirteen years' knowledge of the Turks led me to consider it as a matter of course; I therefore saluted, and passed on my way. On my arrival in Erzerum I waited on the governor-general, Ismail Pasha, to give him the detailed contents of the magazines of Kars, on the 8th inst., estimating the force at 14,000 men and 2000 horses, viz.:—

Wheat.	37 days' consumption.
Barley.	84 ”
Flour.	4 ”
Biscuit.	23 ”

“I acknowledged having passed large convoys proceeding to Kars, and again received his promise not to relax in his efforts; but this interview plainly indicated the only course which was left for me in my future communications with Shukri Pasha, now at the head of

this army, and Hussein Pasha, the chief of the staff; and I consequently wrote him a letter, the enclosed copy of which will explain to your lordship the nature of the conduct of both, and against which I have protested in firm and, I trust your lordship will think, appropriate terms. This letter will meet Shukri Pasha on the road, on his return to Erzerum; and as I learn from Lieutenant Teesdale that, after the arrival of this functionary at Kars, he had not been able to get the account of the daily issue of provisions from the magazines of that garrison, the suspicions which my recent interview with the governor-general and the military pashas raised in my mind are fully borne out, and my resolution to take a stand against a concerted plan on the part of the ferik, Shukri Pasha, and the chief of the staff, is, if possible, strengthened. Their object is obviously to deprive me of those sources of information which have thus far enabled me to put her majesty's government in possession of the effective strength and intended movements of this army, as well as to lay bare the enormous frauds which characterise its administration, civil and military, which might have, and still may (if this clique be not crushed in the bud), lead an allied force into difficulty, and, perhaps, terminate in great disasters.

"The governor-general and the defterdar of the province have just returned my visit. They are dispatching large supplies of every denomination to Kars, and they afford me all the intelligence I require. Ismail Pasha is, however, a man of extreme old age, and should be invested with a government better suited to his feeble body and impaired faculties."

When the foregoing statement arrived in England, the Earl of Clarendon addressed to Lord de Redcliffe the following letter, calculated to arouse his lordship's attention to his own neglect, and that of the Turkish government, towards a deserving British officer:—

"Her majesty's government have had under their consideration General Williams' despatch of the 17th of November; and it is with regret, or it would be more appropriate to say with indignation, that they have again to complain of the conduct of the Turkish officers at Kars.

"Her majesty's government have sent to the head-quarters of the unfortunate army at Kars a distinguished officer, whose knowledge and experience peculiarly fitted him for the service; and it is not too much to say that he has already preserved the remnants of the army from the destruction that awaited it at the hands of its commanders. He has already saved large sums to the sultan by checking the most barefaced robberies; and yet it appears, that without respect for the character of General Williams as the commissioner of the Queen

of England, or regard for the sultan's service, General Williams is exposed to affront from Shukri Pasha and the chief of the staff, who endeavour to prevent his acquiring the information that the Turkish government are deeply interested that he should possess, in the vain hope that he may be disheartened and foiled, and that the system of plunder may recommence. But General Williams must be upheld, and her majesty's government must insist that his exertions to render the army at Kars fit to take the field in the spring should be aided by the Turkish government.

"Your excellency will take the means you may think most expedient for bringing this despatch to the knowledge of the Turkish government, but her majesty's government desire that it should be by a written communication.

"Your excellency will require that the most stringent instructions shall be sent to the muschir to respect and support General Williams; and your excellency will obtain a copy of those instructions and send it to General Williams."

Foreign Office, Dec. 29th, 1854.

While yet at Erzerum, the attention of Colonel (Brigadier-general) Williams was directed to its defence. The munitions of war which it contained were of great value; and if the pashas did not prize them, the Russians might show a different estimate of their value by a sudden swoop upon the place. Keeping these circumstances in view, the colonel* wrote, on the 26th of November, as follows:—

"Two regiments of infantry, and as many of cavalry, having been sent by Hussein Pasha from Kars to Ardahan, throws a large force from the point where it was, in my opinion, more immediately required, that is, Toprak-Kaleh and Bayazid. I had frequently advised Zarif Mustafa Pasha (as I have already stated in former despatches) to hold his men in hand and keep his eye on Bayazid; and Hussein Pasha made this movement after I quitted Kars. I hope it will lead to no important embarrassment, as the weather is now inclement, and I do not think General Wrangel would risk a disaster (from snow and frost) at this critical period of affairs in the East. . . . Until Ismail Pasha arrives here nothing which I can hint at will be listened to, and I shall not lose a moment to draw his attention towards putting Erzerum into a respectable state of defence. The ground around presents favourable points, and we now have a battering train to arm redoubts most formidably; these inestimable guns, moreover (in such a difficult

* Williams calls himself colonel; Lord Clarendon calls him general. His rank in the army was colonel; his local rank, brigadier-general.

country to bring them into), are prizes which might induce the enemy to make a dash on this city, where ammunition and stores to a large amount are in the magazines."

The Ismail Pasha referred to in the above letter was appointed muschir by the sultan, but a complaint in the eyes detained him at Constantinople. The commissioner was too hopeful of Ismail; for even the best and bravest of these provincial governors were but little suited for co-operation with an English officer. Before Ismail could arrive, Shukri determined, while the chief command was in his possession, to do all the mischief he could. The following extract from a letter sent by the British consul, Mr. Brant, at Erzerum, shows how far this Shukri was determined to proceed, and the vigilance of the consul in discovering his plan:—

"You will have perceived that Shukri Pasha, second in command to the new muschir, Ismail Pasha, was prepared to thwart Colonel Williams in his energetic exertions to save the remnant of the Kars army from annihilation by sickness and famine, and to put it into a state of efficiency.

"I have since been informed, from a source that I may depend on, that a plot has been got up among the superior officers of the army to persuade his Excellency Ismail Pasha, on his arrival, that Colonel Williams' interference is unauthorised and most prejudicial; and to induce his excellency to invite the colonel to an interview, in which he will be requested to produce his credentials from the seraskier, and, in case such are not shown, he will be told that any further interference in the affairs of the army will not be tolerated. I have warned the colonel of this plot."

Placed in possession by Mr. Brant of this important information, Colonel Williams, despairing of any farther usefulness as long as he was unsupported at Constantinople, wrote in the most urgent terms to the ambassador, appealing to him in words at which honour and patriotism should have kindled. We quote the most important portion of General Williams' communication to Lord Stratford de Redcliffe:—

"Since I fulfilled the duties confided to me as her majesty's commissioner to the headquarters of the army at Kars, I have had the honour of addressing to your excellency fifty-four despatches, identical with those forwarded simultaneously to the Earl of Clarendon and General Lord Raglan. Each packet has been accompanied by a private letter containing details and suggestions, which, had they found place in my public communications, would

have inconveniently lengthened those documents.

"On the 23rd of September I was honoured by a private letter from your lordship, appealing to my 'spirit and humanity,' relative to the captivity of those unfortunate Russian ladies who had then recently been seized and carried into the mountains by Sheik Schamyl, the Circassian chieftain. Since the above date, I have not been favoured with a line by your excellency—even with an acknowledgment of the reception of my public or private communications. To one who has served your lordship for so many years, such an avowal on my part can only be recorded with feelings of deep disappointment and mortification—feelings which I have studiously endeavoured to conceal, even from my aide-de-camp and secretaries, because each successive post was anxiously looked for, in the hope of receiving answers from your lordship on the pressing and important affairs connected with my mission to the head-quarters of the army of Kars.

"Nor have I either, for the above reasons, directly or indirectly, to Lords Clarendon or Raglan, hinted at the silence which your lordship has been pleased to preserve towards me, until the 28th of November, when I acquainted the authorities of the Foreign-office with my intention to make my representations on this, to me, distressing subject.

"I need not trouble your lordship with a recapitulation of the contents of my various identic despatches; but as the Earl of Clarendon and General Lord Raglan will be furnished with a copy of this communication, I owe it to her majesty's government and to myself to remind your lordship of communications, public and private, especially addressed to you.

"Independent of my various conversations with your lordship, before and after my visit to Lord Raglan at Varna, I invoked, in a public despatch, dated the 20th of September, your excellency's 'countenance and support' in my endeavours to save the remnant of the Kars' army from the horrors of last year.

"I forwarded, with my first packet from Kars, for your excellency's inspection, a Russian and a Turkish cavalry sabre; and having thus shown one of the principal causes of the want of efficiency of the Turkish horse at the battle of Injé-Dereh, I stated the necessity of having 5000 English light cavalry sabres as the only hope of rendering that important arm efficient for next spring. On this point I at the same time addressed a private memorandum on the necessity of allowing Baron de Schwartzburg to re-organise and drill this wretched arm of the service.

"In consequence of the great scarcity of a certain kind of ball-cartridge in the magazines of Kars, and applicable to the arms in use by

the only really efficient troops in that intrenched camp, I hoped that your lordship would excuse the great liberty I was taking, and respond to my urgent prayer for a supply to be sent to me, when I enclosed two cartridges in a despatch, telling your excellency at the same time that it was only through you, and you alone, that I could hope for a supply. I need not add that in the event of an attack during the winter this intrenched camp may owe its capture to the want of this ammunition, for none other, as I at the time explained to your lordship, will fit the muskets and rifles of their corps of *élite*, which were the only regiments which behaved well at the battle of Injé-Dereh.

"When at Kars I first heard of the intention on the part of Shukri Pasha to treat me with contempt, I added to my public despatch on that subject a private note, assuring your excellency that your promptly exerted influence could alone stop this dangerous conspiracy, or effectually sound the real intentions as regarded myself of the newly-named muschir; and I have faithfully detailed, in subsequent despatches and private letters, the insolence of Shukri and Hussein Pashas since my arrival here.

"The last report of Lieutenant Teesdale, which your lordship will receive by this messenger, proves what results the fear of that retribution, which I know they hourly expect, is working upon the minds of the pashas and colonels; for the safety of this army I trust it will not be long ere it fall upon all those officers whose names stand forth in infamous notoriety in my despatches, for theft, cowardice, or drunkenness; but, unhappily, the result I allude to by my quotation of Lieutenant Teesdale's report is merely temporary, for the consciousness of worthlessness on the part of those pashas and colonels will not render them either more brave or less thievish, and the danger to that garrison is consequently imminent.

"Under these circumstances I most respectfully, but as firmly insist, through the influence and interference of your lordship, that my reports be promptly attended to by the Turkish government; that those officers, pashas, and colonels, who have been convicted of robbery by false muster, direct thefts, and drunkenness, be dismissed, and others named in their places.

"With regard to the principal criminal, Zarif Mustafa Pasha, who, as I have stated in my despatches from Kars, might have, by his false muster-rolls and other dangerous deceptions, caused the discomfort and disgrace of any British force sent to his assistance, I leave him in the hands of the allied governments; for happily he can do no more harm here. With regard to Shukri and Hussein Pashas, if

they are not instantly recalled to Constantinople there will be very little, if any, use in my attempting to execute the difficult and onerous duties imposed upon me. And having made this appeal to your lordship in the name of her majesty's government, it is my duty to state distinctly that I shall not be able to give such intelligence to my superiors as is absolutely necessary for them to be masters of, that I shall fail to preserve the power I have (unaided) seized, and that I shall consequently not succeed in shielding the troops from starvation, without my demands be complied with. If they be not, the dissolution of this army and the fate of Asia Minor will inevitably follow, and a golden opportunity be lost."

When Colonel Williams addressed this appeal to the ambassador it was the fifty-fourth in eleven weeks, the previous fifty-three having been unanswered. The excuse offered for this subsequently by his lordship is lame and impotent. He alleged that the tardiness and illusive conduct of the Turkish government rendered it impossible for him to give such assurances of support to Colonel Williams as he required; and his lordship did not wish by writing to hold out false hopes to the gallant officer. This was the reason given for leaving more than fifty despatches unanswered. How the pasha of the embassy (as we may well call my lord) must have winced when he perused the eloquent and indignant despatch of the 8th of December from the neglected commissioner! Most of the despatches written by Colonel Williams were accompanied by private letters, affording to the ambassador such peculiar information as was unsuitable to a despatch, and the importance and urgency of which no one better understood than his excellency.

The English minister for foreign affairs became increasingly indignant at the conduct of the ambassador to the commissioner, and the despatches between these two great officials are very instructive, although too voluminous to give at length. Lord Stratford presumed to tell Lord Clarendon in a despatch, that much of what Colonel Williams had written was "superfluous and exaggerated." Lord Clarendon somewhat haughtily replied that the English government could not understand the application of these terms to the actual circumstances; that the Turkish army had been without "clothing or shoes; that the cauldrons in which their food was cooked were in such a state as to render it poisonous; that the muster-rolls exceeded greatly—often one-half—the numbers really present; and lastly, when there is reason to believe that nearly 18,000 men perished last year through the want of ordinary care and precautions, her majesty's government cannot consider that there has been any super-

fluous or exaggerated matter in the reports which have reached them during the last twelvemonths, and respecting which they have so often and ineffectually remonstrated with the Turkish government."

"General Williams was in a position of great difficulty and responsibility, surrounded by traitors and robbers, with whose occupations he was bound to interfere, and he stood in need of all the support and encouragement that her majesty's servants could afford him.

"It was my duty regularly to acknowledge the despatches of General Williams, containing a painful recital of the difficulties against which he had to contend, and it has been to me a great satisfaction to convey to that gallant officer the entire approval of her majesty's government of the energy and success with which he overcame the obstacles to improvements, some of which he found on his arrival, and others which have since been wilfully thrown in his way. Her majesty's government, therefore, cannot but regret the silence observed by your excellency towards General Williams, and they can well understand the discouragement and mortification he must have felt at receiving no acknowledgment of his fifty-four despatches, accompanied by private letters; for he looked to your excellency as his natural protector, and must have well known that the great—the deservedly great—influence of your excellency must be more powerful on the spot than any her majesty's government could exercise to save him and the Turkish army from the consequences of that corruption, ignorance, prejudice, and want of public spirit which your excellency so well describes, and the proofs of which are in every direction unfortunately but too apparent."

When the despatch of Colonel Williams to Lord Stratford de Redcliffe, dated the 8th of December, arrived in London, the government gave it the most serious consideration, and the feeling produced in the English cabinet towards her majesty's ambassador at Constantinople was one of unmitigated anger. The following epistle was directed by the Earl of Clarendon to his excellency:—

MY LORD,—Brigadier-general Williams has transmitted to me a copy of the despatch which he addressed to your excellency on the 8th of December, recapitulating the various communications which he has at different times made to you on the state of the Turkish army in Asia, and of which it would seem that your excellency has not taken any notice to Brigadier-general Williams. Her majesty's government desire to receive your excellency's observations upon the despatch of General Williams, which I need hardly say has been read by them with great regret, after the anxiety they

have felt, and the remonstrances which they have in vain addressed through your excellency to the Porte, respecting the unfortunate army at Kars." "Such is the conduct of Shukri Pasha, the man just sent from Constantinople to take the command at Kars, and who, if he had not positive instructions to treat General Williams with contempt, can have had none to show him respect, although your excellency announced on the 15th of November last that he was to have the rank of *ferik* in the Turkish service. But her majesty's government will no longer endure to be trifled with, and they are determined that if the Turkish government still persist in treacherously disregarding the sultan's interests, the Turkish officers shall, at all events, not insult the queen's commissioner; and your excellency is instructed to demand the immediate dismissal of the person who gave orders that General Williams should be thus unbecomingly addressed. Your excellency will also transmit to me a copy of your application to the Turkish government for the official recognition of General Williams when he went to Kars, and of the answer which you received; and you will also demand, if you have not yet got it, a copy of the instruction that was sent by the Porte. Your excellency will understand that her majesty's government require to be furnished with a full and detailed report of everything which has passed between her majesty's embassy and the Porte respecting the army at Kars, in compliance with the instructions that so frequently, but in vain, have been addressed to your excellency."

"Foreign-office, January 6, 1855."

On the 14th of December, Lord de Redcliffe addressed the English foreign minister in a tone which showed that he began to feel some alarm as to how his neglect might affect his own reputation; yet he was desirous to make things *quiet* everywhere—except at Kars, where they might take their chance. It is almost amusing to observe how satisfied he seems with the movements of the Turkish government just then, although his want of confidence in its honour and promptitude were assigned as his reason for not replying to some fifty despatches from the seat of war! To that communication the Earl of Clarendon replied in a tone of cutting rebuke, exposing the flimsy pretences of the ambassador, whose conduct was open to the very censure he had pronounced against that of the Turkish government. We annex an extract from Lord Stratford de Redcliffe's letter of the 14th of December, 1854:—

"It will be satisfactory to your lordship to know that some apparent progress is making towards an improved state of things in what regards the Turkish army at Kars. An inten-

tion had been entertained of sending Mustafa Pasha, the muschir commanding at Batoum, to take provisionally the chief command in place of Ismail Pasha, who is destined to command the army of the Danube during Omar Pasha's absence in the Crimea; but Vassif Pasha, late commander-in-chief of the Arabian *corps d'armée*, being at liberty, it is intended to employ him for that purpose. He will be instructed to attend to the advice offered to him by Colonel Williams, and he will be also empowered to remove, if necessary, Shukri and Hussein Pashas, of whom the colonel has had occasion to complain. Letters of reprimand have been already addressed to those officers, at the same time that letters of approbation have been sent to Kerim and Hafiz Pashas, founded on the request of Colonel Williams. Colonel Williams' diploma as *ferik* is in preparation."

This letter was received on the 30th of December, 1854, and on the 1st of January following Lord Clarendon thus replied:—

"MY LORD,—With reference to what your excellency reports in your despatch of the 14th of December, respecting the progress of measures for ameliorating the state of the army at Kars, I have to express to your excellency the hope of her majesty's government that Vassif Pasha is fit for the post of commander-in-chief, to which he is to be appointed, and that this has been ascertained by your lordship, as the object of her majesty's government is to obtain an efficient commander, and not simply a change of generals. As no result whatever has yet ensued from the repeated and urgent remonstrances of her majesty's government, and as the improvement, such as it is, in the army at Kars, is solely due to the exertions of General Williams, I have requested M. Musurus to convey to the Porte the dissatisfaction of her majesty's government. The rank of *ferik* is necessary for securing to General Williams the authority and respect required for the performance of his arduous duties; and in your despatch of the 15th of November, your excellency reported that your application for that rank had been acceded to by Redschid Pasha; yet your excellency writes, in your despatch of the 14th of December, that the diploma for Colonel Williams as *ferik* is in preparation; and this unfortunately shows that the wishes of her majesty's government and the interests of the sultan are alike disregarded by the Turkish ministers. Your excellency will report to me the cause of the delay in issuing this *firman*."

During all these proceedings on the part of the corrupt pashas, the conduct of the Turkish common soldiery was excellent, justifying the panegyrics passed upon them by General Wil-

liams himself when, at the close of the war, he returned to his country, and was received at public entertainments given in his honour. At the dinners given to the general by the Lord Mayor of the City of London, and by the Reform Club, portions of his speeches touching this subject were thus reported:—"Referring to the position and conduct of the Turkish troops in Kars, he [General Williams] said that better materials for an army did not exist than was to be found among the Turks. The position in which he found the troops in Kars was such that few, if any, European soldiers, would have been kept together under such depressing circumstances. They were hungry—they were penniless—their pay was three years in arrear, and the officials whose duty it was to supply them with food were wilfully and corruptly neglecting to do so. The army had no officers on whom they could rely, and they seemed when he arrived to have no hope of being able to withstand an attack from the enemy. These gallant men, starving as they were, stood in the breach for seven hours, and kept one of the finest armies of the world at bay." . . . "With regard to the Turkish forces who stood by me," continues the general, "through so many troubles and trials, it is impossible I could speak in adequate terms. But I can, and will at least do so—hold them up on every occasion that may present itself to me, as men worthy of public consideration and sympathy. I can assure you that it was not only the Turkish soldiers who stood by me at Kars, but the heroic townsmen of that place—I may almost say the children who formed the population of that town. Their misery and suffering, their abnegation you all know—but I can tell you that which you do not know. It is this—on my return by Tiflis, I met with General Mouravieff, and almost the last thing he told me was, that after he entered Kars he found no less than ten dead bodies in one house. My lords and gentlemen, these were the corpses of heroic men—men who had silently died—men who preferred the terrible end of death by starvation, rather than to come to ask me for that bread which they knew my garrison and the women and children of the town required. My gallant friend—for I shall always call General Mouravieff my gallant friend—observed that in very many houses he had found one or two dead bodies, but that in this one he had found no less than ten dead bodies."

Events to be recorded at a future page of this History are referred to in this extract, but are here anticipated as showing on the highest testimony—that of General Williams himself, given at a time when he could look back upon the whole story of Kars—what his estimate of the troops and people were whose superior

qualities were displayed from the very first, in spite of bad pashas and unfavourable fortunes.

It is necessary to a full comprehension of the disasters which had previously fallen upon the Turkish army, and the difficulties which Colonel Williams encountered in preparing it for future service, to notice the arms and discipline of the different departments of the troops. The cavalry of the Turks had for ages obtained a great reputation, but since the father of the present sultan introduced European discipline, the Moslem horsemen have lost their prestige, they have ceased to be what they were—wild riders and splendid horsemen, and have not become a well-disciplined European cavalry. They have been drilled after a variety of plans, British, French, and Prussian, without attaining an organisation after any model. Dr. Sandwith says,—“I never yet heard of their accomplishing a charge.” Some of these horsemen have a ludicrous resemblance to European hussars,—the Hungarian refugees in the sultan’s service having made sundry abortive attempts to give a semblance of that description of cavalry to the wild men of the Armenian mountains. Their horses were good, but badly fed, the officers plundering and selling the corn allowed for them. The Turkish officer has no patriotism—the connection of his feelings or sentiment with the government of Constantinople being purely fanaticism. To kill Jews and Christians, by way of execution or cowardly massacre, is the only use to which he wishes to put his sword. He will therefore steal the barley allowed to the horses of his troopers, and convert the horse-clothing to various purposes of convenience in connection with his tent, or sell it to some Jew or Armenian pedlar. The clothing of the troopers was most inappropriate. He wore no helmet, a light fez being the only protection of his skull from the unfriendly contact of Russian sabres. His garments were in tatters, what was left of them was gaudy and filthy in the extreme; on his feet were large slippers, which required more ingenuity to keep them, walking or riding, than an English trooper could put forth. The arms of this wretchedly apparelled man were in keeping with his accoutrements and horse-furniture. He had a carbine of the old flint lock order, which would not always go off, and by which no enemy was ever shot except by chance. A very short sword, of very bad workmanship, constituted his remaining weapon, which was utterly useless in opposition to the sword of a Russian dragoon, or to that of any other cavalry soldier. The mode of sitting on horseback peculiar to the Turks favoured the use of the sword, but that posture on the saddle had been put aside by the Prussian drill officers, and a stiff and formal seat was substituted, the legs being stretched ludicrously in efforts,

barely successful, to bring the feet in contact with the stirrups. Dr. Sandwith, in describing them, says, “I do not presume to enter into the military question of cavalry drill and tactics, and the necessity of reducing every detail to the necessary standard; I merely give a Yorkshireman’s opinion of the horseman I see before me, and do not hesitate to say he makes a ridiculous figure. How different is the appearance of that Bashi-bazouk dashing across the plain on his active little Kurdish mare! What perfect command he has both of horse and arms! A regiment of men well drilled to manœuvre, but retaining the seat formed from childhood, will surely answer better than this half-Prussian style. If I am not mistaken, our irregulars in India, rising daily into higher repute, are an illustration of this remark.” The Doctor afterwards adds, “I had not seen Captain Nolan’s book when I wrote these remarks in Erzerum, about Christmas, 1854.”

The infantry were rather better equipped and better armed than the cavalry, but the advantage thus possessed was small. The clothing was of coarser cloth than that allowed to the cavalry, but seemed to wear better. They were armed with the old “brown Bess,” once so dear to the British soldier. Dr. Sandwith describes them as low in stature, but broad-chested, and the calf of the leg better developed than he had ever seen with British soldiers. It is very doubtful whether any Asiatic soldier could exceed in this respect the recruits brought to the British army from the Highlands of Scotland and the west of Ireland. There was among the infantry an élite corps, called *shishanajis*, these were armed with the French *carabines-à-tiges*. They were recruited from the Zebeks, a race inhabiting a mountain district south of Smyrna, who are habituated from early youth to the use of the rifle. They were formidable marksmen, vigilant, brave, hardy, and active. The Turkish infantry are drilled on the French system.

The artillery was brought to great perfection under Ibrahim Bey, a Prussian officer, and a Turkish officer named Tahir Pasha, who had been educated at Woolwich. These men had set an example of skill and bravery in the combats and battles of the campaigns of 1854, which checked the progress of disaster.

The general organisation of the army was the worst possible. The muschir, although chief in command, seldom took upon him any responsibility or originated any orders without bringing together his feriks, or lieutenant-generals. While sitting together, smoking and sipping coffee for many hours, or perhaps engaged in a very much worse manner, they discussed military projects, and the plan of a battle or a campaign; the decisions were, in

one respect, not unlike those of most councils of war—resolutions to do nothing were generally passed unanimously. All were bound to keep secret the subjects of conversation in the council, but before the morning dawned all that passed was in possession of the Russian spies. A chef-d'état major and a considerable staff was in theory an important part of the military system in the field, but in practice very little attention was paid to it. Guyon held this post until driven away by persecution; he had no foreign cabinet to interpose on his behalf. Colonel Thorn exaggerated in no degree the merits of this glorious man when he said that, "had he the command of the army not a Russian would have retained a foot of land even in Georgia." Guyon's superior staff were foreigners—Hungarians, Poles, and Italians; his junior staff were educated young Turks from the military school at Constantinople. Against these the animosity of the muschir and his feriks, and the colonels of regiments, was especially directed. The simple circumstance of their being well educated, and pretending to some knowledge of the military art, was sufficient to excite the envy and malice of the whole tribe of ignorant pashas and beys. This may be easily conceived from what happens in the British army. The educated officers are notoriously not popular. It is no recommendation in a gentlemanly corps to have been at Sandhurst or in a French military college. Ignorance, especially if associated with rank, hates talent, even when its possessors are made to subserve the selfish ends of those who hate it.

For nearly two months before Colonel Williams' arrival the troops had gone through no exercises of any kind, and, as an army, were utterly unfit to take the field. Exception should be made in favour of a small body of cavalry, which, under the gallant and able Hungarian, Kmety, kept the outposts. The general position of the army, strategically considered, was good. Its left flank rested for support on Batoum, from whence supplies of men, provisions, and munitions, could at any time, before the depth of winter, have easily been sent. Kars was the centre, and thence to Trebizond was only eleven days' journey for convoys. Bayazid, Kaghisman, Toprak-Kaleh, are within easy and secure distances for military operations from Kars. The right flank of the army extended towards Bayazid, but was not so well supported as the left. So deficient were the command, organisation, transport, and commissariat of the army, that any movement of an offensive kind, even with such an advantageous base of operations, would have exposed it to destruction. Dr. Sandwith quaintly observes, "the only organisation complete was that of peculation." The

main difficulty of an external nature was the faithlessness of the races inhabiting the country all around. The Armenians were so subjected to robbery, murder, and every species of oppression, from the Bashi-bazouks, that they would welcome the Russian, or any other Christian rule, instead of the Mohammedan. Long oppression had made the whole nation cowards, or they would have risen against the Turks in arms, and seriously aggravated the miseries endured. It is a curious fact that the Georgians, who are of the Greek religion, are far less attached to the Russians than are the Turkish Armenians. Perhaps this is to be explained by the circumstance that the Georgians have already tested Muscovite rule, while the Armenians have not as yet tried it; for the inhabitants of Russian Armenia are less Armenian in religion, and have on the whole been favoured by Russian policy. The Kurds, although Mussulmen, were not loyal—robbers at heart, they would serve any standard under which might be found the best hopes of plunder. Many of the irregular cavalry of Russia were Mohammedans, and subjects of the Porte. At the beginning of the winter of 1854, the czar had more Turkish subjects in his irregular cavalry than the sultan himself. The disposition of the Georgians in favour of the sultan did not last long, for the frequent forays of the Bashi-bazouks into their borders, were attended by such atrocities as altered the feeling of the people towards the contending powers,—they decided that Russia was, of the two, the less ruthless master. During these raids the Bashi-bazouks were encouraged by certain pashas, to bring the heads of as many Giaours as they could decapitate, and they should receive a proportionate reward. Men, women, and children, were murdered in cold blood—many young virgins were selected for the caprices of their captors, or were sold as slaves. Among these were beautiful and educated women (for the women in Georgia are better educated than the men), torn from their happy homes, and treated by these Turkish robbers with a barbarity no pen could describe. Such was the state of matters when Colonel Williams, accompanied by Lieutenant Teesdale, and Dr. Sandwith, the whole of his staff at that time, arrived at Kars.

The Doctor is a native of Yorkshire, a medical man of some professional reputation, and a scholar. He is of a scientific turn of mind, and also possesses much natural aptitude for military things. He is the author of an excellent work on the subject of the war in Asia. Lieutenant Teesdale was born in 1833, at Grahamstown, in the colony of the Cape of Good Hope, where his father, Colonel Teesdale of the Royal Artillery, was then quartered. Young Teesdale entered the Royal Military

Academy in 1848, and in 1851 received his commission in the Royal Artillery, to which branch of the service especially, and to the army generally, he is an ornament. At the conclusion of the war he had risen to the rank of major in the British service, and was, while serving in the army at Kars during the last campaign, lieutenant-colonel by courtesy, holding that local rank.

Another name rendered memorable by association with Kars, is that of Mr. Churchill. He is a native of Pera, was educated at Paris, accompanied Colonel Williams when sent out some years ago to adjust the Turco-Persian boundary, and finally acted as his secretary during the momentous events with which he was lately connected.

It is an important element in forming a judgment upon the conduct of the Turkish generals, and the British commissioner respectively, to take into account the winter climate of Armenia. About the middle of November the sky, generally clear and frosty for six weeks before, becomes piled with clouds, which, after a time, break in snow gusts upon the whole country. The severity of the winter becomes more and more intense, until, about Christmas, it reaches its full force. Dr. Sandwith, who spent that period in 1854 at Erzerum, writes, "About Christmas the snow falls in immense quantities, and from time to time 'tepehs,' or snow-storms occur, burying whole caravans which have been venturesome enough to brave the weather. These blinding snow-storms often overtake the poor peasant, as he passes from one village to another, in which case he is found cold and stiff the next morning, perhaps buried in a snow-drift a few yards from his own door." As winter advanced, the preparations made for the ensuing campaigns were all conducted on the principle of robbing the soldiery and the people. The pashas had correspondents at Constantinople, who were themselves pashas or other officials, or perhaps contractors, and

regular plans for plunder were concocted, and acted upon, reducing the sources of supply in the territories of the sultan, disgusting the people, neglecting the troops, and exposing the country to all the chances of inadequate preparation for a campaign in the ensuing spring. Such is a true, and as ample an account as our space affords, of the condition of affairs during the last autumn months of 1854, and the closing months of that year.

During the negotiations in Europe, and while the closer alliance of the Western powers was forming with Austria, the prospects of a peace at that juncture were viewed very jealously by all persons acquainted with Asia, in consequence of the disasters which had befallen the Turkish arms there. In our East Indian territories such considerations had great weight, as it was there generally believed that all Central Asia would be influenced by the defeats which had been inflicted by the armies of Russia in Asia Minor. The feeling entertained in India, and the reasoning of men cognisant of oriental affairs and of British interests in those regions, were thus represented by the *Madras Athenæum*:—"No peace with Russia can at present satisfy English interests; the ascendancy gained by that power in Asia Minor lays British influence in Persia and Central Asia prostrate for many years to come. The best diplomacy is that which an army in Armenia could carry on. Let the sound of English cannon be heard on the confines of Persia, or the English flag be seen floating in Tiflis, and then a peace on almost any terms would retrieve the influence of England in the Eastern world, and put all machinations against her Indian empire out of the thoughts of all men. If we have a peace now, every one, great and small, from St. Petersburg to Bokhara, that meddles with politics, will meditate insult or aggression. The vulnerability of England in the East will be an accepted opinion in the Asiatic nations."

CHAPTER LVI.

HOME EVENTS AT THE CLOSE OF THE YEAR 1854.

"It will be the country which will urge forward the ministers to spare no pains, to omit no exertion, to make every sacrifice and every effort, for the purpose of securing a just and honourable peace, in consequence of a successful and vigorously prosecuted war."—THE EARL OF DERBY in the *House of Peers*, Dec. 1854.

WHILE the army battled and suffered before Sebastopol, and numbers perished in the infected corridors of the Scutari hospitals,—while intrigue worked its tortuous course at Vienna, and procrastination characterised the proceedings of the tardy diplomatists,—while the czar was publishing manifestoes, and recruiting his armies by conscription and his treasury by

new imposts—the hearts of men in Western Europe were thrilled with the tidings which were daily borne upon the wings of the press throughout their cities and centres of civilisation. A December session, so unusual in English parliamentary sittings, was summoned by her Britannic majesty. The English government was alarmed at the growing discontent in

every part of the country with the way in which the war was managed, and they were therefore desirous to shelter themselves under the protecting ægis of the senate, but they were also solicitous to obtain its support in matters constitutionally requiring parliamentary sanction. The queen's speech was neither better nor worse than such political documents usually are, and the topics referred to in it were only noticed so far as was necessary to bring out the party tactics of the political combatants of the house. On the 12th her majesty opened parliament in person, and the government was immediately put upon its defence by the opposition, for the way in which the war had been conducted. The Earl of Derby, in his brilliant invective, charged the government with a total want of foresight, disqualifying its members for the offices which they filled, and blaming them for all the disasters which attended the occupation of Roumelia and Bulgaria, and the campaigns in the Crimea. The fierce political assaults of the eloquent leader of the opposition in the lords, evoked from the Duke of Newcastle more open statements and admissions than were deemed politic by his party, or just to his colleagues and himself. The noble duke admitted that the government were not possessed of the experience required for the emergency, but expressed such readiness to profit by past misadventures and shortcomings, and with such an air of ingenuousness, as produced a personal feeling in the house favourable to the honesty of the government, which was supposed to be on the whole the most able which the state of parties would allow of being formed. The statements of his grace were also calculated to remove various impressions among the general public which were prejudicial to the government. It was thought by most men that the policy of the Western powers was not so identical as had at first been supposed; the duke protested that both before and since war had been declared, the imperial policy and that of her Britannic majesty had been in complete unison.

The Earl of Derby charged the government with vacillation as to the Crimean expedition, and as having entered upon the war with no fixed plan of procedure. To this the minister replied as follows:—"The noble earl represented that it was only after the siege of Silistria was raised that we contemplated the invasion of the Crimea, and in support of that statement he quoted passages from speeches made by the noble lord the president of the council, and his noble friend near him (Earl Granville). Now, let me inform the noble earl that he is in error in the whole of that statement. From the very first the invasion of the Crimea was contemplated, and I only wish that it were consistent with my duty to lay

before your lordships the despatches between Lord Raglan and myself with reference to the conduct of this war. My lords, I say at once that by me certainly no blame whatever shall be cast upon any portion of that army. I believe that no blame belongs to them; and certainly I am not the man to blame them. But, my lords, if the noble earl means to say that, because no blame attaches to the army, blame, therefore, does attach to the government, will he be good enough to look at the facts of the case, and, having studied them, then pronounce an opinion? With the greatest energy and activity Sir E. Lyons, Sir G. Brown, and others, were employed for nearly a month in obtaining those materials and planning those operations the neglect of which might have occasioned the embarking and disembarking of the troops to be attended with very different results from those which took place. By far the most serious cause of delay, however, was the breaking out of cholera in the camp. As regards the deficiency of preparations which the noble earl charges against the government, I really do not know to what the noble earl refers, unless it be, as he specified, the paucity of men. I can only say, that those preparations were not only immense, but minute. My lords, that body of nearly 60,000 men landed at once on the shores of the Crimea, and I believe that the records of history do not show any undertaking upon such a scale so successfully accomplished throughout. Look at the great military power of Austria. What have they been doing during the last four or five months? Were they in an effective state to take the field at the time when war was declared by this country? Certainly not; and if they had been obliged, as we were, to send a force into the field, is it not notorious that they would have been obliged to send one much more inadequate and much less fitted for the service in view than they will now be enabled to do? My lords, if that is the case with great military nations—nations whose whole military system is based upon conscription—what must it be with a country whose military system rests entirely upon voluntary enlistment? My lords, the siege of Sebastopol commenced, and, after a considerable amount of necessary preparations, upon the 17th of October, and it soon afterwards became apparent, from the intelligence which reached this country, that that siege was likely to be more protracted than I readily admit the government at first expected. I say I readily admit—if that be any blame to the government—that we did hope and believe that long before the time at which we are now assembled that fortress would have fallen; and if we erred in that expectation—if we were over confident, I believe that we erred in common with many men of great experience in war, and men

whose opinions were well worth having—we erred in our confidence in common with the public at large, both in this country and in France. We did not expect that an army could be moved from Odessa to Sebastopol with the marvellous rapidity with which that movement was effected; and, probably, some of your lordships will be surprised to hear that, through the extraordinary efforts of the Russian government, through the means they were able to command of an unlimited number of cars and cattle, that march was effected at such a rapid rate, that on one day a march of forty-two miles was actually effected. Now, I may be imprudent in making these confessions, but I wish to deal frankly with your lordships.”

This was the defence of the government, made by the highest authority—the war-minister himself; and, however well received by the peers, it was regarded by the country as proving his incompetency, and that of the government of which he was so prominent a member, to deal with matters requiring urgency, energy, foresight, and acquaintance with military detail.

In the House of Commons Mr. Sidney Herbert assumed a bold and defiant tone, admitting no errors, and betraying a self-sufficiency that ill comported with the practical impotency which had been displayed by his colleagues and himself. The reply of Mr. Layard, who had the advantage of having been an eye-witness of many events in the Crimea, told with withering force against the pragmatical secretary. The description given by the former, of the source of all the indecision of the government, was so obviously the true one, that it took hold of the public mind, and produced an effect unfavourable to coalition ministries, however well versed their members in government routine:—“Mr. Layard said he never addressed the house with a more painful sense of responsibility than he did on that occasion, and that sense of responsibility was increased by the speech which they had just heard from the Right Hon. the Secretary for War. He could not conceal, that, after what had passed, he did not feel that confidence in her majesty’s government which he wished he could say he did feel. He did not say that after all they may not have embarked in a policy worthy of this nation. On that he had not now to touch. But if he could see that the calamities which we had suffered were the result of inexperience, and that in the future they might hope for better things, he should still place confidence in her majesty’s government. Instead of that, however, he believed that those calamities were solely to be attributed to the want of a definite policy. He believed, moreover, that it was impossible for a government composed as the present government was,

to have a definite policy. How could a definite policy be expected from a cabinet which included representatives of all the political parties in Europe, from a minister who represented the holy alliance down to another who represented the extremest state of liberal opinion in this country. From a cabinet so composed, it was inevitable that they should have a half-and-half policy, for the members of it must meet one another half-way and propose half measures, or they could not otherwise act together. That might answer very well in ordinary matters, but on a great question like that, they could not have half-and-half measures, and a half-and-half policy would not do. Last session, he (Mr. Layard) had attempted to warn the country of the dangers and calamities to which they were hurrying, but the same appeal was made to him, and which had been again made that evening by the right hon. gentleman (Mr. Sidney Herbert), namely, that the appearance of dissension on that question should be avoided, and that they should show themselves to be a united people. Was that a position for the government of a great nation? Was that government to govern merely when a pressure was exerted on it from without, and at the last moment? If so, any twelve men they could pick up between Westminster Hall and Charing-Cross would be equally as capable of governing. Before proceeding further, he begged it to be distinctly understood, that although he felt it his duty to attack the government upon this great question, it was upon that question alone, and that on all others he was faithful to those great principles on which he had been elected to that house. They were told that in attacking the acts of her majesty’s government upon this question they were, at the same time, imputing blame to our allies, the French, and might give them offence. Now, so far was it from being the case that the French were implicated in the mismanagement of our government, that, on the contrary, the French had taken the initiative in every act that was sound and straightforward, and we were compelled to follow them.”

On the whole, the opening debates were rather in favour of the government, so far as the feeling of parliament was concerned; but the effect upon the country was detrimental to the ministry, public confidence never afterwards rallied, and the foundation was laid in the opinion of the people for the popular discontent which at last rose in its might, and overwhelmed the cabinet.

The public interest was much excited by the passing of votes of thanks to the allied armies and navies for their heroism and endurance in the campaign of 1854. These votes were proposed on the 15th of December. In the House

of Lords the performance of this agreeable task devolved upon the Duke of Newcastle. The objects of the public gratitude upon the occasion were comprised in various distinct classes—the general officers and regimental officers of the army, and the army at large, the navy, the medical staff of both services, and the army and navy of our ally. In the Commons, Lord John Russell proposed a similar vote, but in a speech inconceivably superior to that of the noble duke in the Lords. The following neat compliment to the common soldiers is probably one of the best conceived ever paid to their undoubted merits:—"And now, Sir, I will proceed to notice that expedition and those contests in which the best blood of this country has been shed; and when I say the best blood of this country, I by no means intend to refer to any particular rank, military or social; for I feel that among the best blood of this country is the blood of those sons of labour who, having entered the military profession, have devoted their whole hearts to their duties—men who have stood in the field of battle without the hope or expectation of being distinguished by those rewards by which men in higher stations are often swayed, but who have performed their duty nobly, reckless even of their lives, at the same time with a feeling of religious obligation that all must admire. For while they have endured with the greatest firmness the assaults of their enemies, they have shrunk with the utmost avoidance from committing the slightest outrage upon any one. I am confident that these children of the peasantry of England are of no less worth in blood and courage than the sons of the highest and the noblest of the land."

The thanks of the House of Lords to the army and navy, and to the French army and navy, was proposed by the Duke of Newcastle on the 15th of December. His panegyric of Lord Raglan, the British commander-in-chief, was that of a thorough partisan. To judge from the speech of his grace, Lord Raglan might be considered the saviour of the army, and the man by whom the greatest deeds were accomplished—whereas never did a commander personally do less for an army by vigour, ingenuity, or the qualities requisite for a great command. He had the power to overrule and control all departments, but he left them to their own miserable incompleteness and incompetency. Long after the date to which we refer, and when the war itself had terminated, the following caustic but just remarks were written in "the leading journal:"—"What, then, are we to say of our late commander-in-chief, as his acts are chronicled in the reports and evidence derived from two commissions?

"Brave with an antique bravery, of most courteous manners, and, to those of his own class,

cordial and kind, he naturally has the warm sympathies of a circle who can see no defects in him. But the nation has to judge of men by the results of their actions. Let the private friends of Lord Raglan cherish his memory, and seek to communicate their enthusiasm to their countrymen. But if the country remains incredulous they must not be surprised. We do not make heroes of good men or polite men, but of those who do great actions and advance a great cause. Now, how stands the case with Lord Raglan? He had been for forty years supreme at the Horse Guards; he knew, if any one might be supposed to know, the British army, with all its merits and defects, its personal bravery, the shortcomings of its commissariat, transport, and medical systems. He was, in fact, at the head of the very department which broke down most egregiously. He had been often abroad, and had enjoyed in France opportunities of seeing the details of a great military organisation; yet, under his guidance the British army—literally the British army, for we had no reserve—was blindly led to destruction, from which only the outburst of popular feeling preserved it. For five months was this army in Turkey before it embarked for the Crimea; not a few of the deficiencies began to be felt even before it moved from Gallipoli to Varna; yet, though endowed with unlimited power, though not only requested, but even abjured, by the government to remedy every defect with a strong hand, the commander-in-chief saw nothing, heard nothing, knew nothing, until the deluge of disaster was upon his devoted troops. In all these inquiries his name hardly appears. The government of the army seems to have been a commonwealth of independent generals and heads of departments. What a quartermaster-general did in Dublin or Quebec, that he felt necessary to do in the Crimea; he did nothing more, it was not in his department, and no higher power interfered. The commissariat could not transport provisions for want of ships and horses; they made requisitions that were not complied with, men perished by hundreds, and we see no help come from head-quarters. Napoleon and Wellington dictated the minutest details of organisation, but all by which wars are made successful—feeding, clothing, transport, shelter—were in this British army abandoned to the fortuitous agreement of some half-dozen departments, each of which, as far as we can see, was carrying on a war of recrimination and provocation with the other."

His Grace of Newcastle took the opportunity of lauding Lord Raglan's staff as unwisely as he heaped eulogy upon the chief himself. Some of these officers certainly deserved no thanks from their country—unless the disasters they caused, and the mismanagement which

they either occasioned or could not control, are titles to a nation's gratitude. Foremost amongst the staff-officers of the army was Sir Richard Airey. The authority last quoted thus notices his claims to renown:—"Sir Richard Airey, too, who will not go one inch beyond the strict limits of his duties as understood on a home station in time of profound peace—had he no means of becoming acquainted with the army's real wants, and the necessity of some breadth of view, and some increased exertion to meet a great crisis? We have him pleading, and pleading successfully, that he is not responsible for anything more than the making of requisitions for what is necessary—a duty which we should think any subaltern in the army might equally perform. We have him exonerating himself by stating that the rugs were half cotton, the coats too small, the boots unfit for wear, the palliasses useless for want of stuffing. We have him sending for tents and huts two months after the landing in the Crimea, because he had no reason to believe they would be wanted before. If he had come from India or the Cape to his post about the time of the battle of the Alma there might be some reasonableness in this defence. But what must we say when it is remembered that this man had been military secretary to the commander-in-chief up to the very day of sailing, must have been aware of the exact state of the army, a confidant of all the doubts, fears, surmises, and anticipations on the subject of the expedition; that he must have known well the terrible suspense of the two governments, the importance they attached to a decisive campaign, the dreadful consequences of any sluggishness or irresolution at such an hour? Yet he and his subordinate, knowing all this, are content with such a perfunctory discharge of their barest duties, that if they had been the agents of a shipowner or a purveyor they would have been dismissed as not taking care of their employer's interests."

On various other officers of the staff "the thunderer" launched his bolts in similar terms, summing up his estimate of their claims upon their country generally in these words:—"They will wear their orders, and their rank and titles, won amid so much desolation, will be blazoned in the face of the world, for of that courage which boldly faces shame they have no lack. But from the verdict of history they cannot escape. They may well hope that obscurity will cover their names, and they may not share the immortality of Mack and White-locke."

These censures are quoted because they convey the actual state of public opinion in England at the time when the Duke of Newcastle so bombastically lauded his friends, to whom he and his colleagues had so unworthily com-

mitted the conduct of a great expedition. His grace did justice to the non-commissioned officers and soldiers in his oration; but he was evidently more at home in expending his eloquence upon Lord Raglan and his satellites. Although this speech was coldly received by the country, it met with great favour in the House of Lords, and some passages of it were perused with warm approbation out of doors. One passage, in which he offered a grateful tribute to the fallen brave, met with a hearty response from both the house and the country; it was one of the duke's happiest oratorical efforts—chaste, unpretending, and full of simple pathos:—"We are called upon to vote thanks to the men who have served their country, but I regret to say that a large body of those who left this country, high in expectation and confident of success, are not now within the reach of our mortal thanks. Their names are not in the list which I am about to submit to your lordships, but I am confident that they are not forgotten. With all our triumphs sorrow is inevitably mingled, and, when I look round upon your lordships at this moment, I see that there are some who bear the outward semblance of that grief which preys upon their inmost hearts for the losses they have sustained. I think, then, your lordships will not deem it unbecoming if, upon this occasion, departing from the dry rule of precedent, we should express our regret at the loss of those noble men, and our condolence with their relatives. I propose merely to ask your lordships so to do. I shall not in that resolution include any names, but it is impossible not to recollect the name of one whom, perhaps above all others, the country most deeply mourns. My lords, I had the happiness to become acquainted with that gallant and noble man, Sir G. Cathcart, by official communications before I ever saw him personally; and from the official communications which I held with him for a year and a half, while he was governor of the Cape of Good Hope, I must say that I never was more struck with the ability, the honour, and the devotedness of any man. In common with the rest of those who were acquainted with him, I confidently looked forward to the time when he would take a position in the British army of the highest value to the country, and to that sovereign who, as much as any one of us, regrets his death. He and his companions sleep on the green hills of a foreign coast, but I am confident their names will live for ever, not unhonoured, in the sad and grateful memory of the people, as well as in the military records of this country." The motion was seconded by the leader of the opposition peers, the Earl of Derby, and carried by acclamation.

In the Commons, Lord John Russell, as the ministerial leader in that house, proposed a

similar vote in one of the ablest speeches ever addressed by his lordship to that assembly, frequently as it has been his privilege and honourably to address it. Lord John's encomiums on Lord Raglan were more judicious than those of his colleague in the other house, but not less decided. Had the gallant chief conquered all Southern Russia, his military skill and brilliant conceptions having chiefly led to such results, Lord John could hardly have presented him to the country as more an object of public admiration. In his speech the noble commoner estimated the Russian army at Inkerman as 80,000 men, and attributed their "robustious coming on," as the great dramatist would call it, to the fact of their being newly-arrived troops, who had not previously encountered the British, and would not have the fear of them with which the Russians who fought at the Alma were said to have been filled. His lordship computed the Russian loss to have been 20,000 men. The leader of "her majesty's opposition" seconded Lord John's proposal, which was carried with unanimity and enthusiasm.

It was very acceptable to the army in the Crimea thus to be remembered and honoured; and the cold bivouac was cheered weeks afterwards there by the recital of the brave words of Lord John Russell, and the acclaim of the senate of England. The effect upon the French government was also gratifying, when Lord Cowley, the British ambassador to the court of Napoleon, formally communicated the votes of the British houses of legislature to the French minister of foreign affairs in the following terms:—

Paris, Dec. 17.

MONSIEUR LE MINISTRE,—Never did a more pleasing or flattering duty devolve on me than that which I now fulfil in transmitting to your excellency the minutes of the sitting of the British parliament of the 15th of this month, in which both houses resolved unanimously to offer their thanks to the French army and navy for the cordial co-operation and assistance which they have given to the naval and military forces of the queen in their combined operations.

In conformity with the usages and rules of parliament, Field-marshal Lord Raglan and Vice-admiral Dundas will be charged to convey to General Canrobert and to Admiral Hamelin the thanks of the two houses, but I am at the same time instructed to make known to the emperor and to his government in what high esteem the British parliament hold the conduct of the French army and navy, as also the great satisfaction with which the government of the queen has seen the national legislature unite with so much cordiality in the sentiments which it itself professes for the imperial army and navy.

In begging your excellency to be the medium of this communication, I am, &c.,

COWLEY.

The first notice the people of England had of the reception which this act of courtesy and alliance met with in France was from the columns of the *Moniteur*, the organ of the imperial government:—"The whole of France will be deeply moved by the thanks which England has just voted by acclamation to

General Canrobert and our army, and to Admiral Hamelin and our navy, for their valiant co-operation and their cordial assistance in the war in the East. To this solemn manifestation, hitherto without example, of the sentiments of a great people towards its faithful ally, France has already replied by its admiration at the brilliant valour of the English fleet and army. She has warmly applauded the eulogiums which our generals-in-chief, after the battles of the Alma, Balaklava, and Inkerman, bestowed upon the intrepidity of Lord Raglan and his troops. The two nations, like the two armies, have done each other the most frank and the most cordial justice. While their soldiers and their sailors struggle with courage and devotion, the two nations appear to rival each other in generosity, in order to accord each to the other the most brilliant share of the glory acquired by both in common. Nothing is better calculated to draw closer their alliance than the exchange of these noble sentiments. Nothing can tend more to enlist the sympathies and the assistance of all civilised nations, and hasten the definitive triumph of the holy cause which they defend."

A more formal, if not more official notice, speedily followed. The English minister for foreign affairs received from Lord Cowley a letter addressed to him by the French foreign minister, in the name of his imperial master, in acknowledgment of the courtesy of the English legislature:—

M. L'AMBAassadeUR,—I have had the honour to receive the letter by which your excellency was good enough to communicate to me the text of the identical resolutions adopted by the two chambers of the British parliament in their session of the 19th inst.

The thanks voted to our army and to our fleet, as well as to their commanders, could not but deeply affect the government of the emperor. The thoughts of his imperial majesty are directed with unceasing solicitude to the scene of the contest in which the allied armies are engaged; it is, therefore, with the utmost satisfaction that he observes the esteem which the soldiers of the two countries mutually entertain for each other increased by the courage and perseverance which they display in the service of one and the same cause. The government of the emperor especially congratulates itself at perceiving in the vote of the parliament an evidence of the intimate union which, connecting together the policy of France and England, blends also in one and the same expression the encomiums to which glorious efforts and toilsome labours so justly entitle the two armies and the two fleets which the two countries have sent to share the same perils and the same fatigues.

Receive, &c.,

DROUYN DE LHUYS.

These communications gave rise to warm discussions in France, according to the political hue of the party whose opinion was conveyed. The *Union*, the organ of the Legitimists, took no notice at all of this mutual exchange of compliments. The *Nationale*, the organ of the Fusionists—the party of united Bourbonists, representing those of the older and younger branches, who were willing to merge their dif-

ferences, in order the more effectually to prevent a Buonapartist dynasty—expressed an unmitigated hatred of England, averring that if she were left alone in the conflict against Russia, its sympathies and those of its party would be with the czar. England never had an enemy more mean, pertinacious, and ungrateful than Louis Philippe, and the whole house of Orleans partakes of the dislike. The great Napoleon often desired alliance with England, to which the unrelenting animosity to him of the English court, aristocracy, and nation, would not listen. The present Napoleon is but carrying out the policy of his great uncle in seeking an English alliance. It is not matter of surprise that the Orleanist and Fusionist *Nationale* should desire that the English had been unaided at Inkerman, and had perished. The *Moniteur* and the other court organs paid the most extravagant compliments to the English government, legislature, army, and navy. But the most sensible, sincere, and hearty expressions of sympathy and goodwill came from unexpected quarters—the republican and popular journals. The *Siccle* represented most intellectually those classes; and the following noble tribute of admiration to our country graced its columns:—"The spectacle which England now presents will, we think, remain in history as a lesson full of force and authority for the conduct of states. Look at that country which has been said to be only one of shopkeepers; it enjoys liberty, and that liberty which has made it so great as a commercial nation has the privilege of suddenly rendering it as heroic and chivalrous as a ballad of the old clans. It would appear that the heart of every Englishman has only one wish, and that an ardent one—victory—complete victory. The war-cry of the Greys and Enniskillens comes forth from every breast. The journals are no longer simple daily papers, recording the events of the morning or the evening; the writers have become poets. Their descriptions of battle smell of more than powder: they breathe forth the most undaunted patriotism; they are almost as overpowering as the charges of Scarlett and of Lord Cardigan. It may be comprehended in reading them that it is not only the English government that makes war—it is the nation; artisans, manufacturers, great lords, and princes—all are engaged in the same intoxication of combats. The hurrah for old England nowhere meets a dissentient voice. Even the Stock Exchange of London—that famous speculative Bourse—appears to think, at the hour of quoting its consols, of the number of millions of rentes fighting at the head of the English troops in the Crimea. It hails with a rise the devotedness of those great lords, who quit their estates, their luxury, their castles, and their clubs to maintain intact

the fortune and the star of Great Britain, and who wish that the aristocracy should remain in the illustration of death and sacrifice. There is not a dissentient voice. Numerous and brave men have been lost, and not a complaint is heard! Are reinforcements, fresh vessels, fresh troops, and fresh supplies of money wanted? The English government is told to take them. It is not the taxpayer who gives them with regret; it is England who offers them with her whole heart. England is pledged; she must triumph. *Salus populi suprema lex.* What strength this unanimity gives to a government! Instead of having to stimulate it has only to direct and moderate. For it there is no uneasiness for the future; in presence of public opinion so powerful and so enthusiastic the parliamentary powers cannot but second with all their force and all their votes the submission of the government to the wishes of the country. We have said that this country is free. When it decided for war it took its decision with a full knowledge of its situation and of its resources. It replied in the affirmative when the first sacrifices were in contemplation, and it cannot use a negative when the last shall be asked for. If by chance some criticising and grumbling voices, as there must be in all *régimes* of liberty, should demand accounts, would not public opinion soon bring the accused towards the Capitol? Is it not the free will of England which ferments in every mind, which inflames every one's courage, and which raises so high the great hurrah of battle that the shrill noise of the spinning-jennies and the loud roar of the steam-engines are but as silence compared to it? And then for the brave men who fall one against five what a consolation there is! For those who fight what a support there is in this fervent public opinion, the echo of which reaches as far as them! In what dignified language it speaks of their heroism; to what sublimity it rises in celebrating their courage; what a pedestal it erects for their devotedness. A man can die with joy when so honoured. More than once we also, the organs of opinion in France, we could have wished to follow our soldiers on the fields of battle, to live on the glory which they acquired, and to identify ourselves by the grandeur and the poetry of our homage with all our efforts. They do not do less than the English; they strike and die like them, and like them they excite admiration; but why not avow it? why should they be less celebrated? The French press has not the warm accents, the acclamations of which resound on the other side of the channel; the phrases of our writers have not the sacred flame which illumines the columns of our English contemporaries. The heart of the English nation burns with a pure and holy patriotism—such a people cannot but

conquer. They are worthy allies of France, appreciating the bravery of our troops; while their only rivalry is in generosity and gallantry. The esteem of such a nation must be appreciated by France."

The highest acknowledgment of the thanks of the English legislative houses proceeded from the emperor himself, who, in opening the legislative session of the 26th of December, referred to the circumstance. His speech gives a faithful picture of the condition and feeling of France at this juncture. Imperial and royal speeches are not always true indices of the country to which they refer—so many motives of policy exist for presenting an unfaithful picture, that these documents seldom receive much credence. From a vast variety of material now before the author of these pages, he can pronounce this address of the French emperor as presenting the real state of affairs in France, and the spirit of the imperial policy:—

"Gentlemen, Senators, and Deputies,—Since your last meeting great events have happened. The appeal which I made to the country to provide for the expenses of the war was so well responded to, that the result even exceeds my hopes. Our arms have been victorious in the Baltic as well as in the Black Sea. Two great battles have shed lustre on our flag. Striking testimony has been afforded of the intimacy of our connection with England. The parliament has voted thanks to our generals and our soldiers. A great empire made young again by the chivalrous sentiments of its sovereign, has detached itself from the power which for forty years threatened the independence of Europe. The Emperor of Austria has concluded a treaty, defensive now, to be offensive, perhaps, soon, which unites his cause to that of France and England. Thus, gentlemen, the longer the war is prolonged, the more does the number of our allies augment, and the more closely are drawn the ties already formed. What ties, indeed, can be more binding than the names of the victories belonging to the two armies, and recalling a glory in common—when the same uneasiness and the same hope agitate the two countries, and when the same intentions animate the two governments upon every point of the globe? Thus the alliance with England is not the effect of a fleeting interest, or a policy of circumstances; it is the union of two powerful nations, associated together to obtain the triumph of a cause, in which for more than a century were involved their greatness, the interests of civilisation, and at the same time the liberty of Europe. Join with me, then, upon this solemn occasion, in thanking, in the name of France, the parliament for its cordial

and hearty demonstration, and the English army and its worthy chief for their valiant co-operation. Next year, should not peace be then re-established, I hope to have the same thanks to address to Austria, and to that Germany whose union and prosperity we desire. I am happy to pay a just tribute of eulogium to the army and the fleet, which, by their devotion and their discipline have, in France, as well as in Algeria, in the north as well as in the south, worthily fulfilled my expectations. The army in the East has, up to this time, suffered everything and overcome everything: epidemy, incendiarism, tempests, and privations—a town unceasingly provisioned, defended by formidable artillery by sea and land—two enemies' armies superior in number—nothing could weaken its courage or arrest its ardour. Every one has nobly done his duty, from the marshal who appeared to compel death to wait until he had conquered, down to the soldier and the sailor, whose last cry in expiring was an aspiration for France, an acclamation for the chosen of the country. Let us, then, declare it together, the army and the fleet have merited well of their country. War, it is true, entails cruel sacrifices; nevertheless, everything enjoins me to prosecute it with vigour; and for this purpose I reckon upon your co-operation. The army is now composed of 581,000 soldiers and 113,000 horses; the navy of 62,000 sailors afloat. To keep up this force is indispensable. Therefore, to fill up the vacancies occasioned by annual retirements and by the war, I ask you, the same as last year, for a levy of 140,000 men. A law will be presented to you, having for its object to ameliorate, without augmenting, the burden of the treasury; the position of the soldiers who re-engage will lead to great advantages, to increase the number of old soldiers in the army, and to allow hereafter a diminution of the burdens of the conscription. This law, I hope, will soon receive your approval. I shall ask your authority to raise a fresh national loan. No doubt, this measure will increase the public debt. Nevertheless, let us not forget that, by the conversion of the stock, the interest of that debt has been reduced twenty-five millions and a-half. My efforts have been directed to the object of limiting the expenses to the receipts; and the ordinary budget, which will be presented to you, will show that both are balanced. The resources from the loan will be solely applied to meet the exigencies of the war. You will see with pleasure that our revenues have not diminished. Industrial activity is maintained. All the great works of public utility are proceeding, and Providence has been pleased to give us a harvest which satisfies our wants. The government nevertheless, does not close its

eyes to the inconvenience occasioned by the dearth of provisions, and has taken every means in its power to prevent that inconvenience, and to mitigate it. It has created in many localities new elements of labour. The struggle which is proceeding, circumscribed by moderation and justice, although it may frighten some, gives so little alarm to great interests, that soon the different parts of the globe may expect to enjoy the fruits of peace. Foreigners cannot fail to be struck with the touching spectacle of a country which, relying upon divine protection, sustains with energy at 600 leagues' distance from its frontiers, and which develops with the same ardour its internal riches—a country where war does not prevent agriculture and industry from prospering, or the arts from flourishing, and where the genius of the nation is displayed in everything that can tend to the glory of France."

From the above speech of the emperor, the measures taken by France to meet the emergencies of the war are indicated. The demands of his majesty were of course complied with by the legislative body, and men and money were provided as required. An active army of half a million of soldiers was thus provided for the contingencies of 1855, and seldom was an army better caparisoned for hostile operations. The French fleet also reached a degree of efficiency never before attained, while the number of sailors was actually one half more than that of England. Of course the commercial marine of Britain was far greater than that of France, and the maritime resources of the former such as the latter is not likely to possess for a long period of her future naval progress; but the bare fact of a numerical proportion superior in such a degree was startling, however conscious Britannia might be that she still "ruled the waves."

The measures originated by the English parliament for carrying on the war in 1855 were few, but there were two especially worthy of notice. One of these referred to the militia. The object of it was to permit regiments to volunteer for service or garrison duty out of the United Kingdom. This measure was introduced by Lord Palmerston, as prime-minister, with all his accustomed tact. He argued that the government was not open to the reflection so generally cast upon it, of having sent forth an army upon a distant expedition without providing any reserve. "Our reserve," said the ready and astute politician, "is the whole British nation." The militia proved, as it always has done, a valuable resource. During the long war with France it fed the army with recruits. It was in fact a round-about conscription. Men were liable to be balloted into

the militia, and then a bounty, often a large one, was given to them to volunteer into the line. When volunteers were demanded, those who held back were sure to be regarded as less patriotic, and what the soldier even feels more, less brave. Frequently, during the insurrection in Ireland, in 1798, the militia behaved better than the troops of the line. On one occasion, when a force consisting of both was defeated by the insurgents, in the county of Wexford, a peasant related the circumstance thus—"the army ran away, and the militia retreated," which, odd as the description was, exactly depicted the event. At Carricknagat, in the county of Sligo, Colonel Vereker, at the head of a few hundred men of the Limerick militia, kept the French force at bay which had landed under General Humbert at Killala. The invaders were turned aside upon the interior of the country, where all were captured. For this exploit Colonel Vereker was made a peer, under the title of Lord Gort. During the war in 1855, the militia were very efficient, volunteering in large numbers into the line, the cavalry, and the Guards. It is a curious fact, but verified by statistics, that fewer men of the Scotch militia deserted than of the English, while a greater number volunteered for the line; and that fewer men of the Irish militia deserted than of the Scotch, and a greater number volunteered for the line. This circumstance justified the policy of Lord Palmerston, who successfully opposed Lord John Russell in the parliamentary discussion concerning the embodying of the Irish militia; the latter noble lord being opposed to the enrolment of the Irish regiments, the former being in favour of including them in the general appeal to arms. At the time, Lord Palmerston's conduct was regarded as a mere political *ruse*, being then a rival of Lord John's; but events showed that the former noble lord understood better the material of which the Irish militia was likely to be composed. The other important measure was a bill to enable the queen to enlist foreigners. The crown formerly had this power, but in 1794 the royal prerogative in this respect was abolished. The English nation was always jealous of any such right on the part of the crown, and one of the causes of the revolution of 1688 was its exercise injudiciously, and for the purpose of infringing upon the constitutional rights of the people. When this measure was proposed in 1854, the *Times*, the great leader of the press, bitterly assailed it; and most of the leading journals, metropolitan and provincial, opposed it as a reflection upon the patriotism of the youth of the nation. Nevertheless the measure was proceeded with, and ultimately carried. The government plan was, that the foreign troops should be formed into

separate corps. In 1837, an act was passed giving permission for the enlistment of one foreigner to every fifty British subjects; but the practical effect of that act was to exclude foreigners from the English army, except a few who held commissions. The discussions in both houses, as well as among the people, were very warm in reference to this measure. The author of these pages, in an article written for a London journal at the time, thus treated the subject. Time proved that his opinion was correct, and the general public at last coincided with the framers and passers of the act:—

With regard to this measure, we are of opinion that it is wise and opportune; for while

“In native swords and native ranks”

dwell our hope of freedom and victory, it cannot be denied that we have power and wealth beyond the proportion of our numbers, and that we have now, as heretofore, embarked in military enterprises which, while within the compass of our skill and resources, require more men to carry out than the anvil, and the loom, and the counting-house can spare. We greatly prefer a foreign legion to the system of subsidies. The governments we subsidised in former wars seldom took our money without intriguing against us, and sometimes professed their incapacity or confessed their unwillingness to fulfil the stipulations on which our money was disbursed. And even when we have attempted to pay and arm people for the defence of their own liberties, they have ignominiously sold the arms we gave them, or fed at our hands and refused to fight with their own. In both kingdoms of the Peninsula this was exemplified upon a grand scale during the late war. More muskets were uselessly distributed than would have armed the whole people, and a base banditti, or still baser regular soldiery, were fed and clothed from our stores, while our own army were ready to perish from want. Wild waste characterised this whole system, while our own brave soldiers were fed, and paid, and rewarded with a parsimony as astonishing to other nations as was the spendthrift freedom of our impolitic and useless largesses.

Let it not be objected that the mercenaries we would employ on any system would neither conduct themselves to our honour nor to their own. It is not proposed by the government to employ men whom the word “mercenaries” would describe. They do not mean to open the way for the Dugald Dalgettys of the Continent to earn British gold by a mere professional soldierhood—albeit that the Swiss and others fight well, with no higher meed of praise before them than that of good soldiers of fortune. Our government evidently aims at

the enrolment of Polish, Hungarian, Italian, and other refugees, men who feel that in fighting for the predominance of Western Europe, they fight for the liberty of their own down-trodden lands. There would be no difficulty in raising a Polish legion, a Hungarian legion, and an Italian legion, as earnest in assailing the tyranny of Russia as our own people could be. The very *élite* of the soldierhood of these three trampled realms will flock to our standards if they perceive that, however England may disclaim interference with Austria, it is her aim so to cripple the force of Russia, as to leave it but little probable that she will again offer her alliance against any of the populations of the Austrian empire who may assert their independence. Even if Austria form a closer alliance with the allies, that would not prevent Austrian fugitives from crowding beneath our standards when Russia is the foe. They know well that it is not Austria, after all, that keeps down their nationalities. Austria would be shaken off in the first throes of their next struggles for freedom, were it not that Russia is her support. Russia stands guarantee for the tyranny of Austria, and every blow that Hun, or Pole, or Lombard aims at that colossus of oppression, is a blow levelled against the Austrian ascendancy.

There exists much sympathy throughout Germany with England in this war. The smaller states of that confederation are generally represented to be as despotic in their sympathies, at least as Austria and Prussia. It is so with the governments; it is not so with the people. In Brunswick and Hanover especially, there is a strong leaning to England; religion, race, old alliance, and family connection, bind those minor states to Britain; and amongst the best officers in Germany, especially in the cavalry and light infantry services, are those of the little states that feel so friendly to us. Hanoverian hussars drilled our light cavalry in the Peninsula, and Hanoverian officers led our cavalry in many a field. Amongst the best horse-soldiers we had were the heavy Germans, whose gigantic forms were stretched on every battle-field of the Peninsula where a cavalry charge was possible. We have a striking instance in the cause of the Foreign Enlistment Act of how useful alien troops may be in a service for which they have sympathy. We lost the far-famed field of Fontenoy by the bravery of the Irish brigades in the French service. It was English policy in those days to allow the Irish Roman Catholics to enter the French army, it was an escape for the adventurous discontent of the day in that discontented country; but at Fontenoy, when the armies of France were beaten, the Irish brigade was ordered to cover the retreat, they, instead of so doing, charged the

victorious army with such impetuosity and heroism, that France snatched a victory from defeat by the gallant, but erring men, to whom she gave a refuge. Our Foreign Enlistment Act followed that fatal proof of the impolicy of giving to France, or any other country, energies we might employ, and sympathies which we might at least endeavour to reclaim. Let us, by all means, instructed by such incidents, have a legion bearing the name of every oppressed nationality in Europe, and of every nation also that sympathises with a war against the grand supporter of the tyrannies of the world.

We are astonished that in our emergencies the army of the East India Company is not thought of. Had we the irregular cavalry of such men as Colonel Christie and Major Jacobs in the Crimea, much alarm and painful watching would have been spared to our brave infantry, as, weary from the trenches, they often sought repose in vain. Egypt, some time ago, refused the passage of British troops to India, by way of the Isthmus of Suez, and with reason; but Egypt is an ally, and can hardly refuse the passage of native troops from India, to the assistance of the Porte, of which the pasha is a vassal. Here, at least, padishaw and pasha might agree, and, if confidence towards the Western powers exist, the progress of a Bombay contingency ought to be facilitated. Russia affects to sneer at the sepoy, but the troops who conquered Moodkee, Ferozashoosha, and Sobraon, would not recede before the serfs of the czar, although rack, Greek masses, and imperial benedictions intoxicated their zeal.

Let us have good troops from every quarter; the example of our own gallant men will not fail to infect with noble aspirations all hearts capable of manly and martial fire.

These two measures were the more important as the vote for the increase of the army for 1855 did not exceed 36,000 men. It seems extraordinary that the government and the country could have been satisfied with a numerical force of native regular troops exceeding that of 1854 by only 36,000 men.

The government made various efforts to improve the organisation of the army during the latter part of 1854. Several camps were formed, in which to give the troops a knowledge of camp life, and prepare them for the contingencies of war. Two separate corps were originated, especially calculated to relieve the soldiers from the labour of road and trench making, and carrying, which so much added to their fatigues and illness, and impeded to so great a degree the progress of the siege of Sebastopol. The two corps intended for this important object were the Army-works Corps and the Land-transport. There existed in the war with France a body called "the Royal Military Artificers," who were of great use,

but these were ultimately absorbed in "the Sappers and Miners,"—a very valuable portion of the British army, which ought to have been much increased previous to the war, and immediately after it had begun. The army in the Crimea suffered from a deficiency of intelligent auxiliaries, such as the proposed corps would supply; for, at the beginning of the war, the whole force of sappers and miners amounted to no more than 3000 men, and only a third of this body could be spared for service in the expedition to the East. The land-transport corps, although one of the government measures of 1854, was not organised and made effectual until long after, when Colonel M'Murdo brought it into order and efficacy. Its utility at the seat of war was soon made manifest—the troops received supplies with more regularity, and pure water, one of the most painful deficiencies in the camp, was made plentiful by its services.

The army-works corps, although not organised and in use until a later period, was so obviously a necessity at the close of 1854, that the attention of the government and public was strongly directed to the desirableness of its formation. It was much discussed, the chief difficulty appearing to be that men could not be engaged to serve in it without a rate of wages so much larger than that given to the soldiers as to excite the jealousy, and possibly insubordination, of the latter. Such was eventually the case, so far as murmuring evinced it,—the sappers and miners protesting that the enlargement of their corps, due promotion, and fair wages, would have rendered any auxiliary service unnecessary. The government thought otherwise, and Mr. Sidney Herbert, in a speech delivered in the House of Commons, July 26, 1855, presented the following picture of the awkwardness and helplessness of the English soldier, and afforded "the house" and the country his views of the philosophy of this assumed fact:—"In England you have the highest degree of civilisation to be found in the world. As a matter of course, you have the minutest subdivision of labour; and, from the smallness of the country and the close proximity of different places, you have the most rapid communication between your cities and towns. What is the result? Why, that the English peasant never does anything for himself, as is the case in less advanced states of society. His house is provided for him, and so is his dress and everything else he requires, except in the case of the most remote districts of the empire, where a few of the peasantry may be found who build their own cabins and make their own clothes, shoes, and other articles in a primitive manner. The great subdivision of labour consequent on high civilisation offers such facilities for every man

getting everything done for him, that he does not know how to turn if he is thrown upon his own resources, and left to shift for himself. I recollect an honourable friend of mine opposite handing me last autumn a letter with suggestions relating to the clothing of the army to be sent to the Crimea, which I adopted without loss of time; and that letter concluded with a remarkable sentence of warning, to the effect that when I had done all the things that he recommended they would be almost valueless, for the men must suffer through not knowing how to help themselves."

There is much exaggeration in these statements, and the motive of making them was obviously to excuse, in an indirect way, the incompetency of the staff of the army, and to throw all the blame upon the peculiar social character and original condition of the men who constituted the British soldiery. Why not make the division of labour to which the men had been accustomed in civil life subservient to their military efficiency? There were in the ranks of all the regiments good carpenters, joiners, cabinet-makers, masons, bricklayers, painters, cutlers, tailors, shoe-makers, smiths, workers in various metals, grooms, servants, farm-labourers, "navvies," sailors, and almost every other conceivable trade and avocation to which poor working men belong. Had these men been organised and set to work, huts could have been erected, tents repaired, apparel set in order, roads made, provisions cooked, and everything else done which was requisite for an army, as far as their numbers admitted of any work being done. The troops were too few for the task assigned to them, there was no organisation to make the most of their handiness and willingness to labour, and no adequate intellectual power at head-quarters to devise anything, or even to rearrange anything which fell out of the usual system of routine. These causes, and not those which Mr. Herbert assigned, accounted for the condition of disaster in which the army was at the close of 1854. The peculiar civilisation to which Mr. Herbert attributes the incapacity of the men to help themselves aided their adaptation to soldiering, and made them more capable of taking care of themselves under proper direction and management. Mr. Herbert was always exceedingly plausible and specious in his military notions, but seldom either philosophical or accurate; the *non causa pro causa* pervaded all his statements concerning the origin of the Crimean disasters, and the remedies to be applied.

The employment of ordinary workmen as auxiliaries to the troops was, however, a good idea; for, in this way, assistance could be obtained from numbers who, willing to go out under civil superintendence, would not enlist

in the sappers and miners, nor otherwise subject themselves to military control. It is difficult to say with whom first the project originated; early in the campaign the *Times* and other London morning journals were made the media of suggestions from civil engineers, and even military men to this effect. One of these letters made considerable impression: the writer thus addressed the public:—"If, in the first investment of Sebastopol, we had sent out a strong and efficient band, composed of railway navigators and Cornish and Lancashire miners, with a complete establishment of barrows, planks, and tools, as well as an experienced gang of well-sinkers and borers, our brave soldiers would have been relieved of a great portion of their harassing duties, and would have been spared the sufferings of thirst, hunger, &c. Such a band, to be effective, must be entirely independent of military discipline, excepting so far as may regard perfect co-operation, but should be conducted by a civil engineer-in-chief, who would receive his instructions from the chief in command of the military—the engineer-in-chief being provided, of course, with proper assistants, as well as a sufficient number of subordinates. The men should be under the immediate control of their own chiefs and heads of gangs, and their own contractor's engineers, as they are called. They should be accompanied by travelling workshops and artisans for making and repairing tools, boring and blasting apparatus, and one or more compact portable high-pressure engines for general purposes, but more particularly for raising water. In proportioning the numbers of such a band to attend upon the regular army, especial regard may be had to the fact that each of those men would do with ease the usual work of three soldiers on fatigue-duty."

The raising and organisation of the army-works corps was committed to Sir Joseph Paxton, who had originated the plan of erecting the Crystal Palace. In a speech delivered by him in the House of Commons, March 3, 1856, he threw considerable light on the difficulties which were encountered in the formation of the body, and he depicted its gradual improvement and ultimate utility. The following extracts from his speech will place these matters with sufficient fulness and clearness before the reader:—"When the corps was first contemplated, the question was not whether the government could induce the particular men who now composed it to proceed to the Crimea, but whether they could get any men at all to go. There not being sufficient sappers and miners to build hospitals, construct roads and bridges, and do the general mechanical work of the camp, what he, acting for the government, had to set about in the first

instance, was to raise a body of men competent for such duties, to officer it, and to dispatch it expeditiously to the seat of war. The first thousand men sent out were not as scrupulously selected, nor as well trained as could have been wished, and a little confusion occurred when they landed; but the second, third, and fourth contingents were carefully chosen and excellently disciplined; and the whole corps was now conducting itself with exemplary propriety. . . . I had no little difficulty in inducing a gentleman of first-class acquirements to go out for merely as much money as he would have been sure to earn if he had remained at home. . . . Sappers and miners might have been in some respects preferable; but it would have taken a year to organise such a force, and the new corps was required in four weeks. The officers and men were the best of the kind that could be procured, and the 'navvies' were the most powerful of their athletic class. With regard to expense, taking all circumstances fairly into consideration, this was the cheapest corps ever raised. The men were one and all in condition at the time they were embodied; they did not require to be drilled and instructed for years; they were all thoroughly conversant with their respective trades, and within three months of their return to this country they might be disbanded and completely got rid of. The best test of efficiency was perhaps the following:—'The commissary-general, seeing how admirably the army-works corps did its business, applied to the war-minister for a body of men to be organised on similar principles for the service of the commissariat department.'

In these notices events are anticipated; but as the discussions in the winter of 1854 originated these plans and movements, and as by relating them here much matter is disposed of which would encumber the narrative of the siege, it seemed judicious to present these transactions in the history of this particular juncture.

Probably the most important movement at home auxiliary to the operations in the Crimea, was the preparation for making a railway from Balaklava to the camp before Sebastopol. This idea originated with Mr. Peto, the celebrated railway contractor; and as "the army-works corps" arose out of the railway undertaking, Mr. Peto may be fairly considered as the parent of both accessories to the progress of the siege. He suggested to the government the feasibility of such an undertaking, and patriotically offered to perform it without any profit to himself, merely sending to the government the bills which in the course of the operation should be sent to him. The government accepted the proposal. Perhaps they were influenced in doing so by the joy with which

the public received the idea, which seemed to promise some speedy relief,—for the general uneasiness and dissatisfaction with government, commanders, officials, and contractors, were very great. The chief representative of public opinion in England thus referred to the subject, producing a still more decided desire among the people to see Mr. Peto's plan carried at once into execution:—

"How are we to spare our men, and make them go as far as possible? How are we to make one Englishman count for half-a-dozen Russians? There ought to be no difficulty as to the reply. Our vast superiority in mechanical art is unquestionable. The Russians are but imitators, ever on the watch to pick up the inventions of their neighbours, and labouring under the want of a mechanical genius even where they copy in the most servile manner. We possess such means of mechanical production, such forges, laboratories, and workshops as are not to be found in Russia, and we have classes of skilled workmen that no serfs could ever vie with. It is our plain duty, then, to give our soldiers every mechanical assistance that art can procure. When this is the first thing to be done, what will be said of the lamentable fact that the reinforcements now going out, are armed with the common musket instead of the Miniés, which have been found so serviceable, and to which we chiefly owe the vast difference between our casualties and those of the foe on the 5th of November? The superiority of the Minié is no longer a question, and the sole reason why the troops going to war are not armed with it is, that there are none to be got. The Birmingham people, who made such a furious and successful fight last year against the establishment of a government factory for small arms, in order to save their own monopoly, cannot make the new muskets fast enough, and at this terrible crisis of the national fortunes our soldiers are sent out with bad weapons. It is clear that the private manufacturers are not to be trusted where the national honour and safety are concerned, and that we must forthwith make ourselves independent of contractors and their workmen. But there is a great deal more to be done before we have exhausted the assistance of art or of our mechanical superiority. After the sacrifice of much valuable time, many beasts of burden, and even some men, in the transport of heavy articles from Balaklava to the batteries, it is suggested that about nine-tenths might have been saved by the use of iron-rails, a sufficiency of which might have done duty for ballast in a single transport, and which it would not have taken a week to lay down. Five hundred 'navvies' too, with their practical experience and their own tools, would have done the earthworks in less than half the

time the soldiers and marines have been about them, and would have completed the defences of our right flank in time to double the Russian loss and halve our own on the terrible 5th. Much more there is, that almost any respectable contractor would suggest, which would contribute to the great object of sparing the British soldier. At present we are simply competing in numbers and brute force against an enemy who has a superabundance of them, and cares not how much he throws away, so long as he can reckon three of his savages to one British grenadier. We must make that grenadier stand for more than three savages, and the dragoon for more than three Cossacks, if we would win the day, and not suffer a reverse, which may be England's first step in that decline which her enemies have so often predicted."

The public impression was right in this case: the most desirable remedy to the evils of the situation in the Crimea was a railroad from Balaklava to the lines. When the disastrous battle of Balaklava deprived the English of the lower and more circuitous, but more facile, road to the camp, their condition became at once one of hardship. Sir Charles Trevelyan, Secretary to the Treasury, affirmed before the Sebastopol Committee, that the want of a good road to the camp from the landing-place was the severest want of the army. Before Mr. Peto's plan was taken up by the country and the government, several others, which would have been beneficial if carried into operation, were brought forth. One of these was the employment of Turkish porters along the track to the camp over the plateau, each to bear for a short distance a load which for a longer distance would be overbearing, but which the suggester calculated could for short journeys be taken without injury. This, certainly, would have been an improvement upon the existing state of things, but was an inadequate remedy. The porters of Constantinople and Smyrna are able to carry loads which the labourers of western Europe could not sustain, and the enrolment of a corps of Turkish carriers would have been of great relief, provided care was taken of the men, and medical attendance provided; but if neglected, as their countrymen were, and as the British were, the corps would have been broken up in a week by sickness and the inclemency of the weather. With proper attention to their physical wants, the Turks of Asia more particularly could have borne the rigours of the Crimean climate better than any other troops employed there.

Sir Francis Head, whose proceedings in Canada had given him so much notoriety, proposed a plank road, such as they use in British North America. The arguments used by Sir Francis were cogent, and many, after the

perusal of these arguments, blamed Lord Raglan for not having the foresight and capacity of himself to have adopted the like. His lordship had no spare labour, but plenty might have been procured from Constantinople, if the British commander-in-chief had made proper representations to the ambassador there,—who, however, if we may judge from his treatment of General Williams, at Kars, was not likely to act with vigour upon such representations, or himself to devise any scheme for the assistance of the troops. The government having decided on adopting the project of Mr. Peto, he and his partners, Messrs. Brassy and Betts, signed an agreement to have the work accomplished in a certain time. They immediately advertised for men, who volunteered in greater numbers than were required. Many of these had been engaged on the Continent and in America in railway operations, and were likely to endure, therefore, the climate of the Crimea. So vigorously did Messrs. Peto, Brassy, and Betts set to work, that shortly before Christmas the first dispatch of *matériel* and labourers left our shores. The fleet for this convoy consisted of two sailing and seven steam vessels:—

	Tons.	Horse-power.
Lady Alice Lambton, screw steamer.	511	90
Great Northern, ditto	578	90
Earl of Durham, ditto	554	90
Baron von Humboldt, ditto.	420	60
Hesperus, ditto	800	150
Prince of Wales, ditto	627	120
Levant, paddle-steamer.	694	500
Wildfire, clipper sailing ship	457	
Mohawk, ditto	850	

The material was astonishing for its magnitude and variety. It was composed of 1800 tons of rails and fastenings, 6000 sleepers, 600 loads of timber, more than 3000 tons of machinery and other material—such as tools, engines, cranes, trucks, waggons, barrows, blocks, chains, chain-falls, wire, wire-rope, picks, crowbars, capstans, crabs, sawing-machines, forges, hammers, anvils, nails, &c. &c. The way in which this vast tonnage was arranged on shipboard was most ingenious, exhibiting great forethought and practical skill; so that if some of the ships were lost, this would not cause the failure of the enterprise. Five hundred workmen went out, in parties or "squad's," each under the charge of a superintendent and assistant. Each ship had on board a victualling clerk, to attend to the proper distribution of food, and a surgeon to watch the health of the men. Huts were sent with them to shelter them from the climate upon their arrival out, and portable stoves, with patent fuel, large railway-goods' covers, thick and waterproof, and warmly lined, were to serve as protection while the huts were being erected, and to prove otherwise useful. Four experienced nurses, selected from the London hospitals, and several dis-

persers of medicine were to aid the medical men in charge of the health of the party. The apparel and personal furniture of the men was curious but very appropriate. Each was provided with a kit which comprised—One painted bag, one painted suit, three coloured cotton shirts, one red flannel shirt and one white, one flannel belt, one pair of moleskin trowsers; one moleskin vest, lined with serge; one fear-nought slop, one pair of lindsey drawers, two blue cravats, one pair of leggings, one pair of boots, one strap and buckle, one bed and pillow, one pair of mits, one rug and blanket, one pair of blankets, one woollen coat, one pair of long waterproof boots, one pair of fishermen's boots, one pair of grey stockings, and two pounds of tobacco. Of course it was scarcely to be hoped that the expedition would be in time to spare the army much of the sufferings of the winter; but it was hoped that before the cold, raw spring of the Crimea was over some assistance would be rendered; and, at last, the labour and fatigue spared, from which the troops had so unintermittingly suffered. The arrival of this novel squadron at Balaklava, and what "the navvies" did upon their arrival, will be more appropriately narrated in the history of events there.

So prompt and energetic were Messrs Peto and Co., that a second detachment sailed on the 2nd of January, 1855. Upon its departure, Lord Henry Clinton, brother to the Duke of Newcastle, addressed the men on behalf of the minister, and Captain Andrews, director of the North Europe Steam Navigation Company, whose aid was most valuable to the expedition, also addressed them. His speech produced a thrilling effect upon the rough, but not unsusceptible navvies, and evoked repeated cheers, and the most enthusiastic utterances of patriotic devotion. This may be readily conceived from the following specimen of Captain Andrews' admirable address:—"They were going to the aid of our heroic defenders, who had not only to fight—and how they fought the whole world would for ever admiringly testify—but had also to work as field-labourers, and perform many duties for which it could not be expected that soldiers were so well adapted as the skilled and trained men who were now going out to relieve them, and to leave them at full liberty to deal with the enemy as they had done in the dashing rush at the Alma, and the immortal conflict at Inkerman. The future success of the siege operations in the Crimea would depend in a great measure on that expedition. They must expect, and would not be cast down by, hardships and privations. Some of these, perhaps, would not appear so terrible in the Crimea even as they would at home. There would be no public-houses to go to, but there would be

plenty of good substantial refreshments always available when needed; and while that was the case, he had no fear that there would be much grumbling at whatever work might be expected at their hands. They were not like Russian serfs, who dare not call their souls their own, but who must slay or be slain without asking wherefore. They were free Englishmen, volunteers, at perfect liberty to go or stay, just as they pleased, according to their own unbiassed judgment, without the least undue influence, concealment, artifice, or exaggeration used to warp their opinions one way or the other. All that was said or done was to guarantee them good clothing, good food, good pay, a good ship, and a good captain. They had also a good cause—the cause of their country, the cause of justice and fair play. They would bring good hearts to that cause—English hearts, that never recoiled from the obligations of duty, come in what shape they might, whether at the point of the pick or the bayonet; and he doubted not that the British navy would prove himself as great a benefactor in repelling the evils of barbarism abroad, as he had been in extending the blessings of civilisation at home."

Mr. Peto did not neglect the spiritual instruction and care of his workmen; a chaplain and two railway missionaries were sent out, and these received from the objects of their concern every proof of confidence and respect. By the end of January, 1855, all the men and material requisite, with some unnoticeable exceptions, were sent out. Few men deserved better of their country for civil services subserving a great war than Mr. Peto. He incurred much anxiety and labour, and, although guaranteed against loss by the government, much personal expense. He was obliged to give up his seat in parliament, an honour of which he was justly proud, but which he freely sacrificed on the altar of his country. The constitutional rules against contractors with the government occupying a seat in the commons' house of parliament was deemed applicable in his case, although it was notorious that he incurred loss by the contract personally; the public were not willing to waive the constitutional principle, although they regretted the effect of its action in this case. The government, however, satisfied the national desire to show Mr. Peto some mark of approbation expressive of the grateful sense of his services by his country. A baronetcy was conferred upon him—a reward to which men of the highest merits might with ambition aspire.

Such were the leading incidents in western Europe affecting the war during the close of 1854. That year closed in England gloomily as to the immediate prospects of the great conflict to which the nation was committed; but the

heart of the people did not quail. They mourned their gallant men-of-arms who slept in Russian graves, or on the pestilential shores of Bulgaria, or in the plague-pits of Scutari, but they were resolved to contend until victory crowned their efforts. The people of England presented at this juncture a most peculiar spectacle to Europe, manifesting the most remarkable practical aptitude, yet possessing an army every department of the government of which was disorganised; showing the most indomitable national will, and yet unable to rectify the abuses of their own military system, and approaching every reform with vacillation, uncertainty, and irresolution; exhibiting to all nations the most extensive and profound experience in constitutional government, and yet unable to ascertain in what department of the administration authority existed to control or direct the various operations of war; portraying the most noble public spirit and public sympathy, yet tolerating a political and administrative system by which the bravest of their brave were permitted to die like dogs under the very beards of an enemy they had so often vanquished, and on a field of conflict where they had contended like gods. The government of the country was actually ignorant of the real state of affairs in Lord Raglan's army. The commander-in-chief of that army either partook of this ignorance, or connived at the suppression of intelligence; while the newspaper press spread the real facts before the nation, and afforded the government the most reliable information it could obtain. Yet that government, and a large party by whom it was supported, abused and hated the press, because its agents were so active, vigilant, patriotic, and faithful;

and by their prompt and reliable communications awakened the country to a proper appreciation of the emergency, and a suitable zeal to meet it. Well might foreigners conceive us to be a most enigmatical and incomprehensible people. As the short, dark days of December, 1854, died away, many mourned in England: widows' weeds were worn—for gallant husbands had perished in the wars; sable suits were numerous in our churches and places of public resort—for brave sons, the children of many solitudes, had sunk beneath the inclement skies of the Crimea, or were stifled by pestilence in the filthy wards and corridors of Scutari. Many of the young and beautiful were widowed who had never worn the bridal robe—their loved and gallant ones died in the struggles of the unequal conflict, and left for them only their fond remembrance and their glory. Tears stained many a manly cheek in England as the old year faded into dimness and distance for ever. Yet there was no repining; the past could not be recalled—

“Seasons and suns return; but when
Shall by-past time come back again?”

The future demanded renewed struggles and fresh sacrifices, and the people were prepared to make them. As the budding tree, checked by ungenial winds, loses not its spring energies, but, conquering the adverse season, asserts its vitality and pushes forth its verdant foliage to perfection; so the nation, chilled, stricken by events so adverse, felt conscious of its power and of its conquering future, with redoubled energy put forth its resources, and displayed its dignity. The heart of the United Kingdom cherished in reference to the war one all-prevailing thought—to perish or to conquer.

CHAPTER LVII.

THE OPENING OF THE YEAR 1855 BEFORE SEBASTOPOL.—THE STATE OF SOUTHERN RUSSIA GENERALLY AS INFLUENCING THE ENERGY OF THE DEFENCE.—TERRIBLE DESTITUTION AND SUFFERING OF THE BRITISH TROOPS.—CONDITION OF THE HOSPITALS IN THE CRIMEA, AND CONDUCT OF THE MEDICAL MEN.

“Blow, blow, thou winter wind,
Thou art not so unkind
As man's ingratitude;
Thy tooth is not so keen
Because thou art not seen,
Although thy breath be rude.
“Freeze, freeze, thou bitter sky,
Thou dost not bite so nigh
As benefits forgot;
Though thou the waters warp,
Thy sting is not so sharp
As bounty's hand unsought.”—SHAKESPEARE.

THE year 1855 opened around Sebastopol in all the gloom and sternness of winter. Both the assailants and defenders felt it; and the sufferings to which the English, and the Russian army of Liprandi, were exposed, were truly terrible. The Russians were not discouraged;

they had received reinforcements despite the state of the roads. Their affairs in Bessarabia and Podolia prospered, in consequence of the diligence of their officers in command there. Troops had been dispatched from these provinces, and were gradually arriving, worn, ill,

and frostbitten; but still able, after a little rest and ease, to do duty, either within the lines or in the field. The conduct of the Austrians in Wallachia and Moldavia on the whole favoured Russian objects. The oppressions perpetrated by the Austrian army upon the Dacian population so disgusted the people with the government and nation which that army represented, that they would have hailed the return of the Russians with satisfaction. This led the people of Bessarabia and Podolia to be content with their masters, and to be indifferent to the success of the allies, which was likely to hand them over, as well as their neighbours, to the Austrian robbers. Incursions were made by the Cossacks into Wallachia and Moldavia, who returned laden with forage and plunder. Letters from Jassy declared that pulks of Cossacks every night crossed the Pruth, and "destroyed, burned, and murdered on the Wallachian territory to their hearts' content." The Austrian troops were ostentatiously ordered to advance upon the Pruth; but a report was circulated that private instructions directed that no interference with the Russians should be offered, and facts bore out the report. In the second article of the treaty between the kasir and the sultan, "His Majesty the Emperor of Austria engages to defend the frontier of the said (Danubian) principalities against any return of the Russian forces, and the Austrian troops shall for this purpose occupy the positions necessary for guaranteeing these principalities against any attack." Thus the honour of Austria was seriously compromised in permitting these razzias. At the beginning of January the commission for regulating the affairs of the two provinces was to have been formed at Jassy, Baron Edward Bach representing Austria, and Dervish Pasha representing the Porte; England and France seemed in no hurry about appointing representatives to the commission, and nothing was done. The Austrians, therefore, continued to grind down the people to the dust,—the English consuls alone offering any opposition, the French consuls rather conniving at their proceedings. This state of things left the chiefs of Southern Russia at ease for their frontiers, and permitted them during December to have troops dispatched so as to arrive at Sebastopol in January, and enable Menschikoff, with increased numbers, to resist the besiegers. The *Soldaten Freund*, which professed to derive its information from Russian sources, related that 30,000 foot and 18,000 horse, from various garrisons in Southern Russia, would be able to reach Sebastopol at various dates up to the 3rd of January, and related that all the great steppe stations in Southern Russia had been filled with corn; while vast herds of horned cattle were being driven from Volhynia and Podolia towards the

theatre of war. The same authority stated that a new plan of defence was to be taken; that twenty-twoships were to be completely equipped in the harbour for a sudden swoop upon such of the allied ships as might remain,—Menschikoff feeling assured that the fleets would never remain through the months of January and February. This assurance was strengthened by the fact of the English sailing ships having been nearly all sent away during the latter part of 1854. Letters from Odessa received in London informed their recipients as follows:—"The Emperor Nicholas is daily expected in the Crimea. The garrison of Odessa at present consists of 30,000 men belonging to the 3rd army corps, which has recently marched along the Dniester; the 2nd corps, under General Panintine, having moved forward towards Bessarabia. General Offenbergh, hitherto commander of the Grenadier division of the Imperial Guard, will probably succeed Osten-Sacken as commander of the 3rd army corps. The 2nd cavalry or Dragoon corps is encamped between the Dniester and the Pruth. Its commander, the general of cavalry, Schabelsky, has his head-quarters at Odessa. Up to the 3rd, Eupatoria was shut in by the cavalry division under Lieutenant-general Korff."

Thus Russia was prepared to open the new year with courage, and to spread her eagles above Sebastopol in defiance of her foes. Meanwhile the condition of those foes was terrible; the greater severity of the weather in January intensified their sufferings. The French had managed to dig chambers in the earth, and roof them with waterproof tent covers; they had also stone grates and iron stoves; and the Christmas present of the emperor, of wine, brandy, and tobacco, made them grateful for his care, and as comfortable in their quarters as camp life in such a climate would admit. The British were all but comfortless—supported only by their heroism, sense of duty, and the knowledge that the brave old country at home sympathised with them. Mr. Emerson portrays the state of the English on New-year's Day in these energetic terms, comprehending in a limited compass their whole case:—"Frozen to death in the trenches! Not one, but many. Stricken down by starvation, cold, and disease,—three thousand miles from home,—a remorseless enemy in the front thirsting for their blood,—around them extremest misery and death,—behind them scarcely a prospect of relief! but seven miles from plenty, and yet dying with hunger; but seven miles from warm clothing and medical stores, and yet ragged, frostbitten, and perishing for lack of help! Surely such misery was scarcely ever endured by a great army; surely such enduring courage was never before shown! Wretched death in view, but still obedience and disci-

pline; suffering but not dismay; unmitigated wretchedness, but yet undaunted bravery. The accounts which reached home of the condition of the British army at the opening of the year 1855 were unquestionably exaggerated; but no doubt can exist that there was in them a lamentable amount of fact. The road from Balaklava to the camp was in the most wretched condition, from the constant traffic and heavy rain and snow. By the most strenuous exertions, sufficient rations were conveyed to the front to save the men from actual starvation, though not from acute privation. The horses and mules were fast perishing, and the road was encumbered with hundreds of their carcasses. The crowded harbour of Balaklava was filled with vessels, unable to discharge their cargoes; and on shore a confusion existed among officials almost defying description. The huts which had been sent from England were arriving but slowly, and the authorities had been compelled to appropriate the few which were available as hospitals for the sick, who were daily borne in melancholy procession from the camp. For a time, the few cavalry horses and the private horses of the officers struggled through the almost impassable roads laden with provisions; but by degrees they died off; for days they had no forage, and were picketed in the open air, exposed to the piercing severity of a Crimean winter. The men were ragged and filthy to a degree; and the hospitals at Balaklava and Scutari had not yet benefited by the devoted labours of the lady nurses. The desperate and almost perishing condition of our fine army seemed utterly to stultify the authorities, who might by energy and promptness have alleviated many of the evils. At the very time when deaths were daily occurring through exposure and cold, transports, laden with clothing, and boots and shoes, huts and stores, were bandied about from port to port unable to discharge their cargoes, without proper instructions—the captains uncertain of their destinations, and the officials on land ignorant of the contents of the vessels. So opened the year upon an almost perishing army."

The troops were also much disheartened by the accounts from home of the spirit in which the government persisted in alleging that all their wants were supplied, and the boast that was made of sending them various things unsought and unvalued; while matters essential to their efficiency as soldiers, and almost to their existence, were either never sent out or lost on their way, or wasted, or purloined, or stored up in inaccessible places. Warm clothing was soon distributed, and continued to be so during January; but the troops had much cause for murmuring at the mode of distribution, and the obstructions presented by the

routine of the service. The quartermaster-general, Airey, had his defence thus set forth for him in the pages of the *United Service Magazine*:—"Sir Richard Airey, discharging the duty which really devolved upon him, adopted every measure for facilitating the issue of stores. To show the absurdity of the stories about routine, it will be only necessary to say that the quartermaster-generals of divisions were ordered to attend at Sir Richard's office every day at twelve o'clock; and here they were directed to examine a tabular form, showing at a glance every description of article in store, which they had full authority to take in what quantities and what proportions they thought necessary. Let us say at once there was no difficulty, and absolutely no limitation. Every one was to have whatever he needed and whatever he asked. The orders to Mr. Boyd, the storekeeper at Balaklava, were most positive—that his only business was to issue, and not only to make no demurs, but to ask no questions. If a soldier came for a great-coat, it was to be given to him; if another demanded a blanket, a blanket he was to have. Lord Raglan's instructions literally embodied the scriptural precept—'Give to him that asketh thee, and from him that would borrow, turn not thou away.' The difficulty was, how the various articles required, all at the same moment, and by an uninterrupted succession of applicants, could be got at by the storekeeper, as they were packed in a mass in a small house and open yard which constituted the only store. But as fast as hands could ply they were plucked out and delivered, though, from the same eternal want of land carriage, there was no provision for taking them away; and men who came down to Balaklava with their approved requisitions, and actually received the articles specified, were obliged to go back to the camp empty-handed, because the load was more than they could carry. The mystery of the non-issue of the stores is now explained. Let us admit, for the sake of argument, that everything necessary was heaped up at Balaklava—how was it to be brought to the camp? Birnam wood could not move of itself. Yet, in spite of this obstacle, we find, from the official return, that during the month of December a suit of warm under-clothing was issued to each man, and a blanket to every two men. It is asked why there was no issue of rugs, and the reason is plain—the men would not receive rugs, when, by their approved requisitions, they were entitled to blankets, and the complement of blankets was not yet supplied—or, rather, though supplied, could not be taken away. The statement about the greatcoats is of the same character as the other allegations. It is not true that greatcoats were withheld in compliance with a stand-

ing regulation; Lord Raglan, as we have said before, overruled all regulations. Nothing—no regulation, no order, no authority, was to stand in the way of the issue of the stores; and everybody fully understood that he had only to ask and have, or even go and take. We have now gone over the various charges brought against Sir Richard Airey; and his most bitter assailants must admit, on a review of the facts, that they are without a shadow of foundation. The public and the press can have no object in awarding blame where it is far from being deserved."

The above remarks, taken from the *United Service Magazine*, may have been written by Sir Richard Airey himself, their complexion is so partisan: certainly the testimony of persons familiar with the facts is utterly opposed to the witness borne by the writer of the article. Mr. Russell, writing concerning the state of things (the 3rd of January), especially refers to the state of the men's clothing:—"It snowed all last night incessantly, and this morning the whole of the bleak grey mountains over Balaklava, and of the landscape of valley, undulating hills, rugged ridges, and mountain-tops, was clothed in a sheet of blinding whiteness. The snow lay on the ground to the depth of six or seven inches, and the cold was aggravated by a high wind which blew into one's very bones. If the men were only well clad, this weather would, however, be far more healthy than the wet and storms of rain we have had recently; but, alas! the poor fellows are not properly provided with outer garments to resist the severity of the climate. I cannot conceive much greater hardships than those to which the men in the trenches are subjected, when, at the end of a twelve hours' watch they return half-cramped and frozen to their damp cheerless tents, to find that there is not wood enough to warm their coffee! Our sentries have got an extra greatcoat—a kind of 'grego' with a large hood; all our men who are exposed to night duty should be provided with them. What the men require most are warm long boots to protect the feet and legs. Some few boots of this kind have been served out, and have been found invaluable. The mits are also most serviceable."

On the 8th of January, the same authority affords the following confutation of the advocate of General Airey:—"The arrangements in Balaklava are much better now than they were when I wrote about them some time ago. But let no one at home dream that our troops are in huts, or that they are well clad. It will be weeks ere the huts can be up at the camp. Some have been pitched close to the town for the artillery, and a few suits of warm clothing have been distributed. But hundreds of men have still to go into the trenches at

night with no covering but their greatcoats, and no protection for their feet but their regimental shoes. The trenches are two and three feet deep with mud, snow, and half-frozen slush. Many men when they take off their shoes are unable to get their swollen feet into them again, and they have been seen bare-footed hopping along about the camp, with the thermometer at 20°, and the snow half-a-foot deep on the ground. Our fine patent stores are wretched affairs. They are made of thin sheet iron, which cannot stand our fuel—charcoal. Besides, with charcoal they are mere poison manufactories, and they cannot be left alight in the tents at night. They answer well for drying the men's clothes at day. There are not many of them distributed as yet, however, so that, such as they are, the troops have not the advantage. On this, the 8th day of January, some of the Guards of her majesty Queen Victoria's household brigade are walking about in the snow *without soles to their shoes*. The warm clothing is going up to the front in small detachments. I don't know how the French get on, but I know this, that our people do not get a fair chance for their lives while wintering in the Crimea—at least, up to the date of my letter. Providence has been very good to us. With one great exception, which must have done as much mischief to the enemy as to ourselves, we have had wonderful weather since the expedition landed in the Crimea."

Under date of the 11th, he affords the following confirmation of the opinions we express, and refutation of the special pleader in the *United Service Magazine*:—

"Yesterday the weather changed again; the wind chopped round to the N.E., blowing strongly, and at the same time the thermometer fell rapidly from 40° to 30°, and in the course of this morning it marked 22°, from which it rose to 24°, where it now remains. This degree of cold is however, as usual, accompanied by an intensely dry cutting wind of extreme severity and sharpness, which causes water to freeze rapidly, has arrested the thaw, and has hardened the grounds and roads, cut up very much by cart-wheels and horse-hoofs during the two or three wet days previously, so as to make it difficult and painful to walk upon, and all but impossible to ride over. Within this week large quantities of warm clothing have been distributed, bought up at Constantinople or sent out from England, and, as there is no uniformity of cut, or colour, or material, 'motley is the only wear' of our brave army. It must not, however, be imagined that the supplies sent up are at all equal to the demand, or that there is any large proportion of our men provided with extra greatcoats, or with anything more than their usual outer covering,

and perhaps an extra blanket. The sick in the hospital marquees, out on the bleak plains or upon the hill-tops, suffer severely from the cold, and the snow blows into their very blankets. However, such supplies as the men have had prove of the greatest service, and have, no doubt, saved many lives. Some of the warm coats sent out for the officers are far too small, and I have just heard a pathetic story from a stout Highlander, respecting the defeat of his exertions to get into his much-longed-for and much-wanted garment. There is only one officer in the whole regiment that the largest of the greatcoats will fit, and he is certainly not remarkable for bulk or stature. The men are far more lucky, and their coats are of the most liberal dimensions, however eccentric in cut and device they may be."

As late as January the 19th he testifies:—"Many thousands of fine coats, lined with fur and skins, of long boots, and of gloves, mits, and socks, have been served out to the men; but I know of regimental hospitals in the front where the sick men in wet marquees have now only one blanket to lie upon at this very date, if the word of the regimental surgeons and the evidence of one's eyesight are to be believed. For myself, I must say one of the most melancholy subjects for reflection in the world is the sight of our present army." On the same date, recording the aspect of things a few days before, he thus wrote, with that peculiar mixture of humour and pathos so peculiar to his countrymen, and so characteristic of himself:—"On the 16th the thermometer was at 14° in the morning, and at 10° on the heights over Balaklava. The snow fell all night, and covered the ground to the depth of three feet; but the cold and violent wind drifted it in places to the depth of five or six feet. In the morning 1200 French soldiers came down to Balaklava for shot and shell, and the agility, good spirits, and energy with which they ploughed through the snow were alike admirable. The wind blew almost a gale, and the native horses refused to face it, but our poor fellows came trudging along in the same dreary string, and there was something mournful in the very aspect of the long lines of black dots moving across the vast expanse of glittering snow between Sebastopol and Balaklava. When these dots came up, you saw they had very red noses, and very white faces, and very bleared eyes; and as to their clothes, Falstaff would have thought his famous levy a *corps d'élite* if he could have beheld our gallant soldiery. Many of the officers are as ragged and as reckless in dress. The generals make appeals to their subalterns 'to wear their swords, as there is now no other way of telling them from the men.' It is inexpressibly odd to see Captain Smith

of the — foot, with a pair of red Russian leather boots up to his middle, a cap probably made out of the tops of his holsters, and a white skin coat, tastefully embroidered all down the back with flowers of many-coloured silk, topped by a head-dress *à la* dustman of London, stalking gravely through the mud of Balaklava, intent on the capture of a pot of jam or marmalade. Do you wonder why we are all so fond of jam? Because it is portable and eatable, and is a substitute for butter; and butter is only sent out here in casks and giant crocks, one of which would exhaust the transport resources of a regiment. Captain Smith is much more like his great namesake of the Adelphi, when, in times gone by, he made up for a smuggler-burglar-bandit, than the pride of the High Street of Portsmouth, or than that hero of the Phoenix Park, with golden wings like an angel, before the redness of whose presence little boys and young ladies trembled. All this would be rather facetious and laughable, were not poor Captain Smith a famished wretch with bad chilblains, approximating to frost-bites, a touch of scurvy, and a severe rheumatism. Many of our men have been crippled by the cold, and of our officers, Captain Strong, of the Coldstream Guards, has been obliged to go down on leave, with one foot badly frostbitten. Our men have been seen hobbling about in the trenches and in the camps, barefooted, and yet ankle-deep in snow. They could not get their frozen boots and shoes on their swollen feet."

At last, when the trying month of January was in its fourth week, Mr. Russell bears witness to the efficient distribution of warm clothing:—"Warm clothing is arriving in great quantities, and the remnant of our army will soon be all comfortably clad, or it will be their own faults. The greatcoats, boots, jerseys, and mits furnished by the government to officers and men, are of excellent quality, and the distribution, though late, is most liberal. A fur cloak, a pea-jacket, a fur cap, a pair of boots, two jerseys, two pair of drawers, and two pair of socks, are to be given to each officer, and several of them have received the boon already. Still it is a fact that, at this moment, there is but one hospital marquee in the whole of the second division camp."

It would be easy to quote other authorities to sustain Mr. Russell, such as Mr. Woods, Mr. Layard, Colonel Hamley, Mr. M'Cormick, and various officers and civilians whose word was beyond doubt. It would be needless to pursue this theme further; nothing but wilful ignorance or deliberate misrepresentation could ever lead men to describe the English army as well clothed during the winter of 1854-5 up to the last week in January, or allege that where deficient the fault was their own, the quarter-

master-general's arrangements assuring them such supplies as they would take the trouble to accept.

The sufferings of the soldiers from the severity of the climate would have been great, however well supplied with food, clothing, tents, huts, and every other camp requisite. The French, who were well supplied, lost many men; but to the neglect or incompetency of the officials at home, the commander-in-chief and his staff in the Crimea, and the British ambassador at Constantinople, the heavy losses of January are to be attributed, as well as those of the previous winter months. Lord Raglan assigned to the small army under his command an equal amount of trench-work and siege duty to that undertaken by its allies, whose numbers were so much greater. Long after it became evident that his army was unequal to the toil, he persevered in maintaining the ground he originally occupied, and performing the labour which he originally undertook. His coldness and apparent indifference to the wants of the men left abuses unremedied, and withheld that stimulus from inferior officers that the presence of a commander-in-chief, in whose hands are rewards or punishments, cannot fail to inspire. This is obvious from the testimony of every one who has written about events in the Crimea during that winter, and by the private letters of numerous officers, non-commissioned officers, and soldiers. It is made further manifest by the fact that when, in the more advanced portions of the month of which we now write, his lordship showed some activity and personal superintendence, the effects which followed were of immediate advantage. Mr. Russell, writing on the 18th, says, "Lord Raglan came down to-day to Balaklava. General Airey also came down, and inspected an attempt to prepare sleighs for carrying up shot to the front. Lord Raglan visited Lord Lucan, and went over the cavalry camp, which he had not seen since it was formed here. Lord Raglan gave several orders calculated to promote the comfort of the troops, and his unusual presence among the officers and men has been attended with the best effects, and has stimulated every branch of the service at Balaklava and at the depots." Again, on the 20th, he alludes to that visit of his lordship as producing beneficial results:—"The visit of Lord Raglan to Balaklava last Thursday seems to have had considerable effect in improving the state of the place. Men are at work throwing stones down into the most Curtius-like gulfs in the street. Major Fellowes is now off on his expedition to organise a waggon and transport train at Constantinople or elsewhere."

There can be no doubt that such visits paid earlier to the different departments of the army would have averted many catastrophes. It has

been alleged that Lord Raglan's years and state of health rendered him inadequate to the task imposed upon him. To this the just reply is, that in such case he should never have accepted the command, or, having underrated its requirements, as soon as he discovered it to be beyond his strength or capacity, he ought to have surrendered it.

From all the causes noticed in the foregoing pages, sickness continued to prevail to a frightful extent. The havoc made among the troops was appalling. Two regiments were so disorganised that the relics of them had to be sent away to Malta to be re-formed. Some regiments were reduced to the strength of a single company. The loss of the Guards was so heavy that the recital produced a great shock to the English public, and strengthened its determination to have the causes of such fearful waste of life investigated. On the 5th of November the brigade lost forty per cent. killed and wounded; and there was a considerable loss at the battle of the Alma; but with these exceptions the sacrifice of men by battle was not great. The brigade left England 2500 strong; the reinforcements sent out afterwards amounted to 1500, making a total of 4000 men sent out up to the end of 1854. At the end of January they mustered about 900. In ten weeks the brigade had lost by work, weather, want of food and shelter, and the sickness entailed by all these causes, 1000 men. Reinforcements for the army arrived out in January, as well as in the previous month, but they generally consisted of mere boys—almost children in some instances; and they were, to use the expressive phraseology applied to them in camp, "washed away" by the rains, or "snuffed out" by the excess of labour, or frostbitten. Those poor lads perished in large numbers almost as soon as they landed. At the close of January the British army could not muster more than 23,000 bayonets, although the representations made by the government at home would lead the country to expect that 55,000 men were able to ply the siege or take the field. During seven weeks previous to the 20th of January, 8000 men went down sick and wounded to Balaklava; of these literally none returned. The illness of the men was aggravated by a peculiar languor which unfitted them from helping themselves in the least. A desire for *rest* at all costs and consequences pervaded nearly all the invalids. How dreadful the impression must have been in the camp when such facts as these were entered in the journal of one who witnessed them:—"About a thousand sick were sent away last week. . . . Three ships will sail with cargoes of sick to-morrow. . . . There was a white frost last night. To-day the thermometer is at 42°. The activity of the heads of departments,

which has been recently observable, is becoming more largely and beneficially developed every day. A large number of sick, and, I fear, dying men, were sent into Balaklava to-day on French mule litters and a few of our bāt-horses. They formed one of the most ghastly processions that ever poet imagined. Many of these men were all but dead. With closed eyes, open mouths, and ghastly attenuated faces, they were borne along two and two, the thin stream of breath, visible in the frosty air, alone showing they were still alive. One figure was a horror—a corpse, stone dead, strapped upright in its seat, its legs hanging stiffly down, the eyes staring wide open, the teeth set on the protruding tongue, the head and body nodding with frightful mockery of life at each stride of the mule over the broken road. No doubt the man had died on his way down to the harbour. As the apparition passed, the only remarks the soldiers made were such as this—‘There’s one poor fellow out of pain, any way!’ Another man I saw with the raw flesh and skin hanging from his fingers, the naked bones of which protruded into the cold air, undressed and uncovered. This was a case of frost-bite, I presume. Possibly the hand had been dressed, but the bandages might have dropped off. All the sick in the mule litters seemed alike on the verge of the grave.”

Some of the medical men did not show as humane a disposition as might be expected from their noble profession. A poor marine was taken ill of cholera, and when application was made for his admission to the hospital at Balaklava, the doctor, who was in bed, would not rise, alleging that it was contrary to rule for a marine to be admitted there. It was urged that the man would die, but this did not shake the resolution of the medical man in favour of routine. Lord Raglan issued some heavy censures upon one or two medical delinquents, but his lordship could not be prevailed upon to follow the matter up—he was indisposed to carry either his severity or interference “too far.”

The want of medical stores and medicine continued throughout January, as in the earlier months, to aggravate the sufferings of the sick, and impede the labour of those zealous physicians whose professional pride and personal generosity led them to make every possible exertion for the men. Mr. Russell relates two shocking instances to this effect, and these were but specimens of many. The correspondents of the *Morning Herald* and *Morning Chronicle* added other instances equally painful in proof of the allegation.

Jan. 25.

“A circumstance occurred in Balaklava to-day which I will state for the calm considera-

tion of the public at home without one single word of comment. The *Charity*, an iron screw steamer, is at present in harbour for the reception of sick British soldiers, who are under the charge of a British medical officer. That officer went on shore to-day and made an application to the officer in charge of the government stoves for two or three to put on board the ship to warm the men. ‘Three of my men,’ said he, ‘died last night from choleraic symptoms, brought on in their present state from the extreme cold of the ship; and I fear more will follow them from the same cause.’—‘Oh,’ said the guardian of the stoves, ‘you must make your requisition in due form, send it up to head-quarters, and get it signed properly, and returned, and then I will let you have the stoves.’—‘But my men may die meantime.’—‘I can’t help that, I must have the requisition.’—‘It is my firm belief that there are men now in a dangerous state whom another night will certainly kill.’—‘I really can do nothing; I must have a requisition properly signed before I can give one of these stoves away.’—‘For God’s sake, then, lend me some; I’ll be responsible for their safety.’—‘I really can do nothing of the kind.’—‘But, consider, this requisition will take time to be filled up and signed, and meantime these poor fellows will go.’—‘I cannot help that.’—‘I’ll be responsible for anything you do.’—‘Oh, no, that can’t be done!’—‘Will a requisition signed by the P. M. O. of this place be of any use?’—‘No.’—‘Will it answer if he takes on himself the responsibility?’—‘Certainly not.’ The surgeon went off in sorrow and disgust. Such are the ‘rules’ of the service in the hands of incapable and callous men.

“Here is a special fact for Dr. Smith, the head of the British army medical department. A surgeon of a regiment stationed on the cliffs above Balaklava, who has about forty sick out of two hundred men, has been applying to the ‘authorities’ in the town for the last three weeks for medicines, all simple and essential, and cannot get one of them. The list he sent in was returned with the observation, ‘We have none of these medicines in store.’ To-day this poor surgeon, too, came down with his last appeal:—‘Do, I beg of you, give me any medicine you have for diarrhoea.’—‘We haven’t any.’—‘Anything you may have, I’ll take.’—‘We haven’t any.’—‘Have you any medicine for fever you could give? anything you can let me have, I’ll take.’—‘We haven’t any.’—‘I have a good many cases of rheumatism among my men, can you let me have any medicines for them?’—‘We haven’t any.’ Thus, for fever, rheumatism, and diarrhoea, the most prevalent complaints of the army, there were no specifics whatever, and the surgeon returned up the hill-side with the

bitter reflection that he could give no aid to the unfortunate men under his care. Can any one of the '*facts*' I have stated be denied? Certainly not by any one who regards the truth, and who is not a shameless utterer of falsehoods. Dr. Smith can prove, no doubt, that there are granaries full of the finest and costliest drugs and medicines for fever, rheumatism, and diarrhoea at Scutari, but the knowledge that they are there little avails poor fellows dying here for want of them."

The influence of Dr. Smith over the unhappy state of the hospitals and the dispensaries connected with them was dwelt upon with stern severity by Mr. Macdonald, the *Times'* commissioner at Scutari, so frequently referred to in previous chapters:—"For the defective state of the military hospitals in the East, the chief blame must be attached to Dr. Andrew Smith, the director-general. He it was who brought his department into a position which deprived it of all that authority and force requisite for its efficiency. The servile submissiveness of its *régime* has prevented its chief officers from protesting with the requisite energy when its free action was impeded or interfered with. While every other department of the service victimised it, the stringent rule of the director-general had destroyed all zeal and independence of spirit in the mass of his subordinates; and when the hour of trial came, it was found that neither in the Crimea nor at Scutari had the principal medical officers the power or the courage to secure from other quarters the co-operation and assistance which were indispensable to them. They were thrown over by the naval authorities, by the quartermaster-general's people, by the commander-in-chief, by, in fact, everybody with whom they came in contact, or upon whom they were dependent; and to complete their humiliation, and the weight of responsibility resting on their chief, they would have submitted in silence and drawn a veil over the horrors of the military hospitals, had these not been disclosed by the press. Such are the miserable results of having at the head of an important department a man whose only qualifications for that office are blind subserviency to his superiors, and a stern terrorism over those placed under his own control."

The government at home, and their abettors in parliament and in the press, made the great storm on the 14th of November an excuse for every neglect. Whatever was deficient was said to be so because the supplies were lost in the *Prince*, or some other ship of the transport squadron. We have shown in previous chapters that the misgovernment which prevailed at Balaklava in connection with the Admiralty appointments, and the contradictory and vacillating procedure of the military head-quarters occasioned this loss. The admirals ought not

to have been exempted from blame; had they studied the probability of such gales in the situation of the ships, and issued orders to the transports accordingly, they might have been better prepared for such an emergency. Admiral Dundas persisted in declining all responsibility connected with the transports, in spite of the urgent solicitations of the Duke of Newcastle. The following extract describes the atmospheric phenomena which precede the tempests of these latitudes:—"The law of storms as defined by the researches of Reid, Piddington, Maury, and Redfield, teaches us that north of the equator rotatory storms commence with a high barometer and light airs from the southward, succeeded immediately by a rapid fall of the mercury, the gale commencing at S.S.E., or S. by E., veering to S.S.W. and W., and ending at W.N.W. or N.W., while the path of the centre of the storm moves from the westward in an easterly direction. Hence it was clear that the greatest danger to our fleets arose from the certainty that the most furious part of the gale would find the vessels anchored on a lee shore, with bad holding-ground. What, then, should have been done? Undoubtedly, every ship should have been signalled to put to sea as soon as the fall in the barometer and the veering of the wind indicated that a severe rotatory gale had commenced. The ignorance which prevented this, or the apathy which omitted it, has led to our dreadful losses, and to the sufferings our brave troops are now enduring from the loss of their winter clothing and other necessities and comforts in the *Prince*."

When the wretched state of the harbour at Balaklava and its management were agitated in the press and the parliament at home, as one of the chief causes of the destitution of the troops throughout January, as well as earlier, the arguments of the press and the inquiries of independent members of parliament were met with the most mendacious statements, "cooked," as the coarse phrase current expresses it, to meet such discussions and inquiries, so as to keep the public quiet. The following is a specimen of this mode of procedure in the House of Commons, February 5:—

"Mr. Deedes said that, seeing the honourable and gallant admiral who was a member of the Board of Admiralty in his place, he begged to ask him a question of which he had not given notice. It having been stated, not only by private channels of communication, but in the public journals, that very great confusion and mismanagement existed at Balaklava among the shipping, and that no arrangements were made for the landing of the cargoes when the ship arrived there, he wished to ask the honourable and gallant admiral whether any information had been received by the Admi-

rality on the subject, and whether the case was as stated; and, if so, whether any and what steps had been taken to put an end to such a state of things?

“Admiral Berkeley said, the honourable gentlemen having intimated to him his intention to put the question which he had just done, he had prepared himself with the means of answering it, he hoped, satisfactorily. He would first read an extract of a letter from Admiral Sir E. Lyons, dated the 13th of January, 1855. That gallant admiral in the course of his letter said:—‘But to revert to the inside of the harbour, the responsibility for the first three weeks rests with me, for I had the superintendence, and all I will say of myself is, that I naturally did my best to promote the success of an object I had so much at heart; but, of my assistants, I may say that no man ever had a more able one than I had in Captain Mends for the details of landing the cargoes, or a more efficient one than I had in Captain Heath for all the duties relating to the ingress, berthing, and egress of the shipping. Thanks, in a great measure, to the zeal and foresight of Rear-admiral Stewart, boats were not wanting, and their lordships may be assured that the best use was made of them by Captains Dacres and Heath and Commander Powell, whose praiseworthy conduct has won for them the admiration of the army and the goodwill of all. I observe that it is alleged that quantities of hay and firewood were allowed to float about the harbour when both were in much request, and I freely admit it must have appeared so to passers-by; but the truth is, the hay had become so saturated with salt water in the late hurricane that the animals would not eat the innermost part of the trusses; the wood was only fit for firewood, and it was considered that the best means of preventing its being pilfered was to let it float out of the reach of the strand until measures could be taken for collecting and distributing it.’ The next extract was also from a letter by Admiral Sir E. Lyons to the secretary of the Admiralty, dated the 22nd of January, off Sebastopol. ‘With reference to your letter of the 18th ult., addressed to my predecessor, and to mine of the 13th inst. in reply thereto, I beg to transmit some documents which I have received from Captain Heath, of the *Sanspareil*, by which their lordships will observe that many of the accounts of the confusion in Balaklava harbour, if not altogether untrue, are at least greatly exaggerated.’ He would now read the answer returned by thirty-six masters of transports to Captain Heath:—

Balaklava Harbour, Jan. 13th.

“SIR,—It is with much pleasure that on the eve of your departure we bear testimony to your unceasing endeavours to regulate the

berthing and insure the safety of the ships in this harbour. We are, &c., (signed by thirty-six masters of transports).’

He (Admiral Berkeley) had several other answers to the statements referred to by the honourable gentleman, couched in equally strong language. The following was an extract from a report of Captain Robert Methden, of the steam transport *Columbo*, of 1800 tons:—‘The gale threw everything into confusion; but by great exertions a re-arrangement was effected, and since then the most watchful care of the shipping, in all cases which seemed to require interference, seems to me to have been afforded. The pilotage of the port, under Captain Powell, requiring the largest ships to be handled under critical circumstances, has caused me repeatedly to express my most unqualified admiration. This duty has called for incessant labour, and it has been bestowed with the most untiring zeal, temper, and cheerfulness, and with an ability not to be surpassed by the most practised hand. On such occasions, when Captain Powell could not himself attend, or when two heads were better than one, I observed that Captain Heath was himself always present. For some weeks past (say four) large bollards have been placed for securing moorings of a light description; and in other respects, having three times entered and departed from this port, I have to state that every application for assistance to either Captain Heath or Captain Powell has been responded to, and I consider the present state of the harbour a marvel of exact arrangement (*laughter*), and the amount of accommodation afforded only to be exemplified by one of the crowded docks of Liverpool.’ (*Ironical cheers.*)”

Admiral Lyons is a politic man, and his replies were free from the glaring attempts to please the Admiralty, which characterised the letter of Captain Methden, which was heartily laughed at in the house and “out of doors.” But by whom did Admiral Lyons fear that the timber would be purloined? The Greeks had been driven out of Balaklava, and the only persons who could have stolen the timber were those who ought to have received it—the sailors and marines serving on shore, and the cavalry while quartered near Balaklava. The trusses of hay which were soaked with salt water could have been easily saved; horses are fond of salt, and would not have refused the hay when dried, because of its having the deposit of salt left by the evaporated water; at all events, horses that devoured their own pack saddles and their neighbours’ tails would not have been so nice about hay with a deposit of salt! Had Admiral Lyons attended to these matters while he was amusing himself in the camp with amateur soldiering, or enjoying the

society of Lord Raglan, he would have better served his country. The foregoing pages do justice to the professional skill and personal courage of the gallant sailor, of whom his country has been proud, and by which he has been sufficiently rewarded; but the toadyism of the admiral, now Lord Lyons, as shown in such letters and despatches, and subsequently before the court of inquiry in Chelsea Hospital, seriously lowers the proud feelings with which the country regarded him. It is scarcely necessary to add that the representations of the Admiralty and Captain Methden did not comport with fact. Improvements at Balaklava did take place during January, but it was still a scene of wretched mismanagement. The man who was most fitted to infuse order into the chaos on shore and afloat, Captain Christie, was asspersed, persecuted, superseded, and ultimately died of a broken heart.

The testimony of Mr. Woods is very conclusive as to the state of the harbour of Balaklava, and it places Admirals Lyons and Berkeley in no favourable light in reference to the above statements:—"A depot for provisions began to be formed at head-quarters when the necessity for such an accommodation had almost ceased to exist; and an immense number of idle vagabonds, the refuse of the Levant, were hired by Lord Stratford de Redcliffe at three shillings and sixpence a-day and their rations, and sent up to make roads. The harbour of Balaklava which, soon after the gale of the 14th of November, had been placed under the charge of Captain G. L. Heath, had been in a most frightful state all through the winter. For a long period none knew who was harbour-master, and very few could be brought to believe that such a functionary existed at all. Vessels came and went as they liked, and anchored where they pleased. On one occasion, when a ship was required to change her berth, she was obliged to slip her cable, as from the numbers of other vessels that had anchored across, it was impossible to get it up. The 'higgledy piggledy' system was perfect: everything was at once in the way and out of the way. No guards were mounted over powder-ships, and two fires occurred on board such vessels laden with ammunition. On one of these occasions, when an inquiry was instituted, it was found that the master and many of the crew were constantly drunk, that lights and fires were kept up all night, and even that firearms had been discharged in the cabins. In other cases, powder-ships were moored side by side with private ships sent up by Maltese and Greeks, on which spirits were sold at all hours of the night. No attempt was even made to separate such floating magazines from ordinary ships; in fact, all did as they liked and left others to

do the same. When at length the transport captains began to murmur, and the accounts of the frightful state of the harbour reached England, Captain Heath at last appeared as harbour-master, and tried to induce the masters of transports to sign a paper to the effect that all was carried on with order and regularity—but the attempt was a signal failure. It was then that Admiral Boxer came up as senior officer, and toiling night and day soon showed, by the altered appearance of the place, what a little well-directed energy could effect."

The fear of incurring responsibility deterred good and intelligent men from attempting anything in the harbour or the camp. The private correspondents and toadies of the Admiralty, the Horse Guards, the medical authorities in London, or the government, would at once have fallen upon them, and they would have experienced the fate of Captain Christie. Returning to the condition of the sick on the plateau we see this painfully exemplified.

Mr. Layard, in a speech delivered in the House of Commons, thus accounted for the neglect and incompetency which prevailed:—"I will tell the house where the mischief lies. There is a general fear of taking any responsibility; every one is afraid to act with vigour; and, with the permission of the house, I will illustrate my position. One day, as I was going up to the lines of the army, in company with a gallant officer, we met a number of carts containing men suffering from disease and wounds, some of whom, I believe, died on the passage down; and with that convoy there were only two or three guards, privates of the line. I was astounded that there was no medical man in charge of so many wounded and sick men, and I went to Lord Raglan, and he was brought to see that convoy. Lord Raglan expressed that indignation which every honourable and humane man must feel at such a circumstance, and he instituted an inquiry. It was found that the medical men and officers had neglected their duty; and Lord Raglan published a general order, in which he stated that the conduct of certain persons had been disgraceful; but he added, that he would spare their feelings, and not mention their names. I can honour and reverence these feelings in a man, but I cannot honour or reverence such feelings in a general."

A medical man, resident in London, who had just returned from the East, made the following comments upon the dietary of the army in January and the winter generally, as one of the most potent causes of the physical deterioration of the troops:—"For months past the camp and hospitals of the East furnish us daily with long lists of deaths, occasioned by dysentery and diarrhoea, and, indeed, up to this hour, no one seems to inquire into the real

cause of this sad calamity. Has a medical board been held and strict inquiry made regarding the remedies used in our hospitals in the East, and how far they have succeeded or failed? During my visit to the Lazaretto in Sebastopol, I learnt that the cases of dysentery and diarrhoea, though malignant in their nature, produced only three fatal cases out of twenty. The doses administered were most powerful, and contained chiefly the tincture of catechu in a mixture of cretal, spirit ætheris chlorici and tinct. opii. I have, however, here to observe that the opinion of the local medical staff of Sebastopol was divided as regards the last-named narcotic. Oil of peppermint, rhubarb, and camphor, were used with much caution. The application of hot baths was found to relax the patient too much, and hot tiles were used instead. The temperature of all the wards was kept up to a degree fixed by the board of surgeons, held once or sometimes twice a-week at the lazaretto; the rooms were well ventilated, the charcoal fires at each end consumed the foul air, and the floors were frequently sprinkled with chloride of lime and vinegar. On inquiry, several of the medical gentlemen assured me that the chief cause of the dysentery and diarrhoea was not so much arising from the weather, but from their half-baked sour bread, mouldy biscuits, salt meat, bacon, onions, &c. They found the bread and salt meat 'relaxing,' the biscuits creating maggots, and even rice, arrowroot, sago, &c., served up 'watery,' disordering the system. Each medical gentleman had to lay (once a-week) before the weekly board a minute account of each individual case.—Our army in the East is still supported by salted provision and biscuits! No human frame can stand the present diet, as served, for more than four months past, to the defenders of the right; and I repeat again, that had our troops been supplied with fresh beef or mutton and thick boiled rice only twice a-week, the lives of thousands would have been saved; biscuits would only occasionally be wanted, and rum given without danger. The price of oxen and sheep for hundreds of miles around the Crimea is even now, in time of war, twenty per cent. to thirty per cent. cheaper than in England, and fifteen per cent. to twenty-five per cent. lower for slaughtered meat than the price charged by the contractors to our government for salted loins of pork. The sheepskins would supply our poor soldiers with excellent blankets, the oxhides afford a good shelter for our ill-provided horses, a flooring of the pit-like tent, or a waterproof covering for provisions, ammunition, &c., stored in the open air."

Others, acquainted with the state of the camp and of the army, attributed much of the prevailing sickness to the use of alcohol. Mr.

McCormick, of New York, thus informs his fellow-citizens on this head:—"If I were to attempt an enumeration of the causes tending to the great mortality among the English troops, I should unhesitatingly give prominence to one point which appears to have been generally overlooked—viz., intemperance. In addition to three rations of rum of very high proof, allowed the men every day, they were frequently known to drink two or three or more glasses on their visits to Balaklava. I saw very many poor fellows so much overcome by excessive drinking that they could not walk erect.—I shall not readily forget a scene which came to my notice as I happened to be walking a little way out of the village on one of the coldest days of the season. A careless Tartar driver of a commissariat pony had chanced to drop a keg of rum by the road-side, and passed on without noticing it. It was quickly seized upon by a passing company, composed chiefly of Irishmen, who speedily rolled it to a dry spot, ended it up, forced out the bung, and began to fill their tin drinking cups, and imbibe the raw liquid as a Knickerbocker would well-iced Croton under an August sun. I asked to whom the keg properly belonged, and why it was not returned to its owner; but already half frantic with excitement and revolting glee, they imagined that I wanted a share of the spoils, and instantly a half-dozen great cups and jugs were pushed into my face, while, with riotous frenzy, I was urged to help myself. I respectfully declined the invitation, but loitered for a few moments to see the termination of the scene. The crowd thickened. An officer demanded to know where the keg came from, and to whom it belonged, but to no better purpose than I; and in a few moments the last drop of liquor had been drained out, and the rum-saturated throng went staggering away, clamorously intimating their desire to meet 'another prize of the same glorious sort!' It was thought by many that the profuse supply of ration rum had been productive of much injury. One fine fellow, with a rugged look, in writing to a friend at home concerning his manner of living, said, 'I have not slept even one night in bed, but mostly on the ground, or on the deck of a ship, and still I am as well as ever. I owe it, I think, to my teetotalism. Those of our men who drink are most subject to illness; and the majority of those who have died were hard drinkers.' While the officers were nearly unanimous in their belief that grog was of the utmost importance to the men, not a few intimated that the quantity which they received had been the means of serious injury in numerous instances."

A blue-book of 100 pages, published since the termination of the war, contains a general and special report by Dr. Lyons (the chief of

the Smyrna hospital) concerning the pathology of the diseases of the army in the East, addressed to the secretary of war. A short abstract of the result of his inquiries will hardly fail to interest many, even of our non-medical readers, and enable them to form some judgment upon the character and causes of the sickness which prevailed. There appears to have been two principal causes inducing the invasion of disease in the Crimea during the winter of 1854-5; these were the fatigues and exposures of trench duty, and the singular and rapid vicissitudes of the climate. The operation of youth and immature physical development is next noticed in the induction of disease among the troops. The joint number on the occasion of the assaults on the Redan, in the summer and autumn of 1855, received into one hospital in the field were 664, embracing all varieties of gunshot wounds of the very worst kind. Of this number of men the average age was twenty-four years and a half, but more than one fourth of the whole were actually only twenty years old and under; and altogether there was a high proportion of immature youth, such as (Dr. Lyons has no hesitation in affirming) it is not consistent with any sound physiological principles to expose to the severe trials and hardships of actual war. The doctor does not object to early enlistment, but he urges the necessity of the gradual training and preparation at home, or on secondary foreign stations in favourable climates for the severer ordeals of warfare. He expresses his unqualified opinion that no soldier under twenty-one years of age should be sent out to the Crimea, or any other seat of actual war, and not even then without a previous training and gradual acclimatisation in suitably selected secondary stations. The various morbid agencies at work in the Crimea induced sensible modifications in the constitution of the soldier, and some of the effects, such as premature appearance of age, were sensible to the eye. The powers of the system, and consequently the vitality of the soldiers were below par, and this was especially manifested in some of the prominent and distinctive characters of the prevalent diseases. A general scorbutic state was recognisable in the soldiers' constitution, and this lent a decided influence to, and even sometimes distinctly modified, the characters of the other diseased processes so commonly prevalent. The abdominal viscera were the organs in which disease was most commonly manifested, and it may be said that the main features of the pathology of the eastern army were embraced in the two great classes of the fevers and the fluxes, and of the latter no small proportion owed their origin to the former. Dysentery was the most prevalent of the true fluxes, and when established as

chronic, it evinced a marked tendency to induce other morbid states in the system. The results of the surgical were fully corroborative of the medical pathology. As a general rule, low forms of diseased action attended the graver surgical cases, and the Russian prisoners exhibited a tolerance of the effects of injury and of surgical operations far superior to that of the allied soldiers, except, perhaps, the Sardinians, when they came upon the theatre of conflict.

The sickness of the troops, the wasted condition of the horses, and the state of the road or track during January, mocked all efforts at getting up sufficient supplies. Happily, the frost made the track very firm for the greater part of the month, or the army in the lines must have positively perished. Lord Raglan and General Airey's neglect of Commissary Filder's proposal, made at the opening of the siege, for the formation of camp depots, told against the army through the whole winter. Their neglect of road making, while that was practicable, was attended by similarly fatal results. But the heads of the army at home and abroad, and those members of government upon whom the efficiency of the army depended, were either indifferent, or had wholly neglected those studies which were essential to qualify them for their situation. The following remarkable speech was delivered by the Rev. J. C. Bruce, LL.D., before the Archæological Institute of Great Britain and Ireland, at their meeting in Edinburgh, some time after the tidings of the sufferings of January and February of 1855 had added to the horrors with which the news of 1854, of a similar kind, had filled the public mind:—"If any one had said to the prime-minister of England, when he declared war against Russia, 'My lord, let me advise you, before you take a single step in the prosecution of this momentous enterprise, to spend at least one week in the study of Roman antiquities,' what would have been thought of him? And what would have been thought of the minister who, in a time of such pressing emergency, should forsake the cabinet council, neglect his despatches, and leave couriers and clerks to stare at one another while he took a run down to the north to examine walls of Hadrian and Antoninus? What would have been thought of him? And yet, if we look into it, the suggestion is not so supremely ridiculous as at first sight it appears. Supposing Lord Aberdeen had come into Northumberland, and had placed himself under the guidance of our local society, what could we have shown him there that would have aided him in directing the warlike energies of this great nation? The first thing, probably, that we should have done would have been to show him the Watling Street, or some of the other lines of Roman

road which there exist in a state of considerable perfection. After we had walked his lordship for some miles over the stones that had been laid in their present bed nearly 1800 years ago, we should have said to him, 'You see here the practice of the Romans. In advancing upon an enemy, they uniformly made the construction of a road keep pace with the progress of the army. This they did, not from cowardly motives, but in order to keep up the communication with their reserves in the rear, that their supplies might be duly forwarded; and that in the case of sudden disaster they might make good their retreat. Here you see how Agricola acted when, in the year 80, he marched against the Caledonians. He made roads. Be sure that in directing the energies of the modern Caledonians against the Russians you impress upon them the necessity of making roads. Let this be one of the first things to be attended to.' Unfortunately, however, the prime-minister of that day was too busy to study antiquities. It was not until after our army had suffered the severest calamities that a road was made from Balaklava to the camp. Again, we should probably after this have taken him to some of our Roman stations on the wall, and shown him the care with which a Roman army intrenched itself when it rested even for a night. At Borcovicus, we would have furnished him with proofs for believing that when the army sat down there to build the wall the first thing they did was to erect the thick stone walls of their own camp, and to rear the stone barracks which were to form their own habitations. We should have confirmed this opinion by referring him to the sculptures on Trajan's column, which represent the soldiers employed in the Dacian campaign as being very extensively employed in building stone dwellings. We should then have pressed upon his lordship the necessity of securing strong and warm habitations for the army the moment that they had reached the ground which they were to occupy even for a moderate length of time. But what is the use of studying antiquities? what is the use of profiting by the experience of past ages. So at least some have thought, for, though the frames of our soldiery are not more hardy than were those of the Romans, they were exposed on the heights of Sebastopol in a way that a Roman army never would have been. Further, we should probably have drawn his attention very particularly to the Roman method of heating their apartments by hypocausts; and we should have suggested to him the adoption of a similar method of enabling the army to endure the rigours of a Crimean winter. When fuel is scarce, what more effectual or economical way can be employed than by making the heated air to pass beneath the floors of the

rooms? One small fire will in this way heat whole suites of apartments. But there was not time to study antiquities; and our army was left to bear up against the rigours of winter as best they could. As to the commissariat of the Roman army, our stations on the lines of Hadrian and Antoninus do not teach us much, but the instructive coil around the column of Trajan makes up for the deficiency. We should have called his lordship's attention to the important fact that foremost in the preparations which Trajan is there represented as making for his campaign in Dacia is laying in a store of hay for his horses. There the haystacks stand to this day. Doubtless, if the horses were cared for, the men would not be neglected. We should have said to him, 'My lord, let your commissariat be complete to the most unimportant article—be sure that you have hay for your horses.' But no; our rulers had not time to throw away upon the study of antiquities, and our noble horses were left on the heights of Sebastopol at a temperature not much above zero, to eat one another's manes and tails. Perhaps by this time it will appear that the idea of even a prime-minister paying a little attention to antiquities is not very absurd. If the evils to which I have referred had been avoided by the adoption of the experience of the Romans, as taught us by the monuments which they have left us, half a-year's income-tax would have been saved to this country, and this surely even utilitarians will consider as a thing of real importance."

The spirit and bearing of the men, under all the dreadful privations and hardships of January rose with the occasion. The only discontent they evinced was the way the supreme command, and the business of the staff were conducted: they were unrepining, generous to one another, full of sympathy and self-sacrifice to their officers, and magnanimous to their foes. The Irish soldiery were generally supposed to be more hardy than their British comrades, but this did not prove to be the fact; the Scotch were the most enduring soldiers beneath the winter's skies of the Crimea. The Irish were certainly the most cheerful under every privation, and they were alone able to cope with the Zouaves in their own peculiar way. They were alternately the most mischievous and the most obedient soldiers in the service. "Sure," said an Irish light company man to a countryman of his, a naval officer who went up to the lines, "those Zouaves are very clever at foragin', an' stalin', an' fightin', and divilment of all kinds; in troth, yer honour, they are nearly as bad as ourselves." Whether the middy took this as a compliment, his hearty laughter gave token that he was not without a disposition for allowing a very general application of his country-

man's estimate of the national propensities. Mr. M'Cormick, already quoted, bears amusing testimony to their good humour, hilarity, and ready wit, and relates various anecdotes which he heard in the lines or at Balaklava to this effect. The following will suffice for specimens:—"In a sortie made by the Russians one night in December, the guard of the 50th regiment was killed, and the enemy took possession of the picket, only to remain for a short time, however; for the rifles, hearing the alarm, soon came up and slaughtered the intruders without mercy. A patrol officer coming along some time after, and finding an Irishman of the rifles on guard, addressed him, 'Well, my man, what are you doing here? You do not belong to the 50th.'—"May it please yer honor," said Paddy, 'the Rooshins relieved the 50th, and we relieved the Rooshins.'—A Scotch friend who had his lodgings in Balaklava, was aroused by the violent ringing of bells, and general confusion throughout the harbour on the demise of the old and the inauguration of the new year. Forgetting the occasion, he sallied forth into the dark cold streets, thinking that there must be a fire somewhere. Soon convinced of his mistake, but ready and anxious as ever (the wicked fellow!) for a bit of fun, he carelessly said to a shivering Erinite whom he found standing on guard, 'Well, sentinel, if a fire should break out here, what should you consider it to be your duty to do first?'—"Indade, sir, I should think it my first duty to warm myself," was the off-hand and witty reply.—A recruit was reproved by an officer for daring to whistle in the ranks while going on duty. Just as the officer spoke, one of Russia's balls came whistling over the ravine. Pat, cocking his eye up towards it, quietly said, 'There goes a boy on duty, and, by jabers, hear how *he* whistles!'"

Never did men bear up more gallantly under fatigue, deprivation, wounds, frost-bites, disease, and neglect; never did men more nobly die for honour and for country. Mr. M'Cormick testifies this in terms which it is most grateful to peruse from the pen of an American:—"Lieutenant Edward Wylde, R.N., an active and intelligent gentleman, who had the arduous duty of superintending the embarkation of the larger portion of the sick and wounded, ordered to the hospitals at Scutari, related to me many remarkable instances of the wonderful *esprit de corps*. In assisting one poor fellow, who had lost a leg, and had been shot through the thigh as well as through the breast, but who was very coolly smoking his pipe, he remarked, 'Well, my good man, I see that you keep your spirits up in the midst of your trouble.' 'O yes!' said the sufferer, with a smile, 'I never allow such trifles to put out my pipe. I paid the Russians for damaging

me, I can tell you. No sooner was my bayonet into one fellow before I jerked it out and drove it into another, and so I went on to the tune of a dozen of them! and if I ever get well and have an opportunity, I'll be at the beggars again, you may be sure of that.'"

In the debate in the House of Commons, upon the vote of thanks to the allied armies, already referred to, Mr. Layard made the following speech illustrative of the spirit of the troops, and the way in which the country should deal with that spirit:—"In the vessel which conveyed him (Mr. Layard) homewards, there was a large number of French soldiers who had been wounded in the battles of the Crimea, and among them he saw many privates and non-commissioned officers, bearing on their breasts the order of the legion of honour and other orders of merit which had been conferred on them for their bravery. As these men stood before him, evidencing the pride with which they regarded the honours bestowed on them, he could not help feeling a deep regret that we had not some similar mode of testifying the country's approval of such services. It then also occurred to him that there were men in our army who, though but its rank and file, would feel as proud of orders of merit, if given to them, as the officers who commanded them could be. It occurred to him that men who returned wounded or disabled to this country, with orders of merit on their breasts, would be more likely to have their future course in life beneficially shaped, and influenced by sentiments of honour and of a just pride, than men who were hastily or indiscriminately rewarded in the field by small pecuniary donations and gifts of that kind; and he therefore earnestly hoped that some higher mode would be adopted by the government for acknowledging the prowess of our soldiery. In conclusion, allow him to say, that he was one of those few who thought that the time had come when, without questioning its political necessity, and however great might be the sacrifices imposed by a struggle of this character, war was almost necessary for our national safety and our national honour. There had been many who believed that the people of this country had relapsed into a state of effeminacy; that a long peace of forty years' duration had destroyed that British spirit to which we owed our liberties and our high position in the scale of nations. The recent events in the Crimea must, however, have dissipated all such gloomy apprehensions. Would that that great captain who had been the noblest exemplar of the true British soldier had been permitted to tarry a little while longer among us, that he might have seen that the British soldier had not degenerated! The feelings with which he

joined in the vote of that evening were greatly increased by the recollection that, united with the vote to the British army, was a vote to the brave troops of our French ally, and he trusted that that friendship which had been cemented between the two armies in the field of battle, might be still further fostered by sentiments of mutual admiration, confidence, and respect, and prove of lasting benefit to the civilised world."

Sir Charles Napier spoke to the same effect on the hustings at the Southwark election, and passionately urged upon the government, from that influential position, the adoption of bold measures to satisfy the country and the army:—"He was sorry to be obliged to remark upon a matter which he believed it to be his duty to touch upon—it was that of officers coming home upon 'urgent private business.' He regretted that the general in command had given one single officer leave to come home on private business; and he trusted that no leave would be given in future to officers, unless privates also were permitted to return home on 'urgent private business.' When an officer went to the Crimea, he went there of his own free will, and nothing should permit him to come thence but severe ill-health. No business, in his opinion, could be so urgent as the business of one's country, and every man who went to the Crimea should remain there till the war was finished, when he could return home and be received with honour and gratulation by his country. Upon these points he agreed completely with that great commander the Duke of Wellington; and he confidently asserted that if we carried on the war in a pitiful and peddling way, we should only be spending money without effecting any object. Upon the question of promotion in the army, the gallant admiral observed that he had seen absolutely children going to the depots to be sent to the war. The fact was, that there was a lack of good men volunteering for the army, and this was because the British soldier was not sufficiently encouraged. When a man entered the army, the utmost he could expect was to be made corporal or sergeant, or it might be an adjutant. But what encouragement was that? We had grand-crosses, knights-commanders, and companions of the Bath, and he saw no reason why this order of distinction should not be extended to the common soldier, who might be called, for instance (when worthy), an 'Associate of the Bath.' When a man had attained to that rank, and had the right to hang a red ribbon to his button-hole, he would give him something substantial along with it—something like a pension—say of £25 a-year. That would be the cheapest way of getting soldiers, because the effect which a man would have on returning to his own neighbourhood

with a 'red ribbon' and a pension of £25 a-year would be enormous, and fifty stout young fellows would volunteer where not one had offered himself before."

Mr. Layard's disapprobation of the way in which the heroism of soldiers in the field was rewarded by small pecuniary gifts met the hearty approbation of the country;—sometimes a sovereign, sometimes two sovereigns, and occasionally a donation of £5, was Lord Raglan's measure of reward for deeds the most dauntless and chivalrous. But what mark of approbation was given, or even proposed, for the quiet manly endurance of such great sufferings? What requital did the poor man ever get for the loss of members by frost-bite, which they would not have incurred had mits, hose, and boots been timely served out? The severe censures by Sir Charles Napier against the officers for returning home on "private business," and on the general-in-chief for permitting it, were read and extensively commented upon in the camp by the soldiery. When officers retired invalided, they were objects of the kindest sympathy and respect from the men, but the retirement of those who had only "private business" excited the sneers of the soldiers, and satirical allusions to them passed from bivouac to bivouac, and trench to trench, which indicated how much the service was injured by those selfish withdrawals. Officers who would have led their men sword in hand upon the enemy, however disproportionate the numbers, shrunk from the privations of the camp and the trenches, and returned home, where they were received as heroes, and promotion was obtained by them at the expense of those who remained before the enemy. Still, nothing daunted or shook the loyalty of the noble soldiers of England. They had, even in sickness and hunger, a desire to meet the enemy. This is no exaggeration, no rhetorical flourish, but a literal truth. When the drum beat to arms, or the trumpet's call echoed among the deep ravines, the wet, weary, hungry, sick man went forth exulting, having no apprehensions except that the foe might possibly not come on. Never did Greece, in the glory of her most heroic days, nor Rome, while yet the splendour of her gifted and stern soldierhood shed a halo over the greatness of her empire, display such fortitude as the legions of England on the plateau before Sebastopol. Briton or Gael—English, Irish, or Scotchman—men of gentle blood, or those whose veins were filled from fountains which flowed in humble hearts like their own; all, all were one in indomitable will, in loyal fealty to the land which gave them being, in proud soldierhood, in lofty aspirations for victory, in generous contempt of death and suffering, if the cause for which they incurred either or both triumphed by

their ruin. The raw recruit emulated the old soldier; the lad fresh from home entered the tide of battle with the placid courage of the veteran, or the enthusiasm of the man who had before fought and conquered. Over all the gloom which threatened our country's greatness, and through the tears we wept for the fallen brave, their valour shone an iris of hope: England could not be vanquished while such hearts were her ramparts,—could not sink in renown while her children thus knew how to suffer and to die,—could not recede from her position while she had sons who performed such

actions as challenged all past chivalry, and set a new example for the ages of futurity. Exposed to the tempest, advancing beneath the still more terrible storm of battle, watching in the snow-choked trench, toiling up the mud-impeded steep, sinking with fatigue within the deluged tent, pining away in the pest-house, they retained the same majestic manhood; it was for "England, home, and duty" they dared and died. As the gem, shattered, dispersed and trodden under foot, retains to the last its lustre, so the spirit of England's army gleamed through every transition of adversity.

CHAPTER LVIII.

LETTERS FROM OFFICERS AND SOLDIERS DEPICTING THEIR SUFFERINGS.—IMPRESSIVE LETTERS DIRECTED TO THE ENGLISH PRESS BY COLONEL NAPIER AND THE HON. S. G. OSBORNE.—LOSS OF THE HORSES IN THE CRIMEA.—ANOTHER GLANCE AT THE HOSPITALS OF THE BOSPHORUS.

"— The poor condemned English,
Like sacrifices, by their watchful fires
Sit patiently, and inly ruminate
The morning's danger; and their gesture sad
Investing lank-lean cheeks, and war-worn coats,
Presenteth them unto the gazing moon
So many horrid ghosts."

SHAKSPEARE. *Henry V.*

THE motto selected might have been written for the occasion to which this chapter relates. "The poor condemned English sat patiently" before Sebastopol. Each night brought its sufferings, and yet amidst them every soldier might well "ruminate the morning's danger." The words of the great poet, alas! picture too truly their lorn and sorrowful condition.

A few letters from the camp will illustrate the spirit and character of the soldiery, and their dreadful condition, better than any narrative which could possibly be given. In these letters they are autobiographers, and the historians of their comrades and regiments. The home-spirit which is blended with the heroic is pleasing, although our men did not die of home-sickness, as the French not unfrequently did. A single instance of such a death in the month of January is the only one of which any evidence can be procured; yet it is not unlikely that silently the heart sank when the men felt how far they were away from wife, mother, sister, or betrothed.

The following simple-hearted letter was published in the *Bucks Advertiser* in Feb., 1855:—

Camp before Sebastopol, Jan. 9.

"DEAR FATHER AND MOTHER,—I received your kind and welcome letter, and was very glad to hear that you were all well, as this leaves me at present in good health. My faith has not failed me yet, and I live in hopes it never will; for I think, after escaping through the last fighting-day, I am almost ball-proof, as the saying is among our division, on Shell

Hill. I wrote a letter to you on the 29th of last month, but had no room to tell you much about Tom, for the 5th of November and its doings filled the sheet. Dear sister, guess my surprise on Christmas-day (at night), about five o'clock, as I was cooking me a drop of coffee for supper, and thinking of the happy evening you were all enjoying at home, and I the only unfortunate and disobedient runaway of the family, when, who should come to where I was cooking but my comrade, and says, 'Corporal, have you got the kettle boiled, for we have a young man come to tea with us, as it is Christmas?' I replied, 'I am sorry we have not a glass to give him; who is it?'—'Well, Edmund,' says he, 'how are you getting on?' and there stood Thomas, in the uniform of her majesty's 71st Highlanders. I could not answer him for a few seconds, for the unhappy part of my brother broke on my mind more than ever it did before. The first thing I said to him was, 'if you knew of him enlisting?' He said he wrote to you from Canterbury before he came on board ship. I told him I was sorry to see him in this miserable country, although he had as much right to act the fool as I had. 'Ah!' says he, 'I only came to bring you a clean shirt, for I thought yours was worn out.' So when I saw he had four on at the time, I took one of them, which was very acceptable. He stayed with me till the following morning, and then went back to his regiment, which is six miles from mine, down at Balaklava. I intend to go down to see him about the 20th, when I get my pay,

and see how he likes his new life. He appeared to me to be very well contented, considering the circumstances. I intend to get him transferred to the 49th, which I think will suit him best; he wants to come now, but I know the difference between lying along with the commissariat stores and the second division, which is the worst we have out here, as our flank is too hard for him yet; for this country goes very hard with fresh troops, and I consider it better for him to remain where he is until he gets a little seasoned to the country, and likewise his work, which it is better for him to come into by degrees. I hope you will excuse this simple talk, as it is just to let you know of our meeting with each other, and nothing to offer each other but a piece of salt beef, as hard as an oak-tree, and a biscuit, so we drank each other's health with our drain of ration grog mixed with a little coffee. Dear father and mother, sisters and brother, I hope you will not see my name in any of the list of killed and wounded; but if you do you can say, 'Well, Edmund, you died the death you never feared,' for there is not a Russian in Sebastopol I fear, for if once I could get in sight of them with my rifle or bayonet I would not fear them. There is nothing fresh occurred here since my last to you. When you see anything of the second division in the paper, remember I am in that, and Tom is in Balaklava with the Highland Brigade; and now I must conclude, with my kind love to all friends and relations, for time is precious, as I am off to the trenches as one of a covering party; so no more from your affectionate son,

"EDMUND POLLARD,

"Corporal, 4th Company, 49th Regiment, Crimea."

As an example of the cheerful spirit in which the miseries of camp life were met, by many of those whose previous social position and habits had been the very opposite to that which the necessities of war compelled them to endure, we insert the following letter from Mr. George Fair, at that time serving as an assistant-surgeon in the 55th regiment, whose services during the worst period of the siege obtained for him not only the approbation of his superiors, but also the decoration of a Chevalier of the Legion of Honour from the French government.

Camp before Sebastopol, Jan. 2, 1855.

"MY DEAR M—, This 'comes hoping' you are as well as I am myself—in bed—under a shower bath—in a tent—in the mud—in the camp before Sebastopol. Next, having informed you of my present and pleasant situation, allow me to wish you a happy new year, and many happy returns of the same."

"Let me explain the heads of my opening remarks. Firstly, I am well and jolly. Secondly, I am in this institution, in bed (which,

in my case, consists of an old sack attached to four poles). I daily retire at the early hour of four, and in most instances it immediately begins to rain, as it is just now doing, and as it only knows how to do in the Crimea, which explains the third and fourth heads. Tents not being calculated to exclude the rain, it comes through in a very interesting manner—although, on the whole, I have little reason to complain to-night, as, having obtained an old tent, which I have placed over my own, I am not now obliged, as formerly, to dedicate all my time to the study of drainage, on the site of the Mackintosh coat barely covering my bed. Mud! most illustrious sir! you are quite ignorant of what mud is. Here, sir, mud is mud indeed—mud which in many cases comes up to your knees—mud which rapaciously pulls off and retains your boots—mud which will never dry or wipe off—mud the half of whose properties I cannot enumerate.

"In the 'Camp before Sebastopol' requires no explanation. I am on the field of Inkerman, close to the Tchernaya, opposite the caverns, in sight of the army of Liprandi, within hail of the Cossack sentinels, and last, not least, within reach of a battery which the brutes have opened for the first time to-day. I may add, within a near sight of Sebastopol, and within hearing of its bells—cannon permitting.

"To let you see my mode of life, I will give you an account of yesterday's doings. I awoke as usual at about half-past five; did conversation disjointedly with B— (the head-surgeon, whose tent I share) from beneath the blankets till the servant brought in the decoction of beans, of which I drank a pint, with rum for milk; went up to hospital tents. There is a sight! We have twelve quite full, each containing twelve or fifteen men lying on the ground in mud or frozen to it. I have actually seen a dead body cut away from the place where the owner of it died. These huts are full of holes. I should have told you that, on issuing from our tent in the morning, we found snow at least a foot deep. We sent away twenty-three cases to Scutari by means of the French mules, to which we are always indebted for the removal of our 'cases.' The snow was heavy, and the wind bitterly cold. Three men died on the mules before reaching Balaklava—a distance of five miles over the hills—how many more since! I went round my remaining cases, and home to breakfast and to bed.

"To treat our cases we have often no medicine—indeed, seldom have any. Nothing but salt pork to feed them on, which they can't eat: so when we can get them, we boil biscuit and rice together, when we can get a fire. Nourishing food, eh?

"As I said, I went to bed, where I remain on bad days (except to go up to hospital), with

all my clothes on, of course. I have only had my trowsers off once within the last month. I went out for a quarter-of-an-hour, but not enjoying it much returned, and took a dose of calomel.

"At three, went and had a look at the miseries; then home to bed and dinner. Salt pork of course; but I must not complain, as my servant got some stunning potatoes for fourpence—all at Balaklava. After dinner, a smoke; and, being turned and tucked, as I fondly hoped, for the night, was waiting the last decoction of beans, when, lo! footsteps at the door. 'Is Dr. Fair in?'—'Yes.'—'You're wanted for picket, sir, and the regiment is on parade.' So up into my wet boots, on with my greatcoat, and off to the parade ground. But the regiment had moved on, and I trotted after them through the snow a distance of full two miles. Now picket is a nice amusement; but as my fingers seem inclined to be brittle, I will defer telling you about it till another night.

"*January 9th.*—Since I wrote the preceding, I have been twice on picket, which now only lasts twelve, instead of twenty-four hours. I don't know that it is an improvement, for I always manage to get the night hours, and am out about every third night, instead of once a week. I came off this morning about seven, after a very pleasant night, as you may suppose, when the snow was deep on the ground, and it was pouring into our tent with rain, making a nice mixture to lie down and sleep therein. However, night is safest, and there is seldom much firing, and you can see shell coming by their burning fusee. The education received in pickets consists in learning to recognise the different sounds made by shells and bits of them, and of round-shot, grape, &c., the direction of their flight from their sounds, the art of rapidly flattening yourself on the ground when a shell falls near you, and of 'bobbing' the pieces and round-shot. Shells fired from mortars whistle beautifully. I fancied I heard one at 'God save the Queen' the other day, but, being a 'Roosian,' it *must* have been fancy or perturbation. You learn also the art of making fires and cutting sticks to do your victuals on; also the art of lying and sleeping on the ground, and of becoming insensible to the effects of being soaked with rain. My usual picket station is at the parallels making on the hill beyond Shell Hill. On the night of the last (picket) I managed to get into a tent; and having foolishly taken off my boots, I found it perfectly impossible to get into them in the morning—they were so frozen. So I had to shiver and look at them till my servant, disturbed by my long absence, came out, lighted a fire, and thawed them.

"My duty in the trenches is to look after every one who is wounded; and much good I do, seeing all I *can* do is to put them on a

stretcher, and send them to camp. Some nasty smashes one sees—heads knocked off, &c. One poor fellow yesterday got all one side carried away, and died in two hours. How he lived so long I don't know. The whiz of a rifle-ball is nasty. I got nearly potted the other day in the Tchernaya, a valley where I was wandering for my amusement. I was standing near an old wall, when crack went a rifle, and a bullet struck the wall not a yard from my head. Then came another; but this time, I guess, I had the wall between the bullet and me. It was fired by some wretch concealed in the caves of Inkerman, and a very good shot it was for about 2000 yards. It has cured me of promiscuously following my nose. I must go up to hospital now, and see a man whose head met a piece of shell to-day.

"*January 11th.*—I don't know what to tell you about now: I can give you no news of the war. There was, they say, a council of war last week, at which Omar Pasha was present. The men all seem to expect something to be done to-morrow. I am afraid not, however: it is the Russian New-year's Day. We have been getting more fresh beef last week, but no rice, &c., which I see the papers say we do; *nor fur coats, gloves, &c.—all, all imaginary, like the huts.*

"It came on frost again last night, but not hard; it is rather slushy still. Blake is ill, and I have a great deal to do. There were two deaths in our hospital last night. One was supposed to be asleep, till I went and felt his pulse, and he was dead. I left one dying when up to-night. It only puzzles me how so many live. My beard and moustache flourish apace. I look rather queer, you may imagine, as I have only been able to get water once since the first of January. I may mention that my honoured parents are ignorant of the dangers to which their '*iligant*' son is exposed, and I wish them to remain so. I was busy all to-day doing amateur cooking on a charcoal stove in Milroy's tent. I composed gingerbread from flour, sugar, and pepper, and we devoured it on the spot. I tried pancakes, but failed—eating the failure notwithstanding.

"I must finish this letter to-night, or I shall never get to the end of it. Write soon a *newsy* letter, and believe me, dear chief,

"Yours, very sincerely,

"G. F."

It will be seen from the doctor's letter that the want of warm clothing which prevailed during the first three weeks in January was one of the chief causes of suffering and disease. The following remarks by "a practical man in a question of cold," points out what ought to have been the remedies:—"In Canada and all the northern parts of America buffalo robes are in constant use in winter as

sleigh wrappers, &c., and they are equally well suited for bedding. There is only one article with which I am acquainted (except what is too expensive) better; this is a robe made of reindeer fawn skins, which, at the same time that it is equally warm, has the advantage of being much lighter; but these cannot be obtained in sufficient numbers for our soldiers. The best covering for the hands are mits made of buckskin, or other soft leather, lined with thick blanketing. These mits should be attached to each other by a cord, and slung over the neck, and ought to be large enough to allow of the hand being inserted or removed with the greatest ease. There ought to be no divisions in the mit, except one for the thumb, as by this means the remainder of the fingers are left in contact. With such mits as those described above, the Indians and other residents in America are enabled to shoot and hunt in all weathers, by removing the right hand from its covering when they are going to fire, and, when they have pulled the trigger, replacing it. A glove may be worn inside if requisite. I have no experience of sheepskins as winter clothing, but we can have no better guide in the matter of clothing than the usage of the enemy, who are natives of the country (perhaps of a more inhospitable one) where our army are fighting under great difficulties, and performing deeds of heroism unsurpassed—probably unequalled—in any former war.”

The following is from a non-commissioned officer:—

Before Sebastopol, Jan. 12.

“Here is nothing but misery; for, even though in health, to live in a canvas tent in frost and snow keeps one in constant pain from sheer starvation. Talk about ‘returns,’ why my very ink has been so often frozen that it has become so pale I can scarcely see it. I suppose there are scores in the hospital frostbitten; no man is well. On every side are cholera, dysentery, diarrhœa, rheumatism, catarrh, and scurvy. The army is covered with dirt, vermin, and rags. You would not know what nation they belonged to. Some wear long boots similar to the Americans, taken off dead Russians; others old sacks stitched round their legs; others have made gaiters of their knapsacks. I saw one wearing a sky-blue jacket, with yellow facings. On going up to him I found it to be Tom Barnacle, dressed as a Cosack. I am now wearing a Russian officer’s sarkout—dark blue, scarlet lining and collar; the gold epaulettes have been torn off, but I have got the two little straps which secured them. I receive your letters very regularly now. Continue. The way I am situated prevents me writing every mail, but I write pretty often nevertheless. The night before last I sat up every hour making out rolls for

the medals and honours, ‘Alma’ and ‘Inker-man.’ If it please God to spare me to return, I shall feel very proud to wear such names on my breast, but they are dear bought. B—— is recommended for a commission, M—— to be quartermaster, and R—— an annuity. D—— is away sick. Forty sick have been sent off this month, and five wounded, two killed, and about twelve dead. We cannot muster 400 duty men, although we came out 911, and have received two draughts; making about 1100 in all.”

A non-commissioned officer, a native of Norfolk, thus wrote to his friends, under date of January the 16th:—“There has been no attempt made to get up the wooden houses, and we are living in tents covered with snow. In Canada there are snow carts provided; if we had two or three per regiment here we could clear away the snow from the camp in a couple of hours every morning. As it is, there are between two and three feet of snow in the camp, and there is no means of removing it. We are obliged to make paths through the camp, and can get about pretty well in the day time, but at night we get up to our knees in snow. We are almost afraid to think of the thaw. I have not received any of my parcels yet, but am anxiously looking out for them. The men are gradually getting their warm things, but what they want most is good boots. There is a great deal of sickness, and some of the regiments are very weak. I really think that if the men were housed, properly clothed, properly fed, and not worked beyond their strength, which they have been, there would not be more sickness than in most garrison towns, but the commissariat arrangements have been of the worst description. The men have been in rags till lately, and the houses are at Balaklava, and I cannot see how they are to be got up. Sixty men were sent down the other day to bring one hut up for the hospital, and they have only brought up a third of one. It takes 180 men to carry one. . . . I must tell you a good story that is told here. When Sir C. Campbell went to meet a flag of truce after the battle of Balaklava, he was asked who the people were who fought in petticoats. Sir Colin answered, ‘They are the wives of the men who ride the grey horses.’ I think that charming.”

The following was sent from Scutari, whither the writer had been sent from the Crimea early in January. He had the good fortune to come under Miss Nightingale’s immediate cognisance, and the good results are depicted in the satisfactory tale he tells of his convalescence. It is necessary, however, to remind the reader that at this very juncture men in other corridors were starving, and that the rate of mortality was most distressing.

Scutari, Jan. 16.

"DEAR MOTHER,—I received William's letter, dated the 29th of last month, and was very glad to hear of your all enjoying good health. When the letter arrived it came to me on a sick bed. Two days before Christmas I was seized with a violent fit of ague, and the following day I was laid up with a fever. I dare say you all thought of me on Christmas-day; I know I did, comparing the difference. This Christmas nothing entered my lips but a drop of tea; so, you see, although you may not have been the best off, I was in a worse state than you expected. I got over it, and was discharged from the hospital on Saturday, the 7th of January, but I had not been but a few minutes in barracks before I was seized in a similar manner, and I was taken back to hospital a great deal worse than ever. I was very bad, and I certainly thought that my last hour had come; but, thank God! I am again recovering fast. I can walk a little now, but my legs are very weak. I get everything I fancy here—fowl, wine, milk—in fact, anything I wish for. Miss Nightingale with some ladies and nuns are always going round with something nice; but I manage my potatoes and mutton now, and I get a pint of porter every day. If I do not get strong soon, I expect I shall be sent to Malta or Corfu, or some warm island in the Mediterranean, until my health is restored; but I expect I shall be all right again soon, and be able to join my regiment in time to be at the storming of Sebastopol. My wound I received at Inkerman has never been any trouble to me, but God knows I have suffered severely enough without that troubling me any more. I suppose George is all right now, busy enough with his soldiering. I hope he does not forget you. As for John, he can have no feeling for any one but himself; he might have sent another playbill, at any rate. If Dick feels inclined to go to sea, I don't think there would be any difficulty in getting him a ship, as he is a fine, hearty boy. I like him well; give my love to him. I am glad Tom is getting on well at school, and I hope he don't come home at night with his books covered with mud. As for Sammy, tell him he must pray for poor brother Jim, lying sick in a strange country, surrounded by people whom he has never seen before. I am lying on my back writing this. I have managed to scrape together a sovereign, and as there is a gentleman here who kindly transmits money home for sick soldiers, I shall take advantage of the chance and send it to you. I got nine shillings pay as orderly in hospital before I was taken sick, and when I assure you all the pay I have drawn since I left England has been seven shillings and sixpence and fifteen-pennyworth of tobacco, you may be sure it is

with great contrivance I have been able to manage; but I have it, and I send it with as free a heart as ever aught was sent; only all I hope it will be put to good use, and I am sure it will do good and keep you going until the war is over. Good-by, and God bless you all, is the prayer of your own,

"JAMES CAMPBELL."

"Don't send any more postage stamps, as they are sent out by some fund in London for our use, and Miss Nightingale stamps all letters for the sick and wounded."

The tone of family love which pervades the above was characteristic of the letter-writers of the Crimea and Scutari.

The letter which follows was addressed to the *Times* by an army-surgeon. It was dated the 15th of January, at which date it will be perceived there was no ambulance corps, although all England rang with the complaints made on that subject by the correspondents of the press, from the arrival of the news of the 20th of September, to the close of the year 1854.

"SIR,—We have heard much of the wooden houses which were to be sent out as winter quarters for the troops. They have not yet arrived, and, having got so far through the winter, we shall, no doubt, be able to manage without them; if they did arrive, we possess not the means of bringing them up to these heights, and we could scarcely ask our allies to bring them up for us as they did our ammunition.

"Time, however, is passing away, and when fine weather returns, and fighting recommences, the British army will again be found without an ambulance corps, and then our fine fellows will suffer over again what they endured at the Alma and Inkerman. I therefore write to entreat you to use your powerful interest to stir up the nation to insist on the sending out as speedily as possible an efficient ambulance corps; otherwise we shall, as before, lose half the wounded. We cannot have a better than that of the French. One of their mules carries two wounded or sick men, and is far superior to our bad waggons, mules, and pensioners, which have proved totally useless. Do, sir, for the sake of the poor men, bring this matter before the public. For the last three months we have been dependent on our allies for the conveyance of our sick and wounded, and each time that they came to render that assistance to those under my care I cannot tell you how how much ashamed I felt for my country.

"The want of an ambulance corps is entirely the fault of the quartermaster-general's department, and not of the medical department."

Perhaps no circumstance during the whole war had shown the incompetency of the government and the heads of departments more than this miserable conduct in regard to the ambulances. Dr. Smith had furnished to the country, as was shown in a former chapter, a detailed and most particular account of the ambulances sent out; but these instruments of relief, if they ever existed, had not found their way to the Crimea up to an advanced date in January, 1855. Well might Mr. Macdonald say in one of his letters from Scutari, that what was wanting there and in the Crimea was a *dictator*, competent to grapple with the difficulties, to set aside routine, to sweep out from the hospitals and commissariat all incompetent persons, and to insist upon the immediate execution of every command. This was the obvious remedy for so profound an emergency, instead of sending out commissions of inquiry, to patch up, as Mr. Layard told the government in the house, the negligent nominees of the government, whose callousness and imbecility disgraced the nation and destroyed the troops. Letters from officers are in many respects more instructive as to the state of things than letters from soldiers. One, from an officer in the fourth division, will exemplify this:—

Before Sebastopol, Jan. 15.

"It is certainly dreadfully cold now; and fancy living in canvas tents, with the snow a foot deep on the plain, and of course in drifts much deeper! The poor 63rd have at last almost disappeared, and we are to have the 18th up now to relieve them. The cavalry, to their great disgust, are now turned to the only possible use that can be found for them—namely, to bring up our food, though the cooking of it is a sad affair, there being very little fuel left. They also use the cavalry for ambulances, and a very ghastly procession of sick and dying men, perched on gaunt horses, goes away terribly often from up here; it is a great thing getting them away at all, for they never seem to recover in our hospital here. The survivors of a six mile jolt on a rough road may benefit from change of air, and, at any rate, more attention can be paid to those left behind. I must tell you an instance, while I think of it, of the clever way in which everything connected with the army is done at home as well as out here. We got up at last about twenty pairs of boots per company—a great want, as the men were in a wretched state, and—would you believe?—they were all too small, and except a very few pairs, utterly useless. How curiously the vein of incapacity seems to wind about through everything, not omitting even the humble boot!

"With endless wealth, great popular enthusiasm, numberless ships, the best material for

soldiers in the world, we are the worst clad, worst fed, worst housed army that ever was read of. Our wealth may be seen rotting in different forms at Balaklava; our ships bring the wrong things to the wrong people, and generally leave them at the wrong places; our soldiers die of inanition, and our fine horses die for want of forage, which rots about the port. Let us hope in time to learn wisdom. It is an astonishing thing how long John Bull, who is in most things a business man, has sat quiet and got so little for his money. We do, indeed, thoroughly appreciate the feelings about us at home, whence every description of necessary and luxury is being sent to us; in fact, everything that can be got for love or money seems to be on its way; and the people of England would, I am certain (if they could be procured), send us out at once what we so sadly want—a box or two of hermetically-sealed generals, commissaries, quartermaster-generals, &c., all fit for immediate use in any climate (see the directions on the lid). Perhaps, in time, we may make some ourselves—who knows?

"*January 19th.* A gentle thaw has set in. The health of the troop is much the same; they fade away quite quietly and patiently, dying at the rate of 100 per diem, independently of the sick, who go off to Balaklava or remain in the hospital here. I took a naval friend round the camp this morning, and he was terribly shocked at all he saw, as, living on board ship, he had not much idea of it. The truth is, people in England do not know half enough of our miseries. The post is going out, so adieu!"

A regimental officer of rank wrote:—

Before Sebastopol, Jan. 20.

"May 1855 be more satisfactory to us than has been the gloomy termination of 1854! I have received two newspapers and your letter without any apparent delay. Letters come regularly, but newspapers are not so sure, being in many instances, in my opinion, confiscated by unscrupulous persons after being landed from the mail steamer, but before reaching the heights of Sebastopol.

"In the shape of news I can give you but little; for days together the whole affair appears to be slumbering. Then, generally about midnight, a furious cannonading match between the French and Russians will wake us up for about twenty minutes. Again the fire slackens, and again the monotonous boom—boom—boom every hour or so is resumed. Having now been 114 days within range, the whistle of a ball has lost its effect, unless, indeed, most dangerously near. The ear instantly detects French, English, or Russian shot, and of the last almost its course.

"The sufferings of the troops are very great;

death and disease on every side. Some of the regiments recently arrived, and principally composed of young men, are reported to be nearly *hors de combat*. I write this in a well-worn canvas tent, the snow eight inches deep without, the ink now half frozen, and totally so almost every night. That any exist astonishes me, for even the miserable tent must at least half the week be exchanged for the open trenches. However, no matter what we have to suffer, doubtless some will survive; but very few who originally encamped before Sebastopol will, I am very much afraid, leave the ground. With regard to the raw reinforcements, they die three to one in proportion to the veterans. This is indeed a sad tale—but it is true.

"In our happiest times, in dear old England, a brighter sun never looked down upon us than it did on Christmas-day, 1854. Standing that day on Green Hill, the yellow ruins of Sebastopol, and the white tents of the beleaguering armies, stretched on either side, caused many reflections—sad and solemn retrospection for the brave men who slept the sleep of death around us—joyful and glorious perspective, picturing to myself the ultimate fate of the formidable fortress. Perhaps I may have been too sanguine, but 'hope on, hope ever,' is a good motto. Such was Christmas-day, 1854, 4 P.M.; yet to that hour the division to which I belong had not received an ounce of meat a man for dinner—in fact, dinner we had none.

"In Turkey, with genial warmth, fuel for cookery, and no enemy to contend against, commissariat rations were to be had in abundance, besides tea, sugar, rice, potatoes, ale and porter, for comparatively nominal prices; yet here, with cold, disease, and powerful enemies in front, flank, and rear, commissariat supplies are frequently 'short,' and extras have totally disappeared. I do not blame the commissariat in the Crimea—I do not blame the people of England. I am well aware that England is willing to do her utmost for us, and I am also aware that she can do more for her defenders than any other nation; but there must exist in our executive department some grossly incompetent functionaries, otherwise we certainly would not now be rotting amid the storms of a Crimean winter.

"I have just read the following:—'If the Crimean Army Fund progresses as it has begun, our brave fellows before Sebastopol will spend a jolly Christmas.' Ah me! I made my dinner that day of a 2 lb. loaf, purchased in the French camp for two shillings and eight pence. We read of wooden houses, fur coats, caps, long boots, &c., but these supplies should have been forthcoming in November, since which 2000 stalwart soldiers have been hurried to untimely graves for the lack of such provision."

A remarkable letter appeared at this juncture from Colonel Napier to the *Times*, which deserved more notice from the public and the authorities than it at the time obtained:—

"SIR,—Quoting from your correspondent in yesterday's leading article, on the state of the war, you say, 'There is no doubt, no despondency out here; no one feels diffident for an instant of ultimate success.' I must admit I would not have given credence to the above, had I not at the same time happened to have seen a letter, dated 'Camp before Sebastopol, January 15,' from a regimental officer of rank, which completely corroborates this fact. After describing the wretched state of our soldiers, still under canvas, the thermometer at 8° and 10° (which is 19° lower than it has been here during the coldest weather we have had of late), with three feet of snow on the ground, starved, overworked, without fuel wherewith to cook the rations, their clothes in rags, and in many cases without soles to their shoes; he says, 'The poor fellows work, and starve, and freeze—and without a murmur die!'

"Adverting next to your memorable article of the 23rd of December, on the state of affairs in the camp before Sebastopol, every word of which he says is true, this officer thus continues, after alluding to a friend about to return home:—'For my part, I would not myself go home if I could; I was always a hardy animal, and hope to pull through it and see the business out, for Sebastopol must fall!' And this noble fellow, a true specimen of indomitable endurance and real British pluck, belongs to that 'regimental' class on whom it was attempted to throw the whole onus of our failures during the war. They are at the camp most anxious for the assault; but, alas! it is like their wish for dry frosty weather during the lately prevailing rains. They appear little to foresee what the realisation of such a wish would bring.

"Weeks and weeks ago I wrote and warned the 'authorities' (warnings based on personal experience) of what a Crimean winter was likely to be. Weeks and weeks ago, I recommended that large quantities of sheepskin clothing should be sent out to our troops; I warned the authorities of the probably fatal consequences of their attempting to pass the winter under tents; I recommended that subterranean habitations should be dug, and excavations made for shelter in the sides of the hills. I did this at the risk of being called an officious meddler, but unexpectedly received most courteous replies to the suggestions which I made. However, in this aristocratic land, when was an opinion, unbacked by 'title, high position, parliamentary influence, or wealth,' ever thought worthy of the slightest regard?

Had my suggestions been attended to, even with the Balaklava road in its present state, a repetition of the Moscow tragedy might possibly not have ensued.

"Our rulers have wantonly neglected, in the prosecution of the war, those appliances of mechanism and science which are at their command. I pointed out a means by which I imagined—and still imagine—that the dock-yards, arsenal, and shipping of Sebastopol might be destroyed, without on our part the loss of a single man; at all events, the trial might have been made—it might yet be made, and at very little cost, even were expense to be regarded with such an object in view. I could at this moment show how the efficiency of our troops, and their destructive powers, might be greatly increased; but publicity in this case would prove of more advantage to the enemy than to ourselves, for they might condescend to avail themselves of a suggestion which our rulers would only 'pooh, pooh!'"

The indifference and routine, the aristocratic coldness and contempt for all beneath their circle, which characterised the government and the officials, so as to provoke the severe strictures of Colonel Napier, continued, notwithstanding all the miseries recorded in letters similar to those which fill the foregoing pages. The people of England manifested their generosity and sympathy towards the sufferers, and their indignation with the government was universally expressed; but the popular deference to the great paralysed all plans which were suggested to make the government and the heads of departments feel that the country was roused to overthrow the system. This want of determined political energy at home to meet the crisis abroad, was the subject of a letter by the Honourable Sydney Osborne to the *Times*, which produced, by its bold, energetic, and truthful tone, a very wide-spread effect:—

"SIR,—Is England voiceless? Are the days for ever gone in which public indignation can find for itself a vent? Does constitutional government consist in the mute submission of the masses to the neglect of their every interest and feeling? We hear the wail of discomfited, discouraged, and betrayed 'party;' we hear as yet no wail from the millions whose every feeling has been outraged, whose dearest interests have been betrayed. Is there one of our so-called statesmen really so dull of apprehension that he does not know what is stirring in the public mind, though—why I know not—its outburst is as yet smothered? Is not society deluged with letters from the Crimea, all telling one tale—the utter incapacity of Lord Raglan; letters, not only of newspaper correspondents, not of mere civilian lookers-on, nor of inexperienced officers, but the outpourings of the

disappointed, disgusted hearts of experienced officers, who, loving the man, stand amazed at his want of all that which, as a general, should make him respected? Yes, the Duke of Cambridge has spoken out the real truth—it has been a soldier's campaign. What has been won has been won by the pure bravery of the men and the officers doing the physical work of the war. Sir E. B. Lytton says, 'Dismiss the ministry, and save the army.' Common sense declares that to be no army which has only the valour of its officers and soldiers to depend upon. Would the country speak out that which it really wants, it would be, not to visit the minister of war with the whole weight of all that has brought us to our present grief; but to cry for the dismissal of that leader on the spot—those blind, obstinate, prejudiced men at home, whose apathy and ignorance of modern warfare would make every effort of any minister abortive.

"Is it a time for this yet great country to be mocked by the pettish actings of jealous, worn-out party leaders? In ordinary seasons, these foolish contentions of the pets of party might amuse, and do no more. We are sacrificing an army to the power we treated with contempt; we are nursed in our moral and physical sickness by the power whose invasion of our land seemed but yesterday to be the bugbear to fright us from our long, peaceful sleep. We are becoming weakened in every muscle of our national strength, and yet we are as though all this was a mere dream—the nation, the fund-holders, the taxpayers, the mourners are passive.

"What do the public really care whether Lord J. Russell is the pitiable thing the Duke of Newcastle and his own speech seem to prove him to be? It may be a serious question to those who, whig-bound by the fostered prejudices of years, think there can be no progress in liberality and freedom, unless this one lord is to lead, or at least to hold the power to destroy those who won't move at his command. Does the country, using its own sober discretion, see its only safety in the rule of some one of half-a-dozen lords, who have been tried again and again, until the history of modern times is a mere kaleidoscope, showing the shaking of these aristocratic fragments into different patterns, each the wonder of one day, the contempt of the next?

"Poor England! poor army! Still sing thy cherished national anthem; still shout, for its music's sake, 'Rule Britannia!' but do, with something like consistency, be up at this time to act, to save your queen from becoming the sovereign of a country that knows not how to afford her a ministry, save her an army, or employ for her a fleet. That cool, calculating discretion which in common hours of trial bids the land be quiet, lest talking to those

who steer the state's vessel should disturb them, is now treason. The worst feature of the worst democracy could show nothing worse, nothing more ominous, than the passive submission of the subjects of a constitutional monarchy, for the sake of an aristocracy, to a tampering with every private principle, every public obligation, which should uphold the honour of the monarch."

There is no doubt that this and similar letters, which were called forth by the tidings from the Crimea and the Bosphorus, prepared the public mind for the overthrow of the ministry, which will be noticed in a separate chapter.

While the men were enduring so much in the Crimea, the horses were fast dying, so that by the end of January the cavalry horses were nearly altogether destroyed. When the surging discontent at home compelled the government to institute a commission of inquiry, Colonel Tulloch and Sir J. McNeil were sent out to the Crimea to investigate on the spot the causes of so much disaster. It has been necessary frequently to refer to this commission, and to the report it made: this report criminated various authorities. Mr. Commissary Filder incurred some censure, although it appears that he was much more "sinned against than sinning." The general commanding the light cavalry, the Earl of Cardigan, and the general-in-chief of cavalry, the Earl of Lucan, were blamed for not having the horses huddled, or in any way placed under shelter until the inclement winter was far advanced (until the end of January, and in some cases until February), and for neglecting opportunity to bring up fodder to the cavalry camp. Whatever may have been the amount of error chargeable upon these officers, it does not appear to have arisen from any indifference to the efficiency of the service, or of the preservation of the horses. These noblemen were at discord; Lord Lucan was not a favourite at head-quarters in the Crimea, although possessing vast influence at the Horse Guards; and these circumstances militated against such arrangements as might otherwise have been easily made. After the battle of Balaklava, the coolness between the commander-in-chief and the lieutenant-general of cavalry was obvious. Whatever Lord Lucan might have accomplished if he had acted more resolutely on his own responsibility, it cannot be denied by those most disposed to censure him (and many are disposed to do so to an unjust extent), that his representations to head-quarters, made early in the winter, were sensible and necessary, and that these representations were treated with neglect. The report of the commissioners reflected much upon the quartermaster-general's department, and upon General Airey personally. The commander-

in-chief, more by implication than directly, was comprised among the blame-worthy. The report attributed the destruction of the cavalry to the neglect and mismanagement of such of the generals as had to do with it. Lord Raglan, General Airey, Lord Lucan, Lord Cardigan, and Mr. Commissary-general Filder, were all held responsible for the loss of the horses. When their report was returned to the government, there was great reluctance to publish it. The commission was alleged to have been a private one, and the report to be for the information of her majesty and her responsible advisers, not for parliament and the public—their business was to pay and confide. Parliament and the people would not confide, and after a hubbub which alarmed the government, the report was permitted to see the light. Immediately the accused generals raised a cry that injustice had been done them, and all their powerful aristocratic connexions joined in the cry. The accused officers were courtiers and friends, or connexions, of the commander-in-chief. One of the most implicated, the Hon. Colonel Gordon, of the quartermaster-general's department, is son of the Earl of Aberdeen, the late premier, a much idolised personage at court. Such influences and connexions were not to be trifled with; these officers impugned the accuracy of the report, and, by implication, the honesty of the commissioners. A new investigation was demanded. The government and the Horse Guards hit upon the expedient of selecting a number of general officers, themselves the very types of routine—men who would be sure to do, in the same circumstances, the same things which the commissioners had denounced. This new commission sat in the hall of Chelsea Hospital, and examined witnesses. Sir John McNeil refused to degrade himself by being present—he had accepted a commission from the crown, and had fulfilled it, and had no more to do with the business. Colonel Tulloch, his colleague, took a different view of his duty; he attended and addressed the court, summoned witnesses, and cross-examined the witnesses of the accused generals, until he at last broke down physically under his herculean exertions. The generals constituting the court of inquisition made a report acquitting every one. The country laughed at the report; it all along ridiculed the appointment of the board of inquiry itself; the mode in which it would proceed, and the judgment at which it would arrive, were as obvious as the motives for its appointment; and the whole metropolitan press denounced the affair as a "job," and predicted its issue. The issue was such as enabled the court and the Horse Guards to keep on their staff appointments the men whom the Crimea commission had represented as bunglers, or worse. Yet it is impos-

sible to deny that the inquiry brought to light a great deal more than was known before. If it acquitted the generals, and evaded as much as possible all admission of the disasters, or censure of the military system which led to them, it brought into public view many exculpatory circumstances so far as the cavalry generals were concerned. If the horses were not sheltered and fed, the fault did not lie wholly, or even principally with them—and this is made obvious by the Chelsea inquiry, whereas the Crimea report brought them under a dark cloud of impeachment. The integrity of the Crimea commission was also made apparent. The way in which all these contradictory things were brought about was by witnesses—"officers and gentlemen"—whose testimony was of one hue when given in the Crimea before commissioners invested with power by the crown, and of another hue when given in Chelsea Hospital, and the opinion and desires of "the Prince," the commander-in-chief, and the government, were well known. It was difficult, under the circumstances, for the commissioners in the Crimea to arrive at other conclusions than those at which they arrived; equally difficult, accepting the evidence of the same witnesses, for the Chelsea inquirers to arrive at a judgment much opposed to that which they promulgated, but which has been met by the ridicule of the press and the people, and the ill-suppressed sneers of the keen-witted premier himself. As a specimen of the mode in which the accused generals have run the gauntlet of the public and the press, let the following suffice as a sample. The Earl of Cardigan impugned the integrity of the Crimea report as to the amount of forage given to the horses in November; this his lordship did in a letter to the minister of war. His lordship's letter was thus subjected to the strictures of a military correspondent of a morning journal:—

"In the explanatory letter which the Earl of Cardigan addressed to Lord Panmure, on the subject of the animadversions which he conceived had been cast upon him by the McNeil-Tulloch report, his lordship attempted to prove, from documents to which he referred, that the cavalry horses of the Light Brigade had, during the month of November, 1854, received much more food than the commissioners' report, and the evidence of the colonels of the light cavalry regiments, had represented them to have received. He stated that the commissariat reports, sent to him daily by Colonel Mayow, showed that on the 17th of November the horses had hay and corn, 'but not their full allowance;' and that up to the 22d they had barley, 'but not quite their full rations.' His lordship also remarked that he believed Colonel Doherty's statement, that ten horses had dropped down dead while being led down from

the encampment on the heights of Balaklava, to be an exaggeration.

"We see, from a letter addressed to Lord Cardigan to the assistant adjutant-general of the cavalry division, dated the 29th of November, 1854, that on that day his lordship resigned his command, and by his own showing the horses of his brigade had, up to the 22d of November, been tolerably well fed.

"Lord Cardigan, on his return from the Crimea, made a good many speeches in public. I wish to compare his account of the condition of the light cavalry brigade, which he had then just left, as delivered to the burgesses of Northampton early in 1855, with that with which he has recently favoured Lord Panmure in February, 1856. In addressing the mayor, aldermen, and town-council of Northampton, the papers of the day reported Lord Cardigan to have said that—

"'Had it not been from circumstances, arising partly from ill-health, over which he had no control, he should not have deemed it his duty to leave the seat of war at that time, although perhaps his remaining there would have been almost useless, *for he had nothing left to command.* . . . In addition to other special reasons for losses incurred, hundreds of cavalry horses died through the commissariat failing to provide provisions or forage for them. Before he left the army, which was early in December, the horses of the brigade which he had the honour to command, had been eighteen days without hay, and but a very small portion of barley had been given them to keep them alive. The consequence was that the horses died daily in great numbers in the lines.'

"How can Lord Cardigan reconcile these statements, made when the real facts of the case were fresh in his memory, with the defence of his conduct which he has now laid before Lord Panmure, in which he labours to prove, at the expense of the characters of the officers under his command, that at the time he resigned it, the condition of the horses of his brigade was not nearly so bad as those officers had represented it in their evidence before the commission to be?"

The Chelsea Board managed to transfer the responsibility from one officer to another, so as at last to fix it upon "the system." Sir Richard Airey was exonerated from blame because Commissary-general Filder did not supply him with his requisitions; the commissary was freed from blame because he was hampered for want of transport; the provision of transport was the work of the commander-in-chief—he depended upon the commander-in-chief at home; and his responsibility was so divided with the Board of Ordnance, the Admiralty, the War-office, and the Treasury, that the thing was dissipated and lost, eluding the

pursuit of wiser heads and quicker hands than those of the jury of generals who sat in the hall of Chelsea College.

It is remarkable, that while among the Turks the loss of life far exceeded that of the British, they lost few horses—as they generally placed them for shelter under their own tents, which were better made than those of either the French or English. While matters were in this condition in the Crimea, but little hope was infused by the arrival of reinforcements of either men or horses. Some Asiatic horses were imported, and also a considerable number of mules, many of them Spanish; but the animals died off with great rapidity, being unable to endure the treatment of the camp any more than their predecessors.

The new arrival of officers came out well prepared for the weather as they thought—they had an abundance of pea-coats, Makintoshes, leggings, freize over-alls, tastefully got up sheepskins, long boots, and some, greatly to the amusement of the old hands, brought umbrellas! The supply of fine soaps and Martin's blacking, with which several of these gentlemen were furnished, was a source of much banter to them. The correspondent of the *Morning Chronicle* gave this humorous portraiture of these uninitiated gentry:—"It is curious to trace these fresh men through the phases of their acclimatisation to the campaign. I had the good fortune of meeting two of them the other day, just as, covered with dust and perspiration after a long day's hard ride, I was galloping over the road from Kadikoi to Balaklava. They stopped me, but if they had not done so I should certainly have stopped them. They were worth looking at; it made me feel at home, and I had a great mind to ask them for the whereabouts of an omnibus, or the starting of the last Woolwich train. They looked for all the world as if somebody had packed them carefully in a box, with plenty of wadding and tissue-paper, and sent them down to St. Katherine's Wharf, with directions of 'This side up,' and 'Fragile—not to be roughly handled.' The men had fancy whips too, slight whalebone affairs, whose ephemeral existence half-an-hour's ride on a Cossack horse would most assuredly terminate. And their bright silver spurs had actually round rowels—good-natured inoffensive rowels, that reminded one of park nags and a decent canter across Dulwich Common. And the men's faces were round and jolly, red and white, and their chins as smooth as a real young lady's on her first coming out. While humbly replying to their stern questions, I looked at these men with undisguised astonishment, while they with a well-bred indifference, which it did my heart good to see, scanned and marked down my tarnished gold lace, rusty sword, and

unblackened boots, and slightly smiled at the haversack which dangled at my side, and the rough Cossack pony which shook its long mane in their smooth faces. That was some days ago. I have seen the men since with half their shine taken out of them by a couple of nights under canvas, and a few meals on (not at) our camp mess-table, the ground. Their blue and velvet bore traces of dust, their metal sheaths had suspicious spots about them, and their chins were darkened with a beard of two days' growth. They rode rough Cossack ponies, and groaned under the weight of heavy haversacks, and, what is worse, their faces somewhat pale and jaundiced, gave indications of that terrible 'seediness' which affects new comers, which, if neglected, sends them either home on sick leave, or to some shunned spot outside the camp, where the turf is broken and the brown earth heaped in little hillocks—where the weary of the army take their long rest, whither no bugle call reaches, and no alarm gun sends its booming sounds."

There was hope however inspired, when, early in January, the camp heard that the railway expedition would certainly sail, and the accession of papers and letters from England was eagerly welcomed, in order to ascertain the progress of "the navvies." They were preceded by some of Messrs. Peto and Brassy's officers, who at once secured a wharf for the especial use of "the squadron," so that it might not be involved in the common confusion upon its arrival. This was a wise and essential measure, for loss of material and great delay would have infallibly befallen the undertaking, if once it became mixed up with either the army or navy service, or came under the control of the harbour-master, quartermaster-general, or any other head of anything there. Lord Raglan ordered the troops to give any assistance that might be requisite, and accordingly fatigue parties were employed to pull down some old buildings, so that the "navvies" might have a separate *locale* for themselves and their appurtenances. Great was the delight of these rough men when the vessel containing them weighed, and sailed from Blackwall. Captain Andrews had the ill-luck to tell them, in one of his excellent and judicious addresses, that "the eyes of Europe were upon them." It never occurred to them until then that their importance was so great, and their vanity was inflated to any dimensions. As they were all to be well armed with Colt's revolvers, they vowed marvellous things against the Russians, whom they were to assault with pick and pistol, and to demolish along with their stronghold. They constantly reminded one another, if any exploit was projected, that "the eyes of Europe were upon them." Some such consciousness must have impelled them to

play the conspicuous part they did on their arrival at Gibraltar: they literally "stormed the rock," as they proposed to do. Great was the surprise with which the sentinels and officers saw these strangely appressed and stalwart men climbing up the almost perpendicular face of the rock, and pushing their way into every conceivable place, however improper, which Gibraltar contained. The astonishment was mutual; the garrison and inhabitants in turn gazed at the novel visitors, who offered to treat all they met, "if there was any tidy place nigh:"—officers, soldiers, and civilians, were without distinction the objects of their benevolent intentions. After doing a good deal of unintended mischief, and completing a few fights among themselves, which did not appear to disturb their harmony much; and having offered various challenges to such persons as they met, Spaniards more particularly, to "try it on," they were collected on board again, and seriously rebuked for their wild behaviour. This took them more by surprise than the rock of Gibraltar itself, for they considered that they had performed all matters most handsomely; having given every one they met a friendly shake hands, and as friendly an offer to drink or fight with them as might best furnish their new acquaintances with an opportunity for pleasure. The Spanish residents literally ran away from them; the English were, on the whole, pleased with the harmless manifestation of home eccentricities. The navvies gave assurances to their superiors that they would be quite different men at the next place where they should land. On their arrival at Malta, however, they showed such tokens of excitement, that their superintendents would allow them to go ashore only upon the condition of taking no money with them. They acceded to this arrangement; but finding that at Malta, as well as everywhere else, money is a *sine quâ non*, they consulted together how to get a little of it. They hit upon a novel expedient thoroughly characteristic, and as thoroughly successful. They dispersed themselves about La Valetta, announcing that at a certain hour a magnificent display of the art of self-defence would be made, by real British pugilists, for the benefit of two distinguished professors of "the noble art." At the hour appointed the astonished people of Valetta and the garrison assembled in great numbers; the sparring came off with much *éclat*. The public were delighted, many of them never having seen the like before. Money was showered into the hats of the navvies by officers, soldiers, and seamen, and by all classes of the English, who were rather proud of the physical display made by their countrymen in the presence of the Maltese. The Maltese were quite satisfied that they had their money's

worth in the novel exhibition; and the navvies, replenished in pocket, thus baffled the plans of their superintendents, and made Valetta ring with the sounds of their jollification. They were in high favour with the seamen and soldiers, the whole proceeding being entirely to their taste. At Constantinople it was apprehended that their oddities would be anything but amusing to the stolid Turks, and it required no small address to prevent them from going on shore. They did not in the least appreciate the reason assigned for withholding the privilege, that "the place did not belong to the queen;" for they replied that "it ought to," and expressed their desire to lend a hand to bring about a consummation which would favour her ambition and their own amusement. When they arrived at Balaklava they were fed and lodged on board ship until the huts for their reception were completed, but they set to work with their own peculiar vigour. Their principal pastime was boxing and sparring; sometimes there were serious battles among them. The military authorities were for very stringent measures, being apprehensive of mischievous disturbances; but Mr. Peto's officers begged that the men would be left to them, and no inconvenience to the army should be experienced—and they were able to make good such an assurance. Notwithstanding the portentous efficiency of picks and revolvers, the Russians did not suffer at the hands of the navvies, otherwise than by the completion of the work which they had been sent out to perform. It was not until the end of January and the beginning of February that the draughts of railway men and material arrived, but as soon as they were fairly huddled, the work began and went on with rapidity.

Meanwhile, to supply the lack of horses—especially as the new importations died so fast—buffaloes were brought from Baltschick and Varna to the number of at least 200; some of them very soon died from the severity of the climate, and the irregularity and inadequacy of food, and soon after hard work killed more. A long row of sheds was erected for them between Balaklava and Kadikoi, which obtained the name of "Buffalo Town." In this spot the fugitives from Balaklava located themselves—Greeks, Jews, Maltese, Karites, Tartars, and Turks, displayed a curious *mélange* of nationalities; and cheated one another, and still more successfully cheated all the British visitors to Buffalo Town. There was no difficulty there, for either commissariat or transport service, in getting up huts and even houses. Mr. Woods, in describing this place, gives the following amusing and life-like picture:—"All the different branches of the English, French, and Turkish services, with other foreigners innumerable, may be met here

on Sunday, in every possible combination of winter costume, from the spruce, active, neat French soldier to our own men-of-war's men, with huge flowing beard and moustaches, greatcoats made of cow-hide, and trowsers of buffalo-skin; resembling, in fact, great bears, with nothing to remind you of our blue-jackets but their bold, rollicking, defiant spirit, which four long months in the trenches have not been able to subdue. The Turks frequent the long, gaudy line of tents, where, under the crescent and sultan's cipher, gin, raki, coffee, sweetmeats, and tobacco, are vended at the most exorbitant prices, and from which seductions the followers of the prophet always come away either discontented or drunk. The English haunt more extensive stores, where everything but the article of which you are in search can be obtained; and where, if one asks for preserved meats, he is sure to be told that they are all gone, but that some admirable teaspoons, tin kettles, and pocket-combs still remain on hand. The French have peculiar places of their own, in which, after much vociferation and many threats of appealing to the authorities, they generally wind up by expending to the amount of an English penny or so. Amid all this clamour and hurry, little Greek and Maltese boys rush in and out, laden with eggs, bridles, thick boots, gloves, pipes, sausages, and all the other little creature-comforts of which dwellers in the camp are supposed to stand so much in need, and generously offer them to passers-by for about one hundred times their actual value. Great was the astonishment and indignation of the 'navvies,' who were at Buffalo Town for the first time yesterday, to find the prices at which these things found eager purchasers here. Such was the scene at our new town on Sunday. Opposite the place where all the trade was going on, a large party of Turks were digging graves; while, a little below them were a party of our own men engaged in a similar melancholy duty; and along the road through the 'town' a long file of sick men from camp, coming in on cavalry horses, wrapped in their blankets, and scarcely able to sit in the saddle, completed the melancholy picture, and gave the 'navvies' a good idea of a Sunday in the Crimea."

"The long file of sick men," so touchingly described by Mr. Woods, continued to descend daily, until they reached the appalling number of 120 per diem for dispatch to Scutari; while many, very many, died on board ship passing thither, in the horrid hospital at Balaklava, descending the bleak plateau from the camp, within the lines, and even in the trenches, they sunk from their work, weariness, and wretchedness, into the repose of death. The medical men bore unanimous

testimony at the end of January, that the warm clothing had come "too late." For the reinforcements the warm coats, strong boots, flannel shirts, and woollen hose, would be useful; but the ordeal of November, December, and January, had been too severe for the ragged host that shivered and wasted away for a faithless government. Quietness, rest, nourishment, nursing, could alone restore the worn-out soldiers; these were not found; but they did find in the water or snow-filled dyke, misnamed a trench, or on the steep acclivities of the wind-beaten hill, or in battle with the foe—death.

In a former chapter we treated upon the hospitals at Scutari, carrying our notices forward to January, and giving a general view of their condition during that month. It is only necessary, therefore, in this place to refer to the fact that up to the month of February, from the rigours of the climate in the Crimea, and the causes which Dr. Lyons specified in his report already mentioned, those hospitals continued to receive new accessions of diseased and mutilated men; and that in spite of Miss Nightingale and her excellent coadjutors, male and female, the horrors of the lazar-houses on the Bosphorus continued. A contemporary writer, who is anonymous, thus sums up the frightful history of these receptacles of the diseased:—"When the old year had given place to the new, all alike found their prospects darkening. The horrors, although slightly changed in kind, were greater in aggregate amount at the end of January than they had been in November. This arose from the enormous number of invalids sent every week from the Crimea. At the end of January there were 5000 sick men at the camp alone; and as these accumulated too rapidly for the surgeons to attend to them, they were sent off by ship-loads to Scutari, where they added to a scene of confusion already overwhelming. Not only did the two hospitals at Scutari become filled almost to the doors, but seven other hospitals on different parts of the Turkish shores—that is, cavalry stables near the Barrack Hospital, fitted up with 150 beds; an hospital for 500 convalescents in the Sultan's Spring Palace, near the General Hospital; an hospital for 400 convalescents at Abydos, on the Dardanelles; another at Kulali, on the Bosphorus, at first appropriated to Russian prisoners, but afterwards made available for British sick by the removal of the Russians to the arsenal at Stamboul; an hospital for convalescents at Smyrna; and two hospital-ships in the Golden Horn; besides the Naval Hospital at Therapia—became almost equally crowded: and the open square of the Barrack Hospital was now fitted up with a structure for 1000 additional patients. The total number was not less than

6000, superadded to the 5000 at the camp. The glory of the victories no longer cheered the enfeebled and sickened soldiers; the wounded men, in November, had some prospect of recovery; but those wounded at a later date were kept down by dysentery and fever, and the wounds refusing to heal, the grave speedily claimed its own; or they arrived exhausted with chronic disease firmly rooted in their broken constitutions, and almost beyond the chance of successful treatment. An almost insupportable gloom now overspread the hospitals, multiplying the miseries already terrible enough. It may well be imagined that the position of Miss Nightingale and her companions became more trying as the difficulties accumulated in number."

Early in 1855 the Civil Hospital at Smyrna was instituted, and it proved a great benefit. It was confined to medical patients, which relieved the hospitals in the Bosphorus from a large class of patients less likely to be attended to there than any other at that juncture. It was at the close of December, 1854, that a plan for establishing an hospital, chiefly or exclusively under the care of civilians, was mooted, and in January the government resolved to carry it out. On the 10th of February, 1855, the Duke of Newcastle announced in the House of Lords—"It will be necessary, in spite of all opposition, and all professional feeling to the contrary, to introduce into the army hospitals the *civil element*." The government of Lord Aberdeen having fallen, the Duke of Newcastle surrendered the War-office to Lord Panmure, who followed up the scheme of his predecessor; and directed the following circular to the heads of the London hospitals, and appended a form of agreement for the signatures of such physicians as would consent to go out in the service of the government. We are particular in laying before our readers this circular and the agreement, that they may better judge of the subsequent extraordinary conduct of the British government:—

COPY OF LORD PANMURE'S LETTER TO THE GOVERNORS OF LONDON HOSPITALS.

War Department, February 17.

GENTLEMEN,—I am desired by Lord Panmure to request your immediate and earnest consideration of a subject which at this moment engages his lordship's most anxious attention—namely, the best means of rendering the vast professional resources of Great Britain, and more particularly of the metropolis, available for the medical relief of the British army at the seat of war. Lord Panmure is well aware that members of the medical profession, ever forward in a cause of humanity, no less than of patriotism, would not be wanting to respond to any appeal which might be addressed to them by the government; but his lordship is of opinion that the present necessities of the army call for medical assistance of an order which can only be insured by selection from individuals who have already given proof of their possession of the requisite skill, and whose antecedents gua-

rantee their experience; such individuals must be looked for first in the medical establishments of the great metropolitan hospitals.

I am directed by Lord Panmure to request your aid and concurrence in his organisation of a special civil medical staff to assist the military medical staff of the army at the seat of war. His lordship considers that this could be best effected by your selection of two or more medical gentlemen for the posts of physician and surgeon; of four or more other gentlemen, of a junior standing, as assistant physicians and surgeons; and of such proportion of advanced medical pupils as you may deem necessary to perform the duty of dressers; but his lordship considers that such an arrangement will fail to secure the services of the most highly qualified of your officers, unless you can at the same time, by an internal and private arrangement of your establishment, protect the gentlemen selected from a permanent professional loss resulting from their humane exertions. This can probably be effected only by declaring that such offices as may be held by gentlemen volunteering to proceed to the seat of war, on temporary furloughs from the establishments to which they belong shall not be declared vacant during their absence; but that their duties shall be provisionally performed by other gentlemen, especially appointed for the purpose, and that they shall be reinstated in such offices on their return.

The remuneration which Lord Panmure would propose for these officers would be that already fixed for the civil medical officers at Smyrna, which is as follows, viz.: physicians and surgeons, £2 2s. per diem; assistant ditto, £1 5s. per diem. But his lordship will be ready to consider any suggestions you may desire to make on that head; and I am instructed to add, that to meet the case of gentlemen who may give up private practice to proceed to the East, it is his lordship's intention to propose that the salary to be paid by the government shall be continued for one year from the termination of the engagement, which it is hoped will enable those who may find their private practice wholly or partly passed into other hands, to bear with less inconvenience the interval that may elapse before they can recover it.

Lord Panmure proposes that the hospitals to be conducted by the civil staff shall be as much as possible distinct from and apart from those in charge of the military staff; nevertheless he proposes to give local medical rank to the gentlemen so engaged.

Lord Panmure is well aware that in the present infected state of the great hospital at Scutari a local removal of the sick is greatly to be wished. This subject presents many practical difficulties; but his attention has been given to the means of overcoming them; and he trusts that the infection in question will not remain to augment the difficulty of the duty.

COPY OF AGREEMENT WITH THE GOVERNMENT.

Smyrna Hospital.

SIR,—We, the undersigned physicians and surgeons appointed to the Smyrna Civil Hospital engage to enter upon the discharge of our duties, to be defined by the medical superintendent for the time being, upon the following conditions:—A free passage out and home, lodgings, or lodging-money, and free rations. To serve a year, and to be guaranteed a year's pay, and, upon our services being dispensed with after the period of twelve months' service, to receive on retirement a gratuity of half-a-year's pay. Officers to give three months' notice of their intention to leave the service, the notice to be given on the first of any month. In the event of leaving within the first year of service, the pay to cease at the date of leaving, except in case of illness, when, upon report of a medical board, an officer shall be entitled to a free passage home, and three months' salary as a gratuity. In the event of death from disease contracted when on duty, the representatives of such officer to be entitled to receive the same gratuity as would be granted under the above regulations to an officer on retirement. Salary to be £2 2s. per diem.

To the Deputy Secretary at War.

The result of this appeal was like that of every other which government made to the

patriotism of the people: gentlemen of superior talents and attainments volunteered for the work, and bravely and nobly performed it; little supposing that they were to experience neglect, and be deprived of their just pecuniary claims at last. Among these gallant and generous-hearted men was Dr. Arthur Leared, of Finsbury Place South, a gentleman of scientific and literary acquirements, and high medical reputation, to whom these pages are indebted for the following brief notice:—

“The Smyrna Civil Hospital was projected at a time when, owing to overtaxed energies, the army surgeons were unable to meet the immense increase of their duties. The senior part of the staff consisted of three physicians and five surgeons, selected from men in practice, and holding hospital appointments chiefly in London. Many of the assistant physicians and surgeons also were connected with public hospitals; and great care was taken in the selection of all to obtain the best possible men, inducements in the way of pay being held out. Sir John Forbes, physician to her majesty’s household, was appointed chief of this efficient staff; owing to illness, however, he resigned before leaving England, and was succeeded by Dr. Meyer, one of the physicians. Early in March, 1855, the civil staff arrived at Smyrna, and found that a great number of sick had been already sent from the Crimea, and were attended by military surgeons, who came with them. These gentlemen immediately handed over their charge. The hospital was a large Turkish barrack, erected for 2000 men, but a very diminished number of sick could be accommodated. It was finely situated, at the foot of Mount Pagus, and on the edge of the beautiful bay. The climate was good—extremely agreeable during the greater part of the year, but too warm at times in summer. A wind prevails from the sea during the day, called by residents the *inbat*, and this is of essential service; at night it fails, and it is then the heat is most oppressive. Supplies of all kinds were abundant at Smyrna. The Turkish population were very well disposed towards us, so that whenever any of the doctors appeared in the Turkish quarter they were sure to be greeted by the children with ‘*Inglis bono*.’ sometimes was added, ‘*Frances bono—Muscov no bono*.’ The Greeks evidently disliked us. The brigands were all Greeks; and they were most anxious to get hold of some of our staff. They said the queen would give a liberal ransom, if not, our heads should pay for it; we having come to oppose their brethren, the Russians. An English resident doctor, Dr. M’Grath, was seized by these brigands while we were at Smyrna. They supposed him to be one of our staff, and demanded £3000 ransom, and proceeded to ill-use him, but as he understood Greek he suc-

ceeded in making better terms. After a week’s captivity, during which he was almost worn out from constant travelling over rugged mountains during the night, he was released on payment of about £370 sterling. He witnessed some brutal acts. One old Turk—whose ass was seized for his use, as he was growing lame from fatigue—was shot dead in his presence. The interior of the country about Smyrna is extremely mountainous, which favours the brigands. Before we left, the band referred to was broken up—the chief shot, and several of the others (there were ten originally) taken and executed. One morning five were beheaded in the street. I saw the body of a man that had been brought in from the country, said to be that of a robber, but it was afterwards stated that he was a peasant shot by mistake. The Turks were by no means particular in these matters. The country people, however, were largely involved in the system; they supplied the robbers with food, &c. Other bands sprung up as soon as previous ones had been extirpated. The Turkish government repaid the ransom of Dr. M’Grath lately: I believe they have done that in the case of all Europeans.

“The cases treated in the hospital were almost exclusively medical; it was found inconvenient to send the wounded so far: a large proportion were fever and scurvy cases. At first we were quite full of work—and hard work; but as the health of the army improved, we had much less to do. Fever proved very infectious; and many of our orderlies and nurses, and one dispenser, died. We had a number of lady nurses besides the paid nurses. These ladies devoted themselves to their work; and some of them narrowly escaped from the fever with which they were attacked, as well as some of the medical staff. The staff, consisting of three physicians, five surgeons, six assisting physicians, and eleven assistant surgeons, was at length too numerous for the wants of the hospital. Several were, therefore, sent to do duty in the Crimea, so that the staff was reduced to four seniors, and juniors in proportion. At the end of November it was thought proper to break up the establishment altogether, to make room for the Anglo-Swiss Legion, just at the time when the hospital was in a high state of perfection—a curious instance of vacillating policy. The experiment altogether was very costly. The hospital at Renqui was established subsequent to that of Smyrna.”

Our readers cannot fail, on perusal of the above account, to observe how uniform the fate of everything which fell under government management. When this hospital had reached its highest state of efficiency it was abandoned, and yet another was almost immediately established! The hospital which had succeeded was

given up, to make room for a Swiss Legion, and the Osmanli horse, in British pay! Immediately upon the breaking up of the hospital an attempt was made to get rid of the medical men, without giving them the compensation they had a right to expect. Men like Dr. Leared and his compeers, who had given up lucrative and important positions, which it might not be so easy to resume, in the active competition which now fills every profession, should be honoured for their promptitude in going to a remote country, and incurring the perils of pestilence and brigands; and it should be the care of government to make such sacrifices lightly felt. Our country is not so poor that it cannot recompense the brave and the humane, whose conduct proves that they would, if needs were, serve her without recompence. But while millions are squandered upon the indolent, and the favourites of those who administer the high departments of the state, merit is seldom requited, unless in deference to public feeling, or from fear of public displeasure. The heads of the military medical staff in London were not favourable to these gentlemen—the civil hospital was regarded with envy, and even animosity. It was so superior to the Crimean and Scutari hospitals as to reproach the magnates of the army medical staff in London. It was resolved by the clique which manages these things to get rid of the institution altogether, and of the men who made it what it was. Even those civilians who were engaged as assistants to the military medical officers at Scutari and the Crimea received a superior remuneration, as if the more plainly to mark the invidiousness with which the gentlemen of the civil hospital were treated. The following extract will show our readers what the feeling of these gentlemen were in August, 1856, nine months after the hospital was abandoned:—

On considering the circumstances under which we went out, the arrangements we had made for a twelvemonth's absence, the expectations we had been led to form, and the course adopted by government in other similar cases, we feel that we have suffered an injustice.

It has already been shown that the original engagement seemed to ensure us *at least eighteen months' pay*, and that Lord Panmure's letter, which immediately followed, gave us, *who had made all the sacrifices to which he alluded*, strong grounds for expecting twelve months' gratuity subsequent to our twelve months' paid service. The following facts show that his lordship's intention has been acted on in other cases.

In consequence of his lordship's letter a number of civilians were sent to Scutari; they served a year, and have received, in addition to their year's pay, a twelvemonth's gratuity, although some of them had not the claim founded on the sacrifice of private practice, inasmuch as at the time of their appointment they were not thus engaged.

Again, the militia surgeons and assistant surgeons, who did not give up practice, many of whom had not commenced practice, and had only just completed their medical studies, who have not even been out of the country, have received a twelvemonth's gratuity in addition to their pay.

Lastly, we desire it to be understood that we found our claim for an enlargement of the gratuity awarded us, not on any special interpretation of the original agreement entered into with us by government, *and which some of us did not sign*, but on the general understanding created by Lord Panmure's letter; on the obviously just principle that all who made large sacrifices for the public service should be liberally treated; on the absolute loss we have suffered owing to our early dismissal from the hospital at Smyrna, which could not be anticipated; and, lastly, on the fact that the principle of remuneration for which we contend *has been acted on by government in regard to gentlemen whose claims are certainly less strong than our own*.

ARTHUR LEARED, M.D., *late Physician to the Royal Infirmary for Diseases of the Chest, &c.*
JOHN BARCLAY, M.D., *late Physician to the Leicester Infirmary.*

SEPTIMUS GIBBON, M.D., *Assistant Physician to the London Hospital, &c.*

CARSTEN HOLTHOUSE, F.R.C.S., *Assistant Surgeon and Lecturer on Anatomy to the Westminster Hospital.*

One of the lady nurses of this institution has written a work entitled, *Ismeer; or, Smyrna and its British Hospital in 1855*. It is an extremely interesting publication, and furnishes much useful information as to the spirit of the patients and the administrative habits of our government. She thus records her own anxiety for one of her patients, and the tenderness of a poor Irish soldier—a class who made by far the best male nurses in the army:—“Next day, at an early hour, I stood at the door of the ward. How my heart beat, I had seen no one who could tell me whether he was alive or dead. At last I summoned courage, and went in, when I saw two orderlies standing by the bed, and D— stretched on it, but whether alive or dead I could not tell, though he looked more like the latter. There I stood at the door, literally unable to move, until the orderly, who had been up all night, turned round and saw me; a smile broke over his face, as he exclaimed, ‘All right, ma’am; Jem’s alive!’ I am very sorry I have forgotten this orderly’s name; he was an Irishman and a soldier—one whose gentleness and attention equalled, indeed, almost surpassed, any woman’s I ever saw.”

Resuming her life in the Smyrna Civil Hospital, she thus estimates her own labours and those of her benevolent sisterhood:—“I believe we were of use. Not in the way many people had a vague idea of at first—*i.e.* that we were constantly going about with a pocketful of lint and plaister, and a case of surgical instruments, perpetually dressing wounds (and I confess that I had a faint vision of this kind myself before I went to Smyrna), but in seeing the doctor’s orders carried out with discretion, in the spirit as well as the letter; that nothing was done out of time, overdone, or neglected; in keeping a systematic regularity; and, above all, in exercising a marvellous moral influence over the soldiers. That nurses—people from their own class—should be sent out to attend

them seemed natural enough; but that ladies—‘real ladies,’ as they used to say—should really come to see that they were taken good care of, filled them with surprise.”

Upon this extract the *Medical Times and Gazette* observes, “That moral influence was the great point gained we entirely admit. We believe that many a British soldier has enduringly benefited from that influence. We have reason to know that its effects upon the most reckless men, whose vicious propensities seemed to be excited rather than quelled by suffering, were, as stated, marvellous. When we consider the aid thus afforded in maintaining order among men accustomed to the iron rule of military discipline, it must be admitted that the lady nurses played a useful part in the civil hospital system applied to soldiers.”

Having devoted two chapters to the condition of the men in the Crimea, their sickness

and wants—the loss of their transport and cavalry horses, and the consequent aggravation of their miseries—the remedies devised for them and the sorrowful failure of most of them, because of the men and the measures adopted by the heads of departments, or the obstructions placed in the way of rational reform,—we shall bring the prosecution of the siege itself once more before the reader. Incidentally, it will be necessary again and again to refer to topics treated more largely in the last two chapters; for so terrible, so all-pervading were the distress, sickness, and suffering of our army, that whatever occurred in the way of military achievement was influenced by this disastrous condition of affairs. The siege itself, and the character of the combats waged around the barrier erected against us by Russian promptitude and energy, were fashioned by the one great all-influencing fact—the physical misery of the British army.
